Table of Contents

Table of Contents	iii
Part I. Getting Started	1
1. Preface	5
1.1 Overview	6
1.2 Summary	7
1.3 Characteristics of GOLDDILOCKS Cluster	11
2. Tutorial	17
2.1 Managing GOLDDILOCKS Instance	18
2.2 Installing GOLDDILOCKS and Creating Database	25
2.3 Managing Database Memory Structure	43
2.4 Managing Schema Object	51
2.5 Managing User	54
2.6 GOLDDILOCKS Property	58
2.7 GOLDDILOCKS Utility	60
3. Cluster Tutorial	63
3.1 Managing GOLDDILOCKS Cluster System	64
3.2 Installing GOLDDILOCKS and Creating Database	72
3.3 Managing Schema Object	76
3.4 GOLDDILOCKS Property	87
4. What's New	91
4.1 Feature Matrix	92
4.2 What's New in GOLDDILOCKS 3.2	153
4.3 Patch Notes	162
Part II. Administration Manual	197
5. Basic Management of GOLDDILOCKS Database	219

5.1	Creating and Configuring GOLDILOCKS Database	220
5.2	Starting up and Shutting down GOLDILOCKS Instance	223
5.3	Managing Process	231
5.4	Managing Memory	237
5.5	Monitoring	239
6.	Structure and Storage Structure of GOLDILOCKS Database	253
6.1	Managing Control File	254
6.2	Managing Redo Log File	258
6.3	Managing Archive Redo Log File	262
6.4	Managing Tablespace	264
6.5	Managing Data File	270
7.	Backup and Recovery of GOLDILOCKS Database	273
7.1	ARCHIVELOG Mode	274
7.2	Backup and Recovery	276
8.	GOLDILOCKS Database Replication	295
8.1	Overview	296
8.2	Operating Method	297
8.3	Trace Log	304
9.	Database Information	307
9.1	DICTIONARY_SCHEMA	308
9.2	INFORMATION_SCHEMA	504
9.3	PERFORMANCE_VIEW_SCHEMA	541
10.	Server Property	603
10.1	Server Property Information	604
10.2	AGING_INTERVAL	605
10.3	AGING_PLAN_INTERVAL	606
10.4	ARCHIVELOG_DIR_1 ~ ARCHIVELOG_DIR_10	607
10.5	ARCHIVELOG_FILE	608
10.6	ARCHIVELOG_MODE	609
10.7	BACKUP_DIR_1 ~ BACKUP_DIR_10	610
10.8	BLOCK_READ_COUNT	611
10.9	BULK_IO_PAGE_COUNT	612
10.10	CDISPATCHER_HOT_POLICY_INTERVAL	613
10.11	CDISPATCHER_SOCKET_BUFFER_SIZE	614
10.12	CDISPATCHER_SYNC_THREADS	615
10.13	CDISPATCHER_THREADS	616
10.14	CHARACTER_SET	617
10.15	CHAR_LENGTH_UNITS	618

10.16	CHECK_DEDICATE_CONNECTION_INTERVAL	620
10.17	CLIENT_MAX_COUNT	621
10.18	CLIENT_NUMA_POLICY	622
10.19	CLOSE_PSM_CHILD_STMTS	623
10.20	CLUSTER_ASYNC_COMMIT	624
10.21	CLUSTER_ASYNC_REPLICATION	625
10.22	CLUSTER_CM_BUFFER_COUNT	626
10.23	CLUSTER_CM_BUFFER_SIZE	627
10.24	CLUSTER_CM_READ_BUFFER_SIZE	628
10.25	CLUSTER_COMMIT_SLAVES	629
10.26	CLUSTER_COMMIT_STREAM_ISOLATION	630
10.27	CLUSTER_CONNECTION	631
10.28	CLUSTER_CONNECTION_TIMEOUT_SEC	632
10.29	CLUSTER_DATA_SYNC_SERVERS	633
10.30	CLUSTER_DISPATCHER_IN_QUEUE_SIZE	634
10.31	CLUSTER_DISPATCHER_NUMA_STREAM_MAP	635
10.32	CLUSTER_DISPATCHER_OUT_QUEUE_SIZE	636
10.33	CLUSTER_HEARTBEAT_INTERVAL	637
10.34	CLUSTER_HEARTBEAT_RETRY_COUNT	638
10.35	CLUSTER_IGNORE_INACTIVE_MEMBER	639
10.36	CLUSTER_MAX_PACKET_SIZE	640
10.37	CLUSTER_MAX_PAYLOAD_SIZE	641
10.38	CLUSTER_PACKET_ALLOCATION_TIMEOUT	642
10.39	CLUSTER_PROTOCOL_SESSION_FATAL_POLICY_TIMEOUT	643
10.40	CLUSTER_PROTOCOL_FAILOVER_POLICY_TIMEOUT	644
10.41	CLUSTER_SERVER_RESPONSE_QUEUE_SIZE	645
10.42	CLUSTER_SPLIT_BRAIN_RESOLUTION_POLICY	646
10.43	CLUSTER_SPLIT_BRAIN_RETRY_COUNT	647
10.44	COMMITTER_HOT_POLICY_INTERVAL	648
10.45	CONTROL_FILE_0 ~ CONTROL_FILE_7	649
10.46	CONTROL_FILE_COUNT	650
10.47	CONTROL_FILE_TEMP_NAME	651
10.48	COORDINATOR_COMMIT_WRITE_MODE	652
10.49	CSERVERS	653
10.50	DATABASE_ACCESS_MODE	654
10.51	DATABASE_INSTANCE_NAME	655
10.52	DATA_STORE_MODE	656
10.53	DA_CLIENT_NUMA_NODE	657
10.54	DDL_AUTOCOMMIT	658

10.55	DDL_LOCK_TIMEOUT	659
10.56	DEFAULT_GLOBAL_SECONDARY_INDEX_CREATION	660
10.57	DEFAULT_INDEX_LOGGING	661
10.58	DEFAULT_INDEX_PCTFREE	662
10.59	DEFAULT_INITTRANS	663
10.60	DEFAULT_MAXTRANS	664
10.61	DEFAULT_PCTFREE	665
10.62	DEFAULT_PCTUSED	666
10.63	DEFAULT_REMOVAL_BACKUP_FILE	667
10.64	DEFAULT_REMOVAL_OBSOLETE_BACKUP_LIST	668
10.65	DEFAULT_SHARDING	669
10.66	DISABLE_DDL_CDC_GIVEUP	672
10.67	DISABLE_UPDATE_PK_CDC_GIVEUP	673
10.68	DISALLOWED_PROTOCOL_TARGETTYPE	674
10.69	DISALLOWED_PROTOCOL_TARGETTYPE_WITH_ALL	675
10.70	DISALLOWED_PROTOCOL_TARGETTYPE_WITH_NAME	676
10.71	DISPATCHER_CM_BUFFER_SIZE	677
10.72	DISPATCHER_CM_UNIT_SIZE	678
10.73	DISPATCHER_CONNECTIONS	679
10.74	DISPATCHER_HOT_POLICY_INTERVAL	680
10.75	DISPATCHER_LOAD_BALANCING	681
10.76	DISPATCHER_NUMA_STREAM_MAP	682
10.77	DISPATCHER_QUEUE_SIZE	683
10.78	DISPATCHER_REQUEST_MINI_QUEUE_COUNT	684
10.79	DISPATCHER_RESPONSE_MINI_QUEUE_COUNT	685
10.80	DISPATCHERS	686

Part III. SQL Manual 823

11.	SQL Elements	865
11.1	Syntax Elements	866
11.2	Data Type	887
11.3	Format String	914
11.4	Expressions	928
11.5	Pseudo Columns	935
11.6	Operators	940
11.7	Functions	943
11.8	Conditions	951
11.9	Built-in Data Type References	963
11.10	Built-in Function References	990
12.	SQL Languages	1,203
12.1	Data Definition Language	1,204
12.2	Data Manipulation Language	1,214
12.3	Data Query Language	1,222
12.4	Control Language	1,236
12.5	Processing SQL in Cluster	1,241
13.	SQL Objects	1,289
13.1	Database	1,290
13.2	Profile	1,297
13.3	Audit Policy	1,303
13.4	Authorization	1,331
13.5	Schema	1,342
13.6	Tablespace	1,353
13.7	Table	1,356
13.8	Index	1,362
13.9	View	1,366
13.10	Sequence	1,369
13.11	Synonym	1,373
13.12	Stored Procedure	1,376
13.13	Stored Function	1,378
14.	Cluster Objects	1,381
14.1	Cluster System	1,382
14.2	Cluster Group	1,389
14.3	Cluster Member	1,391

14.4	Cluster Location	1,393
14.5	Cluster Table and Shard	1,394
14.6	Global Secondary Index	1,410
15.	SQL Tuning	1,413
15.1	Overview	1,414
15.2	SQL Processing	1,415
15.3	Query Optimizer	1,421
15.4	SQL Execution Plan	1,455
15.5	SQL Trace Log	1,494

1.

Preface

1.1 Overview

This user manual is intended for the user who is configuring, managing and operating GOLDDILOCKS. The purpose of this manual is to convey the basic concepts required for installation and management of GOLDDILOCKS. This manual also describes cautions when using GOLDDILOCKS system.

- The description which is presented in this document can be changed according to the installation environment and specific usage.
- This document is based on GOLDDILOCKS 3.2 version.
- This document is based on RedHat linux - based platform.

Target Reader

The target readers are as follows.

- Programmers who need basic knowledge about how to manage GOLDDILOCKS database
- Administrators and performance managers of GOLDDILOCKS database
- Administrators and performance managers of GOLDDILOCKS cluster system

1.2 Summary

This chapter describes the basic structure and characteristics of GOLDDILOCKS for the novice user. A user can select either a standalone or a cluster system architecture to use GOLDDILOCKS. Differences of each architecture and their usages are described.

GOLDDILOCKS Database Management System

GOLDDILOCKS is an in-memory relational DBMS. GOLDDILOCKS stores all user data in in-memory as a table form so that it performs search and update operations of all such data effectively.

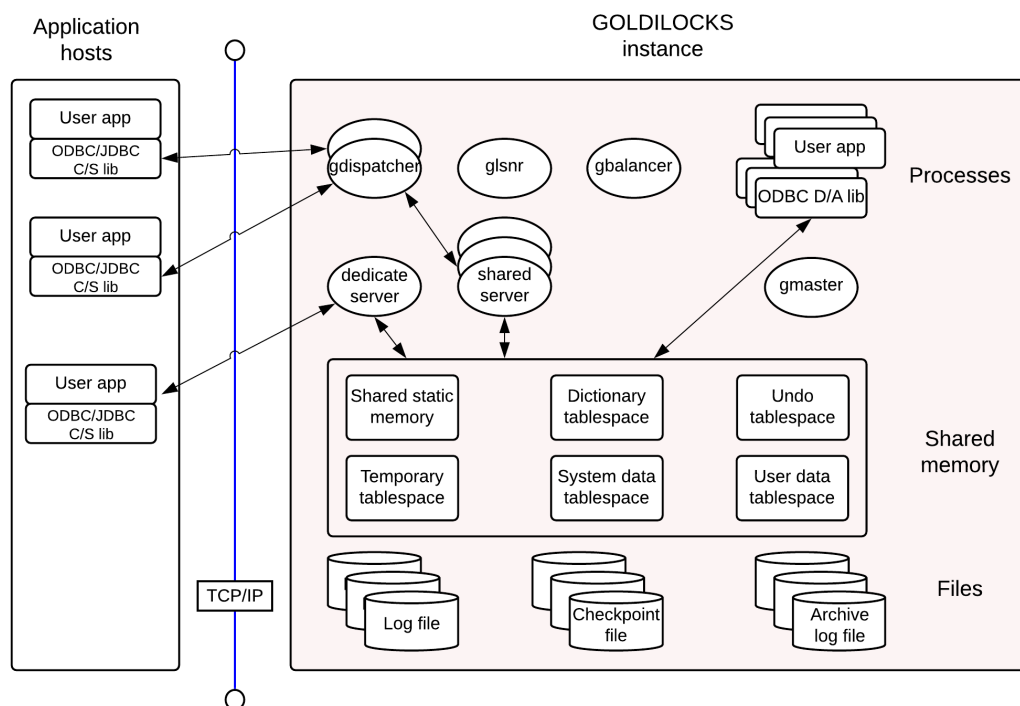

GOLDDILOCKS database system consists of the following parts.

- User-installed GOLDDILOCKS software binaries
- Database which is a set of tablespaces, implemented with one or more shared memory on in-memory
- Various files for persistence support of database
 - The data files created with the same size as shared memory per shared memory
 - Redo log files which support the recovery of the database in the event of a failure
 - Configuration files for database settings
 - Trace log files which record information such as events during database operations
- gmaster processes which manage in-memory database, and many system threads within it

GOLDDILOCKS Architecture

To prevent spreading the application process failure over the entire database system, GOLDDILOCKS database is a multi-process architecture based on shared memory, instead of a multi-thread architecture. The overall architecture of GOLDDILOCKS database is as shown in figure 1. Data are loaded onto a shared memory and gmaster process is a management daemon which manages database such as boot-up, log flush, aging. Also, it stores redo log files and data files on a disk file to ensure the permanence of data. Applications using GOLDDILOCKS database will use one of the following two accessing models.

Figure 1 GOLDILOCKS architecture

- Direct Access (D/A) model
 - A user may use D/A model when user application is operated on the same equipment as GOLDILOCKS database.
 - User applications should be used by linking with GOLDILOCKS ODBC/JDBC libraries for D/A.
 - GOLDILOCKS ODBC/JDBC libraries for D/A include query processing module and storage management module inside and they process user request by directly attaching shared memory configuring that database.
 - It is suitable to implement a few works which require low-latency because the communication load between application process and database process module is removed.
- Client/ Server (C/S) model
 - A user may use C/S model when user application is operated on the same equipment as GOLDILOCKS database or on a different equipment.
 - User applications should be used by linking with GOLDILOCKS ODBC/JDBC libraries for C/S.
 - The GOLDILOCKS development library for C/S processes user's requests through TCP communication with the server (gserver) which serves the database specified in the connect string.
 - The response speed of single application of C/S is inferior to that of D/A. However, C/S does not depend on the location of the application, and the relatively stable operation is possible even when an error occurs in the application.
 - C/S model may be operated in shared mode or dedicated mode. In dedicated mode, a single server (gserver) process is performed on a single client. In shared mode, it responds to multiple clients because dispatcher (gdispatcher) and shared-server (gserver) are always running.
 - Dedicated mode is suitable for large amount of data, and shared mode is suitable for many clients, small amount of data.
 - For more information about setting dedicated mode or shared mode, refer to **odbc.ini File** and **Lis**

tener Configuration.

Note

In D/A model, an application directly accesses to database and manipulates it, and thus the database instance becomes unstable because many errors occur at an early development stages. Therefore, it would be efficient to develop it in C/S model at an early development stage, and then, to switch it to D/A model at the final development stage.

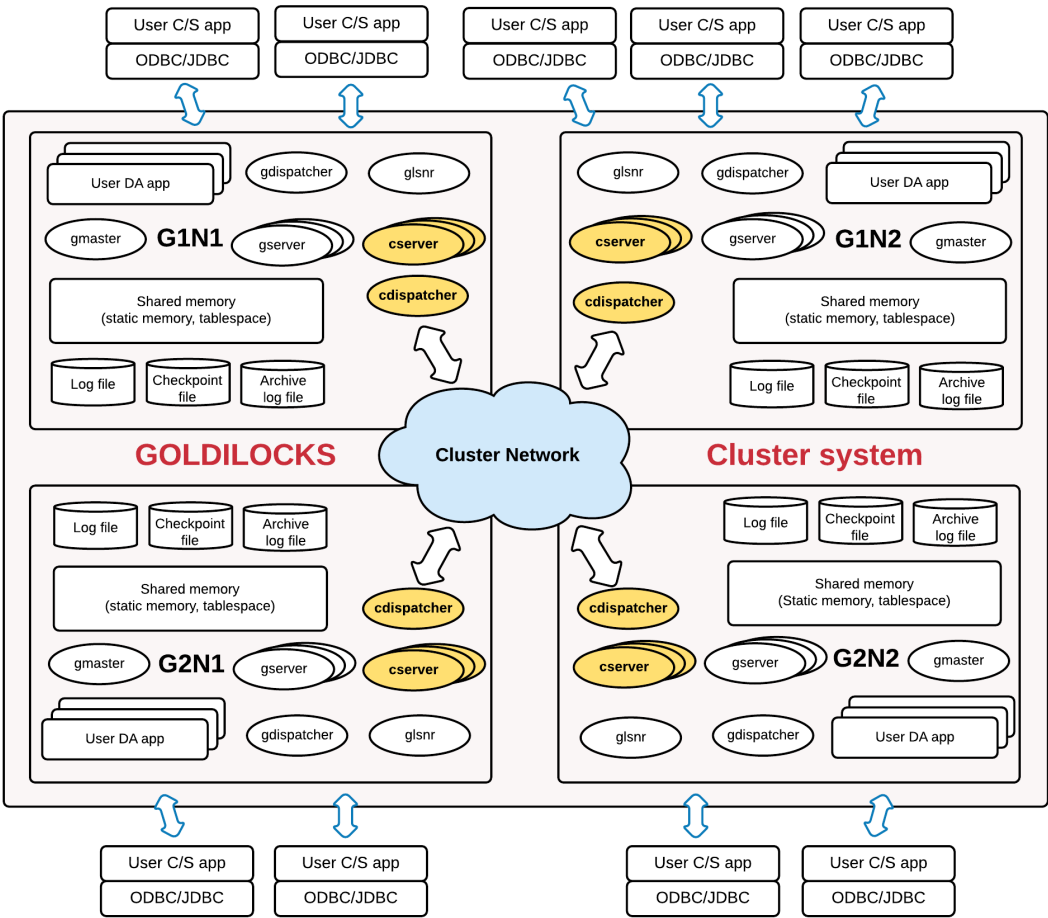

GOLDILOCKS Cluster System Architecture

GOLDILOCKS can be used by configuring a standalone database, or binding multiple databases into a single cluster and managing the database in cluster unit. In other words, a user can distribute and store table data into multiple nodes according to the desired sharding strategy. This guarantees high availability and improves the throughput due to the parallel processing.

GOLDILOCKS cluster system guarantees ACID of transaction which is cluster-widely performed. Therefore, it provides the data reliability as same as that of the transaction performed on a standalone server when any node belonging to the cluster system is connected to perform the transaction.

Each database belonging to GOLDILOCKS cluster system has a structure for multi-process structure and data loading method, which is as same as the structure of the standalone database. However, cdispatcher process and cluster server (cserver) process are added. cdispatcher is a process for efficient communication between member nodes in a cluster, and cluster server (cserver) process is for the data storage and management on the cluster member node. Also, tablespaces and management areas for transaction management of cluster system are added to the shared memory.

Figure 2 GOLDILOCKS cluster system architecture

1.3 Characteristics of GOLDDILOCKS Cluster

Features of Cluster

GOLDDILOCKS cluster is a cluster system of shared nothing structure and it overcomes limitations for transaction performance and storage of an existing standalone system.

- High throughput
 - GOLDDILOCKS cluster does not limit creating groups, and the linear performance can be improved by creating groups.
 - It overcomes the limitation for the storage space of the existing memory-based standalone system.
- High availability
 - If a group consists of multiple members and at least one member is running in a group, it does not affect the availability.
 - Even when not every member in a group is available, other groups except for that group normally provides service.
- Online expansion and online recovery
 - creating groups or members are possible even when the service is in progress, and it does not affect the service in progress.
 - Even the member of the suspended service due to an error can participate in a cluster online.
- Providing the perfect transaction
 - It perfectly provides the following properties of which a transaction should comply with.
 - Atomicity
 - Consistency
 - Isolation
 - Durability
- Providing the perfect MVCC (multi-version concurrency control)
 - GOLDDILOCKS cluster provides a global statement level consistency as standalone system does.
 - The SQL starting at a specific point can access a desired version among the various versions when accessing to any node.
- Providing the standard SQL and the standard DBC
 - It provides SQL which is equivalent to SQL 92.
 - It provides standard DBCs such as JDBC, ODBC.
- Application compatibility
 - The application source or SQL developed in the existing standalone system can be used in GOLDDILOCKS cluster without modifying it.

Constraint of Cluster

All SQL statements in GOLDBLOCKS cluster can be used same as those in standalone system except for the following constraints.

Note

PRIMARY KEY for the sharded table, UNIQUE constraint and the UNIQUE INDEX should include a sharding key.

The following is an example of a failure because the constraint of UNIQUE (name) does not include an id column which is a sharding key.

```
gSQL>
CREATE TABLE t1
(
    id    INTEGER PRIMARY KEY,
    name  VARCHAR(128),
    UNIQUE (name)
)
SHARDING BY HASH(id);
ERR-HYC00(16380): UNIQUE or PRIMARY KEY must include all sharding key columns for cluster
system
```

The constraint should be generated including sharding key like as UNIQUE (id, name) or UNIQUE (name, id) in the following example.

```
gSQL>
CREATE TABLE t1
(
    id    INTEGER PRIMARY KEY,
    name  VARCHAR(128),
    UNIQUE( id, name )
)
SHARDING BY HASH (id);
Table created.
```

Note

Non-deterministic statements should have the global secondary index to distinguish the same rows among the cluster members.

The following is an example of error which occurs when creating a table omitting the global secondary index by force.

```
gSQL> CREATE TABLE t1 ( c1 INTEGER ) WITHOUT GLOBAL SECONDARY INDEX;
Table created.
gSQL> INSERT INTO t1 VALUES (1), (2), (3), (4), (5);
5 rows created.
gSQL> COMMIT;
Commit complete.
```

The following is an example of deleting three rows and it does not guarantee that the cluster members delete the same rows.

```
gSQL> DELETE FROM t1 FETCH 3;
ERR-42000(16423): does not support non-deterministic DML in the cluster system : global
secondary index expected
```

The following example does not guarantee that the cluster members update the same rows to the same value by using RANDOM(1, 100).

```
gSQL> UPDATE t1 SET c1 = RANDOM(1, 100);
ERR-42000(16423): does not support non-deterministic DML in the cluster system : global
secondary index expected
```

The following is an example of updating the row at the current position by using updatable cursor, and it requires the global secondary index to distinguish the same rows among cluster members.

```
gSQL> \var v1 INTEGER
gSQL> DECLARE cur1 CURSOR FOR SELECT c1 FROM t1 FOR UPDATE;
Cursor declared.
gSQL> OPEN cur1;
Cursor is open.
gSQL> FETCH cur1 INTO :v1;
V1
--
```

1

1 row fetched.

gSQL> UPDATE t1 SET c1 = 1 WHERE CURRENT OF cur1;

ERR-42000(16423): does not support non-deterministic DML in the cluster system : global secondary index expected

Note

It does not support the deferrable constraint.

gSQL> ALTER TABLE t1 ADD CONSTRAINT t1_uk UNIQUE(id) DEFERRABLE;

ERR-HYC00(16388): does not support deferrable constraints in the cluster system :

ALTER TABLE t1 ADD CONSTRAINT t1_uk UNIQUE(id) DEFERRABLE

*

ERROR at line 1:

Note

It does not guarantee the sequence when using the same sequence in different servers.

- It is executed in g1n1 server.

gSQL> SELECT seq1.NEXTVAL FROM dual;

NEXTVAL

1

1 row selected.

gSQL> SELECT seq1.NEXTVAL FROM dual;

NEXTVAL

2

1 row selected.

- It is executed in g2n1 server.

gSQL> SELECT seq1.NEXTVAL FROM dual;

NEXTVAL

```
-----  
      21  
1 row selected.
```

- It is executed again in g1n1 server.

```
gSQL> SELECT seq1.NEXTVAL FROM dual;  
NEXTVAL  
-----  
      3  
1 row selected.
```

2.

Tutorial

2.1 Managing GOLDBLOCKS Instance

This chapter describes the basic knowledge of managing the GOLDBLOCKS instance.

Overview

GOLDBLOCKS database system consists of database and instance. Database is a collection of various files which are necessary for driving database such as dictionary data on memory, user data, data file for dictionary data and user data, online redo files.

Database instance consists of two parts. One is the memory portions containing the run-time information for operating GOLDBLOCKS database, and the other is the background process which is used to operate and manage it. Each database instance is identified as shared memory key value and "GOLDBLOCKS _DATA" environment variable value, both are used to configure shared memory.

Property Setting

GOLDBLOCKS properties are listed in `$GOLDBLOCKS _DATA/conf/goldilocks.properties.conf` file. A user may install GOLDBLOCKS using the basic properties. This chapter describes the main properties such as TBS (Tablespace), LOG, CONTROL FILE.

The followings describe main property items of when installing GOLDBLOCKS.

Table 2-1 Main property items

Property	Description	Default value
SYSTEM_TABLESPACE_DIR	It is the directory path of installing the following system TBS. <ul style="list-style-type: none"> • DICTIONARY_TBS • MEM_DATA_TBS • MEM_UNDO_TBS • MEM_TEMP_TBS • MEM_TRANS_TBS 	'<GOLDBLOCKS_DATA>/db'
SYSTEM_MEMORY_DICT_TABLESPACE_SIZE	It is the dictionary tablespace size.	128M
SYSTEM_MEMORY_DATA_TABLESPACE_SIZE	It is the data tablespace size.	200M
SYSTEM_MEMORY_UNDO_TABLESPACE_SIZE	It is the undo tablespace size.	32M

Property	Description	Default value
LOG_DIR	It is the default log directory path.	'<GOLDDILOCKS_DATA>/wal'
SYSTEM_LOGGER_DIR	It is the system log directory path.	'<GOLDDILOCKS_DATA>/trc'
CONTROL_FILE_COUNT	It is the number of control files.	2
CONTROL_FILE_0	It is the first control file path.	'<GOLDDILOCKS_DATA>/wal/control_0.ctl'
CONTROL_FILE_1	It is the second control file path.	'<GOLDDILOCKS_DATA>/wal/control_1.ctl'

Note

- **DICTIONARY_TBS:** It is the tablespace which stores dictionary tables of GOLDDILOCKS.
- **MEM_DATA_TBS:** It is the tablespace in which the user table/index is generated.
- **MEM_UNDO_TBS:** It is the tablespace which contains the undo (rollback) information of the transaction.
- **MEM_TRANS_TBS (Cluster only):** It is the tablespace used for the global transaction recovery in cluster system. The size is automatically calculated based on the transaction table size and the number of cluster node.

A user can change the text property file (\$GOLDDILOCKS_DATA/conf/golddilocks.properties.conf), or define a new variable in the form of GOLDDILOCKS_<property_name> to change the database settings or instance settings. In the priority, the property file takes precedence over the environment variable.

Background Process

GOLDILOCKS has a background process (gmaster) for managing instance. gmaster consists of multiple system thread internally, and the contents are as follows.

Table 2-2 System threads

Thread	Description
Main thread	It starts or ends gmaster process.
Log archiving thread	It copies the previous redo log file to a specified location when switching online redo file, and stores it.
Ager thread	It cleans up the resources being used by dropped schema objects.
Page flusher thread	It distributes the task to the IO slave and controls them in order to store the dirty pages of in-memory into the disk at checkpoint.
Log flusher thread	It periodically collects the log records accumulated in the redo log buffer, and then stores them into online redo log file at run-time.
Checkpoint thread	It downloads the in-memory's changes to the data file on the disk and the online redo log file when switching redo log file.
Cleanup thread	It cleans up resources used by abnormally terminated clients, and then rolls back the transactions.
IO slave thread	It performs all disk IO related to data file such as checkpoint and data file loading.
Process monitor thread	It monitors after executing the processes such as balancer (gbalancer), dispatcher (gdispatcher), shared-server (gserver), then reexecutes when abnormal termination is detected.
Cluster Recover Thread (Cluster only)	It recovers a global transaction in cluster system.
Failover Thread (Cluster only)	It deals with the failover through reselecting offline and coordinator for the members when an error occurs on a specific node or in a network in cluster system.

Client Process

Client/ Server Model

The Client/ Server (C/S) model application is connected to listener (glsnr) which is waiting for access request. Then it creates a new database service process (gserver), in dedicated mode, and it handles user's request by using TCP communication. All these operations are carried out through inter process communication, so any signal generated in the application process does not affect on the state of the database. Moreover, cleanup thread regularly checks and returns all the resources used by abnormally terminated application.

Direct Access Model

GOLDDILOCKS supports a direct access (D/A) model as well as Client/ Server (C/S) model. All applications using D/A model are linked to the server library supported by GOLDDILOCKS, and then directly access database and instance. Therefore, no other special service process exists but only the application processes does exist.

When D/A model application process is interrupted abnormally by the signal generated during operation, all resources in use will be cleaned up by the signal handler function which the library set during connection. The function cleans up the resources according to the two following steps.

1. The signal handler marks an abnormal termination on the session object and terminates the process.
2. The cleanup thread of gmaster return resources to the database in the same way as C/S model after a certain period of time.

Application processes directly access the database area in D/A model. Therefore, comply with the following precautions.

- When the D/A model application process is terminated by a fatal signal such as SEGV, the signal handler which was registered by the library at connection to the database should stop using shared resources. If a specific signal handler should be installed in the application it should be declared before connecting to the database.
- When forcibly shut down the application process, do not use SIGKILL (kill-9) because the process can not detect the generation of the signal. A user should use SIGTERM, SIGQUIT or SIGUSR2.

Memory Architecture of Instance

The memory size used by the database instance is determined by the relevant properties in the property file. Shared memory used by instance can be divided into static area and tablespace area. Static area includes basic information about public instance, each session, statement, transaction, redo log buffer, dictionary cache and several other operation. Tablespace area includes page frame of each tablespace and Page Control Header (PCH) for controlling them.

The application process memory includes instance memory attached at connection. Additionally, it includes process basis sharing ODBC environment, several ODBC handles, heap memory area with bind information.

Startup and Shutdown Instance

To startup the GOLDILOCKS instance, set the `SHARED_MEMORY_STATIC_KEY` property differently from other instances. After that, a user can startup the GOLDILOCKS instance by using `gsql`. Execute it to take `sysdba` role as follows.

A user should run **listener** before startup or shutdown the GOLDILOCKS instance in dedicated mode of C/S model.

A user can not startup or shutdown the GOLDILOCKS instance in shared mode of C/S model.

```
% gsql sys gliese --as sysdba
Connected to GOLDILOCKS Database.
gSQL>
```

Startup phrase in the SUNDB instance has several phases as follows.

- NOMOUNT
 - It starts up gmaster process which is a managing daemon of the GOLDILOCKS instance.
- MOUNT
 - It loads properties and recovery control file by using `$GOLDILOCKS_DATA` environment variable.
- OPEN
 - After loading the tablespace contents from data file, it recovers by using redo log, rebuilds no-logging indexes, creates dictionary cache, and then waits for the user's service connection.

A user can start up the GOLDILOCKS instance by using `gsql` as follows.

```
gSQL> \startup nomount
Startup success
gSQL> alter system mount database;
System altered.
gSQL> alter system open database;
System altered.
```

To directly enter into OPEN phase, do as follows.

```
gSQL> \startup open
Startup success
```

If GOLDILOCKS instance is shut down, gmaster (the daemon process for management) would be terminated. Then, connection and database operation is no longer possible.

There are four ways to shutdown the GOLDILOCKS instance as follows.

- NORMAL
 - After blocking the access of a new session and waiting until the end of all connected sessions, a user performs a checkpoint and shuts down the instance.
- TRANSACTIONAL
 - After blocking the start of a new transaction and waiting until the end of all running transactions, a user performs a checkpoint and shuts down the instance.
- IMMEDIATE
 - After blocking the execution of a new unit operation (Connection unit with GOLDILOCKS database, e.g. FETCH or EXECUTE, etc.) and waiting until the end of all unit operations, a user rolls back all transactions, performs a checkpoint and shuts down the instance.
- ABORT
 - Regardless of any connected session's status, a user terminates gmaster and shuts down the instance.

To shutdown an instance, use gsql with sysdba role and perform \shutdown, as follows.

```
% gsql sys gliese --as sysdba
Connected to GOLDILOCKS Database.
gSQL> \shutdown normal
Shutdown success
gSQL>
```

Start and End of Listener

A user should run the listener to provide the service in the client/ server environment.

A user can start the listener as follows.

```
% glsnr --start

Listener is started successfully.
%
```

A user can end the listener as follows.

```
% glsnr --stop

Listener is stopped.
%
```

For more information about listener control, refer to **glsnr**.

For more information about how to start or end cluster system refer to **Start and End of Cluster System**.

2.2 Installing GOLDBLOCKS and Creating Database

This chapter describes how to install the GOLDBLOCKS software and create a database.

Overview

GOLDBLOCKS software is a compressed file with the name such as *goldilocks-⟨version_no⟩-⟨os_type⟩-⟨cpu_type⟩.tar.gz*. After decompressing the file, software binaries, various samples, fundamental database directory structures are created at the corresponding location, and then installation is completed. After the installation, the directory is created, and the directory is named after the package. Then directories whose names are *goldilocks_home* and *goldilocks_data* are created under it.

- *goldilocks_home* directory
 - Binary home of GOLDBLOCKS product
 - Defined as GOLDBLOCKS_HOME environment variable
 - Operation binaries, libraries for the client, header files, licenses, etc. are located.
- *goldilocks_data* directory
 - Home of the user database (instance) which GOLDBLOCKS creates.
 - Defined as GOLDBLOCKS_DATA environment variable
 - A default location which has data files, log files, property files

After that, use a utility called *gcreatedb* in *\$GOLDBLOCKS_HOME/bin* directory to create a database in *\$GOLDBLOCKS_DATA* directory.

Release Platform

GOLDBLOCKS is available in the following release platform.

Table 2-3 Release platform

Platform	Platform name	OS	CPU	Remarks
Server platform	linux-x86_64	linux	x86_64	>= linux kernel 2.6 >= glibc 2.1 >= gcc 4.1.2 >= java 1.4 <= java 1.6
	hpux11.31-itanium-64	HP-UX 11.31	itanium	>= java 1.4 <= java 1.6

Platform	Platform name	OS	CPU	Remarks
	aix6-powerpc-64	AIX 6.1	powerpc	>= java 1.4 <= java 1.6
Client platform	linux-x86_64	linux	x86_64	>= linux kernel 2.6 >= glibc 2.1 >= gcc 4.1.2 >= java 1.4 <= java 1.6
	linux-x86_32	linux	x86_32	>= Linux kernel 2.6 >= glibc 2.1 >= gcc 4.1.2 >= java 1.4 <= java 1.6
	hpux11.31-itanium-64	HP-UX 11.31	itanium	>= java 1.4 <= java 1.6
	hpux11.31-itanium-32	HP-UX 11.31	itanium	>= java 1.4 <= java 1.6
	aix6-powerpc-64	AIX 6.1	powerpc	>= java 1.4 <= java 1.6
	windows-x86-64	Windows	PENTINUM x86	java 1.6
	windows-x86-32	Windows	PENTINUM x86	java 1.6

System Requirements

Check the following requirements before installing GOLDDILOCKS.

- At least 2 G should be secured at the physical memory and disk space.
- A sufficient amount of paging (swap) area is required.
- The correct package version which fits into the platform to be installed is required.

GOLDDILOCKS Package Configuration

This chapter describes the directory configuration when installing GOLDDILOCKS.

Package Directory Configuration

Table 2-4 Parent directory configuration

Directory	Server	Client	Description
GOLDBLOCKS_HOME	O	O	Binaries and libraries are installed, overwriting-enabled group when updating
GOLDBLOCKS_DATA	O	X	The data storing path, overwriting-unabled group

Table 2-5 Package directory configuration

Parent directory	Package directory	Description
GOLDBLOCKS_HOME	admin	Required schema script to create database
	bin	Execution files
	lib	Library files
	include	Header files such as ODBC, XA, Embedded SQL, etc.
	license	License files
	sample	Sample files
	msg	Error message files
	script	Script file for ease of use (It will be supported in future)
	app_dev	Application development
GOLDBLOCKS_DATA	conf	Configuration files
	db	Database files
	wal	Log files, control files
	archive_log	Archive log files
	backup	Back up files
	trc	Trace log files, warning message files
	journal	Journal file used at cluster rebalance

Package File List

The followings are description of files in a directory, and whether it is included in server package or client package.

Table 2-6 admin/ standalone directory

File name	Server	Client	Description
README	O	X	Read me
DictionarySchema.sql	O	X	Dictionary schema creating script
InformationSchema.sql	O	X	Information schema creating script
PerformanceViewSchema.sql	O	X	Performanceview schema creating script

Table 2-7 admin/ cluster directory

File name	Server	Client	Description
README	O	X	read me
DictionarySchema.sql	O	X	Dictionary schema creating script
InformationSchema.sql	O	X	Information schema creating script
PerformanceViewSchema.sql	O	X	Performanceview schema creating script

The script created in admin/standalone directory is used when using GOLDDILOCKS in standalone. On the other hand, the script created in admin/cluster directory is used when using GOLDDILOCKS by configuring cluster system.

Table 2-8 bin directory (Unix)

File name	Server	Client	Description
README	O	O	Read me
gmaster	O	X	GOLDDILOCKS master
gcreatedb	O	X	Database creating tool
glsnr	O	X	Listener control tool
gbalancer	O	X	Loads balancer for C/S shared
gdispatcher	O	X	Manages multiple connections for C/S shared
gserver	O	X	Instance manager for C/S
gsql	O	X	Interactive SQL tool
gsqlnet	O	O	Interactive SQL tool for C/S
gpec	O	O	Embedded SQL precompiler
logmirror	O	X	Redo log replication tool
cyclone	O	X	CDC replication tool
gloader	O	X	Import/ export tool
gloadernet	O	O	Import/ export tool for C/S
cymon	O	O	CDC monitoring Tool
gdump	O	X	Control/ log/ data/ binary property file viewer
gsyncher	O	X	Synchronization utility for shared memory log and disk log files
tablediff.jar	O	X	Table comparison tool
cdispatcher	O	X	Manages cluster connections and distributes protocols in cluster system
cserver	O	X	Instance manager for cluster system
gtrclogger	O	X	Trace log manager for cluster system
gmon	O	X	Process monitoring tool
galocator	O	X	Location management tool
gagent	O	X	Location provider tool
gloctl	O	O	Interactive location editing tool

Table 2-9 bin directory (Windows client)

File name	Server	Client	Description
README	X	O	read me
gloadernet.exe	X	O	Import/export tool for C/S
gpec.exe	X	O	Embedded SQL precompiler
gsqlnet.exe	X	O	Interactive SQL tool for C/S
gloctl.exe	X	O	-

Table 2-10 lib directory (Unix)

File name	Server	Client (64 bit)	Client (32 bit)	Description
README	O	O	O	Read me
libstib.so	O	X	X	Shared library for infiniband
libgoldilocks.a	O	X	X	D/A and C/S-inclusive static library for ODBC
libgoldilocks.a	O	X	X	D/A-only static library for ODBC
libgoldilocksas.so	O	X	X	D/A-only shared library for ODBC
libgoldilocksc.a	O	O	O	C/S-only static library for ODBC
libgoldilockscs-ul32.so	O	O	X	64 bit-C/S-only shared library for ODBC (SQLLEN = 4 byte)
libgoldilockscs-ul64.so	O	O	X	64 bit-C/S-only shared library for ODBC (SQLLEN = 8 byte)
libgoldilockscs.so	X	X	O	32 bit-C/S-only shared library for ODBC
libgoldilockscvtGB18030_32.so	X	X	O	32 bit GB18030 character set conversion library
libgoldilockscvtGB18030_64.so	O	O	X	64 bit GB18030 character set conversion library
libgoldilockscvtUHC_32.so	X	X	O	32 bit UHC character set conversion library
libgoldilockscvtUHC_64.so	O	O	X	64 bit UHC character set conversion library
libgoldilocksesql.a	O	O	O	Static library for embedded SQL
libgoldilocksesqls.so	O	O	O	Shared library for embedded SQL
libgoldilockss.so	O	X	X	D/A and C/S-inclusive shared library for ODBC
goldilocks4.jar	O	O	O	C/S-only JDBC library (java 1.4)
goldilocks5.jar	O	O	O	C/S-only JDBC library (java 1.5)
goldilocks6.jar	O	O	O	C/S-only JDBC library (java 1.6)
libgoldilocksjni.so	O	X	X	D/A-only JDBC shared library

Table 2-11 lib directory (Windows client)

File name	Server	Client (64 bit)	Client (32 bit)	Description
goldilocksc.lib	X	O	O	C/S-only static library for ODBC
goldilockscs.dll	X	X	O	32 bit-C/S-only shared library for ODBC
goldilockscs-ul64.dll	X	O	X	64 bit-C/S-only shared library for ODBC (SQLLEN = 8 byte)

Installing GOLDILOCKS Software

This chapter describes the operating system and the environment setting before installing GOLDILOCKS.

Kernel Parameters

Shared Memory

Shared memory is a type of Inter Process Communication (IPC). It is a memory which is used for sharing data in multiple programs. GOLDILOCKS uses shared memory with user programs using gsql, gloder, ODBC for Client/ Server (C/S) environment. Because all tablespaces for operation are created in shared memory, the precise parameter setting is required.

The followings are parameters and the recommended values required for the shared memory which is used to install GOLDILOCKS.

Table 2-22 Kernal properties for shared memory

Parameter name	Description	Recommended value	Remarks
shmmax	The maximum size of single shared memory segment	The value should be bigger than the size of the biggest datafile.	The value should be set bigger than the size of the biggest datafile belonging to the desired tablespace.
shmmni	The maximum number of shared memory segment available in system	The value should be bigger than the value of which the number of all datafile + 1.	The value should be set bigger than the value of which the number of all datafile + 1 (shared memory segment for SSA).
	The total sum of all shared	The value should be bigger	It is the total sum of pages in shared memory available in system. Generally, it is used for

Parameter name	Description	Recommended value	Remarks
shmall	memory segment (The number of pages)	er than the total sum of tablespace configuratio n.	8 GB or bigger shared memory. If the total s um of tablespaces in GOLDBLOCKS is 32 GB, shmall should be set bigger than it.

The following is an example of setting shmall when the total size of tablespaces is 32 GB.

```
kernel.shmmax = 34359738368
kernel.shmmni=4096
kernel.shmall = 8388609
```

- It is assumed that the shmmax is 32 GB and PAGE_SIZE is 4096 bytes.

```
8388609 = (34359738368 / 4096) + 1
```

- In this case, the value of shmall should be bigger than 8388609.

Semaphore

Semaphore is a kind of IPC, like as shared memory, and it is a technology to control multiple processes' behavior using the resources from the operating system. Depending on semaphore setting, multiple processes can simultaneously refer to a relevant resource, and when any process is in use, the other process may wait until it stops using the resource.

GOLDBLOCKS uses semaphore to control the access sequence to the shared memory. For example, if multiple GOLDBLOCKS client programs request a change to the same data, it should be controlled properly. The semaphore parameter value should be set to an appropriate value according to semaphore operation of GOLDBLOCKS. A general Linux value is recommended.

The followings are recommended semaphore values to install GOLDBLOCKS.

Table 2-23 Recommended kernel parameter value for semaphore

Kernel parameter	Description	Recommended value
semmsl	The number of semaphores per single semaphore set	250
semmni	The number of semaphore sets	128
semmns	The total sum of semaphore sets (semmni * semmsl)	32000
semopm	The maximum number of semaphores per system call	100

In Linux based system such as Redhat, Ubuntu, if a user creating IPC resource logs out the session list managed by systemd, then the corresponding IPC resource is automatically deleted. Therefore, the system sh

ould be set as follows to prevent deleting the semaphore. (kernel 3.0.0 and higher)

```
# cp -i /etc/systemd/logind.conf /etc/systemd/logind.conf_prev
# cat /etc/systemd/logind.conf
[Login]
#NAutoVTs=6
#ReserveVT=6
...
RemoveIPC=no
```

- Modify it, then execute it.

```
# systemctl restart systemd-logind
```

Network

The backlog means the sockets' queue length waiting to be accepted during the TCP socket listen. Set gls nr's backlog in GOLDDILOCKS as gls nr config file's BACKLOG. If the backlog's maximum value in system is bigger than somaxconn, then it sets to somaxconn. In this case, somaxconn should be extended.

GOLDDILOCKS uses Unix Domain Socket (UDS) queue when it operates in C/S shared mode. The queue length is set to max_dgram_qlen. If the value is small when clients access the network simultaneously, then it leads to bottleneck state of communication among gls nr, gbalancer and gdispatcher.

The followings are recommended network values to install GOLDDILOCKS.

Table 2-24 Recommended kernel parameter value for network

Kernel parameter	Description	Recommended value
somaxconn	The maximum value of listen backlog	1024
max_dgram_qlen	Unix domain socket queue size	256

Applying Parameters

For a one-time execution, a user can do as follows. (It is required to reapply when the user restarts the system).

```
[SHELL]> echo 34359738368 > /proc/sys/kernel/shmmax
[SHELL]> echo 8388608 > /proc/sys/kernel/shmall
[SHELL]> echo 4096 > /proc/sys/kernel/shmmni
[SHELL]> echo 250 32000 100 128 /proc/sys/kernel/sem
[SHELL]> echo 1024 > /proc/sys/net/core/somaxconn
[SHELL]> echo 256 > /proc/sys/net/unix/max_dgram_qlen
```

If a user wants to apply it automatically even when the user restarts the system, the user can do as follows in `/etc/sysctl.conf`.

```
# shared memory
kernel.shmmax = 34359738368
kernel.shmall = 8388608
kernel.shmmni = 4096
# semaphore
kernel.sem = 250 32000 100 128
# network
net.core.somaxconn = 1024
net.unix.max_dgram_qlen = 256
```

Use the following command to apply the changes given above.

```
[SHELL]> sysctl -p
```

Checking Parameters

The described parameters can be checked by using the following commands.

```
[SHELL]> ipcs -l
----- Shared Memory Limits -----
max number of segments = 4096
max seg size (kbytes) = 33554432
max total shared memory (kbytes) = 33554432
min seg size (bytes) = 1
----- Semaphore Limits -----
max number of arrays = 128
max semaphores per array = 250
max semaphores system wide = 32000
max ops per semop call = 100
semaphore max value = 32767
```

Decompressing GOLDBLOCKS

GOLDBLOCKS package is supplied in a compressed form. The basic installation completes by decompressing on.

The followings are simple examples of how to install the GOLDBLOCKS package.

```
## $GOLDILOCKS_HOME=/home/GOLDILOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
[HELL]> gzip -d goldilocks-mercury.2.1.0-linux-x86_64.tar.gz
[HELL]> tar -xvf goldilocks-server-mercury.2.1.0-linux-x86_64.tar
goldilocks-server-mercury.2.1.0-linux-x86_64/goldilocks_home/include/sqlex.h
goldilocks-server-mercury.2.1.0-linux-x86_64/goldilocks_home/include/goldilocks.h
goldilocks-server-mercury.2.1.0-linux-x86_64/goldilocks_home/include/sqlca.h
...
```

When the decompression completes, a user can change the directory name <package_file_name> on the user's taste, and accordingly the user should change the environment variables of \$GOLDILOCKS_HOME and \$GOLDILOCKS_DATA.

For more information about directory created by decompression, refer to **GOLDILOCKS Package Configuration**

Setting Environment Variables

After decompression of GOLDILOCKS package, bin and lib path will be created under \$GOLDILOCKS_HOME directory. Then as given below, a user should add bin and lib path under PATH and LD_LIBRARY_PATH to execute GOLDILOCKS software and develop applications. (When developing GOLDILOCKS client application, a user should always insert \$GOLDILOCKS_HOME/include to include file directory of compile option.)

```
export PATH=$GOLDILOCKS_HOME/bin:$PATH
export LD_LIBRARY_PATH=$GOLDILOCKS_HOME/lib:$LD_LIBRARY_PATH
```

Environment variables are required to use GOLDILOCKS. A user should set them prior to installation because some variables are referenced to even during installation.

Table 2-25 OS environment variables for GOLDILOCKS installation

Environment variables	Description	Remarks
GOLDILOCKS_HOME	Directory path to install GOLDILOCKS binaries	This variable is referenced during GOLDILOCKS operation, and the directory to install GOLDILOCKS should be set as an environment variable in advance.
GOLDILOCKS_DATA	The location to create GOLDILOCKS database instance	This variable is referenced during GOLDILOCKS database creation and operation.
PATH	Directory path of GOLDILOCKS executable file	This variable should be set to execute various GOLDILOCKS binaries without an absolute path.
		<ul style="list-style-type: none"> If the character set is different from the original character set which is created during GOLDILOCKS database creation, characters (Except alphabets, numbers and special characters) may not be displayed properly. Or the string rela

Environment variables	Description	Remarks
LANG	Character set of terminal	<p>ted functions may not be executed correctly.</p> <ul style="list-style-type: none"> A user should set locale corresponding to GB18030, SQL_ASCII, UHC, UTF8. e.g. export LANG=ko_KR.utf8

```
## $GOLDBLOCKS_HOME=/home/GOLDBLOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
[HELL]> gzip -d goldilocks-mercury.2.1.0-linux-x86_64.tar.gz
[HELL]> tar -xvf goldilocks-server-mercury.2.1.0-linux-x86_64.tar
goldilocks-server-mercury.2.1.0-linux-x86_64/goldilocks_home/include/sqlx.h
goldilocks-server-mercury.2.1.0-linux-x86_64/goldilocks_home/include/goldilocks.h
goldilocks-server-mercury.2.1.0-linux-x86_64/goldilocks_home/include/sqlca.h
...
```

Deleting Database

Delete datafile, control file, redo log file and archive log file (when using the archive log file) should be deleted when deleting the existing database to recreate the GOLDBLOCKS DATABASE.

The following is an example of deleting GOLDBLOCKS DATABASE.

```
## $GOLDBLOCKS_BASE=/home/GOLDBLOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
## $GOLDBLOCKS_DATA=/home/GOLDBLOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
    goldilocks_data/
## $GOLDBLOCKS_HOME=/home/GOLDBLOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
    goldilocks_home/
[HELL]> rm -rf $GOLDBLOCKS_DATA/db/*.dbf
[HELL]> rm -rf $GOLDBLOCKS_DATA/wal/*.ctl
[HELL]> rm -rf $GOLDBLOCKS_DATA/wal/*.log
[HELL]> rm -rf $GOLDBLOCKS_DATA/archive_log/*.log
```

The location of the data file and archive file may vary depending on the settings by a user.

Deletion

GOLDBLOCKS package is not provided in compressed file format, so a specific deletion rule is not required. Delete the installed directory after terminating DATABASE.

The following is an example of deleting GOLDBLOCKS package.

```
## $GOLDILOCKS_BASE=/home/GOLDILOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
## $GOLDILOCKS_DATA=/home/GOLDILOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
    goldilocks_data/
## $GOLDILOCKS_HOME=/home/GOLDILOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
    goldilocks_home/

[SHELL]> rm -rf $GOLDILOCKS_DATA
[SHELL]> rm -rf $GOLDILOCKS_HOME
[SHELL]> rm -rf $GOLDILOCKS_BASE
## ~/.bash_profile
$GOLDILOCKS_BASE=/home/GOLDILOCKS/goldilocks-mercury.2.1.0-linux-x86_64/ ❶ Delete
$GOLDILOCKS_DATA=/home/GOLDILOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
    goldilocks_data/ ❷ Delete
$GOLDILOCKS_HOME=/home/GOLDILOCKS/goldilocks-mercury.2.1.0-linux-x86_64/
    goldilocks_home/ ❸ Delete
```

Creating Database

Create database after the completion of property creation. A user can create database by using \$GOLDILOCKS_HOME/bin/gcreatedb. The followings are how to use the gcreatedb commands.

```
[SHELL]> gcreatedb --help
Usage
    gcreatedb [options]
Options:
    --cluster          cluster system (if not specified, stand-alone system)
    --db_name          database name
    --db_comment       database comment
    --timezone         timezone ( {+/-}{TZH:TZM} )
    --character_set    character set
                        SQL_ASCII
                        UTF8
                        UHC
                        GB18030
    --char_length_units char length units
                        OCTETS
                        CHARACTERS
    --home             home directory
    --member           local member name
    --host             host address
```

```
--port          host port
--silent        suppresses the display of the result message
--help          print help message
```

examples:

```
gcreatedb --db_name="goldilocks" --db_comment="goldilocks database" --timezone="+09:00"
--character_set="UTF8" --char_length_units="OCTETS" --silent
```

`$GOLDBLOCKS_HOME/conf/goldilocks.properties.conf` is referenced when creating database. Then, table space files are created in `SYSTEM_TABLESPACE_DIR` path in `goldilocks.properties.conf` with the value of `***_TABLESPACE_SIZE`.

--cluster option should be specified when creating the database which is to participate in cluster system.

The followings are execution arguments of gcreatedb.

Table 2-26 Execution arguments of gcreatedb

Argument	Description
--cluster	It is the database to be used in cluster system If it is omitted, standalone database is created.
--db_name	It is the database name If it is omitted, it is set as goldilocks.
--db_comment	It is the database description If it is omitted, it is set as goldilocks database.
--timezone	It is the timezone. If it is omitted, it is set as TIMEZONE property.
--character_set	It is the database character set. GOLDBLOCKS supports four types of character sets. <ul style="list-style-type: none"> • GB18030: Simplified Chinese • SQL_ASCII: Character set supporting ASCII • UHC: Unified Hangul Code • UTF8: Unicode Transformation Format - 8 If it is omitted, it is set as CHARACTER_SET property.
--char_length_units	It is the unit of character length. <ul style="list-style-type: none"> • OCTETS: It identifies 1 byte as 1 character • CHARACTERS: It identifies 1 character (n byte) as 1 character. If it is omitted, it is set as CHAR_LENGTH_UNITS property.
--home	It is the database home directory. It searches for a property file, and is referenced to as a location of creating and storing various DB files. If it is omitted, it uses the value set in GOLDBLOCKS_DATA environment variable.
--member	It is the member name of local database to be used in cluster system. If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER property.
--host	It is the IP address of local member to be used for communication between cluster system members.

Argument	Description
	If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER_HOST property.
--port	It is the TCP listen port of local member to be used for communication between cluster system members If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER_PORT property.
--silent	It hides display messages.
--help	It displays help messages.

A user should consider the followings when creating database.

- Setting kernel parameter shared memory
 - If the size specified in shared memory setting is smaller than the size described in \$GOLDILOCKS_HOME/conf/goldilocks.properties.conf, a user can not create the database.
- Tablespace size
 - Tablespace files are created when the database is created, and the tablespace is used after being allocated to the memory as big as the tablespace size when driving GOLDILOCKS. Therefore, it uses memory even when the actual user data does not exist in the data tablespace. Therefore, a user should create database with the sufficient memory considering the actually available memory as well as shared memory on GOLDILOCKS startup machine when writing goldilocks.properties.conf.
- Whether to use cluster system
 - It should be specified that whether the database will participate as a member of cluster system when creating the database. In other words, --cluster option should be omitted when executing gcreatedb using the database as standalone, but --cluster option should be specified when using the database as cluster system.

When database is created successfully, a user can check the following tablespace file in the path described in SYSTEM_TABLESPACE_DIR of goldilocks.properties.conf.

```
[SHELL]> gcreatedb
Database created
[SHELL]> gcreatedb --db_name="TEST_DB" \
                --db_comment="test database comment" \
                --timezone="+09:00" \
                --character_set="UHC" \
                --char_length_units="OCTETS"
Database created
[SHELL]> ls $GOLDILOCKS_DATA/db
system_data.dbf system_dict.dbf system_undo.dbf
```

The following is an example of creating database to be used in cluster system.

```
[SHELL]> gcreatedb --cluster
Database created
[SHELL]> gcreatedb --cluster --member=G1N1
Database created
[SHELL]> gcreatedb --cluster --member=G1N1 --host=127.0.0.1 --port 10101
Database created
[SHELL]> gcreatedb --cluster \
                    --db_name="TEST_DB" \
                    --home=$GOLDDILOCKS_DATA \
                    --host=127.0.0.1 \
                    --port=10101 \
                    --db_comment="g1n1 db comment" \
                    --timezone="+09:00" \
                    --character_set="UHC" \
                    --char_length_units="OCTETS"
Database created
[SHELL]> ls $GOLDDILOCKS_DATA/db
system_data.dbf  system_dict.dbf  system_trans.dbf  system_undo.dbf
```

Building Dictionary Schema Information

Create the following schema to get the system and object information.

Caution

A user should build the following schema after database creation. Otherwise, there is a possibility of malfunction in Catalog API of ODBC, JDBC for obtaining the object's structure information (for example, `SQLTables()` function). If so, it will not interlock with third party tools.

- **DICTIONARY_SCHEMA:** It consists of views and tables to get object information such as `DBA_*`, `ALL_*`, `USER_*`.
- **INFORMATION_SCHEMA:** It consists of views and tables included in the SQL standard `INFORMATION_SCHEMA`.
- **PERFORMANCE_VIEW_SCHEMA:** It consists of views to get system information by combining the fixed tables' information.

Views and tables included in each schemas provides convenience to get system information.

After driving GOLDILOCKS instance on OPEN phase, a user should execute the sql files as follows. It should be done at least once after the first database creation.

Note

The scripts to build dictionary schema information are divided into the script for standalone system and the script for cluster system. Therefore, a user should use the appropriate script for the purpose to build the information.

The following describes how to build the information by using the script for standalone database.

```
% gsql --as sysdba --import $GOLDILOCKS_HOME/admin/standalone/DictionarySchema.sql
% gsql --as sysdba --import $GOLDILOCKS_HOME/admin/standalone/InformationSchema.sql
% gsql --as sysdba --import $GOLDILOCKS_HOME/admin/standalone/PerformanceViewSchema.sql
```

The following describes how to build the information by using the script for cluster system.

```
% gsql --as sysdba --import $GOLDILOCKS_HOME/admin/cluster/DictionarySchema.sql
% gsql --as sysdba --import $GOLDILOCKS_HOME/admin/cluster/InformationSchema.sql
% gsql --as sysdba --import $GOLDILOCKS_HOME/admin/cluster/PerformanceViewSchema.sql
```

2.3 Managing Database Memory Structure

This chapter describes the database components which compose GOLDDILOCKS instance.

Database Memory Structure

GOLDDILOCKS database is divided into memory area and disk area. Memory area is a collection of tablespaces consisting of one or more shared memories. Owing to its in-memory database, GOLDDILOCKS database never goes down to the disk by replace operation.

Disk area consists of data files, control file, property file, online redo log files. Data file exists one per shared memory of each tablespace, and control file contains instance configuration information. Property file stores instance environment settings, and online redo log file is used to recover database.

Control File

Control file records the physically stored information on the disk of database, and determines the status of database by firstly reading at the beginning of Instance startup. The control file records the following information.

- Instance state at the time of the previous checkpoint
- Transaction durability mode (CDS/TDS) at the time of the previous startup
- Online redo log file information
- Data file information of each tablespace

Online Redo Log File

Online redo log files store all changes made to the database by transactions in instances. It is used to recover unwritten changes on the data file when restarting instance after database's abnormal termination. Four online redo log files are generated by default in the size specified in LOG_FILE_SIZE property when creating database. A user can add more if the user need. The redo log files are reused in circulation manner.

Checkpoint are generated when online redo log file switches to the next file, and then some dirty pages move down to an appropriate data file. If the checkpoint operation is delayed and the updated page does not move down (ACTIVE state), all transactions will be suspended until checkpoint completion. Therefore, creating a suitable size online redo log file according to the application's characteristic is helpful to improve the database system performance.

Undo Segment

Undo segments records images in advance of changing operation to use when transactions partially or to tally rollback. A single undo segment is assigned to a single transaction during update operation. Undo segments are stored in MEM_UNDO_TBS tablespace. It is recommended to secure enough undo tablespace, in preparation for multiple update transactions or a single transaction with large amount of update operation (bulk delete).

Data File

Data file includes the contents of tables/indexes stored in tablespace.

Data file consists of the followings.

- Page
 - The minimum unit of database I/O. The current size is 8 Kbytes.
- Extent
 - A certain number of continuous pages' collection. The minimum unit of which the segment is allocated space from the tablespace.
 - Extent size of each tablespace could be different.
- Segment
 - A specific type of data structure's collection. A segment consists of extent sets.

Exceptionally, a temporary tablespace, such as MEM_TEMP_TBS tablespace, does not execute redo logging, nor does data file create.

Tablespace

Database is divided into multiple tablespaces with logical structure, which contain tables and indexes. Tablespace is implemented as a set of one or more shared memories, and it is a tool to manage the space of loading data. When a user enquires V\$TABLESPACE table, tablespace information on current database will be outputted.

GOLDILOCKS supports the following tablespaces by default.

Table 2-27 Tablespaces of GOLDILOCKS

Owner	Name	Description
SYSTEM	DICTIONARY_TBS	Default dictionary tables are stored in this tablespace to operate database.
	MEM_UNDO_TBS	Undo segments and transaction information are stored in this table space.
	MEM_DATA_TBS	If a user does not specify a tablespace when creating schema object, the data table is stored in this tablespace by default.
	MEM_TEMP_TBS	Indexes which does not specified tablespace name, and temporary tables which are used by queries are created in the tablespace. Indexes are rebuilt when resta

Owner	Name	Description
		ring instance because logging does not occur.
	MEM_TRANS_TBS	It is used to recover global transaction in cluster system. It is created only when it is configured as cluster system.
USER	User-defined	User defines this tablespace to collect specific tables to a specific tablespace and manage them.

Tablespace Types

There are five types of tablespace as follows.

- DICT
 - Tablespace type for storing dictionary tables and indexes.
- DATA
 - Tablespace type for storing general schema objects such as tables and indexes.
 - It becomes the subject of redo logging and page flushing.
- UNDO
 - Tablespace type for storing undo segments.
 - It becomes the subject of redo logging and page flushing.
- TEMPORARY
 - Tablespace type for storing the temporary tables and no-logging indexes which are created during SELECT query.
 - It is not the subject of redo logging and page flushing.
- TRANSACTION (Cluster only)
 - Tablespace type which is used to recover global transaction in cluster system

Checking Information of Database Storage Structure

This chapter describes a method to check the information about multiple database storage structure which are mentioned above.

Control File Information

Use gdump utility to check the contents because control file is stored in binary format.

```
[SHELL]> gdump CONTROL control_0.ctl
```

Online Redo Log File Information

Retrieve the control file by using gdump tool, then the name and current state of each online redo file will be displayed.

Data File Information

Retrieve the control file by using gdump tool, then the data files in each tablespaces and its states will be displayed. Also, viewing the V\$DATAFILE table, their current states will be displayed.

Tablespace Information

Retrieve the control file by using gdump tool, then the name and state of each tablespace in the current database will be displayed. Also, a user can enquire the V\$TABLESPACE table by using SQL.

Property Information

Open the text file \$GOLDILOCKS_Data/conf/goldilocks.properties.conf, then the property information will be displayed. When working online, retrieve V\$PROPERTY table, then the information about currently applied property values will be displayed.

General Operation of Data Storage

A tablespace stores data, and its operation is as follows.

Creating Tablespace

USER DATA tablespace is created as follows.

```
gSQL> CREATE TABLESPACE TEST_TBS DATAFILE 'TEST_TBS.dbf' SIZE 10M;  
Tablespace created.
```

TEMPORARY tablespace does not include data file, so it is created as follows.

```
gSQL> CREATE TEMPORARY TABLESPACE TEST_TEMP_TBS MEMORY 'TEST_TEMP_TBS' SIZE 10M;  
Tablespace created.
```

Retrieving Tablespace Usage State

A tablespaces space is allocated or deallocated in the unit of one extent consisting of one or more consecutive pages. A user can retrieve the size of one extent (BYTE) in a specific tablespace as follows.

```
gSQL> SELECT EXTENT_SIZE FROM V$TABLESPACE WHERE TBS_NAME = 'TEST_TBS';
EXTENT_SIZE
-----
        262144
1 row selected.
```

A user can view the state of all extents in tablespaces by using D\$TABLESPACE_EXTENT table. When an extent is in use, the STATE column is 'U'. When an extent is in free state, the STATE column is 'F'. Therefore, the remaining size of space in the current tablespace (the number of extents) can be calculated as follows.

```
gSQL> SELECT COUNT(*) FROM D$TABLESPACE_EXTENT('TEST_TBS') WHERE STATE = 'F';
COUNT(*)
-----
        38
1 row selected.
```

Seeing the result above, the empty space in TEST_TBS is $38 * 262144 = 9437184$ Byte.

Altering Tablespace

A user can alter the tablespaces by using Add/Remove Data File (Memory in case of temporary tablespaces), and Online/Offline.

Add/ Drop Data File (or Memory)

If a user wants to add spaces to tablespaces while operating the database, the DATA tablespaces allocate the additional space by using the following syntax.

```
gSQL> ALTER TABLESPACE TEST_TBS ADD DATAFILE 'TEST_TBS2.dbf' SIZE 10M;
Tablespace altered.
```

TEMPORARY tablespace adds spaces as follows. Unlike DATA tablespace, a name should be given, and the name should be a unique memory name in database.

```
gSQL> ALTER TABLESPACE TEST_TEMP_TBS ADD MEMORY 'TEST_TEMP_TBS2' SIZE 10M;
Tablespace altered.
```

A user can drop the space in DATA tablespace by using the following syntax. However, if any part of the area is used, the user can not drop it.

```
gSQL> ALTER TABLESPACE TEST_TBS DROP DATAFILE 'TEST_TBS2.dbf';
Tablespace altered.
```

Similarly, a user can withdraw the space in TEMPORARY tablespace by using the following syntax.

```
gSQL> ALTER TABLESPACE TEST_TEMP_TBS DROP MEMORY 'TEST_TEMP_TBS2';
Tablespace altered.
```

Offline Tablespace

Switch the tablespace to offline mode if a user wants to move the location of data file in the tablespace. Use the following syntax.

```
gSQL> ALTER TABLESPACE TEST_TBS OFFLINE;
Tablespace altered.
```

A user can switch the tablespace to online mode again by using the following syntax.

```
gSQL> ALTER TABLESPACE TEST_TBS ONLINE;
Tablespace altered.
```

Rename

Rename the tablespace by using the following syntax.

```
gSQL> ALTER TABLESPACE TEST_TBS RENAME TO TEST_TBS2;
Tablespace altered.
```

Switch the tablespace to offline mode, if a user wants to change the location of data file in the tablespace. Then, move the data file by using OS command, rename it by using ALTER TABLESPACE statement, then switch the tablespace to online state.

```
gSQL> ALTER TABLESPACE TEST_TBS OFFLINE;
Tablespace altered.
gSQL> ALTER TABLESPACE TEST_TBS RENAME DATAFILE 'TEST_TBS.dbf' TO 'TEST_TBS_1.dbf';
ERR-42000(16164): file does not exist :
ALTER TABLESPACE TEST_TBS RENAME DATAFILE 'TEST_TBS.dbf' TO 'TEST_TBS_1.dbf'
*
ERROR at line 1:
```

- The following procedure describes how to rename the file by using OS command.

```
gSQL> ALTER TABLESPACE TEST_TBS RENAME DATAFILE 'TEST_TBS.dbf' TO 'TEST_TBS_1.dbf';
Tablespace altered.
gSQL> ALTER TABLESPACE TEST_TBS ONLINE;
Tablespace altered.
```

Dropping Tablespace

Drop an unnecessary tablespace by using the following syntax. The statement after INCLUDING is optional, but if the statement is given then it will delete all the content (schema object) and data file in the tablespaces.

```
gSQL> DROP TABLESPACE TEST_TBS INCLUDING CONTENTS AND DATAFILES;
Tablespace dropped.
```

Store Mode

GOLDILOCKS uses the store mode as an instance unit to maximize performance under certain circumstance. Store mode defines which part of ACID property to give up to improve the operation performance in the transaction.

GOLDILOCKS supports two types of store modes.

- Transactional Data Store (TDS) mode
 - TDS mode is default store mode of GOLDILOCKS database.
 - Transactional Data Store (TDS) mode is general DBMS store mode. In this mode, all transactions in the instance write both undo log and redo log. Therefore, a user can rollback the transactions and recover using data file and online redo log file even when an instance is terminated abnormally, because periodical checkpoint are performed.
- Concurrent Data Store (CDS) mode
 - All running transactions in the instance write undo logs, but do not write redo logs. Therefore, the transactions can deal with all run-time errors, and can rollback. But if an instance is terminated abnormally or terminated using shutdown abort statement, all updated data would be lost. (It does not provide recover facility). It is because checkpoint action does not occur. CDS Mode controls concurrency among transactions, so it ensures normal operations of transactions even when different transactions access the same object at the same time.
 - CDC Mode is mainly used in run-time information oriented database in which query/update operations are frequently performed but does not require durability such as cache server.

Store mode is set through the property setting when a user starts up the instance. Transactions can not b

e executed in different store modes. The user should carefully set the store mode when the user starts up the instance because the user can not change the instance in online mode.

2.4 Managing Schema Object

Schema Object

Schema object is a set of logical structure created by a user. GOLDILOCKS supports the following schema objects, which are table, index, synonym, view, sequence, constraint and stored procedure.

Schema Object Management Privileges

Currently, GOLDILOCKS supports user and his privilege. Therefore, not all the users share all the created objects, so the privilege should be given to a user.

Managing Table

This chapter describes table overview, methods of retrieving the table information, creating/ altering table and loading/ dropping data.

Table

A table is the most basic unit of storage containing user data. A table consists of columns and rows.

Table Type

Currently, GOLDILOCKS supports general heap table whose data saving order is irrelevant to sort order of a particular column. However, GOLDILOCKS does not support clustered table, partitioned table.

- It supports basic heap table only.
- It supports primary key/unique/not null constraint.
- It supports the datatypes as follows.
 - BOOLEAN
 - SMALLINT, INTEGER, BIGINT, REAL, DOUBLE, NUMERIC, FLOAT
 - CHAR (MAX 2000), VARCHAR (MAX 4000), BINARY, VARBINARY, LONG VARCHAR, LONG VARBINARY
 - DATE, TIME, TIMESTAMP, INTERVAL (It supports WITH/WITHOUT TIMEZONE of TIME/TIMESTAMP.)
 - It does not support BLOB type.

- The number of columns, indexes and constraints are not limited.
- A user can retrieve the entire table information using a query *SELECT * FROM TABLES;*

If a huge number of rows are stored in a particular table, and then the table size becomes big, even bulk delete operation does not return the table's empty space to the tablespace. But TRUNCATE operation can return all existing space to the tablespace.

Table data can be stored and retrieved being distributed to multiple nodes according to the user's desired distribution policy when using GOLDILOCKS configuring it as cluster system. For more information, refer to **Managing Table**

Managing Index

This chapter describes index overview and creating/deleting index.

Overview

Index is a subsidiary schema object which is linked to tables. A user can easily find the location of specifically conditioned row using the index. A user can also retrieve the row's column value if the column is the key column of the index.

GOLDILOCKS can create as many indexes in need to tables. However, too many indexes burden the execution of inserting/ changing/ deleting operation of the table, then it may lower the performance.

Primary key or unique constraint automatically creates an index on that column.

Index Property

- It supports B-link tree form index.
 - GOLDILOCKS provides B-link tree form index by default.
- The size of a single index node is 8 Kbytes.
- The maximum number of key columns is 32, and the maximum key length is 2000 bytes.
- It supports unique index.
- It supports Ascending/Descending, NULLS FIRST and NULLS LAST.
 - A user can define whether to sort index key columns in ascending order (ASC) or in descending (DESC) order.
 - A user can define whether to list NULL value of the index key column at first (NULLS FIRST) or at last (NULLS LAST).
- A user can retrieve the whole index information by using the query *SELECT * FROM INDEXES;*
- A user can calculate the index size in the similar way of calculating table because index is implemented by segment in the same way of implementing table.

Sequence

Sequence is a schema object which generates a unique number.

A user can generate the sequence as follows.

```
gSQL> CREATE SEQUENCE customers_seq START WITH 1000 INCREMENT BY 1 NOCACHE NOCYCLE;  
Sequence created.
```

A user can use the sequence by using NEXTVAL.

```
gSQL> SELECT customers_seq.NEXTVAL FROM dual;
```

A user can drop the sequence as follows.

```
gSQL> DROP SEQUENCE customers_seq;
```

Global sequence object is automatically created when user creates sequence by using GOLDLOCKS configuring cluster system. This object manages the global pool of the sequence value which is used being shared by all member nodes in cluster system. Each member node is allocated the sequence value as many as specified from the global object when calling NEXTVAL and uses them.

For more information, refer to **Global Sequence**.

2.5 Managing User

Creating User

Only the SYS user and the user with the CREATE USER ON DATABASE privilege can create a user for GOL DILOCKS database. The CREATE SESSION ON DATABASE privilege is required to connect to the newly created user.

The followings are the syntax to create a user.

```
<user definition> ::=
    CREATE USER user_identifier IDENTIFIED BY password
    [ DEFAULT TABLESPACE tablespace_name ]
    [ TEMPORARY TABLESPACE tablespace_name ]
```

The followings are the syntax rules and parameters to create a user.

- user_identifier
 - It is a username to be created.
 - The username and the role name should be unique.
 - The length of a user_identifier should be smaller than 128 bytes.
- password
 - The password is stored encrypted.
 - The length of a password should be smaller than 128 bytes.
 - Password is case-sensitive.
- DEFAULT TABLESPACE tablespace_name
 - It specifies the default tablespace which stores the objects such as tables, indexes (LOGGING) created by a user which is to be created.
 - If DEFAULT TABLESPACE clause is omitted, it is specified as the default data tablespace (MEM_DATA_TBS) which is defined when creating DATABASE (<database definition>).
- TEMPORARY TABLESPACE tablespace_name
 - It specifies the TABLESPACE to store user-created temporary tables, index (NO LOGGING), and query processing-generated intermediate results.
 - If TEMPORARY TABLESPACE clause is omitted, it specifies as the default temporary tablespace (MEM_TEMP_TBS) which is defined when creating DATABASE (<database definition>).
- INDEX TABLESPACE tablespace_name
 - It specifies the default tablespaces to store an index object created by a user to be created.
 - If INDEX TABLESPACE clause is omitted, the default value is INDEX TABLESPACE NULL.

Dropping User

It drops the created user of GOLDBLOCKS database. An access privilege and user range for dropping user are as same as those for creating user.

The following is the syntax to drop a user.

```
<drop user statement> ::=
    DROP USER [ IF EXISTS ] user_identifier [ <drop behavior> ]
    ;
<drop behavior> ::=
    RESTRICT
    | CASCADE
```

The followings are the syntax rules and parameters for dropping a user.

- IF EXISTS
 - Even when the user does not exist, an error does not occur.
- user_identifier
 - It is a database username to be dropped.
 - A user can not drop a user, such as SYS, which is automatically generated when the database is created.
 - It does not drop objects, such as tablespace, which is not the owner but created by user_identifier.
- drop behavior
 - If drop behavior is omitted, the default value is RESTRICT.

Altering User

It alters the definition of the GOLDBLOCKS database user. ALTER USER privilege is required for an ordinary user. However, if a user is the user_identifier user, then the user can alter the definition without the privilege.

The followings are the syntax to alter the user definition.

```
<alter user statement> ::=
    ALTER USER user_identifier <alter user action>
    | ALTER USER PUBLIC <alter schema path>
    ;
<alter user action> ::=
```

```

    <alter password>
  | <alter profile>
  | <alter default tablespace>
  | <alter temporary tablespace>
  | <alter index tablespace>
  | <alter schema path>
<alter password> ::=
    IDENTIFIED BY new_password [ REPLACE old_password ]
<alter profile> ::=
    PROFILE { profile_name | DEFAULT | NULL }
<password expire> ::=
    PASSWORD EXPIRE
<account lock> ::=
    ACCOUNT { LOCK | UNLOCK }
<alter default tablespace> ::=
    DEFAULT TABLESPACE tablespace_name
<alter temporary tablespace> ::=
    TEMPORARY TABLESPACE tablespace_name
<alter index tablespace> ::=
    INDEX TABLESPACE { tablespace_name | NULL }
<alter schema path> ::=
    SCHEMA PATH ( { schema_name | CURRENT PATH } [, ...] )

```

The followings are the syntax rule and parameters for altering user.

- user_identifier
 - It is a username to be altered.
- <alter password>
 - It alters user password.
 - IDENTIFIED BY new_password
 - It changes the current password, and the new password is stored encrypted.
 - The length of a password should be smaller than 128 bytes.
 - Password is case-sensitive.
 - REPLACE old_password
 - If a user have ALTER USER ON DATABASE privilege, the user can omit it.
 - If a user do not have ALTER USER ON DATABASE privilege, the user can not omit it.
 - The user and user_identifier should be same.
- <alter profile>
 - It alters the profile for password management policies.
 - PROFILE profile_name
 - It allocates profile_name created by a user.

- PROFILE DEFAULT
 - It allocates "DEFAULT" which is the default profile.
- PROFILE NULL
 - It does not allocate the profile.
- <password expire>
 - It expires the user password.
- <account lock>
 - ACCOUNT LOCK
 - It locks the user account.
 - ACCOUNT UNLOCK
 - It unlocks the account lock.
- <alter default tablespace>
 - It alters user's default tablespace.
 - tablespace_name should be data tablespace.
- <alter temporary tablespace>
 - It alters user's temporary tablespace.
 - tablespace_name should be temporary tablespace.
- <alter index tablespace>
 - It alters the index tablespace of a user.
 - It assigns INDEX TABLESPACE tablespace_name
 - When assigning the data tablespace, it should be the LOGGING index.
 - When assigning the temporary tablespace, it should be the NOLOGGING index.
 - INDEX TABLESPACE NULL
 - It does not assign the index tablespace.

2.6 GOLDBLOCKS Property

GOLDBLOCKS property is classified as the property which is applied when creating database and the property which can be updated at online/offline. A user can change the tablespace path and the redo log file only at MOUNT phase of startup.

Properties When Creating Database

Table 2-28 Properties when creating database

Name	Description
SYSTEM_MEMORY_DICT_TABLESPACE_SIZE	Initial size of dictionary tablespace
SYSTEM_MEMORY_DATA_TABLESPACE_SIZE	Initial size of system data tablespace
SYSTEM_MEMORY_UNDO_TABLESPACE_SIZE	Initial size of system undo tablespace
SYSTEM_MEMORY_TEMP_TABLESPACE_SIZE	Initial size of system temporary tablespace
LOG_BLOCK_SIZE	Block size of redo log file
LOG_FILE_SIZE	Initial size of redo log file
LOG_GROUP_COUNT	The number of redo log files
CHARACTER_SET	Character set
TIMEZONE	Time zone
CHAR_LENGTH_UNITS	Character length unit

Properties When Driving Database

There are more than 100 properties in GOLDBLOCKS database. The followings are frequently used properties among them.

Table 2-29 Frequently used properties when driving database

Name	Description
SHARED_MEMORY_STATIC_KEY	Key value to create the shared memory
SHARED_MEMORY_STATIC_SIZE	Size of the shared memory
DATA_STORE_MODE	Storage mode of GOLDBLOCKS instance
LOG_BUFFER_SIZE	Log buffer size
LOG_DIR	Directory path of redo log
PRIVATE_STATIC_AREA_SIZE	Static area size per session
CLIENT_MAX_COUNT	The maximum number of accessible session
PROCESS_MAX_COUNT	The maximum number of process

Name	Description
NET_BUFFER_SIZE	Network buffer size per session

2.7 GOLDBLOCKS Utility

gcreatedb

The gcreatedb utility initializes GOLDBLOCKS database and gets ready for the service. The gcreatedb generates data files and log files in the GOLDBLOCKS_DATA environment variable location according to given properties. The following is a syntax.

```
[SHELL]> gcreatedb --help
Usage
    gcreatedb [options]
Options:
    --cluster          cluster system (if not specified, stand-alone system)
    --db_name          database name
    --db_comment       database comment
    --timezone         timezone ( {+/-}{TZH:TZM} )
    --character_set    character set
                        SQL_ASCII
                        UTF8
                        UHC
                        GB18030
    --char_length_units char length units
                        OCTETS
                        CHARACTERS
    --home             home directory
    --member           local member name
    --host             host address
    --port            host port
    --silent           suppresses the display of the result message
    --help            print help message
examples:
    gcreatedb --db_name="goldilocks" --db_comment="goldilocks database" --timezone="+09:00"
    --character_set="UTF8" --char_length_units="OCTETS" --silent
```

Tablespace files are created in *SYSTEM_TABLESPACE_DIR* of goldilocks.properties.conf as each value of ***_TABLESPACE_SIZE* by referring to \$GOLDBLOCKS_HOME/conf/goldilocks.properties.conf when creating the database.

The followings are execution arguments of gcreatedb command.

Table 2-30 Execution arguments of gcreatedb

Argument	Description
--cluster	It is the database to be used in cluster system. If it is omitted, standalone database is created.
--db_name	It is the database name. If it is omitted, it is set as <i>goldilocks</i> .
--db_comment	It is the database description. If it is omitted, it is set as <i>goldilocks database</i> .
--timezone	It is the timezone. If it is omitted, it is set as TIMEZONE property.
--character_set	It is the database character set. GOLDILOCKS supports four types of character sets. <ul style="list-style-type: none"> • GB18030: Simplified Chinese • SQL_ASCII: Character set supporting ASCII • UHC: Unified Hangul Code • UTF8: Unicode Transformation Format - 8 If it is omitted, it is set as CHARACTER_SET property.
--char_length_units	It is the unit of character length. <ul style="list-style-type: none"> • OCTETS: It identifies 1 byte as 1 character • CHARACTERS: It identifies 1 character (n byte) as 1 character. If it is omitted, it is set as CHAR_LENGTH_UNITS property.
--home	It is the database home directory. It searches for a property file, and is referenced to as a location of creating and storing various DB files. If it is omitted, it uses the value set in GOLDILOCKS_DATA environment variable.
--member	It is the member name of local database to be used in cluster system. If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER property.
--host	It is the IP address of local member to be used for communication between cluster system members. If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER_HOST property.
--port	It is the TCP listen port of local member to be used for communication between cluster system members. If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER_PORT property.
--silent	It hides display messages.
--help	It displays help messages.

gsql (GOLDILOCKS Interactive SQL Tool)

gsql is an interactive command line utility to execute SQL statements for managing GOLDILOCKS database. DBA creates initial table schema by using gsql, or checks the current database state.

The following is the gsql syntax.

```
[SHELL]> gsql <userid> <passwd>
gSQL> CREATE TABLE T1 ( COL1 INTEGER );
create success
gSQL> \q
[SHELL]>
```

gloader (GOLDILOCKS Data Upload/download Tool)

The gloader utility downloads existing data in database to a file in text format, or it uploads an existing data in text format to a new database. The text data file format of gloader is Comma-Separated Value (CSV).

The following is how to use gloader.

```
gloader [export|import] userid/passwd control='control_file_name' \
data='data_file_name' log='log_file_name' bad='bad_file_name'
```

Table 2-31 Arguments of gloader

Argument	Description
export import	It declares whether to download the contents of existing table to data_file_name, or to upload existing data in data_file_name to a specified table in control_file_name.
userid	It specifies user ID.
passwd	It specifies the password of the userid.
control	It specifies the file path in which detailed settings are written during export/import operation.
data	It specifies target data file to export, or data file to import.
log	It specifies log file path in which the progress and the elapsed time of import/export operation.
bad	It specifies bad file path which records data records failed in insertion at importing due to various errors.

The following is an example of a control file.

```
TABLE TEST_TBL
FIELDS TERMINATED BY ','
OPTIONALLY ENCLOSED BY ''''
```

3.

Cluster Tutorial

3.1 Managing GOLDDILOCKS Cluster System

This chapter describes the basic information for configuring and managing the cluster system by using multiple GOLDDILOCKS databases. Only the parts added to the cluster system or distinguishing the cluster system comparing to the standalone database are described in this chapter, so it is prerequisite to read the standalone database tutorial before read this chapter.

Overview

GOLDDILOCKS can be used by configuring a standalone database as described in the previous chapter. Or, a user can also bind multiple databases into a single cluster, then select an appropriate solution for data distribution. In other words, a user can customize how to distribute massive data to multiple servers when using GOLDDILOCKS cluster system. This guarantees high availability and improves the throughput due to the parallel processing.

GOLDDILOCKS cluster system consists of one or more cluster groups, and a cluster group consists of one or more cluster members. It does not require an extra application server or a meta server. Applications are operated accessing to cluster members corresponding to the data server. Cluster members belonging to the same cluster group keeps the same data replication.

A user should determine whether to use GOLDDILOCKS database as standalone system or as cluster system, when creating database of each node. To use it as cluster system, a user should add options related to cluster when creating database of each node.

Property Setting

Properties to build cluster system are described in `$GOLDDILOCKS_DATA/conf/golddilocks.property.conf` file of each server like as when using standalone database. Main properties for TBS (tablespace), LOG, CONTROL FILE can be set as same as setting in standalone system even when using cluster system. However, there should not be the same path or port of files among cluster members when creating multiple databases to configure cluster system in a single server.

The followings describe main property items of when configuring cluster system.

Table 3-1 Main property items

Property	Description	Default value
	It is the directory path of installing the following system TBS.	

Property	Description	Default value
SYSTEM_TABLESPACE_DIR	<ul style="list-style-type: none"> • DICTIONARY_TBS • MEM_DATA_TBS • MEM_UNDO_TBS • MEM_TEMP_TBS • MEM_TRANS_TBS 	'<GOLDDILOCKS_DATA>/db'
SYSTEM_MEMORY_DICT_TABLESPACE_SIZE	It is the dictionary tablespace size.	256M
SYSTEM_MEMORY_DATA_TABLESPACE_SIZE	It is the data tablespace size.	200M
SYSTEM_MEMORY_UNDO_TABLESPACE_SIZE	It is the undo tablespace size.	32M
LOG_DIR	It is the default log directory path.	'<GOLDDILOCKS_DATA>/wal'
SYSTEM_LOGGER_DIR	It is the system log directory path.	'<GOLDDILOCKS_DATA>/trc'
CONTROL_FILE_COUNT	It is the number of control files.	2
CONTROL_FILE_0	It is the first control file path.	'<GOLDDILOCKS_DATA>/wal/control_0.ctl'
CONTROL_FILE_1	It is the second control file path.	'<GOLDDILOCKS_DATA>/wal/control_1.ctl'
LOCAL_CLUSTER_MEMBER	It is the name of cluster member of which local server uses in cluster system.	'G1N1'
LOCAL_CLUSTER_MEMBER_HOST	It is the host name of local server.	'127.0.0.1'
LOCAL_CLUSTER_MEMBER_PORT	It is TCP listen port of which local server uses for the communication in cluster system.	10101

The name of cluster member and host-port combination should be unique in cluster system. To omit the property setting above, provide information by using `--member`, `--host`, `--port` options when creating database using `gcreatedb`. The member information provided by property or `gcreatedb` option is stored and managed in `$GOLDDILOCKS_DATA/wal/location.ctl` file.

To modify the properties, update the text property file (`$GOLDDILOCKS_DATA/conf/golddilocks.properties.conf`), or define a new variable in a form of `GOLDDILOCKS_<property_name>` in an environment variable. The property file is prior to the environment variable.

Background Process

GOLDDILOCKS cluster system has the background process (gmaster) to manage instances per each member node. gmaster of each node consists of multiple system threads internally. Most of them are as same as those in standalone system, but the following system threads are added to manage cluster system.

The following threads are performed only when starting the database created as cluster mode.

- Cluster recover thread: It recovers global transaction in cluster system.
- Failover thread: It deals with the failover through reselecting offline and coordinator for the member s when an error occurs on a specific node or in a network in cluster system.

Two following processes are additionally driven when using GOLDDLOCKS as cluster system.

- cdispatcher: It transmit/receive cluster packet and manages sessions.
- cserver: It performs operation of modifying and querying for the database to which the member node belongs.

GOLDDLOCKS cluster system requires complex cluster protocol communication among member nodes, and cluster dispatcher (cdispacher) is a process to efficiently perform the management of network communication context and packet distribution mechanism. In addition, it performs monitoring continuously the validity of cluster session through heartbeat.

In cluster system, SQL performing in a specific node (driver node) needs to store data on the remote member node by referring to the sharding strategy of the target table or enquires the data stored in the corresponding node. In this case, a process is required to process this request and return the result in each member node, and that process is cserver.

Client Process

A user can use both client server (C/S) model and direct access (D/A) model in cluster system like as standalone system. However, each member node of cluster system has its own listener, so the client program should know the listen port of the cluster member to access beforehand (in C/S mode). A user can process various transactions when accessing to any node of cluster system like as standalone database.

Signal handling, cleanup for connection, releasing shared resources in cluster system are processes as same as those in standalone system.

Memory Structure of Instance

GOLDDLOCKS cluster system is used to bind multiple shared-nothing databases to a management unit which is a single cluster system. Therefore, a method of using memory of cluster member nodes is similar to that of standalone. The memory size of which each member node uses are determined by properties set in its own property. Static area contains instance basic information for database management, information for each session, statement, transaction, redo log buffer, dictionary cache, and other operational information like as standalone system. Additionally, information for management of cluster session such as inf

ormation for location and cluster session are also stored.

Tablespace area consists of page frames and page control header (PCH). The page frame contains the contents of each tablespace and PCH controls those page frames.

The application process memory contains instance memories attached when connecting, ODBC environment shared in process unit, various ODBC handles and heap memory area containing other information such as bind information.

Start and End of Cluster System

To start GOLDDILOCKS system, create instance on each member node beforehand (gcreatedb), and then register cluster group and cluster member. Later, a user can start or end the system by using sysdba role through gsql and gsqlnet.

listeners should be in operation if a user wants to start or end GOLDDILOCKS cluster system in dedicated mode of C/S model (to use gsqlnet).

GOLDDILOCKS cluster system can not be started or ended in the shared mode of C/S model.

```
% gsql --as sysdba
Enter user-name: sys
Enter password:
Connected to an idle instance.
gSQL>
```

GOLDDILOCKS cluster system has the following startup phases. OPEN phase is subdivided into LOCAL OPEN and GLOBAL OPEN unlike the standalone system.

- NOMOUNT
 - It launches gmaster which is a demon to manage GOLDDILOCKS instance.
- MOUNT
 - It reads properties, and the control file for the recovery by using \$GOLDDILOCKS_DATA environment variable.
- LOCAL OPEN
 - It loads tablespace content from data files, then performs recovery by using the redo log files, and recovers in-doubt global transaction, newly build no-logging indexes, and creates dictionary caches.
- OPEN (GLOBAL OPEN)
 - It connects cluster sessions of each cluster member, arranges shard map, selects a global manager (global coordinator) and a group manager (group coordinator), then waits for the user to access the service.

To start or end the GOLDDILOCKS cluster system the cluster system environment should be configured performing the following preliminary works. If the member name, host address, port number are uniquely given when creating each member database by using gcreatedb, the property setting process for each node can be omitted.

- Setting property: Update property files to be used on each member node.
- Creating database: Create the database through gcreatedb on each member node.
- Creating cluster group and adding a member: Create a group and a member configuring cluster system.
- Driving listener: The listener on each node should be driven beforehand to use gsqlnet.

Use the following syntaxes to create a cluster group or a member.

- **ALTER CLUSTER GROUP name ADD MEMBER**
- **CREATE CLUSTER GROUP**

- Creating database: It is performed on each node.

```
% gcreatedb --cluster --db_name='goldilocks' --member='g1n1' \
    --host='192.168.0.11' --port 10110
% gcreatedb --cluster --db_name='goldilocks' --member='g1n2' \
    --host='192.168.0.12' --port 10120
```

- Creating a cluster group and a member: It is performed on a single node.

```
gSQL> create cluster group g1 cluster member g1n1
        host '192.168.0.11' port 10110;
gSQL> alter cluster group g1 add cluster member g1n2
        host '192.168.0.12' port 10120;
```

If the configuration of GOLDDILOCKS cluster system is completed as above, the entire cluster system can be started or ended by using the following two methods.

- Accessing to each member node to start or end nodes one by one
 - Use \startup and \shutdown commands.
- Start or end the entire member node at once in a single member node
 - Connect through gsqlnet, and then use \cstartup and \cshutdown commands.

The following describes the first method above which is how to access each member node then drive cluster system. \startup command is used to directly enter into LOCAL OPEN phase without the intermediate phase. This can be operated being subdividing into three phases, which are \startup nomount, alter system mount database, and alter system open local database.

Drive up to LOCAL OPEN phase on each node through \startup, and then access a single node and drive

up to GLOBAL OPEN phase.

- Startup up to LOCAL OPEN: It is performed on each member node.

```
% gsql sys gliese --as sysdba
gSQL> \startup
Startup success.
```

- Startup up to OPEN: It is performed on a single node.

```
% gsql sys gliese --as sysdba
gSQL> alter system open global database;
System altered.
```

Starting up with the first method can be a burden to an operator if many nodes are included in cluster system. It is because the entire process from end of cluster system to LOCAL OPEN should be performed everytime on every member node. The following is a simple method to startup the entire member for the ease of operation.

- Startup to GLOBAL OPEN: It is performed on a single node.

```
% gsqlnet sys gliese --as sysdba
gSQL> \cstartup
Startup success.
```

Note

- \cstartup and \cshutdown commands can be performed only in gsqlnet, and it is not supported in gsql. Also, listener should be driven beforehand on every member node to be driven.
- To build GOLDDILOCKS cluster system containing multiple members on a single physical node, home directory name, member name and the cluster port information should not be duplicated when creating each database.

When GOLDDILOCKS system ends, gmaster, the management daemon process, ends on each member node, so it does not allow any more connection or other database operations.

The followings are two ending modes of GOLDDILOCKS cluster system.

- **NORMAL:** It blocks an access of a new session, waits for the termination of all sessions, performs checkpoint, then unloads the instance.
- **ABORT:** It immediately terminates gmaster regardless of the state of connected sessions, and unloads the instance.

If \shutdown command is performed by using gsql as follows, only the connected member node is terminated.

```
% gsql sys gliese --as sysdba
Connected to GOLDILOCKS Database.
gSQL> \shutdown normal
Shutdown success
gSQL>
```

To terminate the entire member belonging to cluster system at once, use \cshutdown command of gsqlnet as follows. The normal option can be omitted.

```
% gsqlnet sys gliese --as sysdba
Connected to GOLDILOCKS Database.
gSQL> \cshutdown normal
Shutdown success
gSQL>
```

Caution

Using abort option when performing \cshutdown, it terminates the entire member node by force. Therefore, some member nodes may fail to join cluster system when restarting it by using \cstartup. Although the failed nodes can join through the following join commands and rebalance processes, it is recommended to terminate it by using \cshutdown normal which is a safe method.

To terminate and start a member node or some member nodes belonging to cluster system, follow the process below. The following describes how to restart only the G1N2 node among cluster member nodes then make it join cluster system.

```
% gsql sys gliese --as sysdba --dsn=g1n2
Connected to GOLDILOCKS Database.
gSQL> \shutdown normal
Shutdown success
gSQL> \startup
Startup success
```

```
gSQL> alter system join database;  
System altered.
```

To restart a member node and make it rejoin cluster system, rebalancing operation for the altered table may be required if the corresponding node is terminated when a transaction occurs. If the rebalancing operation is not performed, the transaction performing on a driver node may fail to alter the table on which the rebalancing is not performed.

A rebalancing operation is a process which synchronizes data distribution policy and property information of table among member nodes, and dividedly stores table data again in each member nodes according to the data distribution policy.

```
% gsql sys gliese --as sysdba  
Connected to GOLDILOCKS Database.  
gSQL> \shutdown normal  
Shutdown success  
gSQL> \startup  
Startup success  
gSQL> alter system join database;  
ERR-42000(16405): some tables in the database need to be rebalanced  
System altered.  
gSQL> alter database rebalance;  
Database altered.
```

3.2 Installing GOLDILOCKS and Creating Database

Installing and creating member database which is to be included in GOLDILOCKS cluster system is almost as same as those in standalone system. This chapter describes only the unique feature and method used for installing and creating database of cluster system comparing to standalone system.

Configuring GOLDILOCKS Package

The package used to configure GOLDILOCKS cluster system is as same as those of standalone database. However, the scripts to build dictionary and performance view are divided into the script for standalone system and the script for cluster system. Therefore, a user should use the appropriate script for the purpose to build the information after creating the database.

The script for standalone database is located below the `$GOLDILOCKS_HOME/admin/standalone` directory and the script for cluster system is located below the `$GOLDILOCKS_HOME/admin/cluster` directory.

Table 3-2 admin/standalone directory

File name	Description
README	Read me
DictionarySchema.sql	It is the dictionary schema creation script.
InformationSchema.sql	It is the information schema creation script.
PerformanceViewSchema.sql	It is the PerformanceView schema creation script.

Table 3-3 admin/cluster directory

File name	Description
README	Read me
DictionarySchema.sql	It is the dictionary schema creation script.
InformationSchema.sql	It is the information schema creation script.
PerformanceViewSchema.sql	It is the PerformanceView schema creation script.

Installing GOLDILOCKS Software

GOLDILOCKS software should be installed on every member node belonging to cluster system, and the installing method is as same as that of standalone system. The method for setting and checking kernel parameter, setting environment variable are as same as those of standalone system, so refer to the corresponding tutorial.

In this case, be cautious that setting properties for each cluster member node, database name, database version, character set, time zone should be same for the normal operation of cluster system.

Creating Database

Use gcreatedb utility to create database on each member node configuring cluster system like as standalone system.

The following options of gcreatedb are used only when creating cluster database. Other options are as same as standalone system.

Table 3-4 Execution arguments of gcreatedb

Argument	Description
--cluster	It represents that it is cluster database. When it is omitted, standalone database is created.
--member	The member name of local database to be used in cluster system. When it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER property.
--host	IP address of local member to be used for communication between cluster system members. If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER_HOST property.
--port	TCP listen port of local member to be used for communication between cluster system members If it is omitted, it uses the value set in LOCAL_CLUSTER_MEMBER_PORT property.

The following is an example of creating database to be used in cluster system.

```
[SHELL]> gcreatedb --cluster
Database created
[SHELL]> gcreatedb --cluster --member=G1N1
Database created
[SHELL]> gcreatedb --cluster --member=G1N1 --host=127.0.0.1 --port 10101
Database created
[SHELL]> gcreatedb --cluster \
--db_name="TEST_DB" \
--home=$GOLDBLOCKS_DATA \
--host=127.0.0.1 \
--port=10101 \
--db_comment="g1n1 db comment" \
--timezone="+09:00" \
--character_set="UHC" \
--char_length_units="OCTETS"
```

Database created

```
[SHELL]> ls $GOLDILOCKS_DATA/db
system_data.dbf  system_dict.dbf  system_trans.dbf  system_undo.dbf
```

Building Dictionary Schema Information

To normally use cluster system, the dictionary schema information should be built like as standalone system. If the following schema is not built, the catalog API (e.g. SQLTables() function) of ODBC, JDBC obtaining object's structure information malfunctions, then it can not interwork with the third party tools. In conclusion, it should be built after creating database.

It is recommended to build schema in cluster system after completing the operation of creating a cluster group and a member. It is because GOLDILOCKS automatically creates schema on every member node when performing creation script by connecting to a member node after completing cluster system configuration.

- **DICTIONARY_SCHEMA**: It consists of tables and views inquiring object information such as DBA_*, ALL_*, USER_.
- **INFORMATION_SCHEMA**: It consists of tables and views included in the SQL standard INFORMATION_SCHEMA.
- **PERFORMANCE_VIEW_SCHEMA**: It consists of views inquiring system information combining information of fixed tables.

The followings describe how to build schema by using the script for cluster system. Perform the operation by accessing to a single member node in GLOBAL OPEN phase as described above.

```
% gsql sys gliese --as sysdba --import $GOLDILOCKS_HOME/admin/cluster/DictionarySchema.sql
% gsql sys gliese --as sysdba --import $GOLDILOCKS_HOME/admin/cluster/InformationSchema.sql
% gsql sys gliese --as sysdba --import
$GOLDILOCKS_HOME/admin/cluster/PerformanceViewSchema.sql
```

Various structure information can be viewed by using the schema information built above. What is different from standalone system is that a user can extract only the desired node information by giving group name and member node after the object when inquiring the information.

```
% gsql test test
Connected to GOLDILOCKS Database.
gSQL> select origin_member_name, stat_name, stat_value
2   from gv$system_mem_stat
3  where stat_name = 'PLAN_CACHE_TOTAL_SIZE';
ORIGIN_MEMBER_NAME  STAT_NAME          STAT_VALUE
```

```

-----

3.3 Managing Schema Object

The schema object is a logical structure created by a user. GOLDDILOCKS cluster system supports the schema objects such as table, index and global sequence. This chapter describes features of each schema object in cluster system comparing to standalone system. How to efficiently manage them is also described.

Managing Table

A user can specify one of four following sharding strategies as an option when creating a table in GOLDDILOCKS cluster system. Sharding strategy is how to distribute and store table data to each cluster group in cluster system. This option can be specified only in cluster system, and it can not be used when database is created as standalone.

- Cloned strategy
 - It equally copies entire table data.
- Hash sharding strategy
 - It distributes table data based on the hash value of sharding key.
- Range sharding strategy
 - It distributes table data based on the range value of sharding key.
- List sharding strategy
 - It distributes table data based on the list value of sharding key.

For more information about creating table, refer to **CREATE TABLE** and **Cluster Table and Shard**.

When omitting the sharding strategy option, it is defined by **DEFAULT_SHARDING** property. The default value of **DEFAULT_SHARDING** is 0, and it creates cloned table.

```
CREATE TABLE t1
(
  id    INTEGER,
  name  VARCHAR(128)
);
```

If a table is created without giving the sharding strategy by a user as above, then GOLDDILOCKS cluster system internally creates a table by using the following syntax.

```
CREATE TABLE t1
(
  id    INTEGER,
```

```

    name VARCHAR(128)
)
    CLONED
    AT CLUSTER WIDE
;

```

Note

Hash/Range/List sharded table should comply with the followings when creating constraints.

- PRIMARY KEY, UNIQUE constraint should include the sharding key.

Cloned Strategy

It does not distribute the table data based on a specific condition, but it copies all data. The target of copying data can be all nodes in cluster system, or it can be a specific cluster group. In other words, it arranges clones in cluster members of a defined cluster group.

- AT CLUSTER WIDE
 - It arranges clones in all cluster members of all cluster group in cluster system.
 - When adding a cluster group or cluster member, a user can rearranges clones by using **ALTER TABLE name REBALANCE** statement.
- AT CLUSTER GROUP group_list
 - It arranges clones in all cluster members of a defines cluster group.
 - When adding a cluster member to a defined cluster group, a user can rearranges clones by using **ALTER TABLE name REBALANCE** statement.
 - Adding cluster group does not affect the rearrangement of clones.

When the option is omitted, the default value is automatically set to *AT CLUSTER WIDE*.

```

CREATE TABLE t1
(
    id    INTEGER,
    name  VARCHAR(128)
)
CLONED
AT CLUSTER WIDE;

```

```

CREATE TABLE t1
(
    id    INTEGER,

```

```

        name VARCHAR(128)
    )
    CLONED
    AT CLUSTER GROUP G1, G2;

```

Hash Sharding Strategy

It distributes the table data based on the hash value of a column defined as a sharding key.

To use hash sharding strategy, sharding key should be defined complying with the following conditions.

- Up to 32 columns can be listed.
- The duplicated column can not be used.
- The column of LONG VARCHAR or LONG VARBINARY type can not be used.

```

CREATE TABLE t1 ( id INTEGER, name VARCHAR(128) )
    SHARDING BY HASH(id);

```

When hash sharding related options are omitted as above, GOLDBLOCKS system interprets it as follows.

```

CREATE TABLE t1 ( id INTEGER, name VARCHAR(128) )
    SHARDING BY HASH(id)
    SHARD COUNT 24
    AT CLUSTER WIDE;

```

Table rows are distributed to one of 24 shards based on hash value of id column, and 24 shards are equally arranged over the entire cluster system. For more information, refer to **Cluster Table and Shard**.

Range Sharding Strategy

It distributes the table data based on the range value of the column defined as a sharding key. The shards are classified based on each range value, and they can be arranged by defining a specific group, or arranged as CLUSTER WIDE.

The following is a syntax of defining six range shards based on the range value of the sharding key column, and creating a table to distribute them as CLUSTER WIDE. If a cluster group is created after creating a table, the rearrangement of shard containing the created group can be performed by using REBALANCE feature.

- Create a range sharded table.
- Arrange six shards in existing cluster groups (g1, g2, g3).

```
CREATE TABLE t1
(
  id    INTEGER,
  name  VARCHAR(32)
)
SHARDING BY RANGE (id)
  AT CLUSTER WIDE
  SHARD s1 VALUES LESS THAN ( 200000 ),
  SHARD s2 VALUES LESS THAN ( 400000 ),
  SHARD s3 VALUES LESS THAN ( 500000 ),
  SHARD s4 VALUES LESS THAN ( 600000 ),
  SHARD s5 VALUES LESS THAN ( 800000 ),
  SHARD s6 VALUES LESS THAN ( MAXVALUE )
;
```

- Add a cluster group.

```
CREATE CLUSTER GROUP g4
  CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;
```

- Rearrange the range shard.
- Rearrange six shards in cluster groups (g1, g2, g3, g4) in which the added group is included.

```
ALTER TABLE t1 REBALANCE;
```

The following is a syntax of defining range shards, which are defined based on the range of sharding key column value, only to be arranged in a specific cluster group. In other words, the shard s1 whose range value is smaller than 200000 is allocated in cluster group g1, s2 is allocated in cluster group g2, and shard s3 is allocated in g3. Like as shards can not be rearranged by using REBALANCE feature even when a cluster group is added later in a table created by defining cluster group.

- Create a range sharded table.
- Allocate each range shards to defined cluster groups.

```
CREATE TABLE t1
(
  id    INTEGER,
  name  VARCHAR(32)
)
SHARDING BY RANGE (id)
  SHARD s1 VALUES LESS THAN ( 200000 )  AT CLUSTER GROUP g1,
```

```
SHARD s2 VALUES LESS THAN ( 400000 ) AT CLUSTER GROUP g2,
SHARD s3 VALUES LESS THAN ( 500000 ) AT CLUSTER GROUP g3,
SHARD s4 VALUES LESS THAN ( 600000 ) AT CLUSTER GROUP g2,
SHARD s5 VALUES LESS THAN ( 800000 ) AT CLUSTER GROUP g3,
SHARD s6 VALUES LESS THAN ( MAXVALUE ) AT CLUSTER GROUP g1
;
```

- Add a cluster group.

```
CREATE CLUSTER GROUP g4
    CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;
```

- Rearrange the range shard.
- A shard is not allocated to the newly created cluster group (g4).

```
ALTER TABLE t1 REBALANCE;
```

The following conditions should be considered to specify the range sharding key.

- Up to 32 columns can be listed.
- The duplicated column can not be used.
- The column of LONG VARCHAR or LONG VARBINARY type can not be used.

List Sharding Strategy

It distributes the table data based on the list value of the column defined as a sharding key. Like as the range sharding strategy, each shard can be arranged by defining a specific group, or arranged as CLUSTER WIDE.

The followings are conditions to define the shard key in list sharding strategy.

- Only a single column can be used.
- The column of LONG VARCHAR or LONG VARBINARY type can not be used.

The following is a syntax of creating a table of which created list shards are arranged as CLUSTER WIDE. Use REBALANCE feature to rearrange shards including a cluster group created after creating a table.

- Create a list sharded table.
- Arrange five shards in existing cluster groups (g1, g2, g3).

```
CREATE TABLE city
(
```

```

    id    INTEGER,
    name  VARCHAR(32)
)
SHARDING BY LIST (name)
    AT CLUSTER WIDE
    SHARD s1 VALUES IN ( 'SEOUL' ),
    SHARD s2 VALUES IN ( 'PUSAN', 'ULSAN', 'DAEGU' ),
    SHARD s3 VALUES IN ( 'DAEJEON', 'GWANGJU' ),
    SHARD s4 VALUES IN ( 'ANSAN', 'GOYANG' ),
    SHARD s5 VALUES IN ( DEFAULT )
;

```

- Add a cluster group.

```

CREATE CLUSTER GROUP g4
    CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;

```

- Rearrange the list shard.
- Rearrange five shards in cluster groups (g1, g2, g3, g4) in which the created group is included.

```

ALTER TABLE city REBALANCE;

```

The following is a syntax of defining list shards, which are defined based on the list value of sharding key column value, only to be arranged in a specific cluster group. Shards can not be rearranged by using REBALANCE feature even when a cluster group is created.

- Create a list sharded table.
- Allocate each range shards to defined cluster groups.

```

CREATE TABLE city
(
    id    INTEGER,
    name  VARCHAR(32)
)
SHARDING BY LIST (name)
    SHARD s1 VALUES IN ( 'SEOUL' )                AT CLUSTER GROUP g1,
    SHARD s2 VALUES IN ( 'PUSAN', 'ULSAN', 'DAEGU' ) AT CLUSTER GROUP g2,
    SHARD s3 VALUES IN ( 'DAEJEON', 'GWANGJU' )    AT CLUSTER GROUP g3,
    SHARD s4 VALUES IN ( 'ANSAN', 'GOYANG' )        AT CLUSTER GROUP g2,
    SHARD s5 VALUES IN ( DEFAULT )                  AT CLUSTER GROUP g1
;

```

- Create a cluster group.

```
CREATE CLUSTER GROUP g4
    CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;
```

- Rearrange the list shard.
- A shard is not allocated to the newly created cluster group (g4).

```
ALTER TABLE city REBALANCE;
```

Managing Index

Global Secondary Index

In cluster system, multiple member nodes exist, and table records are dividedly stored or duplicated based on the shard strategy. Standalone system guarantees the uniqueness of a record by storing unique value (Row Identifier: RID) in the database when the record is stored. However, in cluster system, each node can have the duplicated value, so the uniqueness can not be guaranteed.

Therefore, it is required to guarantee the uniqueness of a record in cluster system. This is a reason why global RID (GRID) is added. The GRID value of a record is not updated even when the record is updated, so it is not updated when shard key is updated then moved to another shard, then it guarantees the uniqueness of a specific record in cluster system.

Global secondary index is a B-tree index which consists of keys to search the GRID value of the records quickly in cluster system.

A user can select whether to create global secondary index through the following properties when creating a table. The user also can delete or recreate the global secondary index after table creation is completed. Only one global secondary index can be created per table.

For more information, refer to **DEFAULT_GLOBAL_SECONDARY_INDEX_CREATION**.

A global secondary index is necessary to perform the non-deterministic query for a table. If a global secondary index does not exist in a table, then a non-deterministic query fails as follows.

```
gSQL> DELETE FROM T1 LIMIT 1;
ERR-42000(16423): does not support non-deterministic DML in the cluster system : global
secondary index expected
```

Enquire USER_GSI_PLACE DICTIONARY, or use ALL_GSI_PLACE and DBA_GSI_PLACE dictionary to check if the global secondary index of a table is created.

```

gSQL> CREATE TABLE T1( I1 INTEGER );
Table created.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT *
      2  FROM USER_GSI_PLACE@LOCAL
      3  WHERE TABLE_NAME = 'T1';
TABLE_SCHEMA TABLE_NAME GROUP_ID GROUP_NAME MEMBER_ID MEMBER_NAME MEMBER_OFFLINE
-----
BLOCKS
-----
PUBLIC      T1              1 G1              1 G1N1          FALSE
      64
PUBLIC      T1              1 G1              2 G1N2          FALSE
      null
2 rows selected.
gSQL> DROP TABLE T1;
Table dropped.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT *
      2  FROM USER_GSI_PLACE@LOCAL
      3  WHERE TABLE_NAME = 'T1';
no rows selected.

```

Global Sequence

GOLDILOCKS cluster system provides global sequence object which are an expansion of the existing sequence for multiple member nodes to share and use the set of sequence value fitting into user defined conditions. In other words, the global sequence object is internally and automatically created when a user creates a sequence in cluster system, then the sequence values in a specific range are allocated and used when calling NEXTVAL on each member node. The following is a syntax of creating and using the global sequence, which are as same as those of sequence in standalone.

```

gSQL> CREATE SEQUENCE global_user_seq START WITH 1000 INCREMENT BY 1 NOCACHE NOCYCLE;
Sequence created.
gSQL> SELECT global_user_seq.NEXTVAL FROM dual;
NEXTVAL
-----

```

1

1 row selected.

gSQL> DROP SEQUENCE global_user_seq;

Sequence dropped.

Like as the sequence used in standalone, the global sequence object can define a cache size as a creating option, and this means acquiring several sequence value from the global sequence object and loading at local cache. The followings are local cache status of each member node and return values of when calling NEXTVAL, this is when creating the global sequence object by setting cache size to 5.

gSQL> CREATE SEQUENCE seq START WITH 1 CACHE 5;

Sequence created.

Member name	NEXTVAL result	The number of remaining local cache sequence		Description
		G1N1	G1N2	
G1N1	1	4	0	From Global Object (Alloc 1 ~ 5)
G1N1	2	3	0	From Local Cache
G1N1	3	2	0	From Local Cache
G1N2	6	3	4	From Global Object (Alloc 6 ~ 10)
G1N2	7	3	3	From Local Cache
G1N2	8	3	2	From Local Cache
G1N2	9	3	1	From Local Cache
G1N2	10	3	0	From Local Cache
G1N2	11	3	4	From Global Object (Alloc 11 ~ 15)
G1N2	12	3	3	From Local Cache
G1N1	4	1	3	From Local Cache
G1N1	5	0	3	From Local Cache
G1N1	16	4	3	From Global Object (Alloc 16 ~ 20)

In the table above, the sequence values are allocated to G1N1 and G1N2 two times each (four times in total) from the global sequence object. The cache option value is set to 5 when creating a sequence, so five sequence values are allocated each from the global object. Those five sequences allocated to a member node is stored in its own local cache, then it is returned one by one whenever calling NEXTVAL.

- G1N1
 - The values of five sequences (1~5) are allocated from the global sequence object when calling the first NEXTVAL.

- A single sequence is returned as a result of NEXTVAL and the values of other four sequences are loaded in its own local cache.
- NEXTVAL called later returns in turn the values of the sequences loaded in the local cache.
- G1N2
 - The values of sequences (6~10) which are after the sequences allocated on G1N1 are allocated when calling the first NEXTVAL.
 - 6 is returned as a result of NEXTVAL, and the values of other four sequences (7~10) are loaded in its own local cache.
 - NEXTVAL called later returns the sequence values loaded in the local cache.
 - Local cache is run out, so values of other five sequences (11~15) are allocated again from the global sequence object.
- G1N1
 - Local cache is run out, so the values of five sequences (16~20) after the sequences allocated last on G1N2 are allocated.

The sequence as big as the CACHE size are allocated to all member nodes when NEXTVAL has never been called on its own node or when all allocated nodes are run out. Therefore, if a system needs to acquire the sequence value quickly, it is required to set the appropriate cache size when creating a sequence to prevent too much frequent allocation. It is because, unlike standalone database, allocating sequence from the global sequence object is accompanied by the network communication cost.

The sequence values loaded in local cache can not be reused when database restarts due to a system error or operational work. The sequence values are allocated again from the global sequence object when calling NEXTVAL for the first time since the restart. Therefore, the CACHE size allocated when creating the sequence also means the range value of sequence which is possible to be lost when an error occurs, so the size should be set appropriately considering not only the corresponding feature but also loss range.

The result value of calling NEXTVAL from a specific node may not be sequential in cluster system. In the example above, the return value is not sequential when G1N1 node calls NEXTVAL. After the first allocated value(1~5) is run out, 16~20 is allocated second, so 16 is returned to a user as the next sequence value of 5. It is because a single global sequence pool is allocated competitively to multiple nodes.

The followings are features and constraints of global sequence object, comparing to the sequence for existing standalone database.

- The sign can not be modified by using INCREMENT BY option in ALTER SEQUENCE statement. (The size can be modified.)
- The duplicated value among member nodes can be returned depending on the pool size of entire sequence when using CYCLE option. Therefore, create the sequence pool big enough, considering INCREMENT BY, CACHE SIZE, and the number of cluster member nodes when CYCLE option is in need.
- The return value from a specific node may not be sequential even when an error does not occur. Of course, if only one member node calls NEXTVAL, then sequential sequence value is obtained.
- The CACHE SIZE is 1 for NOCACHE, so the additional sequence values are not loaded in local cache. In this case, only one sequence is allocated from the global sequence object whenever calling NEXTV

AL, and it increases the network cost and degrades the performance.

- Creating, updating and deleting sequences are operated as AUTO COMMIT.
- All sequence values loaded in local cache of all nodes are reset when the size of CACHE and INCREMENT are updated by ALTER statement. In other words, a new sequence set should be allocated from the global sequence object when calling NEXTVAL afterwards.

3.4 GOLDILOCKS Property

The followings are main properties used in GOLDILOCKS cluster system.

Table 3-5 Main properties of GOLDILOCKS

Name	Description
LOCAL_CLUSTER_MEMBER	Member name
LOCAL_CLUSTER_MEMBER_HOST	Host address for connecting to cluster session
LOCAL_CLUSTER_MEMBER_PORT	Port for connecting to cluster session
CDISPATCHER_THREADS	The number of cluster dispatcher threads
CSERVERS	The number of cluster server process
CLUSTER_DATA_SYNC_SERVERS	The number of cluster server process to synchronize replica data

Each property has the following two alterable scopes in GOLDILOCKS cluster system.

- LOCAL: It can alter property values not only for entire member but also for a specific member only.
- GLOBAL: It can not alter the property value only for a specific member, but it should alter the property value for all members.

For example, PRIVATE_STATIC_AREA_SIZE properties can be altered up to the LOCAL range (IS_GLOBAL column = FALSE) as follows, so the property value can be altered by using *alter system set* statement not only for entire member but also for a specific member only. If AT clause is not added to after *alter system set* statement, the altered properties are applied to all members of cluster system.

```
% gsql test test
Connected to GOLDILOCKS Database.
gSQL> select origin_member_name, property_name, property_value, is_global
2   from gv$property
3   where property_name = 'PRIVATE_STATIC_AREA_SIZE';
ORIGIN_MEMBER_NAME  PROPERTY_NAME                PROPERTY_VALUE  IS_GLOBAL
-----
G1N1                PRIVATE_STATIC_AREA_SIZE    104857600      FALSE
G1N2                PRIVATE_STATIC_AREA_SIZE    104857600      FALSE
2 rows selected.
gSQL> alter system set private_static_area_size = 2000000000 at g1n2;
System altered.
gSQL> select origin_member_name, property_name, property_value, is_global
2   from gv$property
3   where property_name = 'PRIVATE_STATIC_AREA_SIZE';
ORIGIN_MEMBER_NAME  PROPERTY_NAME                PROPERTY_VALUE  IS_GLOBAL
```

```

-----
G1N1          PRIVATE_STATIC_AREA_SIZE 104857600      FALSE
G1N2          PRIVATE_STATIC_AREA_SIZE 200000000      FALSE
2 rows selected.
gSQL> alter system set private_static_area_size = 300000000;
System altered.
gSQL> select origin_member_name, property_name, property_value, is_global
       2   from gv$property
       3   where property_name = 'PRIVATE_STATIC_AREA_SIZE';
ORIGIN_MEMBER_NAME  PROPERTY_NAME          PROPERTY_VALUE  IS_GLOBAL
-----
G1N1                PRIVATE_STATIC_AREA_SIZE 300000000      FALSE
G1N2                PRIVATE_STATIC_AREA_SIZE 300000000      FALSE
2 rows selected.

```

However, DDL_AUTOCOMMIT can be altered up to GLOBAL as follows. Therefore, an error occurs when specifying a member by using AT clause in *alter system set* statement.

```

% gsql test test
Connected to GOLDILOCKS Database.
gSQL> select origin_member_name, property_name, property_value, is_global
       2   from gv$property
       3   where property_name = 'DDL_AUTOCOMMIT';
ORIGIN_MEMBER_NAME  PROPERTY_NAME  PROPERTY_VALUE  IS_GLOBAL
-----
G1N1                DDL_AUTOCOMMIT NO          TRUE
G1N2                DDL_AUTOCOMMIT NO          TRUE
2 rows selected.
gSQL> alter system set ddl_autocommit = false at g1n2;
ERR-42000(16398): the domain of property does not match with domain 'G1N2' :
alter system set ddl_autocommit = false at g1n2

System altered.
gSQL> select origin_member_name, property_name, property_value, is_global
       2   from gv$property
       3   where property_name = 'DDL_AUTOCOMMIT';
ORIGIN_MEMBER_NAME  PROPERTY_NAME  PROPERTY_VALUE  IS_GLOBAL
-----
G1N1                DDL_AUTOCOMMIT NO          TRUE

```

G1N2	DDL_AUTOCOMMIT NO	TRUE
2 rows selected.		

4.

What's New

4.1 Feature Matrix

This chapter briefly describes the features added to each major version.

Architecture

System Architecture

The following is a feature matrix for system architecture.

Table 4-1 Feature matrix for system architecture

Feature	1.x	2.x	3.1	3.2
Shared Nothing Cluster	X	X	O	O
DA (Direct Attach)	O	O	O	O
JDBC DA (Direct Attach)	X	X	O	O
C/S (Client/Server) Dedicated	X	O	O	O
C/S (Client/Server) Shared	X	O	O	O
multi-process applications	O	O	O	O
multi-threaded applications	O	O	O	O
Linux platform	O	O	O	O
HP platform	X	O	O	O
AIX platform	X	O	O	O
Windows Client Platform	X	O	O	O
CDC(Change Data Capture) replication	X	O	O	O
CDC replication with log mirror	X	O	O	O
multi-level start up	X	O	O	O
parallel database loading	O	O	O	O
parallel index build	X	O	O	O
SQL plan cache	X	O	O	O

Storage Internal

The following is a feature matrix for storage internal.

Table 4-2 Feature matrix for storage internal

Feature	1.x	2.x	3.1	3.2
memory dictionary tablespace	O	O	O	O
memory data tablespace	O	O	O	O
memory undo tablespace	O	O	O	O
memory temporary tablespace	X	O	O	O
memory bitmap data segment	O	O	O	O
memory bitmap undo segment	O	O	O	O
memory bitmap instant segment	X	O	O	O
memory heap table	O	O	O	O
memory instant table	X	O	O	O
memory B-tree index	O	O	O	O
memory instant B-tree	X	O	O	O
memory instant hash	X	O	O	O
global secondary index	X	X	O	O

Transaction Control

The following is a feature matrix for transaction control.

Table 4-3 Feature matrix for transaction control

Feature	1.x	2.x	3.1	3.2
CDS(Concurrency Data Store) database mode	O	O	O	O
TDS(Transactional Data Store) database mode	O	O	O	O
read-only database	X	O	O	O
read/write database	O	O	O	O
flat transaction	O	O	O	O
distributed transaction	X	O	O	O
read-only transaction	X	O	O	O
read/write transaction	O	O	O	O
READ COMMITTED isolation level	O	O	O	O
SERIALIZABLE isolation level with SELECT FOR UPDATE	O	O	O	O
MVCC(Multi Version Concurrency Control)	O	O	O	O
multi-version read consistency	O	O	O	O
multi-statement consistent read	O	O	O	O
implicit lock for DML	O	O	O	O
writer don't blocks readers	O	O	O	O
row-level locking	O	O	O	O
deadlock detection	O	O	O	O
deadlock resolution	O	O	O	O
lock granularity	O	O	O	O
read lock	O	O	O	O

SQLCODE Function	X	X	O	O
SQLERRM Function	X	X	O	O
%TYPE Attribute	X	X	O	O
UPDATE Statement Extension	X	X	O	O
WHILE LOOP Statement	X	X	O	O

API

ODBC

The following is a feature matrix for the ODBC standard API.

Table 4-17 Feature matrix for the ODBC standard API

Feature	1.x	2.x	3.1	3.2
SQLAllocHandle()	O	O	O	O
SQLBindCol()	O	O	O	O
SQLBindParameter()	O	O	O	O
SQLCloseCursor()	O	O	O	O
SQLColAttribute()	X	O	O	O
SQLColumnPrivileges()	X	O	O	O
SQLColumns()	X	O	O	O
SQLConnect()	O	O	O	O
SQLDescribeCol()	O	O	O	O
SQLDescribeParam()	O	O	O	O
SQLDisconnect()	O	O	O	O
SQLDriverConnect()	X	O	O	O
SQLEndTran()	O	O	O	O
SQLExecDirect()	O	O	O	O
SQLExecute()	O	O	O	O
SQLExtendedFetch()	X	O	O	O
SQLFetch()	O	O	O	O
SQLFetchScroll()	X	O	O	O
SQLForeignKeys()	X	O	O	O
SQLFreeHandle()	O	O	O	O
SQLFreeStmt()	O	O	O	O
SQLGetConnectAttr()	O	O	O	O
SQLGetCursorName()	X	O	O	O
SQLGetData()	X	O	O	O
SQLGetDescField()	O	O	O	O
SQLGetDescRec()	O	O	O	O
SQLGetDiagField()	O	O	O	O
SQLGetDiagRec()	O	O	O	O
SQLGetEnvAttr()	O	O	O	O
SQLGetFunctions()	O	O	O	O
SQLGetInfo()	X	O	O	O
SQLGetStmtAttr()	O	O	O	O

Feature	1.x	2.x	3.1	3.2
SQLGetTypeInfo()	X	O	O	O
SQLMoreResults()	X	O	O	O
SQLNumParams()	O	O	O	O
SQLNumResultCols()	O	O	O	O
SQLParamData()	X	O	O	O
SQLPrepare()	O	O	O	O
SQLPrimaryKeys()	X	O	O	O
SQLProcedureColumns()	X	O	O	O
SQLProcedures()	X	O	O	O
SQLPutData()	X	O	O	O
SQLRowCount()	O	O	O	O
SQLSetConnectAttr()	O	O	O	O
SQLSetCursorName()	X	O	O	O
SQLSetDescField()	O	O	O	O
SQLSetDescRec()	O	O	O	O
SQLSetEnvAttr()	O	O	O	O
SQLSetPos()	X	O	O	O
SQLSetStmtAttr()	O	O	O	O
SQLSpecialColumns()	X	O	O	O
SQLStatistics()	X	O	O	O
SQLTablePrivileges()	X	O	O	O
SQLTables()	X	O	O	O

The following is a feature matrix for API other than the ODBC standard API.

Table 4-18 Feature matrix for API other than the ODBC standard

Feature	1.x	2.x	3.1	3.2
xa_open	X	O	O	O
xa_close	X	O	O	O
xa_start	X	O	O	O
xa_end	X	O	O	O
xa_rollback	X	O	O	O
xa_prepare	X	O	O	O
xa_commit	X	O	O	O
xa_recover	X	O	O	O
xa_forget	X	O	O	O
SQLGetXaSwitch	X	O	O	O
SQLGetXaConnectionHandle	X	O	O	O
SQLGetGroupCount	X	X	X	O
SQLGetGroupIDs	X	X	X	O

Feature	1.x	2.x	3.1	3.2
SQLGetGroupName	X	X	X	O
SQLGetSuitableGroupID	X	X	X	O

JDBC

The following is a class feature matrix for JDBC.

Table 4-19 Class feature matrix for JDBC

Feature	1.x	2.x	3.1	3.2
CallableStatement	X	X	O	O
CommonDataSource	X	O	O	O
Connection	X	O	O	O
ConnectionPoolDataSource	X	O	O	O
DatabaseMetaData	X	O	O	O
DataSource	X	O	O	O
Driver	X	O	O	O
ParameterMetaData	X	O	O	O
PooledConnection	X	O	O	O
PreparedStatement	X	O	O	O
ResultSet	X	O	O	O
ResultSetMetaData	X	O	O	O
RowId	X	O	O	O
Savepoint	X	O	O	O
Statement	X	O	O	O
XAConnection	X	O	O	O
XADataSource	X	O	O	O
XAResource	X	O	O	O
GoldilocksInterval	X	O	O	O
GoldilocksTypes	X	O	O	O

Embedded SQL

Precompiler Option

The following is a feature matrix for precompiler option.

Table 4-20 Feature matrix for precompiler option

Feature	1.x	2.x	3.1	3.2
--help	X	O	O	O
--include-path	X	O	O	O
--no-prompt	X	O	O	O
--output	X	O	O	O
--unsafe-null	X	O	O	O
--version	X	O	O	O

Embedded SQL-only Syntax

The following is a feature matrix of embedded SQL-only syntax.

Table 4-21 Feature matrix for embedded SQL-only syntax

Feature	1.x	2.x	3.1	3.2
EXEC SQL AT	X	O	O	O
EXEC SQL ATOMIC INSERT	X	O	O	O
EXEC SQL AUTOCOMMIT	X	O	O	O
EXEC SQL BEGIN DECLARE SECTION	X	O	O	O
EXEC SQL COMMIT RELEASE	X	O	O	O
EXEC SQL CONNECT	X	O	O	O
EXEC SQL CONTEXT ALLOCATE	X	O	O	O
EXEC SQL CONTEXT FREE	X	O	O	O
EXEC SQL CONTEXT USE	X	O	O	O
EXEC SQL DISCONNECT	X	O	O	O
EXEC SQL END DECLARE SECTION	X	O	O	O
EXEC SQL FOR	X	O	O	O
EXEC SQL GET GROUPID	X	X	X	O
EXEC SQL INCLUDE	X	O	O	O
EXEC SQL INCLUDE SQLCA	X	O	O	O
EXEC SQL OPTION	X	O	O	O
EXEC SQL ROLLBACK RELEASE	X	O	O	O
EXEC SQL WHENEVER	X	O	O	O

Host Variable Data Type

The following is a feature matrix for embedded SQL data type which can be used for HOST variables.

Table 4-22 Feature matrix for host variable data type

Feature	1.x	2.x	3.1	3.2
C native type	X	O	O	O
struct, union	X	O	O	O
typedef	X	O	O	O
VARCHAR	X	O	O	O
LONG VARCHAR	X	O	O	O
BINARY	X	O	O	O
LONG VARBINARY	X	O	O	O
BOOLEAN	X	O	O	O
NUMBER	X	O	O	O
DATE	X	O	O	O
TIME	X	O	O	O
TIME WITH TIMEZONE	X	O	O	O
TIMESTAMP	X	O	O	O
TIMESTAMP WITH TIMEZONE	X	O	O	O
INTERVAL YEAR	X	O	O	O
INTERVAL MONTH	X	O	O	O
INTERVAL DAY	X	O	O	O
INTERVAL HOUR	X	O	O	O
INTERVAL MINUTE	X	O	O	O
INTERVAL SECOND	X	O	O	O
INTERVAL YEAR TO MONTH	X	O	O	O
INTERVAL DAY TO HOUR	X	O	O	O
INTERVAL DAY TO MINUTE	X	O	O	O
INTERVAL DAY TO SECOND	X	O	O	O
INTERVAL HOUR TO MINUTE	X	O	O	O
INTERVAL HOUR TO SECOND	X	O	O	O
INTERVAL MINUTE TO SECOND	X	O	O	O

Dynamic SQL

The following is a feature matrix for dynamic SQL.

Table 4-23 Feature matrix for dynamic SQL

Feature	1.x	2.x	3.1	3.2
SELECT .. INTO	X	O	O	O
EXECUTE IMMEDIATE sql	X	O	O	O

Feature	1.x	2.x	3.1	3.2
PREPARE stmt	X	O	O	O
EXECUTE stmt	X	O	O	O
DECLARE cursor FOR sql	X	O	O	O
DECLARE cursor FOR stmt	X	O	O	O
OPEN cursor	X	O	O	O
OPEN cursor USING	X	O	O	O
FETCH cursor INTO	X	O	O	O
CLOSE cursor	X	O	O	O
DELETE .. WHERE CURRENT OF cursor	X	O	O	O
UPDATE .. WHERE CURRENT OF cursor	X	O	O	O

PyDBC

Module

The following is a method feature matrix for pygoldilocks provided by PyDBC.

Table 4-24 Feature matrix for pygoldilock method

Feature	1.x	2.x	3.1	3.2
connect	X	X	X	O
Date	X	X	X	O
Time	X	X	X	O
Timestamp	X	X	X	O
DateFromTicks	X	X	X	O
TimeFromTicks	X	X	X	O
TimestampFromTicks	X	X	X	O
Binary	X	X	X	O
STRING	X	X	X	O
BINARY	X	X	X	O
NUMBER	X	X	X	O
DATETIME	X	X	X	O
ROWID	X	X	X	O
getDecimalSeparator	X	X	X	O
setDecimalSeparator	X	X	X	O

The following is an attribute feature matrix for pygoldilocks module.

Table 4-25 Feature matrix for pygoldilock attribute

Feature	1.x	2.x	3.1	3.2
apilevel	X	X	X	O
threadsafety	X	X	X	O
paramstyle	X	X	X	O
version	X	X	X	O
lowercase	X	X	X	O

Connection

The following is a method feature matrix for connection object.

Table 4-26 Feature matrix for connection method

Feature	1.x	2.x	3.1	3.2
cursor	X	X	X	O
commit	X	X	X	O

Feature	1.x	2.x	3.1	3.2
rollback	X	X	X	O
close	X	X	X	O
getinfo	X	X	X	O
execute	X	X	X	O
set_attr	X	X	X	O

The following is an attribute feature matrix for connection object.

Table 4-27 Feature matrix for connection attribute

Feature	1.x	2.x	3.1	3.2
autocommit	X	X	X	O
searchescape	X	X	X	O
timeout	X	X	X	O

Cursor

The following is a method feature matrix for cursor object.

Table 4-28 Feature matrix for cursor method

Feature	1.x	2.x	3.1	3.2
excute	X	X	X	O
executemany	X	X	X	O
fetchone	X	X	X	O
fetchall	X	X	X	O
fetchmany	X	X	X	O
commit	X	X	X	O
rollback	X	X	X	O
skip	X	X	X	O
nextset	X	X	X	O
close	X	X	X	O
setinputsizes	X	X	X	O
setoutputsize	X	X	X	O
callproc	X	X	X	O
callfunc	X	X	X	O
tables	X	X	X	O
columns	X	X	X	O
statistics	X	X	X	O
rowIdColumns	X	X	X	O
rowVerColumns	X	X	X	O
primaryKeys	X	X	X	O

Feature	1.x	2.x	3.1	3.2
foreignKeys	X	X	X	O
procedures	X	X	X	O
getTypeInfo	X	X	X	O

The following is an attribute feature matrix for cursor object.

Table 4-29 Feature matrix for cursor attribute

Feature	1.x	2.x	3.1	3.2
Description	X	X	X	O
rowcount	X	X	X	O
arraysize	X	X	X	O
connection	X	X	X	O
fast_executemany	X	X	X	O

Row

The following is an attribute feature matrix for row object.

Table 4-30 Feature matrix for row attribute

Feature	1.x	2.x	3.1	3.2
cursor_description	X	X	X	O

Utility

gcreatedb

Command Usage

The following is a feature matrix for command usage of gcreatedb.

Table 4-31 Feature matrix for command usage of gcreatedb

Feature	1.x	2.x	3.1	3.2
--character_set	O	O	O	O
--char_length_units	X	O	O	O
--cluster	X	X	O	O
--db_comment	O	O	O	O
--help	O	O	O	O
--host	X	X	O	O

Feature	1.x	2.x	3.1	3.2
--member	X	X	O	O
--port	X	X	O	O
--silent	O	O	O	O
--timezone	X	O	O	O

glsnr

Command Usage

The following is a feature matrix for command usage of glsnr.

Table 4-32 Feature matrix for command usage of glsnr

Feature	1.x	2.x	3.1	3.2
--help	X	O	O	O
--home	X	X	O	O
--silent	X	O	O	O
--start	X	O	O	O
--status	X	O	O	O
--stop	X	O	O	O

Configuration File

The following is a feature matrix for configuration of glsnr.

Table 4-33 Feature matrix for configuration of glsnr

Feature	1.x	2.x	3.1	3.2
BACKLOG	X	O	O	O
DEFAULT_CS_MODE	X	O	O	O
LISTENER_LOG_DIR	X	X	O	O
LISTEN_PORT	X	O	O	O
TCP_EXCLUDED	X	O	O	O
TCP_INVITED	X	O	O	O
TCP_HOST	X	O	O	O
TCP_VALIDNODE_CHECKING	X	O	O	O
TIMEOUT	X	O	O	O
USR_DIR	X	X	O	O

gsql/gsqlnet

Command Usage

The following is a feature matrix for command usage of gsql.

Table 4-34 Feature matrix for command usage of gsql

Feature	1.x	2.x	3.1	3.2
username password	O	O	O	O
--as {SYSDBA ADMIN}	X	O	O	O
--conn-string	X	O	O	O
--dsn	X	O	O	O
--enable-color	O	O	O	O
--help	O	O	O	O
--import	O	O	O	O
--no-prompt	O	O	O	O
--prompt	O	O	O	O
--silent	O	O	O	O
--version	O	O	O	O

Interactive gsql Command

The following is a feature matrix for interactive gsql command.

Table 4-35 Feature matrix for interactive gsql command

Feature	1.x	2.x	3.1	3.2
\\	O	O	O	O
\connect userid password [as sysdba]	X	O	O	O
\cshutdown	X	X	O	O
\cstartup	X	X	O	O
\ddl_cluster	X	X	O	O
\ddl_db	X	O	O	O
\ddl_tablespace	X	O	O	O
\ddl_profile	X	O	O	O
\ddl_audit_policy	X	X	X	O

4.2 What's New in GOLDDILOCKS 3.2

This chapter briefly describes the features added to GOLDDILOCKS 3.2.

Architecture

System Architecture

It has not been changed.

Storage Internal

It has not been changed.

Transaction Control

It has not been changed.

Backup & Recovery

It has not been changed.

Database Information

DICTIONARY_SCHEMA

The following views have been added to enquire the information about audit policy object.

- `AUDIT_POLICIES`
- `AUDIT_POLICY_OPTIONS`
- `AUDIT_POLICY_ENABLED`

`AUDIT_TRAIL` has been added to enquire the audit record.

The following views are deleted.

- `ALL_COL_PLACE`
- `DBA_COL_PLACE`
- `USER_COL_PLACE`

INFORMATION_SCHEMA

It has not been changed.

PERFORMANCE_VIEW_SCHEMA

The following views have been added to enquire the information which can be listed in a system action and in a privilege action when defining audit policy options.

- V\$AUDITABLE_DB_PRIVILEGES
- V\$AUDITABLE_SYSTEM_ACTIONS

Server Property

Property for Global Temporary Table Has Been Added

TEMP_UNDO_ENABLED property has been added to assign the undo logging tablespace for the global temporary table.

TEMP_SEGMENT_CACHE_SIZE has been added to assign the segment cache size of the global temporary table or the global temporary index.

Recompile Feature Based on the Change of Pages Are Deleted

The recompile feature based on the change of pages, which is supported until 3.1, are deleted. Therefore, the following properties are not supported any more.

- RECOMPILE_CHECK_MINIMUM_PAGE_COUNT
- RECOMPILE_PAGE_PERCENT

Property for Auxiliary Tablespace Has Been Added

SYSTEM_MEMORY_AUX_TABLESPACE_SIZE property has been added to determine the size of the auxiliary tablespace

Property for Communication Data Compression Has Been Added

PACKET_COMPRESSION_THRESHOLD property has been added to determine whether to compress the communication data.

Property for Redo Log Compression Has Been Added

REDO_LOG_COMPRESSION_THRESHOLD property has been added to determine whether to compress the redo log.

USE_LARGE_PAGES Property Has Been Added

USE_LARGE_PAGES property has been added to use HugePage.

SQL

SQL Element

Data Type

It has not been changed.

Function

The following aggregation functions related to variation have been added.

STDDEV

STDDEV_POP

STDDEV_SAMP

VARIANCE

VAR_POP

VAR_SAMP

The string function **REVERSE** has been added.

The date function **MONTHS_BETWEEN** has been added.

Object

Audit Policy

Audit policy object which can audit SQL performance has been added.

Global Temporary Table

Global temporary table which is a temporary table depending on the session has been added.

SQL Language

Parallel Processing of ANALYZE TABLE Statement

Parallel processing option has been added to **ANALYZE TABLE** statement.

Audit Policy DDL

The following DDLs which can control audit policy objects have been added.

- Creating audit policy
 - **CREATE AUDIT POLICY**
- Dropping audit policy
 - **DROP AUDIT POLICY**
- Altering audit policy
 - **ALTER AUDIT POLICY**
- Activating audit policy
 - **AUDIT POLICY**
- Deactivating audit policy
 - **NOAUDIT POLICY**
- Dropping audit trail
 - **ALTER DATABASE CLEAR AUDIT TRAIL**

User DDL

User's default index tablespace has been added.

- Creating a user
 - **CREATE USER**
- Altering a user
 - **ALTER USER**

Table DDL

The following DDLs which alters the table object have been added.

- Altering the name of the table constraints
 - **ALTER TABLE name RENAME CONSTRAINT**
- Altering the table properties
 - **ALTER TABLE name READ { ONLY | WRITE }**
- Altering the specific shard name of a table in a cluster environment
 - **ALTER TABLE name RENAME SHARD**

DDL creating **global temporary table** has been added.

Index DDL

The following DDL altering an index object has been added.

- Altering the index name

- **ALTER INDEX name RENAME TO**

Cluster System DDL

The following DDL altering a cluster system object has been added.

- Assigning an irrecoverable cluster member
 - **ALTER SYSTEM IRRECOVERABLE CLUSTER MEMBER**

System DCL

The following DCL controlling a system object has been added.

- Setting the reconnection of a session using GLOBAL CONNECTION
 - **ALTER SYSTEM RECONNECT GLOBAL CONNECTION**

API

ODBC

odbc.ini

LOCATOR_SERVICE and PACKET_COMPRESSION_THRESHOLD have been added to **odbc.ini file** as a data source name keyword.

ALTERNATE_LOCATORS and CONNECTION_TIMEOUT have been added as a location keyword.

GLOBAL CONNECTION

It supports **global connection**.

Statement Attributes

SQL_ATTR_FETCH_FAILOVER has been added to the statement property values.

JDBC

Connection Property

packet_compression_threshold has been added to **connection property**.

Embedded SQL

EXEC SQL GET GROUPID INTO statement has been added.

PDO

PDO driver which can access GOLDBLOCKS from PDO has been added from Venus 3.2 version.

PyDBC

PyDBC which is API for python language is provided from Venus 3.2 version.

Ruby

Ruby driver which is API for ruby language is provided from Venus 3.2 version.

Hibernate

The source which can interwork with **hibernate**, Java ORM framework, is provided from Venus 3.2 version.

Utility

gcreatedb

It has not been changed.

glsnr

It has not been changed.

gsq/gsqnet

DDL Output of an Audit Policy Object

`\ddl_audit_policy`, an interactive command, has been added to output DDL of an audit object.

SET HEADING {ON | OFF}

`\set heading` has been added to set whether to output the header in the query result.

gloader/gloadernet

WHERE Clause

The following conditional clauses can be set in an export (data download).

- `WHERE`
- `--where`

--group-id

gloader command argument `--group-id` has been added.

--directio-size

gloader command argument `--directio-size` has been added.

gdump

It has not been changed.

tablediff

It has not been changed.

gsyncher

It has not been changed.

gmon

It has not been changed.

gtrclogger

It has not been changed.

glocator

Configuration

ALTERNATE_LOCATORS has been added as a configuration keyword which is related to the replication.

Argument

--sync option has been added to an argument.

gagent

Configuration

ALTERNATE_LOCATORS has been added as a configuration keyword.

gloctl

Configuration

Configuration file which sets the driving environment of gloctl has been added.

conf option which assigns the configuration file has been added.

--dsn

dsn option of when driving gloctl is deleted.

Replication

cyclone

Recovery function has been added.

Operating CYCLONE in Cluster function has been added.

Database supporting the slave supports **ORACLE_DRIVER** as well as **GOLDILOCKS**.

Executing options of the standalone have been added.

Local **executing options** have been added.

logmirror

It has not been changed.

cymon

It has not been changed.

4.3 Patch Notes

3.2.14 Patch Note

ISSUE-6253 It supports the property to use the normal page when it fails to allocate the shared memory using the large page.

Description

It supports `USE_LARGE_PAGES` property. This property allows to use the normal page and the large page when allocating the shared memory. This property also allows to allocate the shared memory using the normal page when it fails to allocate the shared memory using the large page.

Workaround

The patch is required.

3.2.13 Patch Note

ISSUE-5862 If the connection object is shared in the multi-thread program of JDBC, the deadlock occurs.

Description

If the connection object is shared and used in the multi-thread program, the deadlock occurs.

Workaround

Create each different connection object per the thread, and use them.

3.2.12 Patch Note

ISSUE-4362 It is abnormally terminated because cserver refers to the freed memory in the cluster.

Description

If executing another dml after freeing the memory used in c server session when the remote member performs dml in the cluster, then it is abnormally terminated. It is because it uses the freed memory, and this is a bug, but this error has been fixed.

3.2.11 Patch Note

ISSUE-3869 The result of row status is wrong when executing array fetch in ODBC.

Description

When executing array fetch in ODBC, the status value of the row can be seen after calling SQLFetch function. If the returned value of SQLFetch is not SQL_SUCCESS, then it is required to check the row status or the diagnostic.

However, even when the returned value of `SQLFetch` is `SQL_SUCCESS_WITH_INFO`, the diagnostic message is seen but all row statuses are `SQL_ROW_SUCCESS`, which are wrong.

Symptom

The following is the string data which can not be converted to number.

```
CREATE TABLE T1 ( I1 VARCHAR(10) );
INSERT INTO T1 VALUES ( '1' );
INSERT INTO T1 VALUES ( '2A' );
INSERT INTO T1 VALUES ( '3' );
INSERT INTO T1 VALUES ( 'AB' );
COMMIT;
```

The following is a part of an example of executing array fetch after converting the data above to the numeric type.

```
sRet = SQLPrepare( sStmt,
                  (SQLCHAR*)"SELECT I1 FROM T1 ORDER BY I1",
                  SQL_NTS );
sRet = SQLBindCol( sStmt,
```

```

        1,
        SQL_C_LONG,
        sI1,
        sizeof(SQLINTEGER),
        sI1Ind );

sRet = SQLSetStmtAttr( sStmt,
                      SQL_ATTR_ROW_BIND_TYPE,
                      (SQLPOINTER)SQL_BIND_BY_COLUMN,
                      0 );

sRet = SQLSetStmtAttr( sStmt,
                      SQL_ATTR_ROW_STATUS_PTR,
                      sRowStatus,
                      0 );

sRet = SQLExecute( sStmt );
sRet = SQLFetch( sStmt );
switch( sRet )
{
    case SQL_SUCCESS_WITH_INFO:
        for( i = 0; i < sFetched; i++ )
            printf( "row status: %d\n", sRowStatus[i]);
        break;
    default
        break;
}

```

The data can not be converted to number is included, but all row statuses are SQL_ROW_SUCCESS.

```

row status: 0
row status: 0
row status: 0
row status: 0

```

Workaround

The patch is required.

ISSUE-3534 gagent does not shutdown the server, but the server is terminated by itself during the cluster failover process.

Description

If gagent receives the non-viability result during the cluster failover process, then gagent used to shutdown the server by executing SHUTDOWN ABORT. However it has been changed so the server is terminated by itself.

ISSUE-3534 glocator is changed to transfer the result only to gagent which enquired while processing the cluster failover.

Description

glocator transfers the failover result not only to gagent which enquired but also to another gagent which is a failover target, during the cluster failover process. However, in this case, gagent which is a failover target also transfers a query to glocator to process the cluster failover. Therefore, glocator is changed to transfer the result only to gagent which enquired.

ISSUE-3314 When registerOutParameter() and set..() which are the method of CallableStatement in JDBC are used in the same parameter, then the normal value can not be get.

Description

A bind type is set to INPUT OUTPUT by using registerOutParameter() method and set...() method to get the out parameter value by calling the procedure whose bind type is not clear by using CallableStatement. Then, it does not return the normal value when calling get...() method to get the result value of the out parameter.

Symptom

Create a table and a procedure as follows.

```
CREATE TABLE PROC_TABLE ( I1 INTEGER );
INSERT INTO PROC_TABLE VALUES ( 1 );
INSERT INTO PROC_TABLE VALUES ( 2 );
INSERT INTO PROC_TABLE VALUES ( 3 );
INSERT INTO PROC_TABLE VALUES ( 4 );
INSERT INTO PROC_TABLE VALUES ( 5 );
```

```

INSERT INTO PROC_TABLE VALUES ( 6 );
COMMIT;
CREATE OR REPLACE PROCEDURE PROC_TEST_1( A1 INTEGER, A2 OUT INTEGER )
IS
BEGIN
    SELECT COUNT(*)
        INTO A2
        FROM PROC_TABLE
        WHERE I1 >= A1;
END;
/

```

The following is a result of calling the procedure PROC_TEST_1 in gsql. The result value is stored in the out value of the second parameter.

```

gSQL> var v1 integer
gSQL> var v2 integer
gSQL> exec :v1 := 1
gSQL> call proc_test_1 (:v1,:v2);
Procedure Call complete.
gSQL> print

```

NAME	VALUE
VAR_ELAPSED_TIME__	null
V1	1
V2	6

```

gSQL>

```

The following is a part of the program code, calling procedure PROC_TEST_1.

```

CallableStatement sCstmt = aCon.prepareCall( "CALL PROC_TEST_1( ?, ? )" );
sCstmt.setInt( 1, 1 );
sCstmt.setInt( 2, 1 );
sCstmt.registerOutParameter( 1, Types.INTEGER );
sCstmt.registerOutParameter( 2, Types.INTEGER );
sCstmt.execute();
System.out.println("OUTPUT: " + sCstmt.getInt(1) + ", " + sCstmt.getInt(2) );
sCstmt.close();

```

When executing the program, then the out parameter value is stored in the first parameter as follows instead of the second parameter.

OUTPUT: 6, 0

Workaround

Make sure the input, output types as follows, and avoid using set method neither registerOutParameter method above, then the normal result is output.

```
CallableStatement sCstmt = aCon.prepareCall( "CALL PROC_TEST_1( ?, ? )" );
sCstmt.setInt( 1, 1 );
sCstmt.registerOutParameter( 2, Types.INTEGER );
sCstmt.execute();
System.out.println("OUTPUT: " + sCstmt.getInt(1) + ", " + sCstmt.getInt(2) );
sCstmt.close();
```

OUTPUT: 1, 6

ISSUE-3302 An error occurs when executing getBytes() method which is the method of CallableStatement in JDBC.

Description

When the out parameter type in CallableStatement is either BINARY, VARBINARY or LONG VARBINARY, then using getBytes() method causes an error.

Symptom

The following is an example of registering the out parameter as Types.BINARY in CallableStatement.

```
CallableStatement sCstmt = aCon.prepareCall( "BEGIN ? := x'aaff'; END; " );
sCstmt.registerOutParameter(1, java.sql.Types.BINARY);
sCstmt.executeUpdate();
byte[] sValue = sCstmt.getBytes(1);
```

When executing the program containing the codes above, then an error occurs.

```
Exception in thread "main" java.lang.ArrayIndexOutOfBoundsException: -1
    at indep.jdbc.dt.RowCache.readBytes(RowCache.java:637)
    at indep.jdbc.dt.Column.getBytes(Column.java:589)
    at indep.jdbc.core.JdbcCallableStatement.getBytes(JdbcCallableStatement.java:316)
```

Workaround

The patch is required.

gloader command argument *--group-id* has been added.

Description

--group-id argument uploads the data in the sharded table by group in the cluster environment.

gloader command argument *--directio-size* has been added.

Description

--directio-size argument is used to modify the direct IO size.

3.2.10 Patch Note

ISSUE-3253 When recovering the offline tablespace during the service, then it does not recover the log written on the log buffer.

Description

When switching the offline tablespace in GOLDILOCKS to online, it may requires the recovery or may not. The recovery is required when *IMMEDIATE* option is used in the offline statement, or when that tablespace was shifted to offline due to an error occurred in the data file during the operation. In this case, the log about that tablespace may remain in the buffer, but the recovery is performed only with the logs written on the log file, so the system can be abnormally terminated or the database becomes inconsistent.

Symptom

It creates the table T1 in the tablespace created by a user, then deletes the datafile and creates the checkpoint while the transaction TX1 updates T1. If the datafile does not exists while performing the checkpoint, then it shifts that tablespace to offline, then rolls back the transaction TX1. Moreover, if recovering the offline tablespace and shifting to online when the log in the log buffer is not written on the disk yet, then it is abnormally terminated.

Workaround

The patch is required.

ISSUE-3222 When GOLDDLOCKS system process in the cluster environment hangs up, then the entire system stops.

Description

If the GOLDDLOCKS system process of the remote cluster member hangs up, so it can not transfer the respond when waiting for the response after transferring the protocol to the remote cluster member in the cluster environment, then not only the session waiting for the response but also the entire system stops. It happens because the query timeout or the session status is not checked for the protocol which should receive the respond within GOLDDLOCKS. This error has been fixed by terminating the session which does not responds within the specified time or by making the remote cluster member which does not responds to be failover then proceeding the service.

When using the policy terminating the session, it waits for the time (seconds) specified in **CLUSTER_PROTOCOL_SESSION_FATAL_POLICY_TIMEOUT**, then terminates the session. However, when using the failover policy, it waits for the time (seconds) specified in **CLUSTER_PROTOCOL_FAILOVER_POLICY_TIMEOUT**, then it makes the remote cluster member which does not responds to be failover.

Symptom

When committing in the session connected to G1N1 after making the commit server of G1N2 member in an 1 by 2 cluster which consists of G1N1, G1N2 to hang up, then the session can not receive the response so stops.

When performing *ALTER SYSTEM SWITCH LOGFILE* in the session connected to G1N1 after making the master of G1N2 member to hangup, then the session can not receive the response and stops.

Workaround

The patch is required.

ISSUE-3175 gpec can not process the annotation in #define statement.

Description

If an annotation exists in #define statements, then gpec can not process it.

Symptom

The macro AA in the following gc file should be same, which is 1. However, gpec can not process the annotation in the macro, so it is processed wrong. If gpec processes the following gc file, then the warning message is output.

```
#define AA 1 /* comment */
#define AA 1
```

```
ERR-42000(41028): 'AA' macro is already defined at line 3, in file test.gc
```

Workaround

The patch is required.

ISSUE-3175 gpec can not process define statement normally in #if, #else.

Description

If #define is used between #if and #endif or between #else and #endif, the gpec can not normally process it.

Symptom

If #define which belongs to the false condition exists between #if and #endif or between #else and #endif, the gpec should not process it, but it actually processes it.

gpec should not process *#define AA 2* which is the false condition in the following gc file, but actually gpec does not ignore it instead processes it so that an error occurs.

```
#if 1
#define AA 1
#else
#define AA 2
#endif
```

```
ERR-42000(41028): 'AA' macro is already defined at line 4, in file test.gc
```

Workaround

The patch is required.

ISSUE-3175 The number #define statements which are processed by gpec is fixed.

Description

The number of #define statements managed by gpec is fixed into 256, and if it exceeds 256, then an error occurs.

Symptom

If the number of each different #define statements in the gc file exceed 256, then the following error occurs.

```
ERR-42000(41000): syntax error at line 258, in file test.gc
ERR-42000(41027): too many 'define' macro (256)
```

Workaround

The patch is required.

ISSUE-3175 gpec can not process the empty bracket annotation normally.

Description

If the bracket annotation containing any contents comes next to the empty bracket annotation such as /* */, then gpec can not parsing it normally.

Symptom

An empty bracket annotation and an ordinary bracket annotation are used together in the following gc file.

```
/**/
EXEC SQL BEGIN DECLARE SECTION;
int value;
EXEC SQL END DECLARE SECTION;
/* comment */
EXEC SQL SELECT 1 INTO :value FROM DUAL;
```

If gpec parses this gc file, then the following error occurs during the progress.

```
ERR-42000(41000): syntax error at line 8, in file a.gc:
```

```
SELECT 1 INTO :value FROM DUAL;
```

```
          ^  ^
```

```
Error at line 1
```

```
ERR-42000(41002): Host variable "value" not declared
```

```
ERR-42000(41006): Fatal error while doing embedded SQL precompiling
```

Workaround

Do not use an empty bracket annotation.

ISSUE-3243 When glsnr receives the wrong protocol it is terminated.

Description

When glsnr receives the wrong protocol, then it is terminated, and this error has been fixed. After the modification glsnr is not terminated though the following log message is output.

```
2020-01-15 17:57:51.835036 THREAD(27742,139777341413120)]
```

```
[LISTENER] Invalid communication protocol : 192.168.0.123
```

Symptom

When glsnr receives the wrong protocol, glsnr outputs the following log message then is terminated.

```
[2020-01-15 11:14:28.738666 THREAD(5706,140285308184384)]
```

```
[LISTENER] abnormally terminated
```

```
ERR-08S01(24001): Invalid communication protocol
```

Workaround

The patch is required.

ISSUE-3174 LOCALITY_GROUP_POLICY, LOCALITY_GROUP_PATH, LOCALITY_MEMBER_POLICY, LOCALITY_MEMBER_PATH have been added to ODBC properties.

Description

The followings have been added to ODBC properties.

- LOCALITY_GROUP_POLICY

- LOCALITY_GROUP_PATH
- LOCALITY_MEMBER_POLICY
- LOCALITY_MEMBER_PATH

ISSUE-3220 When multiple subquery conditions exists for more than three joins, some subquery conditions are omitted

Description

If two or more subquery conditions exist when joining three more more tables, then the location in which the subquery conditions are processes is determined. (push-down subquery filter)

In this case, if the first subquery condition is placed at the lowest table, and the second subquery condition is placed at the upper join, then the first subquery condition is omitted.

Symptom

Create the table and the data as follows.

```
CREATE TABLE r ( r_c1 INTEGER,
                  r_c2 INTEGER );
COMMIT;
CREATE TABLE s ( s_c1 INTEGER,
                  s_c2 INTEGER );
COMMIT;
CREATE TABLE t ( t_c1 INTEGER,
                  t_c2 INTEGER );
COMMIT;
CREATE TABLE u ( u_c1 INTEGER,
                  u_c2 INTEGER );
COMMIT;
CREATE TABLE v ( v_c1 INTEGER,
                  v_c2 INTEGER );
COMMIT;
INSERT INTO r VALUES ( 1, 1 );
INSERT INTO s VALUES ( 1, 1 );
INSERT INTO t VALUES ( 1, 1 );
INSERT INTO u VALUES ( 1, 1 );
INSERT INTO v VALUES ( 1, 1 );
COMMIT;
```

If *EXISTS* condition exists like as the following query, then the result satisfying the condition does not exist

t.

```

SELECT
    *
FROM r,
    s,
    t
WHERE r_c1 = s_c1
    AND s_c1 = t_c1
    AND EXISTS (
        SELECT u_c1
        FROM u
        GROUP BY u_c1
        HAVING u_c1 < 0
    )
;
no rows selected.

```

However, if *AND NOT EXISTS* subquery condition is inserted to the query above as follows, then the wrong query result is created.

```

--# wrong result
SELECT
    *
FROM r,
    s,
    t
WHERE r_c1 = s_c1
    AND s_c1 = t_c1
    AND EXISTS (
        SELECT u_c1
        FROM u
        GROUP BY u_c1
        HAVING u_c1 < 0
    )
    AND NOT EXISTS ( SELECT *
                     FROM v
                     WHERE v_c1 = r_c1 + s_c1 )
;
R_C1 R_C2 S_C1 S_C2 T_C1 T_C2
-----

```

```

1      1      1      1      1      1
1 row selected.

```

Workaround

Insert *NO_PUSH_SUBQ* hint to *NOT EXISTS* subquery as follows, then the correct result is obtained.

```

SELECT
    *
FROM r,
    s,
    t
WHERE r_c1 = s_c1
    AND s_c1 = t_c1
    AND EXISTS (
        SELECT u_c1
        FROM u
        GROUP BY u_c1
        HAVING u_c1 < 0
    )
    AND NOT EXISTS ( SELECT /*+ NO_PUSH_SUBQ */ *
        FROM v
        WHERE v_c1 = r_c1 + s_c1 )
;
no rows selected.

```

ISSUE-3199 It can not be processed normally when obtaining GroupId in array in EmbeddedSQL.

Description

The program is abnormally terminated when obtaining GroupId in array then executing the cached SQL statement again.

Symptom

```

EXEC SQL BEGIN DECLARE SECTION;
int sGroupId[5];
int sValue[5];
EXEC SQL END DECLARE SECTION;
int i;

```

```

for( i = 0; i < 5; i++ ) {
    sValue[i] = i;
}
EXEC SQL GET GROUPID INTO: sGroupId
        INSERT INTO TEST_T1 VALUES( :sValue );
EXEC SQL
        INSERT INTO TEST_T1 VALUES( :sValue );

```

The program is abnormally terminated if performing the cached *INSERT INTO TEST_T1 VALUES(:sValue)* statement again.

Workaround

Do not use an array, otherwise alter the host variable not to use the cached SQL statement.

ISSUE-3197 gpec can not process < ... > string normally.

Description

If < > exists on the same line, then gpec can not parsing it normally.

Symptom

```

for( i = 0; i < 5; i++ ) { // > COMMENT
    sValue[i] = i;
}

```

It can not process < 5; i++) { // > string normally, so an error occurs when performing gpec.

Workaround

Write the gc file by relocating the bracket or the comment as follows.

```

for( i = 0; i < 5; i++ ) // > COMMENT
{
    sValue[i] = i;
}

```

```

for( i = 0; i < 5; i++ ) {
// > COMMENT
sValue[i] = i;
}

```

3.2.9 Patch Note

ISSUE-3188 `set heading` has been added in `gsqL`.

Description

It can be set whether to output the header in the query result by using `set heading {on|off}`.

3.2.8 Patch Note

ISSUE-3175 `gpec` can not process a non-ascii character.

Description

When `gpec` processes the preprocessor whose `#if`, `#ifdef`, `#elif` and `#else` are false groups, the contents in the group are converted into whitespaces. However, a non-ascii character in the false group is not converted into a whitespace.

Symptom

```
#if 0
    EXEC SQL INSERT INTO TEST_T1 VALUES( :sC1, :sC2 ); -- 주석
#endif
```

When `gpec` processes the example above, then all contents should be converted into whitespaces, but a non-ascii character remains the same.

```
주석
```

Workaround

Process a non-ascii character in a form of c annotation.

ISSUE-2958 The group ID of the SQL statement can be obtained in the embedded SQL.

Description

It obtains the the group ID of the delete/ insert/ select/ update statement in the table in which the shard key is set, in the cluster environment which uses the global connection. For more information, refer to `EXEC SQL GET GROUPID INTO`.

ISSUE-3186 When two nodes are abnormally terminated at a time, then a hang may occur during the failover.

Description

When a domain coordinator node and a global coordinator node are abnormally terminated at a time, then a hang may occur during the failover, and this error has been fixed.

Symptom

A hang may occur during the failover, then the online transaction service of the groups to which the abnormally terminated nodes belong may stop operating.

Workaround

The patch is required.

3.2.7 Patch Note

ISSUE-3093 An error occurs while gpec parses the preprocessor `#define`.

Description

An error occurs when C reserved word comes to the alternative string of the preprocessor `#define`.

Symptom

```
#define SQLCA_STORAGE_CLASS extern
```

A parsing error occurs when executing gpec.

```
$ gpec test.gc
FileName: test.gc
Pre-compile test.gc -> test.c
```

```
ERR-42000(41000): syntax error at line 1, in file test.gc:
#define SQLCA_STORAGE_CLASS extern
.....^
Error at line 1, in file test.gc
```

Workaround

Define the keyword in an ordinary header file which does not execute gpec.

3.2.6 Patch Note

ISSUE-3149 gpec can not parse the file normally which uses a structure array in SELECT INTO statement.

Description

gpec can not process the gc file normally which uses a structure array as a host variable in SELECT INTO statement.

Symptom

```
EXEC SQL BEGIN DECLARE SECTION;
typedef struct AA
{
    char c1[10+1];
    char c2[10+1];
    char c3[10+1];
    char c4[10+1];
} AA;
AA sArr[10];
EXEC SQL END DECLARE SECTION;
EXEC SQL SELECT c1,c2,c3, c4
        INTO :sArr FROM EMP;
STL_TRY(sqlca.sqlcode == 0);
```

SELECT INTO statement in the example above is altered to the following incorrect statement.

```
sqlargs.sqlstmt = (char *)"SELECT c1,c2,c3,c4\n"
"    INTO :sArr ?, ?FROM EMP\n"
```

Workaround

The patch is required.

ISSUE-3145 SSA is increasing due to allocating the new memory even though the available memory exists in the session.

Description

The memories used after the session is started can be reused, and it is managed into multiple levels according to its size for an efficient memory allocation for the memory fragment. However, the new memory chunk is allocated when reallocating the released memory instead of the memory which is available to be reallocated to minimize the fragment, then it continuously increases SSA, and this error has been fixed.

Symptom

When viewing V\$SYSTEM_MEM_STAT while retrieving the table which includes LONG VARBINARY type, it can be viewed that VARIABLE_STATIC_ALLOC_SIZE is continuously increasing.

```
gSQL> SELECT STAT_NAME, ROUND(STAT_VALUE/1024/1024) FROM V$SYSTEM_MEM_STAT WHERE STAT_NAME =
'VARIABLE_STATIC_ALLOC_SIZE';
```

```
STAT_NAME                                ROUND(STAT_VALUE/1024/1024)
```

```
-----
```

VARIABLE_STATIC_ALLOC_SIZE	1800.25
----------------------------	---------

1 row selected.

```
gSQL> SELECT STAT_NAME, ROUND(STAT_VALUE/1024/1024) FROM V$SYSTEM_MEM_STAT WHERE STAT_NAME =
'VARIABLE_STATIC_ALLOC_SIZE';
```

```
STAT_NAME                                ROUND(STAT_VALUE/1024/1024)
```

```
-----
```

VARIABLE_STATIC_ALLOC_SIZE	3663.41
----------------------------	---------

1 row selected.

Workaround

The patch is required.

ISSUE-3144 gloder can not import the data normally when the first character of the field delimiter and that of the line terminator are the same.

Description

If the first character of the field delimiter and that of the line terminator are the same, then the data may be missing or gloder process may be abnormally terminated.

Symptom

```
>$ cat test.dat
1234^C2^C3456^S
>$ gloder test test -i --tablename TEST --fieldterm ^C --lineterm ^R\n --data test.dat
gSQL> SELECT * FROM TEST
I1    I2 I3
-----
1234  C2 3456S
1 row selected.
```

The first character of the field delimiter and that of the line terminator are the same, which is ^. The correct result value of the column I3 when gloder imported the data is supposed to be 3456^S, but the actual value is an incorrect value in which ^ is missing.

Workaround

Use different characters for the first character of the field delimiter and that of the line terminator each other.

3.2.5 Patch Note

ISSUE-3093 gpec can process #define and #undef only when they were declared in the declare section. Also, it does not alter the statement about the false value of *if group* such as #ifdef into a white space.

Description

gpec processed #define and #undef which were declared in the declare section, so it can not process the macro in the if group such as #if, #ifdef. Also it does not alter the c code of the *if group* which correspond

ds to the false value into a white space, so preprocessor is not available in the middle of the c code or the SQL statement.

Symptom

If preprocessors `#define` and `#undef` are not declared in the declare section, then gpec can not recognize the corresponding macro because it could not process `#define` and `#undef`. A user should repeatedly write the same contents because it can not use SQL the preprocessor corresponding to the *if group* in the middle of SQL.

```
#define _DEV_
EXEC SQL BEGIN DECLARE SECTION;
char
#ifdef _DEV_           ❶
sTrue[10];           ❷
#else
sFalse[10];
#endif
EXEC SQL END DECLARE SECTION;
EXEC SQL SELECT       ❸
#ifdef _DEV_
    "true" INTO :sTrue
#else
    "false" INTO :sFalse
#endif
FROM DUAL;
```

Note

- ❶ It is false because `_DEV_` is declared outside of the declare section.
- ❷ The preprocessor is not processed as a white space, so gpec processes it as a parsing error.
- ❸ An error occurs during parsing the SQL statement.

Workaround

Declare the preprocessors `#define` and `#undef` in the declare section, and do not use preprocessors in the middle of the c code and the SQL statement.

ISSUE-3075 An error occurs because the data type is changed when repeatedly executing `PreparedStatement.setCharacterStream(int, Reader, int)` method and `PreparedStatement.addBatch()` method in JDBC

Description

The data type was determined by using the parameter length when executing `PreparedStatement` class method of JDBC such as `setAsciiStream()`, `setBinaryStream()`, `setCharacterStream()` methods, and it has been changed to use only the long data type.

Symptom

When calling `addBatch()` method after setting the data of the length which was allowed for the `VARCHAR` type by `setCharacterStream()` method, and trying to set the data which exceeds the length which was allowed for the `VARCHAR` by `setCharacterStream()` method, then the data type is changed from `VARCHAR` to `LONG VARCHAR`, which is an error.

```
gSQL> create table t1 ( i1 long varchar );
Table created.
```

```
sPstmt.setCharacterStream( 1, new StringReader( DATA ), DATA.length() );
sPstmt.addBatch();
sPstmt.setCharacterStream( 2, new StringReader(BIG_DATA), BIG_DATA.length() );
sPstmt.addBatch();
```

Caused by: `java.sql.SQLException: Parameter type[LONG VARCHAR] is mismatch with previous type[VARCHAR] during batch`

Workaround

`setAscii/ Binary/ Character Stream()` methods of `PreparedStatement` class have two methods, which are the method with the parameter length and the method without the parameter length. Use the method without the parameter length among them.

ISSUE-3056 Characters which returns `TRUE/ FALSE` when performing `ResultSet.getBoolean()` in JDBC have been diversified.

Description

Previously, only "true", "false" character strings could be converted into boolean type when `ResultSet.getBoolean()` in JDBC, but "t", "f", "y", "n", "yes", "no", "on", "off", "1" and "0" characters can also be converted.

ed into boolean type now.

Symptom

When reading "0" and "1" with `ResultSet.getBoolean()`, then an error occurs.

```
gSQL> create table t1 ( i1 varchar(10) );
Table created.
gSQL> insert into t1 values ( '1' );
1 row created.
gSQL> commit;
Commit complete.
```

```
ResultSet rs = stmt.executeQuery("select * from t1");

while(rs.next())
{
    System.out.println( rs.getBoolean(1) );
}
```

```
Exception in thread "main" java.sql.SQLException: The value[1] is out of range of [boolean]
type
```

Workaround

The patch is required.

ISSUE-3055 Transferring an invalid character when connecting server and client whose character sets are different each other

Description

It transfers an invalid character when connecting server and client whose character sets are different each other, and this error has been fixed.

Symptom

The user "가" is created in Linux server.

```
gSQL> create user "가" identified by test;
User created.
gSQL> grant create session to "가";
```

```
Grant succeeded.
gSQL> commit;
Commit complete.
```

An error occurs when connecting from Windows client to Linux server.

```
D:\goldilocks_home\bin>gsqlnet.exe "가" test
ERR-28000(16004): invalid username/password; logon denied
```

It is operated normally when connecting from Linux client to Linux server.

```
% gsqlnet "가" test
gSQL>
```

Workaround

Either set character sets in the server and that in the client same, or include only ASCII in a string which is used for the connection.

ISSUE-2359 cluster peer without a parent session

Description

A cluster peer without a parent session exists in a remote node, and this error has been fixed.

Symptom

When an error occurs while altering password when a parent session tries to login, then a cluster peer without a parent session may exist in a remote node

A cluster peer session may be created in a remote node while altering password, and if it fails to alter the password then the parent session is terminated without terminating the cluster peer session.

Workaround

The patch is required.

3.2.4 Patch Note

ISSUE-3026 Altering the location of AT statement when performing \ddl_tablespace in gsql

Description

AT statement is located in a wrong position when performing \ddl_tablespace in gsql, and this error has been fixed.

Symptom

An error occurs when performing SQL statement which is created with \ddl_tablespace.

```
gSQL> create tablespace test_tbs datafile 'test.dbf' size 10m;
Tablespace created.
gSQL> \ddl_tablespace test_tbs
SET SESSION AUTHORIZATION "SYS";
CREATE MEMORY DATA TABLESPACE "TEST_TBS"
    DATAFILE
        '/home/sunje/goldilocks_data/db/test.dbf'
        AT "G2N1"
        SIZE 10485760 REUSE
    ,
        '/home/sunje/goldilocks_data/db/test.dbf'
        AT "G2N2"
        SIZE 10485760 REUSE
    ONLINE
    LOGGING
    EXTSIZE 262144
;
COMMIT;
```

```
gSQL> CREATE MEMORY DATA TABLESPACE "TEST_TBS"
    DATAFILE
        '/home/sunje/goldilocks_data/db/test.dbf'
        AT "G2N1"
        SIZE 10485760 REUSE
    ,
        '/home/sunje/goldilocks_data/db/test.dbf'
        AT "G2N2"
        SIZE 10485760 REUSE
    ONLINE
```

```

LOGGING
EXTSIZE 262144;
ERR-42000(40000): syntax error:
      AT "G2N1"
      ^^
Error at line 4

```

Workaround

Alter the location of AT statement in SQL which is created with \ddl_tablespace.

```

gSQL> CREATE MEMORY DATA TABLESPACE "TEST_TBS"
DATAFILE
      '/home/sunje/goldilocks_data/db/test.dbf'
      SIZE 10485760 REUSE
      AT "G2N1"
,
      '/home/sunje/goldilocks_data/db/test.dbf'
      SIZE 10485760 REUSE
      AT "G2N2"
ONLINE      LOGGING
EXTSIZE 262144;
Tablespace created.

```

ISSUE-3023 BEGIN BACKUP AT DOMAIN error

Description

It is not normally operated when using AT DOMAIN clause to backup only within a specific group or a member, and this error has been fixed.

Symptom

BEGIN BACKUP fails even when the member G1N2 is being operated with ARCHIVELOG as follows.

```

gSQL> SELECT ARCHIVELOG_MODE FROM V$ARCHIVELOG;
ARCHIVELOG_MODE
-----
ARCHIVELOG
1 row selected.
gSQL> ALTER DATABASE BEGIN BACKUP AT G1N2;
ERR-HY000(16247): MEMBER(G1N1): cannot BACKUP; noarchive mode

```

Workaround

Perform BACKUP BEGIN/ END without using AT DOMAIN.

3.2.3 Patch Note

ISSUE-3006 A transaction is created when performing EXPLAIN PLAN ONLY

Description

A transaction is created when performing EXPLAIN PLAN ONLY, and this error has been fixed.

Symptom

```
gSQL> select * from x$transaction;
no rows selected.
gSQL> \explain plan only update t2 set c2 = 1 where c1 = 10;
>>> start print plan
< Execution Plan >

=====
====

1 row selected.
gSQL> commit;
Commit complete.
gSQL> select * from x$transaction;
no rows selected.

```

Workaround

The patch is required.

3.2.2 Patch Note

ISSUE-2947 The previous version data of a remote group which was executed in the same session is retrieved in cluster environment.

Description

If selecting after executing a domain transaction which is updatable only in a specific remote group of a session, then the previous version data is retrieved, and this error has been fixed.

Symptom

Add a record to a shard in G1 after creating a sharded table in cluster groups G1, G2 as follows.

```

gSQL> CREATE TABLE T1 ( C1 NUMBER ) SHARDING BY RANGE ( C1 )
SHARD S1 VALUES LESS THAN ( 1000 ) AT CLUSTER GROUP G1,
SHARD S2 VALUES LESS THAN ( MAXVALUE ) AT CLUSTER GROUP G2;
Table created.

```

```
gSQL> ALTER TABLE T1 ADD PRIMARY KEY ( C1 );
Table altered.
gSQL> INSERT INTO T1 VALUES ( 1 );
1 row created.
gSQL> COMMIT;
Commit complete.
```

Delete a record (transaction T1) of group G1 in a session (session 1) connected to a member of group G2, then execute a global transaction (transaction T2) in another session (session 2) and commit. When committing T1 and retrieving the record of G1, while T2 is completed in group G1 and is not completed in G2, then the deleted record is retrieved.

```
gSQL> DELETE FROM T1 WHERE C1 = 1;      // T1  -- session 1
1 row deleted.
gSQL> CREATE TABLE T2 ( I1 INTEGER );  // T2  -- session 2
Table created.
gSQL> COMMIT;                          // -- session 2
Commit complete.
gSQL> COMMIT;                          // -- session 1
Commit complete.
gSQL> SELECT * FROM T1 WHERE C1 = 1;    // -- session 1
C1
--
1
1 row selected.
```

Workaround

When selecting after executing a domain transaction in the same session, execute it by replacing SELECT statement with SELECT FOR UPDATE.

ISSUE-2965 Data is missing when BigDecimal types is used as a parameter in JDBC

Description

If the value exceeding the double type precision is used as a parameter in BigDecimal type, then the data is missing, and this error has been fixed.

Symptom

The data is missing without the user's intention.

```
gSQL> CREATE TABLE T1 ( C1 NUMBER );
Table created.
```

```
PreparedStatement pstmt = con.prepareStatement("INSERT INTO T1 VALUES (?)");
pstmt.setBigDecimal(1, new BigDecimal("12345678901234567890.123456789"));
pstmt.executeUpdate();
```

```
gSQL> select * from t1;

                C1
-----
12345678901234600000
1 row selected.
```

Workaround

Process it with a string instead of the BigDecimal type.

```
pstmt.setString(1, "12345678901234567890.123456789");
```

```
gSQL> \set numsize 40
gSQL> select * from t1;

                C1
-----
12345678901234567890.123456789
1 row selected.
```

ISSUE-2955 gsqlnet can not consecutively execute cstartup or cshutdo wn in cluster environment.

Description

gsqlnet builds the connecting information of a location file and glocator through ODBC.

This information is built when executing cstartup or cshutdown for the first time.

When executing cstartup or cshutdown for the second time, then it ignores the information construction process. However, the flag configuration is wrong, so an error occurs.

Symptom

An error occurs when gsqlnet process executes cstartup or cshutdown, then executes it again.

Workaround

Restart gsqlnet session and execute cstartup or cshutdown.

ISSUE-2943 agable scn does not increase when a query timeout occurs in cluster environment.

Description

When processing DML in async in a cluster environment, it sets the view scn information of remote members in a session. In this case, if an exception such as query timeout occurs when there is not any remote member to whom DML is successfully transferred, then the view scn information of remote members set in the session can not be initialized, and which is a bug. Therefore, the agable scn of the system does not increase while the session is connected even though the statement in progress does not exist in a system.

Therefore, it is fixed to initialize the view scn information of remote members when an exception occurs while processing an async to prevent an error.

Symptom

agable scn stops after a query timeout occurs in cluster environment, so the undo, data segments become insufficient.

Workaround

Terminate the session in which a query timeout occurred.

ISSUE-2927 Deadlock Due to the Lack of Transaction Slot

Description

A hang may occur due to the lack of transaction slots when all server processes allocate transaction slots and the transactions do not release slots. It is fixed to make an error on the corresponding patch when the specified time passed.

Symptom

A hang may occur due to the lack of transaction slots when multiple transactions simultaneously occur in multiple sessions.

Workaround

The patch is required.

ISSUE-2922 Adding SQL_ATTR_FETCH_FAILOVER to statement attribute in ODBC

Description

SQL_ATTR_FETCH_FAILOVER has been added to statement attribute in ODBC, and the following values can be set.

- SQL_FETCH_FAILOVER_OFF
- SQL_FETCH_FAILOVER_ON

```
SQLSetStmtAttr( stmt,
                SQL_ATTR_FETCH_FAILOVER,
                (SQLPOINTER)SQL_FETCH_FAILOVER_ON,
                0 )
```

Symptom

There is not any symptom.

Workaround

The patch is required.

ISSUE-2513 EXEC SQL AT :sConn DISCONNECT can not detect VARCHAR type

Description

gpec detects VARCHAR type as char type in EXEC SQL AT clause.

Symptom

When using VARCHAR type variable in EXEC SQL AT clause, gpec does not process it as VARCHAR type but processes it as char type.

- Example gc file

```
EXEC SQL BEGIN DECLARE SECTION;
VARCHAR sAT[20];
EXEC SQL END DECLARE SECTION;
EXEC SQL AT :sAT DISCONNECT;
```

- Example c file generated by gpec

```
sqlargs.conn = (char *)sAT;
sqlargs.sql_ca = &sqlca;
sqlargs.sql_state = SQLSTATE;
sqlargs.sqltype = 35;
sqlargs.sqlfn = (char *)__FILE__;
sqlargs.sqlln = __LINE__;
sqlargs.sqlstmt = NULL;
sqlargs.atomic = 0;
sqlargs.unsafenull = 0;
sqlargs.iters = 0;
DBESQL_Disconnect(NULL, &sqlargs, NULL, 0);
```

It processes VARCHAR type as char * type, so an error occurs when compiling a c file created by gpec.

Workaround

Use char type instead of VARCHAR type.

ISSUE-2349 When gpec processes a preprocessor, __LINE__ macro indicates the wrong line.

Description

When gpec processes a preprocessor such as #if, __LINE__ macro indicates the wrong line.

Symptom

When gpec processes a preprocessor such as #if, #ifdef, #ifndef, #else, #elif, a comment has been added so it leads to a wrong value unlike the intended __LINE__ macro value.

- Example gc file

```
#if 0
    printf("[%s:%d] if\n", __FILE__, __LINE__);
#else
```

```

    printf("[%s:%d] else\n", __FILE__, __LINE__);
#endif
    printf("[%s:%d] endif\n", __FILE__, __LINE__);

```

The following is a result of which gpec processes the code.

- Example c file generated by gpec

```

#if 0
/*Macro condition FALSE*/
    printf("[%s:%d] if\n", __FILE__, __LINE__);
#else
/*Macro condition TRUE*/
    printf("[%s:%d] else\n", __FILE__, __LINE__);
#endif
    printf("[%s:%d] endif\n", __FILE__, __LINE__);

```

If gpec executes the created c file, then unexpected line is output.

```

$ ./pp_bug
[pp_bug.gc:9] else
[pp_bug.gc:11] endif

```

The following is a normal __LINE__ macro value.

```

$ ./pp_bug
[pp_bug.gc:7] else
[pp_bug.gc:9] endif

```

Workaround

The patch is required.

3.2.1 Patch Note

ISSUE-2902 Deadlock When Referring to the Global Sequence Value in Cluster Environment

Description

A deadlock occurs while acquiring the global sequence latch for the entire cluster member to get the next value because the cached value in local members were run out when referring to the global sequence value in cluster environment.

Symptom

A hang occurs due to a deadlock when repeatedly performing a statement of which multiple sessions simultaneously refers to the global sequence.

Workaround

The patch is required.

Part II.

Administration Manual

5. Basic Management of GOLDILOCKS Database	219
5.1 Creating and Configuring GOLDILOCKS Database	220
Creating Database	220
Specifying Initial Property	221
Managing Initial Property Using GOLDILOCKS Configuration File	221
5.2 Starting up and Shutting down GOLDILOCKS Instance	223
Starting up Instance	223
Shutting down Instance	228
5.3 Managing Process	231
Master Process	231
Listener Process	236
5.4 Managing Memory	237
GOLDILOCKS Memory Architecture	237
Managing SSA	237
Managing PSA	238
5.5 Monitoring	239
Monitoring with Trace File	239
Monitoring Performance Using View	251
6. Structure and Storage Structure of GOLDILOCKS Database	253
6.1 Managing Control File	254
Control File Contents	254
Multiplexing Control File	256
Restoring Corrupted Control File	256
Control File Information	257
6.2 Managing Redo Log File	258
Redo Log File Structure	258
Redo Log Group and Its Member	259
Restoring Corrupted Redo Log File	260
Redo Log File Information	261
6.3 Managing Archive Redo Log File	262
Creating Archive Redo Log File	262
Maintaining and Dropping Archive Redo Log File	262
Multiplexing Archive Redo Log File Directory	263
6.4 Managing Tablespace	264
Tablespace Type	264
Managing Tablespace and Data File	264
6.5 Managing Data File	270
Data File Matching	270
Data File Information	271

5.

Basic Management of GOLDBLOCKS Database

5.1 Creating and Configuring GOLDDILOCKS Database

Creating Database

Create database using `gcreatedb` which is included in GOLDDILOCKS package. Before creating database, the followings should be considered.

Table 5-1 Considerations when creating database

Considerations	For more information, refer to
Consider the space size of tables and indexes to be used in database.	<ul style="list-style-type: none"> • Structure and Storage Structure of GOLDDILOCKS Database
Consider the location to create database files. It is because the database performance will be improved by properly distributing the files and dispersing the disk IO. For example, a user can allocate redo log file to a separate disk or stripe it, and then disperse data file into a number of disks, to execute a parallel disk IO operation.	<ul style="list-style-type: none"> • Managing Redo Log File
Be aware of each property's concepts and its operation which are set in server property file, then constantly manage them.	<ul style="list-style-type: none"> • Specifying Initial Property • Managing Initial Property Using GOLDDILOCKS Configuration File • Server Property

In addition to the above considerations, refer to **Creating Database** in **Getting Started** for more options to be considered when creating database.

A user should set environment variables to use GOLDDILOCKS, and the variables are `$GOLDDILOCKS_HOME` and `$GOLDDILOCKS_DATA`. The property file, *goldilock.properties.conf*, for creating and managing GOLDDILOCKS database is in *\$GOLDDILOCKS_DATA/conf*.

- `GOLDDILOCKS_HOME`: Binaries which are included in GOLDDILOCKS package are installed here, and it can be overwritten during software version upgrading (The license backup is required.)
- `GOLDDILOCKS_DATA`: Log file, data file, control file which are used by GOLDDILOCKS database are installed here, and it can not be overwritten.

Specifying Initial Property

A user can use properties to control the information for operation and management in GOLDBLOCKS.

Initial Property

Set the properties of when creating or starting the database as follows.

1. Setting system environment variable
 - I. Change it by typing in the command window in which GOLDBLOCKS is installed and database is created or operated.
 - II. It is necessary to add the prefix before the property name, and the prefix is *GOLDBLOCKS_*.
- The following is an example of changing SHARED_MEMORY_STATIC_SIZE to 100M.

```
export GOLDBLOCKS_SHARED_MEMORY_STATIC_SIZE=100M
```

2. Property file: The prefix is not required, so change it directly in the property file.

- The following is an example of changing SHARED_MEMORY_STATIC_SIZE to 200M.
- Shared memory static size (100M ~ 32G)

```
SHARED_MEMORY_STATIC_SIZE = 200M
```

Note

If the same property is set to system environment variable and property file, then the value of the property file will be applied. For example, if SHARED_MEMORY_STATIC_SIZE is set to 100M as the system environment variable, and SHARED_MEMORY_STATIC_SIZE is set to 200M as the property file, then SHARED_MEMORY_STATIC_SIZE will be applied to 200M when operating database.

Managing Initial Property Using GOLDBLOCKS Configuration File

Property file is in *\$GOLDBLOCKS_DATA/conf*, and is divided into two according to the file format.

- Text property file
 - File name: goldilocks.properties.conf

- It is "property name = value" format file, and a user can directly edit it.
- If a binary property file exists, it does not read text property file.
- Binary property file
 - It is created by the system, and a user can not edit it directly.
 - File name: goldilocks.properties.binary
 - Use gdump tool to retrieve the binary file's contents.

Note

If a text property file and a binary property file exist together, it reads the binary property file only. The text property file is not processed. This binary property file is managed by user SQL (ALTER SYSTEM SET), and can be edited using SQL only.

For information, refer to **ALTER SYSTEM SET property_name**, **ALTER SYSTEM RESET property_name**.

- Editing text property file
 - Use "PROPERTY_NAME = VALUE" format.
 - Use '#' for annotation.
 - Property has one of the following three data types.
 - Character data type: Use a single quote (') to set the character value. Use <GOLDBLOCKS_DATA> if the character value includes \$GOLDBLOCKS_DATA link.
 - Numeric data type: Do not use calculation for numeric data. For example, LOG_BUFFER_SIZE = 1024 * 1024 is not allowed to use. Its size is selectable accordingly such as K (kilobyte), M (megabyte), G (gigabyte), T (terabyte), and P (petabyte)
 - Boolean data type: Allowed to use ON/OFF, ENABLE/DISABLE, 1/0 and TRUE/FALSE, YES/NO.

5.2 Starting up and Shutting down GOLDDILOCKS Instance

This chapter describes starting up and shutting down of GOLDDILOCKS instance.

Starting up Instance

GOLDDILOCKS instance can be started only by a user with SYSDBA privilege.

GOLDDILOCKS instance can be started by using DA(Direct Attach) method and dedicated method of C/S(Client/Server). However, it can not be started by using shared method of C/S.

Multi-level Startup

GOLDDILOCKS has multi-level startup procedure. Multi-level startup procedure enables to change the database's state by the intervention of administrator in each phase.

The phases are idle, nomount, mount, open, and each phase has the following features.

Idle Phase

The idle phase is a state in which an instance is not started up.

If connecting to gsql when an instance is not started, then it will be connected to idle instance as follows. In this phase, any sever command can not be executed except for \startup.

```
% gsql sys gliese --as sysdba
Connected to an idle instance.
gSQL> select * from dual;
ERR-08003(40044): connection does not exist
gSQL>
```

- Administrator operations in idle phase
 - Adjusting the property required to start up the instance
 - Transition to nomount using \startup in gsql
- Operation in an instance at the nomount transition
 - Starting up gmaster which is a daemon managing GOLDDILOCKS instance
 - Starting up timer thread and cleanup thread in gmaster
 - Allocating and initializing Shared memory Static Area (SSA).

Table 5-2 Applied properties at the transition to nomount

Property name	Description
CLIENT_MAX_COUNT	Maximum number of connectable sessions
CONTROL_FILE_0 ~ 7	Path of control file
CONTROL_FILE_COUNT	The number of valid path among the path of control file
DATA_STORE_MODE	Store mode of GOLDDILOCKS instance
PLAN_CACHE_SIZE	Maximum size of shared memory for plan cache
PROCESS_MAX_COUNT	Maximum number of connectable process
SHARED_MEMORY_ADDRESS	Address of shared memory
SHARED_MEMORY_STATIC_NAME	Name of shared memory
SHARED_MEMORY_STATIC_KEY	Key value for creating shared memory
SHARED_MEMORY_STATIC_SIZE	Size of shared memory to be created
SYSTEM_LOGGER_DIR	Path of system logger

Properties can not be changed in idle phase. An administrator changes the properties as follows.

To use an environment variable, then set GOLDDILOCKS_[property_name] to a desired value and transit it to nomount. Then, the properties will be applied.

```
% export GOLDDILOCKS_CLIENT_MAX_COUNT=1000
```

To use 'SCOPE = FILE', record the property value to be changed in the file. The recorded property will be applied at nomount transition.

```
gSQL> alter system set client_max_count = 1000 scope = file;
System altered.
gSQL> \shutdown
Shutdown success
gSQL> \startup
Startup success
gSQL>
```

Nomount Phase

The nomount phase is a state in which it is not mounted to database, and only the gmaster process has been started. A gmaster is a daemon which manages GOLDDILOCKS instance.

The following describes how to transit idle phase to nomount phase.

```
% gsql sys gliese --as sysdba
Connected to an idle instance.
gSQL> \startup nomount
Startup success
```

gSQL>

- Administrator operations in nomount phase
 - Adjusting nomount property

◦ For more information, refer to **16.34 ALTER SYSTEM {MOUNT | OPEN} DATABASE, 16.**

21 ALTER DATABASE RESTORE.

- Operation in an instance at the mount transition
 - Loading the control file to database
 - Preparing for database recovery
 - Starting up threads in gmaster such as checkpoint, log flusher, page flusher, IO slave, archive log

Table 5-3 Updatable properties in nomount phase

Property name	Description
DATABASE_ACCESS_MODE	Database access mode (READ ONLY, READ WRITE)
LOG_BUFFER_SIZE	Redo log buffer size
PARALLEL_LOAD_FACTOR	The number of threads for parallel operations after loading database
PARALLEL_IO_FACTOR	The number of parallel threads for loading database
PARALLEL_IO_GROUP_1 ~ 16	Datafile group at parallel loading
PENDING_LOG_BUFFER_COUNT	The number of delayed log buffers
TRANSACTION_TABLE_SIZE	Transaction table size
UNDO_RELATION_COUNT	The number of undo relations

Mount Phase

The mount phase is a state in which it is mounted to database, and the database recognizes the control file. All sections in the control file is controllable in this phase.

The following describes how to transit nomount phase to mount phase.

```
% gsql sys gliese --as sysdba
Connected to an idle instance.
gSQL> \startup nomount
Startup success
gSQL> alter system mount database;
System altered.
gSQL>
```

- Administrator operations in mount phase
 - Adjusting mount properties
 - **ALTER SYSTEM {MOUNT | OPEN} DATABASE**

- ALTER DATABASE ADD LOGFILE
 - ALTER DATABASE DROP LOGFILE
 - ALTER DATABASE RENAME LOGFILE
 - ALTER DATABASE { ARCHIVELOG | NOARCHIVELOG }
 - ALTER DATABASE DELETE BACKUP
 - ALTER DATABASE REGISTER
 - ALTER DATABASE RECOVER
 - ALTER DATABASE RESTORE
 - ALTER SESSION SET property_name
 - ALTER SYSTEM RESET property_name
 - ALTER SYSTEM SWITCH LOGFILE
 - ALTER SYSTEM [KILL | DISCONNECT] SESSION
 - ALTER TABLESPACE name ADD [DATAFILE|MEMORY]
 - ALTER TABLESPACE name RENAME DATAFILE
 - ALTER TABLESPACE name [ONLINE|OFFLINE]
- Operation in an instance at the open transition
 - Loading all data file used in an instance to shared memory
 - Performing instance recovery
 - Creating NOLOGGING index
 - Deleting objects or files which are not deleted by ager thread
 - Creating cache for dictionary objects
 - If "SHARED_SESSION" property is set to YES, process monitor thread in gmaster will be started up.
 - Process monitor thread executes balancer process, dispatcher process, shared-server process.

Table 5-4 Updatable property in mount

Property name	Description
ARCHIVELOG_FILE	Prefix name of archive file
IN_DOUBT_DECISION	Decision about in-doubt transaction
LOCK_HASH_TABLE_SIZE	Hash table size of lock administrator
LOG_MIRROR_MODE	Log mirroring mode
LOG_MIRROR_SHARED_MEMORY_STATIC_SIZE	Shared memory size for log mirroring
SUPPLEMENTAL_LOG_DATA_PRIMARY_KEY	Whether to perform supplemental logging at the database-level

Open Phase

The open phase is a state in which all the data file is loaded to memory, and it is ready for service. All operations are allowed in this phase.

```
% gsql sys gliese --as sysdba
Connected to an idle instance.
gSQL> \startup mount
Startup success
gSQL> alter system open database;
System altered.
gSQL>
```

The database access mode is selectable at the transition to open phase. The database access modes are divided into READ_ONLY mode and READ_WRITE mode. The READ_ONLY mode can only read data in database, but READ_WRITE mode can both read and write the data.

To open database in READ_ONLY mode, the previous database should be normally shut down. If the access mode is omitted, it refers to the DATABASE_ACCESS_MODE property value when opening database.

```
gSQL> \shutdown abort
Shutdown success
gSQL> \startup mount
Startup success
gSQL> alter system open database read only;
ERR-42000(14038): unable to recover database in READ ONLY mode
gSQL> alter system open database read write;
System altered.
...
gSQL> \shutdown normal
Shutdown success
gSQL> \startup mount
Startup success
gSQL> alter system open database read only;
System altered.
```

Diagnosis

It is possible to execute several phases at a same time using a single command(\startup) when starting up instance. If a certain phase fails, the administrator should figure out in which phase the failure occurs. Check using to which phase the instance has come using V\$INSTANCE. Then the administrator can continue operations of startup instance from the subsequent phase.

The following is an example of starting up instance to open phase after \startup failure.

```
% gsql sys gliese --as sysdba
Connected to an idle instance.
```

```

gSQL> \startup
ERR-42000(14051): media recovery required - 'TEST_TBS'
gSQL> select INSTANCE_STATUS from v$instance;
INSTANCE_STATUS
-----
MOUNTED
1 row selected.
...
gSQL> alter system open database;
System altered.

```

Shutting down Instance

GOLDBLOCKS instance can be terminated only by a user with SYSDBA privilege. It is not allowed to create new session during shutdown.

GOLDBLOCKS instance can be shut down by Direct Attach (D/A) method and dedicated method of Client/Server (C/S), but it can not be shut down by shared method of C/S.

```

% gsql sys gliese --as sysdba
ERR-RD000(13034): Service is not available

```

There are four types of instance shutdown mode, and they are shutdown normal, shutdown transactional, shutdown immediate and shutdown abort.

Shutdown Normal

The shutdown normal is set by default if a particular mode is not specified when shutting down. Use this type if a user wants to shut down an instance normally.

```

gSQL> \shutdown normal
Shutdown success
gSQL>

```

The followings describe the characteristics of shutdown normal.

- New session is not allowed.
- New transactions and statements are allowed in session which already have been connected.
- Waiting for all the sessions which are connected to the instance to be shut down.
- It does not execute instance recovery process when starting up the instance.

Shutdown Transactional

Use this type to shut down the currently proceeding transactions normally even when the session is forcibly shut down.

```
gSQL> \shutdown transactional
Shutdown success
gSQL>
```

The followings describe the characteristics of shutdown transactional.

- Neither new session nor is new transaction allowed.
- New statements are allowed in ongoing transaction.
- Waiting for the ongoing transactions to be shut down.
- The session will be automatically terminated after the ongoing transactions is terminated.
- It does not execute instance recovery process when starting up the instance.

Shutdown Immediate

Use this type to terminate the instance when a user can not terminate current transactions.

```
gSQL> \shutdown immediate
Shutdown success
gSQL>
```

The followings describe the characteristics of shutdown immediate.

- Neither new session nor is new transaction allowed.
- Forcibly shut down ongoing sessions and transactions.
- Waiting until the background thread of the system to be completed.
- It does not execute instance recovery process when starting up the instance.

Shutdown Abort

Use this type when a user judged the instance is in an abnormal state.

```
gSQL> \shutdown abort
Shutdown success
gSQL>
```

The followings describe the characteristics of shutdown abort.

- Neither new session nor is new transaction allowed.

- Forcibly shut down ongoing sessions and transactions.
- Instantly shut down the background thread of the system.
- It executes instance recovery process when starting up the instance.

5.3 Managing Process

This chapter describes the background processes of GOLDILOCKS instance.

Master Process

Master process performs the asynchronous operation for database performance and monitoring. It consists of many threads.

The master process' executable file name is gmaster.

Checkpoint Thread

Checkpoint thread executes asynchronous checkpoint events which occur in the log flushing thread. The checkpoint event occurs whenever redo log file is switched.

Checkpoint event is executed asynchronously regardless of a user, and its log is recorded in system.trc as follows.

```
[2014-09-11 14:04:34.704465 THREAD(14497,140178383427328)] [INFORMATION]
[CHECKPOINT] begin
...
[2014-09-11 14:04:34.743933 THREAD(14497,140178383427328)] [INFORMATION]
[CHECKPOINT] save control file
[2014-09-11 14:04:34.759521 THREAD(14497,140178383427328)] [INFORMATION]
[CHECKPOINT] end
```

Log Flushing Thread

User transactions record redo log in log buffer, and it is periodically recorded in log file by log flushing thread.

Log switching occurs when redo log is recorded to the end of the log file, then it will be recorded in the next redo log file. When the log switching occurs, checkpoint event is transferred to a checkpoint thread.

If reusable log file does not exist when the log file is switched, all queries except for the read-only queries will wait until the reusable log file is created.

The message remains as follows in system.trc when logging is blocked.

```
...
[2014-09-11 14:31:44.315871 THREAD(19102,139674683647744)] [INFORMATION]
[LOG FLUSHER] disable logging - blocked lfsn(1)
...
```

Log Archiving Thread

The log archiving thread asynchronously archives redo log file. This thread is executed only when database is operated in ARCHIVELOG mode.

Log archiving is a part of checkpoint process, and it is executed by log archiving event in which the checkpoint thread occurred.

The message remains as follows in system.trc when redo_0_0.log is archived to archive_0.log.

```
[2014-09-11 14:13:32.515996 THREAD(16913,140631135463168)] [INFORMATION]
[ARCHIVELOG BEGIN] LOG(/home/test/work/product/Gliese/home/wal/redo_0_0.log(0)) =>
ARCHIVE(/home/test/work/product/Gliese/home/archive_log/archive_0.log)
[2014-09-11 14:13:33.145850 THREAD(16913,140631135463168)] [INFORMATION]
[ARCHIVELOG END] (/home/test/work/product/Gliese/home/archive_log/archive_0.log) : SUCCESS
...
```

Ager Thread

Ager thread physically drops the logically dropped database objects.

DROP TABLE statement executes only logical drop operation to maintain statement level consistency in GOLDBLOCKS. Therefore, the statement which was invoked before DROP TABLE can explore the records of dropped table even when DROP TABLE is executed.

The message remains as follows in system.trc when table and tablespaces are physically dropped.

```
[2014-09-11 14:13:37.966788 THREAD(16925,139892990408448)] [INFORMATION]
[AGER] aging table - object scn(4561), object view scn(4562), type(0), physical
id(25043954302976)
...
[2014-09-11 14:13:37.966917 THREAD(16925,139892990408448)] [INFORMATION]
[AGER] aging tablespace - object scn(4561), object view scn(4564), tablespace id(61)
```

Timer Thread

Timer thread asynchronously sets time to the system to reduce the time measuring cost of user transactions, and the user transactions read the time set in the system.

The set time precision is 10 ms.

The followings describe the case of using the time set in the timer thread. The time error is 10 ms.

- Time out: QUERY_TIMEOUT, IDLE_TIMEOUT, DDL_LOCK_TIMEOUT, ...
- Message record time written in trace log
- Startup time of login statement or transaction
- Time recorded in transaction commit redo log

Page Flusher & IO Slave Threads

It applies the updated data pages to the disk when a checkpoint occurs. The updated information is stored in multiple data files in a tablespace. For that, the page flusher thread distributes operations to IO slave threads per each tablespace and data files and manages them. Then the IO slave threads record the updated pages in the data file in parallel.

Storing the updated pages as many as possible at a time improves performance. The number of written pages at each time follow the properties in **MAXIMUM_FLUSH_PAGE_COUNT**.

After the updated pages are written to the data file, the message remains in system.trc is as follows.

```
[2014-09-11 14:13:38.329162 THREAD(16925,139893221086976)] [INFORMATION]
[IO SLAVE] flush datafile ( tablespace : 0, datafile : 0 )
[2014-09-11 14:13:38.552161 THREAD(16925,139893221086976)] [INFORMATION]
[IO SLAVE] flush datafile ( tablespace : 1, datafile : 0 )
[2014-09-11 14:13:38.587510 THREAD(16925,139893221086976)] [INFORMATION]
[IO SLAVE] flush datafile ( tablespace : 2, datafile : 0 )
[2014-09-11 14:13:38.587831 THREAD(16925,139893221086976)] [INFORMATION]
[IO SLAVE] flush datafile ( tablespace : 62, datafile : 0 )
[2014-09-11 14:13:38.620239 THREAD(16925,139893221086976)] [INFORMATION]
[IO SLAVE] flush datafile ( tablespace : 63, datafile : 0 )
```

Cleanup Thread

Cleanup thread cleans up the system resource asynchronously, and performs the following operations.

- It cleans up normally terminated session. GOLDILOCKS processes termination of a user session logically, and uses cleanup thread for physical termination of a session.
- It cleans up abnormally terminated session. If the session is using transactions, then they will be rolled

back.

- It checks the time-out of snapshot statements. If a session exceeds the time-out, it is forced to be terminated.

When cleaning up the abnormally terminated session, a message remains in system.trc as follows.

```
[2014-09-12 10:34:38.387349 THREAD(23003,140722556352256)] [WARNING]
[CLEANUP] cleaning session - env(19), session(20), transaction(FFFFFFFFFFFFFFF),
program(gsql), pid(23209), thread(140080441665280)
[2014-09-12 10:34:38.387515 THREAD(23003,140722556352256)] [WARNING]
[CLEANUP] cleaning up 1 sessions
```

If a snapshot statement exceeds the time-out, a message remains in system.trc as follows.

```
[2014-09-12 10:49:21.842179 THREAD(3972,139706316711680)] [WARNING]
[CLEANUP] long statement timeout - pid(8029), thread(140053960505088), program(gsql),
statement start time(2014-09-12 10:48:49.963471)
```

If abnormally terminated session is terminated by 'kill-9' signal during changing shared memory when exclusive latch is acquired, it is no longer possible to operate the database. In this situation, a message remains in system.trc as follows, and the instance should be terminated using *SHUTDOWN ABORT*.

```
[2014-09-12 11:12:58.809249 THREAD(15313,140671386121984)] [WARNING]
[CLEANUP] failed to cleaning session - server restart required
..... dead session in critical section - env(3), session(4), transaction(47001E0004),
pid(15296), thread(140178075756288)
```

Process Monitor Thread

The process monitor thread executes processes, and monitors them.

- It is executed only when "SHARED_SESSION" property is set to *YES*.
- It executes load-balancer (gbalancer), dispatcher(gdispatcher), shared-server(gserver), and re-executes them when they are abnormally terminated.
- It does not monitor listener (glsnr) process.

Cluster Recover Thread

When starting up a node on a cluster system environment, if the node phases up to the mount phase, then the cluster recover thread is created. If there is an in-doubt transaction, the cluster recover thread communicates with the cluster recover thread on the remote node, and recovers the in-doubt transaction.

If there is an in-doubt transaction, the cluster recover thread communicates with the cluster recover thread

d on the remote node, and figures out the status of the in-doubt transaction. If the remote node is restarted and it is not recovered yet, then it transfers a message requesting the preferential completion of recovery and recovers the in-doubt transaction status after the recovery is completed.

The in-doubt transaction statuses figured out through the remote node are NONE, PREPARE, COMMIT, and ROLLBACK. If the cluster recover thread received the response such as COMMIT, ROLLBACK from at least one remote node, then it performs COMMIT or ROLLBACK. If the cluster recover thread received the response such as NONE, PREPARE from all remote nodes, then it performs ROLLBACK because COMMIT or ROLLBACK never has been performed on any cluster node.

The in-doubt transaction recovery using the cluster recover thread leaves the following messages in system.trc.

```
[2018-11-22 16:52:00.466805 INSTANCE(G3N2) THREAD(7828,140557371479808)] [WARNING]

id(5.35127356), local transaction id(60)
```

Failover Thread

When starting up a node on a cluster system environment, if the node phases up to the LOCAL OPEN phase, then the cluster failover thread is created. Cluster failover thread performs the failover for the error node by reselecting a coordinator or offlining when an error occurs on a specific node or the network in the cluster system.

In a situation requiring the failover, a normal node which acquired a failover lock among other normal nodes communicates with failover threads of other nodes, then performs the failover.

The failover performed by the failover thread leaves the following messages in system.trc.

```
[2018-11-22 15:27:34.619208 INSTANCE(G1N1) THREAD(20140,140219957368576)] [INFORMATION]

Listener Process

Listener process enables remote access through the network in a client/server environment. Listener process waits for a client connection using **LISTEN_PORT**. If connected in dedicated mode, new gserver starts, and connects a client. If connected in shared mode, it selects underloaded dispatcher (gdispatcher) using load-balancer (gbalancer), and connects a client.

gserver is a kind of operation server, and it executes a client request.

If LISTEN_PORT is already in use, the following error occurs.

```
% glsnr --start
ERR-HY000(11077): given address is already in use
```

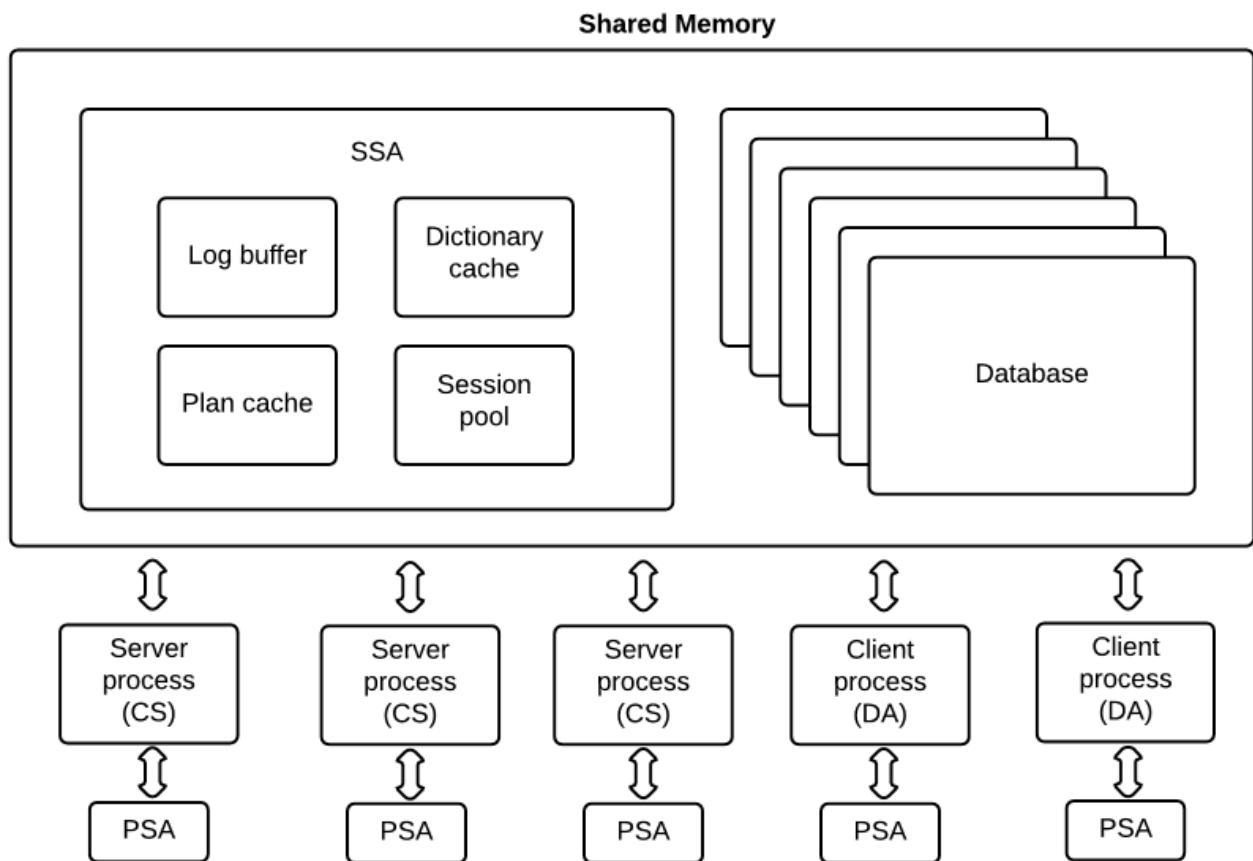

Listener process operates independently from the instance. In other words, listener process can start up and shut down regardless of instance start up anytime.

5.4 Managing Memory

GOLDILOCKS Memory Architecture

GOLDILOCKS uses SSA which is a memory shared by all sessions in the system, a shared memory for data base pages, and PSA (heap memory) which each session uses independently.

Figure 1 Shared memory

Managing SSA

Shared Static Area (SSA) is a memory area to store information which is shared by the system's all sessions.

A new process should use the same physical address for using SSA. It is because the position of all information referenced by SSA uses the physical address.

The physical starting address of SSA is determined by **SHARED_MEMORY_STATIC_KEY** and **SESSION_FATAL_BEHAVIOR**. The following error occurs when another program is already using shared memory key assigned by the same **SHARED_MEMORY_STATIC_KEY**, and the memory assigned by **SHARED_MEMORY_ADDRESS**.

```
% gsql sys gliese --as sysdba
Connected to an idle instance.
gSQL> \startup
ERR-HY000(11029): shared memory segment exists
gSQL>
```

SSA stores main information, and they are log buffer, dictionary cache, plan cache, session pool, lock pool, and transaction pool.

SSA size is determined by **SHARED_MEMORY_STATIC_SIZE**. The system automatically manages memories used in session/lock/transaction pool and dictionary cache, and a user can not arbitrarily manage them. However, a user can arbitrarily manage the usage of log buffer and plan cache.

If the default value of log buffer and plan cache are increased, **SHARED_MEMORY_STATIC_SIZE** should be increased accordingly. Otherwise, the following error occurs.

```
% gsql sys gliese --as sysdba
Connected to an idle instance.
gSQL> \startup
ERR-HY000(13010): Insufficient static area
gSQL>
```

Managing PSA

Private Static Area (PSA) is a heap memory area, and it is used independently by each session. **PRIVATE_STATIC_AREA_SIZE** determines the maximum size of PSA.

An initial size is allocated to PSA when a session is created. If additional memory is required in the session, PSA can be allocated up to its maximum size. The following error occurs when it exceeds the maximum size.

```
ERR-HY000(13011): Unable to extend memory: [MAX: 104857600, TOTAL: 102764408, ALLOC: 2097240]
DESC: private static area
```

5.5 Monitoring

Database monitoring is needed not only to detect and prevent the problem which can be an issue in the future, but also to find a way to improve database management. For monitoring, GOLDDILOCKS database provides text file type trace log and several performance views.

Monitoring with Trace File

From when the instance starts up until it terminates, GOLDDILOCKS database provides the system log which records the overall system error, warning, information. In addition, it provides XA transaction log, trace

log such as DDL log, and SQL Trace Log. For more information, refer to **15.5 SQL Trace Log**.

Managing Trace Log File

GOLDDILOCKS database's trace log file consists of system.trc file and xa.trc file. The system.trc file records system log and DDL log, and xa.trc file records XA transaction log. Trace log file is created in directory set in SYSTEM_LOGGER_DIR property. Therefore, it is generally created in trc directory below the directory specified in GOLDDILOCKS_DATA environment variable. The trace log file's size is 10 Mbytes. If its space is insufficient, the existing trace log file with unique file extension is preserved, and the new trace log file is created.

Listener trace log file is created as *listener.trc* in trc directory below the directory specified by GOLDDILOCKS_DATA environment variable. The log file size is 10 Mbytes. If the space is insufficient, the existing log file with unique file extension is preserved, and the new trace log file is created.

Except for system log, XA transaction log and DDL log can ON/OFF the monitoring. Set the TRACE_DDL property value to 0 to turn off the DDL log, or set it to 1 to turn on the DDL log. XA log is set in the same way using the TRACE_XA property.

System Log

The errors, warnings, and information which occurred in database instance from when master process starts up until it terminates are recorded in the system log.

System Log Format

System log is recorded in the following format.

```
['log record data and time' THREAD('process Id', 'thread handle')] ['log level']
['log prefix'] 'log body'
```

- 'log record date and time' is the date and time of the recorded log.
- THREAD('process Id', 'thread handle') is the information of log process id and thread handle.
- 'log prefix' is the entity or feature which created the log, and 'log body' is the detailed information.
- 'Log level' is the level of log recorded in system log, and its value is FATAL, ABORT, WARNING, INFO. 'log level' has the properties as follows.

Table 5-5 Log level properties

Log level	Description	Processing
FATAL	The state which master or client process is shut down abnormally.	The client should be reconnected in case of client process FATAL, and the database instance should be shut down and restarted in case of system FATAL. Backup the data file, control file, redo log file, system log file and contact the manufacturer.
ABORT	The state to continue service after rollback.	It is the normal state for system operation. Execute it again after eliminating the rollback cause.
WARNING	Operational warnings	The abnormal state of database instance. there is no operational problem but cause analysis is needed.
INFO	Operational information	-

For example, the following system log recorded the operational information at 17:30:55 on September 11 in 2014 by process id 21395 (The thread handle is 139982731163392). Log prefix is 'STARTUP-SM' and was executing the storage manager when the master process of GOLDILOCKS database started up. It means that the transition to NO-MOUNT phase had been done during multilevel startup.

```
[2014-09-11 17:30:55.758164 THREAD(21395,139982731163392)] [INFORMATION]
[STARTUP-SM] NO-MOUNT PHASE
```

Operational Information of GOLDILOCKS Database

It is the log for creating database instance, multilevel startup and shutdown, loading data file, recovering restart and media. It records the necessary information for the operation of the master process from when master process starts up until it terminates.

- GOLDILOCKS instance creation log

The system log records the following information when database instance is created. It creates the control file after the transition to NO-MOUNT phase to create database.

```
=====
Startup GOLDILOCKS

- The logs of master process checkpoint, log flusher, log archiving, ager, parallel IO, cleanup thread during database operation

A checkpoint reflects to disk all data files which are updated only in memory and not written to the disk yet at checkpoint time. If it uses the parallel IO, it executes parallel IO in data file units. One unit of checkpoint log is from '[CHECKPOINT] begin' to '[CHECKPOINT] end'.

[IO SLAVE] is a log which is recorded by IO thread dedicated to parallel IO. '[IO SLAVE] flush data file (tablespace: 0, datafile: 0)' log is recorded after the data file (whose datafile id is '0' and whose tablespace id is 0) is reflected to the disk. These data file flush logs are repeatedly recorded as many as the number of data file at checkpoint time.

'[PAGE FLUSHER] flushed lsn(139039), flushed page count(9216)]' means that the reflected minimum Lsn in the disk is 139039, and reflected pages are 9216. The last log Lsn archives redo log files which are smaller than 139039. They record checkpoint log and control file, then stores them in the disk.

If a database is large its checkpoint time will be longer. Check if the datafile is continuously being recorded by tracking [IO SLAVE] logs. And if disk IO does not operate and stops, then check if log archiving is in progress. If the space is insufficient, then spare the space and ensure the log archiving proceed normally.

If checkpoint fails '[CHECKPOINT] CHECKPOINT was failed' log will be recorded. The checkpoint can be specially omitted at checkpoint time due to the log file switch, where '[CHECKPOINT] CHECKPOINT was skipped' log might be recorded.

```

- Log of creating, dropping, altering tablespace by a user

The system log records the operations of creating, deleting, updating of a user tablespace. Tablespace related to DDL is recorded by default, regardless of TRACE_DDL ON/OFF. DDL failure will not be recorded in the system log. Therefore, a user should operate the system by setting TRACE_DDL to *ON* in order to figure out more details about DDL log and the causes of its failure.

- System internal error and index creation failure log

An internal error occurs when GOLDILOCKS database system error occurs but the exact cause of the failure

re can not be defined. If an internal error occurs, the SQL statement which raised the error is rolled back. The service is continuously available because the error does not affect the system nor does other sessions.

By the way, if the error raising SQL statement is executed again, it could be failed for the same reason, or the cause of failure could disappear and the operation could succeed. Therefore, a user should not change the database at the point of failure, but should request cause analysis to find the cause.

The index creation fails if the same key index on a table exists when creating UNIQUE index. Even though the index creation fails, it does not affect the index tables which are already created. Therefore, it does not affect the service.

```

Index creation failed ( physical id : 22638772617216, error code : 14016 )
```

XA Log

It records the success or failure log of start, close, end, rollback, prepare, commit, recover, forget operations of XA transaction interface for processing distributed transactions. GOLDILOCKS database does not record XA trace log by default. TRACE_XA should be set to *ON* to record the XA trace log as follows. For more information, refer to **XA API References**.

```
gSQL> alter system set trace_xa = yes;
System altered.
```

XA trace log is recorded in 'xa.trc' as follows. At first, executed XA interface is recorded, and then the status (*complete* or *failed*) is recorded. The information such as session id and transaction id is also recorded. If it fails, the error code defined in **XA API References** is recorded.

Trace Log Replication

Replication trace log is recorded in a separate file when using GOLDILOCKS' replication tool such as CYCLONE and LOGMIRROR. For more information about replication trace log, refer to **operating CYCLONE** in CYCLONE chapter and **operating** in LOGMIRROR chapter.

Listener Log

The errors and information which occurs from the startup of listener process until the end of the process are recorded in the listener log.

Listener Log Format

The listener log is recorded in the following format.

```
['log recorded date and time' THREAD('process id', 'thread handle')]
['log prefix'] 'log body'
```

- 'log record date and time' is the date and time of the recorded log.
- THREAD ('process Id', 'thread handle') is the information of log process id and thread handle.
- 'log prefix' is the entity or feature which created the log, and 'log body' is the detailed information.

Monitoring Performance Using View

Concurrency control for multi-user is needed because database is accessed or updated by multiple users at the same time. The concurrency should be provided for system data and shared resources as well as explicit data by SQL statements. GOLDILOCKS controls the concurrency using latch.

The concurrency control using lock can cause a deadlock when same data is updated by multiple different transactions. The concurrency control using latch (supported by GOLDILOCKS) can cause a deadlock, too. It is because the deadlock affects the performance, so a view is provided to handle the latch when a deadlock occurs.

The transactions generating the deadlock will be found when using V\$LOCK_WAIT. Then, the administrator should monitor them, and unlock the deadlock. For more information about V\$LOCK_WAIT, refer to V\$LOCK_WAIT. For more information for monitoring latch item causing the deadlock, refer to V\$LATCH.

6.

Structure and Storage Structure of GOLDILOCKS Database

6.1 Managing Control File

A database instance should be created to use GOLDDILOCKS database, and the control file is created when creating a database instance. The information is written on the control file when GOLDDILOCKS multilevel startup moves from nomount level to mount level. The absolute path and the size of the file to be used in database are recognized by using the recorded information on the control file. The control file is a binary file and database information is stored as follows.

Control File Contents

Table 6-1 GOLDDILOCKS database system information

Item	Description
Data store mode	It stores mode which is set when database starts up. (TDS, CDS)
Server state	It is the database instance state. (NONE, RECOVERED, RECOVERING, SERVICE, SHUTDOWN)
Last checkpoint lsn	It is the LSN of the checkpoint which was executed last in the database.

Table 6-2 Log information

Item	Description
Checkpoint lid, lsn	It is the log information (LSN, log position) of the checkpoint which was executed last in the database.
Last inactivated log file sequence	It is the log file sequence which was changed to inactive last.
Archivelog mode	It is the archivelog mode of the database in operation.
Creation time	It is the database created time.

Database information stores information about database operating, all tablespace in use, and data. The database operating information stored in the control file is as follows.

Table 6-3 Database information

Item	Description
Transaction table size	It is the maximum number of using transaction table in database.
Undo relation count	It is the number of using undo relations in database.
Tablespace count	It is the number of tablespaces in use created in database.
New tablespace id	It is the tablespace ID to be created later.

Tablespace information is stored in the control file as follows.

Table 6-4 Tablespace information

Item	Description
Tablespace id	It is a unique tablespace ID.
Attributes	It is the attribute of a tablespace such as storage device (memory, disk), persistence attribute (temporary, persistent), tablespace usage (dictionary, undo, data, temporary).
Page count in extent	It is the number of extent pages.
State	It is the tablespace status. (CREATING, CREATED, DROPPING, DROPPED, AGING)
Relation id	It is the relation ID to store pending operation of tablespace.
New data file id	It is the data file ID which is set when new data file is inserted to tablespace.
Is logging	It is the logging mode of a tablespace. (LOGGING, NOLOGGING)
Is online	It is the online or offline status of a tablespace. (ONLINE, OFFLINE)
Data file count	It is the number of data files used by a tablespace.
Offline lsn	It is the last LSN which executes recovery if needed, in order to shift offline tablespace to online.
Offline state	It is the status of offline tablespace. (CONSISTENT, INCONSISTENT) CONSISTENT offline tablespace does not have to be recovered when shifting the status to online. It is because the tablespace status is shifted to offline after the most recent data in memory is stored to disk. On the other hand, INCONSISTENT offline tablespace executes recovery using the log when shifting to online.

Data file information is stored in the control file as follows.

Table 6-5 Data file information

Item	Description
Name	It is the data file name including the absolute path which stores data.
State	It is the data file status. (CREATING, CREATED, DROPPING, DROPPED, AGING)
Data file id	It is the unique data file ID in a tablespace.
Auto extend	It is whether to extend automatically or not when a data file is full.
Size	It is the data file size.
Next size	It is the size to be extend when a data file is full.
Max size	It is the maximum size of extendable data file.
Timestamp	It is the time when data file was created.
Checkpoint lsn, lid	It is the checkpoint log information when the last checkpoint is executed in the data file. (LSN, log position)
Creation lsn, lid	It is the checkpoint log information of when a data file is created. (LSN, log position)

It stores each incremental backup information operated in the database. GOLDILOCKS database supports the incremental backup for database and tablespaces, and the incremental backup information is stored in the control file as follows.

Table 6-6 Incremental backup information

Item	Description
Backup lsn, lid	It is the checkpoint log information which was executed last at the beginning of backup. (LSN, log position)
Begin time	It is the incremental backup beginning time.
Completion time	It is the incremental backup completion time.
Tablespace id	It is the unique tablespace ID of which an incremental backup is executed. If incremental backup for a tablespace is executed, its tablespace ID is recorded. If the backup is not executed for a tablespace, then the maximum tablespace ID (65535) is recorded.
Level	It is the level of executed incremental backup.
Object type	It is the target of incremental backup. (database, control file, tablespace)
Backup file name	It is the name of the incremental backup file.
Backup option	It is the incremental backup option. (cumulative, differential)

Multiplexing Control File

The control file stores the physical structure of GOLDDILOCKS database and the information about data consistency. If the control file is corrupted or deleted by mistake, it is not possible to operate database.

Therefore, GOLDDILOCKS database recommends creating at least two or more control files and keep them in physically separated disks. GOLDDILOCKS supports multiplexing up to 8. To add control files when creating a database, set the number of multiplexing control files in the property file, and set the path of each control file. To add control files when operating database, increase the property value for control file multiplexing, and add the control file paths.

Restoring Corrupted Control File

If a control file is corrupted due to database's abnormal termination, the corrupted control file is restored using a normal control file among multiplexed control files, and then it is restarted.

If all multiplexed control files are corrupted, the backup control file is restored, and the incomplete media recovery is executed for archive redo log files and redo log files, and then it is restarted. For more information about incomplete recovery using the backup control file, refer to **When all multiplexed control files are corrupted** in recovery examples.

Control File Information

A user can enquire the control file name by using V\$CONTROLFILE which is the performance view to retrieve the location and the name of the control file as follows.

```
gSQL> SELECT CONTROLFILE_NAME FROM V$CONTROLFILE;  
CONTROLFILE_NAME
```

```
-----  
/goldilocks_data/wal/control_0.ctl
```

```
/goldilocks_data/wal/control_1.ctl
```

```
2 rows selected.
```

A user can retrieve the correct information written in the control file using **gdump** the dump tool of GOL DILOCKS.

6.2 Managing Redo Log File

GOLDDILOCKS uses the redo log files to ensure database persistency. In other words, the database can be restored to the state before shutdown database using the redo log files and data files when GOLDDILOCKS database is abnormally terminated due to various reasons.

In order to do so, GOLDDILOCKS database uses Write Ahead Logging (WAL) policy to store log of all update operations.

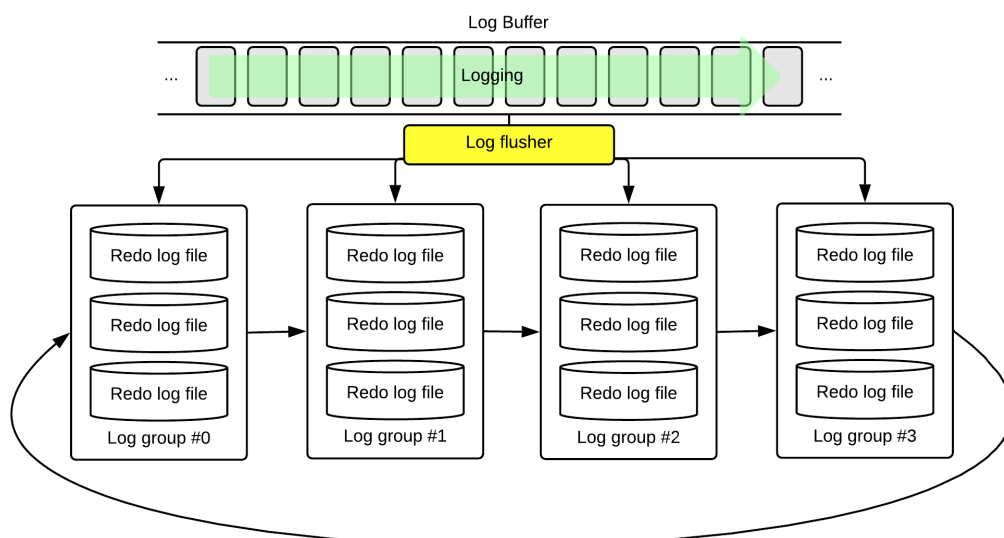

The updated data by the update operation is not recorded in the data file, but the log for the update operation is recorded in the redo log file. It is because it is much more efficient in the terms of database performance. Whenever each update operation is recorded in the data file, a random access occurs and the update operations for the same file causes the excessive disk IO. However, the update log is smaller than the updated data, and it performs the efficient disk IO in a way being appended at the end of log file.

GOLDDILOCKS database uses log buffer in shared memory to record the updated logs to the log buffer, and then records log buffer to the log file all together, and it leads to more efficient disk IO.

Redo Log File Structure

The redo log buffer and log file in GOLDDILOCKS have a circular structure. The log files are created as many as predefined number of log groups, and then they record logs. If a log file is full, the following log file is used. When all log files are used up, the previously used log file is reused. The log file is a circular structure consisting of a single log group of several members. GOLDDILOCKS performs the logging using minimum four log groups.

Figure 1 GOLDDILOCKS redo log file, log buffer structure

Redo Log Group and Its Member

GOLDILOCKS database uses a log group and members to record logs to the disk log file during database operation. A single redo log file is a member of a log group, and a log group consists of several log members. Log group which consists of many members ensures high availability because other log members can be used when a particular disk fails or a particular log member is corrupted.

The system records logs to a log group, and if the log group is full, the following group is used. This is a circular log group. The currently used log group shifts to the following log group one and this is called as log switching.

A log group, the number of members and each of its position are set by the property when creating database. They can be altered by adding or dropping syntax when operating database.

Log Group State

The state of log group is initialized to UNUSED when creating it. It is changed to CURRENT, ACTIVE, and INACTIVE state by the system during operation.

Table 6-7 GOLDILOCKS log group state

Log group state	Description
UNUSED	The log group has never been used after creation.
CURRENT	The log group is being used by the current system.
ACTIVE	It is not yet ready to be reused after CURRENT log group is switched.
INACTIVE	ACTIVE state log group is ready to be reused.

ACTIVE log group can not be reused in the system, but it can be reused after it is changed to INACTIVE by archive log thread. Archive log thread wakes up by an event before the checkpoint is completed, and it changes ACTIVE log groups to INACTIVE state. In order to do so, log archiving thread archives log file in ACTIVE log group, then change it to INACTIVE when the system is operated in ARCHIVELOG mode. If the system is operated in NOARCHIVELOG mode, then the ACTIVE log group is immediately reusable after changing the log group state to INACTIVE.

Adding Log Group and Log Member

Adding Log Group

Adding log group is allowed only in mount phase of GOLDILOCKS database multilevel startup. The new log group is added next to the CURRENT state of the log group which is currently being used.

The following is an example to add a new log group whose file name is 'abc.log', and file size is 20 Mbytes to group ID 10.

```
ALTER DATABASE ADD LOGFILE GROUP 10 ('abc.log') SIZE 20M;
```

Adding Log Member

A new log member can be added for the stability of log group in use. It can be added in mount phase of GOLDDILOCKS database multilevel startup in the same way of adding log group. The following is an example to add the log file named as 'test log' to group ID 10. The log file size is not specified because the log member size in a log group is same.

```
ALTER DATABASE ADD LOGFILE MEMBER 'test.log' TO GROUP 10;
```

Altering Log Member Name

The position and the file name of the log member in use can be altered by executing RENAME in mount phase. RENAME is executed for log member when the log member's disk is physically failed or the log member should be transferred to another disk in terms of performance.

The following is an example to RENAME the log file '/disk1/goldilocks_data/wal/redo_0_0.log' to the log file '/disk2/goldilocks_data/wal/redo_0_0.log'.

```
ALTER DATABASE RENAME LOGFILE '/disk1/GOLDDILOCKS_data/wal/redo_0_0.log' TO  
'/disk2/GOLDDILOCKS_data/wal/redo_0_0.log';
```

Dropping Log Group or Log Member

A log member or log group in use can be dropped in mount phase when a user wants to reduce log groups, log members or when log file disk is failed.

The following is an example to drop all members of log group ID 10.

```
ALTER DATABASE DROP LOGFILE GROUP 10;
```

Dropping log member is allowed only when at least two members exist in the log group.

The following is an example to drop the '/disk1/goldilocks_data/wal/redo_0_0.log' log member.

```
ALTER DATABASE DROP LOGFILE MEMBER '/disk1/GOLDDILOCKS_data/wal/redo_0_0.log';
```

Restoring Corrupted Redo Log File

If the system fails and the redo log files are corrupted, then the restart recovery fails and the system cannot be operated. If normal log members exist in the corrupted log group, the restart recovery and the system

m operation can be executed by copying the log file of the normal log member to the corrupted log files.

If all log files in a log group are corrupted or there is only one log member, it can be restarted by executing incomplete media recovery. The incomplete media recovery is restricted to the normal log file.

For more information about incomplete media recovery, refer to **Incomplete Recovery**.

Redo Log File Information

A user can enquire V\$LOGFILE which is a performance view to retrieve the location and the name of the redo log files. When inquiring V\$LOGFILE, the log file name, its log group ID, its state, the file size are retrieved as follows.

```
gSQL> SELECT FILE_NAME, GROUP_ID, GROUP_STATE, FILE_SIZE FROM V$LOGFILE;
FILE_NAME                                GROUP_ID GROUP_STATE FILE_SIZE
-----
/disk1/goldilocks_data/wal/redo_0_0.log      0 INACTIVE  104857600
/disk1/goldilocks_data/wal/redo_1_0.log      1 CURRENT   104857600
/disk1/goldilocks_data/wal/redo_2_0.log      2 UNUSED    104857600
/disk1/goldilocks_data/wal/redo_3_0.log      3 UNUSED    104857600
4 rows selected.
```

6.3 Managing Archive Redo Log File

The database should be operated in archive log mode for media recovery using backup, because GOLDILOCKS redo log file reuses log group which is used when *circular* structure log group is used. Then the written completed redo log files are copied to the archive redo log files.

For more information about GOLDILOCKS database's archive log mode, refer to **ARCHIVELOG Mode**.

Creating Archive Redo Log File

The redo log file is copied to archive redo log file directory by log archiving thread which is GOLDILOCKS database's system thread. Log archiving thread is activated by checkpoint thread during checkpoint, and it archives the proper object among redo log files.

Archive redo log file is created in the directory set by the ARCHIVELOG_DIR_1 property. The name of archive redo log file is composed of its prefix set by the ARCHIVELOG_FILE property and of the sequence number of each redo log file.

Maintaining and Dropping Archive Redo Log File

Media recovery using backup can fail if archive redo log files, similarly to the redo log files, are arbitrarily dropped. Therefore, archive redo log files should be saved with backup files, and the archive redo log files for media backup can be dropped when the backup file is not needed any more.

Backup is copying the data file which is downloaded to the disk by the most recent checkpoint. Therefore, the archive log files of the oldest LSN and later are needed to recover media using backup. Checkpoint is executed by the system when redo log file is switched, so one or more checkpoint logs exist in every log file except for the redo file in CURRENT state.

The followings describe how to get the archive redo log file required for media recovery using backup file.

1. Get the checkpoint LSN which is recorded in the file header of backup data files.
2. Dump the archive redo log file, and get the archive redo log file including checkpoint LSN.
3. The archive redo log file needed for the media recovery using backup begins just before the archive redo log file of No. 2.

Dump the control file and get the checkpoint LSN to get the archive redo log file needed for incremental backup. Subsequent process is as same as the entire backup process.

If backup files are not needed any more, the archive redo log file required for the media recovery using ba

ckup can be removed.

Multiplexing Archive Redo Log File Directory

If the archive redo log file is moved from the directory set in ARCHIVELOG_DIR_1 to the other directory or media to preserve the archive redo log file, the media recovery fails because it can not find the required archive redo log file.

Move the archive redo log file back to the directory set in ARCHIVELOG_DIR_1 to resolve this problem. Or set the archive log files existing directory to ARCHIVELOG_DIR_2 ~ ARCHIVELOG_DIR_10, and add archive redo file directory for media recovery. READABLE_ARCHIVELOG_DIR_COUNT should be set as many as the number of directory when using ARCHIVELOG_DIR_2 ~ ARCHIVELOG_DIR_10 for the media recovery.

6.4 Managing Tablespace

All the data used in database are stored in physical disk file, and use the database's logical structure for efficient data management and performance. GOLDDILOCKS manages the disk space efficiently by using the logical structure such as tablespace, segment, extent, and page.

A tablespace can include multiple data files, and each tablespace is set to online/offline to support high data availability. Distributing data storing disks improves the IO performance, and reduces the contention of physical disk IO.

Tablespace Type

GOLDDILOCKS tablespace is divided into SYSTEM tablespace and non-SYSTEM tablespace. SYSTEM tablespace is created when database is created, and it is used and controlled only by the GOLDDILOCKS system. Non-SYSTEM tablespace is created and used by a user.

SYSTEM Tablespace

It is created when GOLDDILOCKS database is created, and it is essential for database operation. There are dictionary tablespace, undo tablespace and system temporary tablespace.

Non-SYSTEM Tablespace

It is a tablespace in which tables and indexes are stored for data storing, and a user can arbitrarily creates or drops.

Managing Tablespace and Data File

Managing Tablespace

Managing Tablespace State

The GOLDDILOCKS database tablespace state is divided into online and offline. The offline tablespace is not accessible. A user can arbitrarily set the tablespace state to offline. Or, an abnormal tablespace can be set to offline by the system. The system tablespace should not be set to offline.

- Offline tablespace

GOLDILOCKS database flushes all data files in the tablespace to disk before the tablespace is set to offline. All related logs should be flushed to disk to flush data file. Therefore, a recovery is not needed when switching to online later. However, it is applied when DDLs occurred in the offline tablespace state is changed to online state.

A tablespace can be immediately set to offline using IMMEDIATE mode, without flushing data file. In this case, the tablespace state is changed to online after media recovery when setting the tablespace to online.

Table 6-8 Tablespace offline option

Option	Description	Media recovery when setting the tablespace to online
NORMAL	Flushing all the data file related logs in tablespace to the disk, then set it to offline	Media recovery is not required.
IMMEDIATE	Immediately setting a tablespace to offline	Media recovery is required.

GOLDILOCKS can set tablespace to offline in mount phase. To do so, the service should be normally terminated, or the server should be operated in ARCHIVELOG mode. This method provides high availability by performing service excluding the unrecoverable tablespaces when starts up database.

```
gSQL> ALTER TABLESPACE TEST_TBS OFFLINE;
```

```
Tablespace altered.
```

```
gSQL> ALTER TABLESPACE TEST_TBS ONLINE;
```

```
Tablespace altered.
```

```
gSQL> ALTER TABLESPACE TEST_TBS OFFLINE IMMEDIATE;
```

```
Tablespace altered.
```

```
gSQL> ALTER TABLESPACE TEST_TBS ONLINE;
```

```
ERR-42000(14051): media recovery required - 'TEST_TBS'
```

```
gSQL> ALTER DATABASE RECOVER TABLESPACE TEST_TBS;
```

```
Database altered.
```

```
gSQL> ALTER TABLESPACE TEST_TBS ONLINE;
```

Tablespace altered.

Attributes of Tablespace

The followings are attributes of tablespace in GOLDDILOCKS database. PERSISTENT or TEMPORARY indicates whether persistence is ensured or not. DATA or UNDO indicates the type of tablespace and stored data.

Table 6-9 Tablespace attributes of GOLDDILOCKS database

Attributes		Description
Persistence	PERSISTENT	It supports persistence of data stored in a tablespace. (A recovery is required.)
	TEMPORARY	It does not support persistence of data stored in a tablespace.
Type of stored data	DATA	It stores the user input data.
	UNDO	It stores data required for MVCC of database.
	DICT	It stores dictionary information for database operation.
	TEMPORARY	It stores data for SQL processing.

Managing Tablespace

- Creating user tablespace

It creates a new user tablespace. The name of tablespace being used in the database instance should be unique when creating tablespace. A tablespace can have up to 1024 data files, and the size of each data file can be up to 30 GBytes. The database can create tablespaces up to 65,535, including system tablespace.

The data file name including the absolute path in the data file should be unique. Use 'REUSE' option to reuse the existing data file which is not being used in database. An extent size of a tablespace is selectable among 64 Kbytes, 128 Kbytes, 256 Kbytes, 512 Kbytes and 1 Mbyte, and the default extent size is 256 Kbytes.

```
gSQL> CREATE TABLESPACE TEST_TBS DATAFILE
      '/goldilocks1/db/TEST_TBS1.dbf' SIZE 20M,
      '/goldilocks2/db/TEST_TBS2.dbf' SIZE 50M,
      '/goldilocks3/db/TEST_TBS3.dbf' SIZE 100M REUSE;
```

Tablespace created.

The state can be set to ONLINE/OFFLINE when creating tablespace, and the LOGGING/NOLOGGING property also can be set.

- Dropping tablespace

The tablespace and data file can be dropped when the tablespace is not needed any more. The unused tablespace should be dropped not to waste the resources. It is because once tablespace is created, the added disk data file and memory is created and remains.

```
gSQL> DROP TABLESPACE TEST_TBS;
Tablespace dropped.
```

Dropping the tablespace does not drop its table index in use by default. Therefore, *INCLUDING CONTENTS* option should be used together when dropping tablespace including tables or indexes in use.

```
gSQL> DROP TABLESPACE TEST_TBS;
ERR-42000(16148): tablespace not empty, use INCLUDING CONTENTS option :
drop tablespace TEST_TBS
          *
ERROR at line 1:
gSQL> DROP TABLESPACE TEST_TBS INCLUDING CONTENTS;
Tablespace dropped.
```

Use *AND DATAFILES* option to drop the data files added in the tablespace.

```
gSQL> DROP TABLESPACE TEST_TBS INCLUDING CONTENTS AND DATAFILES;
Tablespace dropped.
```

- Altering tablespace size

Add datafiles to the tablespace or drop datafiles from the tablespace to alter the tablespace size. Add new datafiles to tablespace to spare space when the storing space is not enough during database operation. Or, drop unused datafile from tablespace not to waste the space.

```
gSQL> ALTER TABLESPACE TEST_TBS ADD DATAFILE 'TEST_TBS2.dbf' SIZE 20M;
Tablespace altered.
gSQL> ALTER TABLESPACE TEST_TBS DROP DATAFILE 'TEST_TBS2.dbf';
Tablespace altered.
```

The data file could be dropped from tablespace only when it has never been used since its creation. The data file can not be dropped once it has been used even when all data was dropped.

```
ALTER TABLESPACE TEST_TBS DROP DATAFILE 'TEST_TBS2.dbf';
ERR-42000(14044): datafile not empty
```

- Managing temporary tablespace

Temporary tablespace does not store data file, but it allocates memory of specified size. Create the tempo

rary tablespace as follows.

```
gSQL> CREATE TEMPORARY TABLESPACE TEST_TBS MEMORY 'TEST_TEMP_TBS' SIZE 10M EXTSIZE 256K;
Tablespace created.
```

Add memory to the temporary tablespace as follows.

```
gSQL> ALTER TABLESPACE TEST_TBS ADD MEMORY 'TEST_TBS2' SIZE 10M;
Tablespace altered.
```

Drop the unused memory from the temporary tablespace as follows.

```
gSQL> ALTER TABLESPACE TEST_TBS DROP MEMORY 'TEST_TBS2';
Tablespace altered.
```

Drop the temporary tablespace as follows.

```
gSQL> DROP TABLESPACE TEST_TBS INCLUDING CONTENTS AND DATAFILES;
Tablespace dropped.
```

Transferring Data File

The data file storage path stored in the database should be modified when altering the datafile storage disk, or directory.

The following is an example to describe how to modify the path when transferring the datafile '/goldilocks1/db/TEST_TBS1.dbf' in tablespace TEST_TBS to '/goldilocks4/db/TEST_TBS1.dbf'.

```
gSQL> ALTER TABLESPACE TEST_TBS RENAME DATAFILE
      '/goldilocks1/db/TEST_TBS1.dbf' TO '/goldilocks4/db/TEST_TBS1.dbf';
Tablespace altered.
```

Tablespace Information

For more information about the tablespaces created in database, refer to **V\$TABLESPACE**.

```
gSQL> \DESC V$TABLESPACE
```

COLUMN_NAME	TYPE	IS_NULLABLE
TBS_NAME	CHARACTER VARYING(128)	FALSE
TBS_ID	NUMBER	FALSE
TBS_ATTR	CHARACTER VARYING(128)	FALSE
IS_LOGGING	BOOLEAN	FALSE

IS_ONLINE	BOOLEAN	FALSE
OFFLINE_STATE	CHARACTER VARYING(32)	FALSE
EXTENT_SIZE	NUMBER	FALSE
PAGE_SIZE	NUMBER	FALSE

6.5 Managing Data File

Data File Matching

Data file can be corrupted due to disk failure, database defects or human error. If the corrupted data file is used in database, serious problems occurs.

GOLDDILOCKS database ensures the matching of the data file using a checksum for each page of the data file. GOLDDILOCKS database's page checksum is generated using LSN and CRC value, and it is stored in each page. A user sets the page checksum type using the value in **PAGE_CHECKSUM_TYPE**, and uses LSN or the default value.

The page checksum is checked when loading the data file into the memory at database startup. If an error occurs concerning the checksum value, the database can not start up the service.

The following is an example to describe the database startup failure when the datafile TEST_TBS.dbf in the tablespace TEST_TBS created by a user is not matching.

```
gSQL> \STARTUP MOUNT
Startup success
gSQL> ALTER SYSTEM OPEN DATABASE;
ERR-HY000(14094): datafile recovery required - datafile(/goldilocks/db/TEST_TBS.dbf) of
tablespace(TEST_TBS) corrupted
```

In case when the data file is not matching, set its tablespace having the data file to *OFFLINE*, or recover the data file to restart the database.

The following describes how to start up the database after setting the tablespace to *OFFLINE*.

```
gSQL> \STARTUP MOUNT
Startup success
gSQL> ALTER SYSTEM OPEN DATABASE;
ERR-HY000(14094): datafile recovery required - datafile(/goldilocks/db/TEST_TBS.dbf) of
tablespace(TEST_TBS) corrupted
gSQL> ALTER TABLESPACE TEST_TBS OFFLINE IMMEDIATE;
Tablespace altered.
gSQL> ALTER SYSTEM OPEN DATABASE;
System altered.
```

Data file full backup or incremental backup should exist when recovering the data file.

The following describes how to recover the data file when backup exists.

```

gSQL> \STARTUP MOUNT
Startup success
gSQL> ALTER SYSTEM OPEN DATABASE;
ERR-HY000(14094): datafile recovery required - datafile(/goldilocks/db/TEST_TBS.dbf) of
tablespace(TEST_TBS) corrupted
gSQL> ALTER DATABASE RECOVER DATAFILE 'TEST_TBS.dbf' CORRUPTION;
Database altered.
gSQL> ALTER SYSTEM OPEN DATABASE;
System altered.

```

Data File Information

For more information about data files being used in database, refer to **V\$DATAFILE**.

```

gSQL> \DESC V$DATAFILE

```

COLUMN_NAME	TYPE	IS_NULLABLE
TBS_NAME	CHARACTER VARYING(128)	FALSE
DATAFILE_NAME	CHARACTER VARYING(1024)	FALSE
CHECKPOINT_LSN	NUMBER	FALSE
CREATION_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	FALSE
FILE_SIZE	NUMBER	FALSE

7.

Backup and Recovery of GOLDBLOCKS Database

This chapter describes GOLDDILOCKS database backup and recovery, database ARCHIVELOG mode for the backup and recovery.

7.1 ARCHIVELOG Mode

GOLDDILOCKS database executes logging using circular log group. A circular log group consists of at least four log groups, and if all log allocated to a log group are run out, then following log group is used. If all created log groups are run out, the first log group is reused. In this case, the new log file is not created but the previously recorded log file is reused.

The previously written logs are lost if a log group is reused in NOARCHIVELOG mode. Therefore, if an administrator does not manage the completed logging group, the completed transactions logs disappear while operating in NOARCHIVELOG mode.

On the other hand, in ARCHIVELOG mode, the system archives log files prior to reusing it when using the following log groups after the completion of recording on log file in a log group. Then the completed logs are permanently preserved unless they are deliberately deleted.

ARCHIVELOG Mode

Log files should be archived before they are reused. It is because all log files after backup moment is required for the recovery using backup, and the backup could be needed anytime. Therefore, the backup is supported only in ARCHIVELOG mode.

The service can be interrupted in busy system due to archiving when operating in ARCHIVELOG mode. Also, an additional space is needed to store files.

NOARCHIVELOG Mode

Backup is not supported in NOARCHIVELOG mode, because it can not be determined if the log files of before reusing exist.

However, system does not archive log files. Therefore, the interruption due to an archiving at checkpoint when bulk logs are continuously being recorded does not occur. Also, it does not need a storage space for archive log files.

NOARCHIVELOG mode is set by the 'ARCHIVELOG_MODE' property value when creating database. Data

base is created in NOARCHIVELOG mode if the 'ARCHIVELOG_MODE' value is 0, and it is created in ARCHIVELOG mode when the 'ARCHIVELOG_MODE' value is 1. This property is valid only when creating database, and it is not referenced when operating database.

Execute the following syntax in mount phase of GOLDILOCKS database startup level to change ARCHIVELOG mode during database operation.

```
gSQL> ALTER DATABASE ARCHIVELOG;
```

```
Database altered.
```

```
gSQL> ALTER DATABASE NOARCHIVELOG;
```

```
Database altered.
```

Enquire *ARCHIVELOG_MODE* of *V\$ARCHIVELOG* which is the performance view to retrieve archive log mode set in database.

```
gSQL> SELECT ARCHIVELOG_MODE FROM V$ARCHIVELOG;
```

```
ARCHIVELOG_MODE
```

```
-----
```

```
NOARCHIVELOG
```

```
1 row selected.
```

7.2 Backup and Recovery

Backup

The Purpose of Backup and Recovery

Database can protect and recover data when various failures or data loss occurs. There are many reasons for failures. The duplicated copy is required especially when the database is physically corrupted or damaged by disaster, and this is called as backup.

When database service is not available due to various failures, it becomes available again by using current database or backup, and this is called as recovery. The restart recovery is to recover by using the current database. The media recovery is to recover by using the backup. GOLDDILOCKS automatically or manually performs the media recovery to recover the backup data file, then recover and restarts by the restart recovery.

Backup

Database backup is divided into physical backup and logical backup. Generally, backup means making copy of data files online. This chapter describes the online physical backup.

Table 7-1 Database backup type

Backup type	Backup form	Database state	Description
Physical backup	Cold backup	Offline	Creating the copy of data file Stopping service to execute backup
	Hot backup	Online	Creating the copy of data file Executing backup during service operation Available only in ARCHIVELOG mode
Logical backup	Export backup	Online	Backup/recovery in table unit Exporting regardless of HW/OS

GOLDDILOCKS uses data files and control files for executing service, and they should be recovered when they were corrupted from a failure. A control file is created when creating database, and stores necessary information to operate database. A data file stores actual data, and they are data files in system tablespace created when database is created and datafiles in user made tablespace. Use backup files for recovery when some of those control files or data files are corrupted.

In other words, control files and data files should be backed up for recovery. In order to do so, GOLDDILOCKS supports control file backup, database backup, and tablespace backup.

Depending on the backup method, it is divided into full backups and incremental backups. Full backup co

pies data files in time of backup, and an incremental backup copies only modified parts since the previous backup. The full backup copies data files, so the copy as big as the data file is created everytime of backup. Therefore, it consumes the storage space as much as the size of database or tablespace.

On the other hand, the size of the incremental backup is relatively small because it copies only the modified part after the previous backup.

Table 7-2 Full backup vs. incremental backup

Item	Full backup	Incremental backup
Backup object	<ul style="list-style-type: none"> Database: Entire data file which is being used by database Tablespace: Data files in database's specific tablespace 	
Description	<ul style="list-style-type: none"> Backup entire data file which is being used by database or tablespace Creating a backup file per a data file Restoring the required data file after failure by using appropriate backup method, then recover it 	<ul style="list-style-type: none"> Backup the modified part of the data file being used by database or tablespace after the previous backup Creating an incremental backup file in which the modified part is recorded Recovery by using multiple incremental backups after failure

Full Backup

Use full backup to execute database backup and tablespace backup. Database backup is to backup control files and data files.

Control File Backup

Backup the control file as follows. Specify the backup control file name including the absolute path, or specify the backup control file name only. If only the backup control file name is specified, the backup file is created in the path set in the 'LOG_DIR' property.

```
gSQL> ALTER DATABASE BACKUP CONTROLFILE TO '/goldilocks_data/backup/backup.ctl';
Database altered.
```

Database Backup

Database backup can backup entire data file being used in database. When backup data file, recording on the file should be prevented while copying the data file. If the file is used during copying, the data file becomes inconsistent, and even worse it will be inconsistent within a page. Set the database to the state which enables backup to prevent those inconsistencies.

```
gSQL> ALTER DATABASE BEGIN BACKUP;
Database altered.
```

Use operating system's file copy feature to create the copy of data file on database backup enabled state. Then set it as follows, then the database backup is completed, and it is writable.

```
gSQL> ALTER DATABASE END BACKUP;  
Database altered.
```

Tablespace Backup

Tablespace backup can backup data files being used by a specified tablespace. Set it to backup enabled state by using the tablespace name (tablespace_name) as follows for the same reason of database backup.

```
gSQL> ALTER TABLESPACE TEST_TBS BEGIN BACKUP;  
Tablespace altered.
```

Use operating system's file copy feature to create the copy of tablespace's data file on tablespace backup enabled state. Then, complete the tablespace backup as follows.

```
gSQL> ALTER TABLESPACE TEST_TBS END BACKUP;  
Tablespace altered.
```

Incremental Backup

An incremental backup supports database unit backup and tablespace unit as same as full backup. An incremental backup does not backup control files separately, but the control file is backed up together when executing the database incremental backup.

GOLDBLOCKS supports incremental level from 0 to 4 for an incremental backup. When an incremental backup is executed for the first time, the level should be set to 0, and backup the entire data file. Set the incremental backup level to 1 or higher to back up only the modified parts since the last backup when executing the incremental backup later.

The given level of incremental backup searches for the time when the same level or lower level was executed. Then, it backs up only the modified parts after the previous backup.

For example, after performing level 0 backup, level 2 backup(1) backs up only the modified parts after the level 0 backup, and level 2 backup(2) backs up the modified part after the level 2(1) backup. In the same way, level 2 backup(3), (4), (5), (6) backs up the modified part after the level 2 backup. The level 1 backup which was executed lastly backs up all modified parts after the level 0 backup.

Figure 1 Incremental backup

Database Incremental Backup

Execute an incremental backup on the entire data file of database as follows. At first, the entire data file of database is backed up at level 0.

```
gSQL> ALTER DATABASE BACKUP INCREMENTAL LEVEL 0;
Database altered.
```

And then, the modified part after level 0 is backed up at level 1.

```
gSQL> ALTER DATABASE BACKUP INCREMENTAL LEVEL 1;
Database altered.
```

Tablespace Incremental Backup

At first, the entire data file of tablespace is backed up at level 0 as follows in the same way as the database backup.

```
gSQL> ALTER TABLESPACE TEST_TBS BACKUP INCREMENTAL LEVEL 0;
Tablespace altered.
```

And then, the modified part after level 0 is backed up at level 1.

```
gSQL> ALTER TABLESPACE TEST_TBS BACKUP INCREMENTAL LEVEL 1;
Tablespace altered.
```

Recovery

Database guarantees data consistency by executing recovery when a failure occurs or database is corrupted.

The types of database failure are as follows.

Table 7-3 Database failure type

Failure type	Causes and symptoms	Solution
Transaction failure	Transaction failure and deadlock due to the logical error (bad input, overflow, data not found)	Abort transaction
System crash	Corruption of volatile storage device due to an abnormal termination (blackout) of DBMS or OS	Restart recovery
Media failure	Corruption of non-volatile storage device	Restore, restart recovery

Abort the executing transactions, rollback all database updates and release obtained lock items to solve transaction failure.

Database processes are abnormally terminated at system crash, so the recent information stored in volatile storage are not reflected in the non-volatile storage, and they are lost. Startup database, and recover the database to the state when it was consistent before abnormal termination. This process is called as restart recovery. To recover the database, the restart recovery uses control files, data files, and log files which were used by database before the failure.

The recovery using database file before failure is not possible if non-volatile storage device is corrupted. It is because control files, datafiles and log files are corrupted so that they can not be used for recovery. In this case, recover the database file by using previously archived backup files and log files, then execute the recovery.

GOLDILOCKS supports both the complete recovery and the incomplete recovery. The complete recovery recovers the datafile to the latest and consistent state by using the log file. The complete recovery targets database, tablespace and data file. For the tablespace and data file, the complete recovery is available for the offline tablespace even during the database service. The complete recovery is divided into the automatic recovery and the manual recovery. The automatic recovery is performed when restarting the database, and the manual recovery uses the recovery statement supported by GOLDILOCKS.

The incomplete recovery is available only for the database, and it recovers to the consistent state of a specific point. The incomplete recovery is performed only manually. It incompletely recovers at once up to the specific point, or it performs the user selective incomplete recovery. The user selective incomplete recovery is a method of which a user selects a log file available to recover and recovers up to that user selected log file.

If both the complete recovery and the incomplete recovery is required, then use redo log and archive log f

iles.

Table 7-4 Database recovery

Recovery	Target	Description
Complete recovery	Database, tablespace, datafile	<ul style="list-style-type: none"> • Automatic recovery (Recovers at the restart) • Manual recovery (Manually recovers the database, tablespace and data file.)
Incomplete recovery	Database	<ul style="list-style-type: none"> • Manual recovery only <ul style="list-style-type: none"> ◦ Incomplete recovery at once ◦ User selective incomplete recovery

Automatic Recovery

The automatic recovery is executed when restarting after a normal or abnormal termination of database. It uses the control files, data files and log files which were used just before the termination.

Especially when the latest database file is corrupted, the backed up database file is recovered and the automatic recovery is executed by using the archive log file.

The recovery is executed in three phases, and they are analysis, redo and undo.

Analysis

Two operations are executed in analysis phase.

First, it searches for the first log to perform the restart recovery. For that, it refers to the most recently executed checkpoint log, and looks for the most recent checkpoint log from the log information recorded in control file.

Second, it initialize the transaction table of the system. It uses transaction information which was executed at checkpoint written on checkpoint log to initialize system transaction table.

Restart Redo

All logs, from the first log obtained in the analysis phase for restart recovery to the last log recorded in the redo log files, execute restart redo. The transaction table is updated when a transaction is completed or a new transaction is started during this process.

Restart Undo

After restart redo is completed, it performs the transaction rollback by performing undo all incomplete transactions remained in the transaction table.

Recovery Using Backup

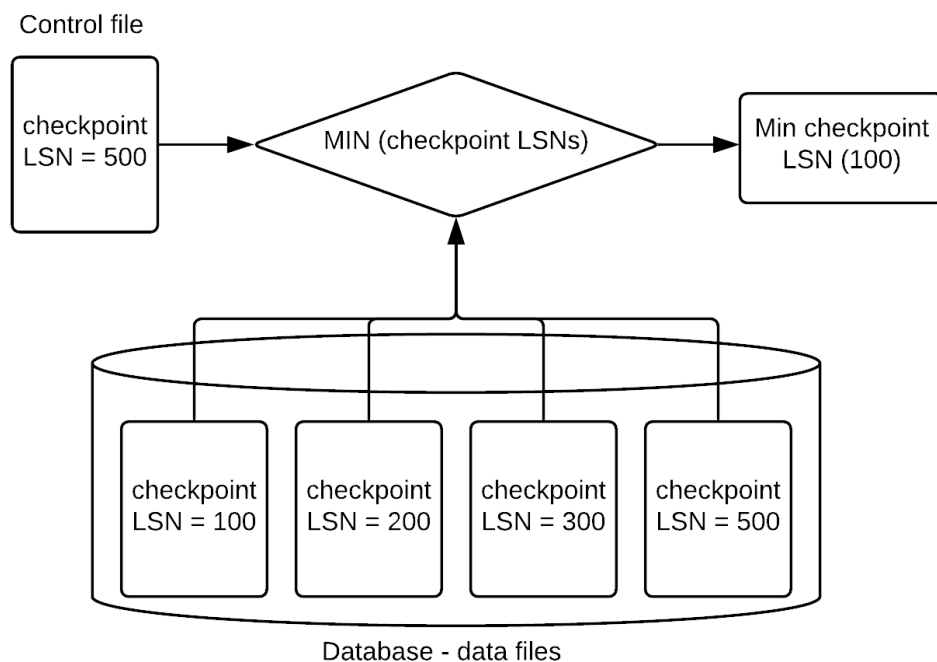

If control files, data files and log files are corrupted or does not exist, the recovery should be performed after it is recovered by using the backup file. It is complicated to find the log on which the recovery starts when performing the recovery by using the backed up control file or the data file.

Analysis for Recovery Using Backup

In analysis phase for the recovery using backup, like as the automatic recovery, it searches for the first log for recovery and initializes the transaction table. It searches for the oldest LSN among the checkpoint LSN recorded in all the data file's file header, then selects the minimum value by comparing it with checkpoint LSN recorded in control file to find the first log for recovery.

The checkpoint LSN recorded in data file header stores the checkpointed LSN of the corresponding data file. Therefore, when using the backup datafile, select the oldest checkpoint LSN, and then select the minimum value comparing to the checkpoint LSN in the control file, then the minimum checkpoint LSN for the recovery is determined.

Figure 2 Procedure to determine the minimum checkpoint LSN for the recovery

Recovery Using Archive Log Files

The recovery using archive log files uses not only redo log files but also archive log files, when the minimum checkpoint LSN defined for the recovery is in an archive log file. The recovery using the backup is executed in a unit of database, tablespace and data file. Database recovery is executed only on MOUNT phase, and the recovery in tablespace and data file unit is executed on MOUNT phase or OPEN phase.

- Restoring the backup data files

Restoring data files is executed by using the full backup or the incremental backup. A user directly executes the full backup by using operating system's file copy command to restore data. On the other hand, the incremental backup is executed by using restoring syntax of GOLDILOCKS. The tablespace should be OFFLINE to restore data files on OPEN phase.

The followings describe how to restore data files using incremental backup.

```
gSQL> ALTER DATABASE RESTORE;
```

Database altered.

```
gSQL> ALTER DATABASE RESTORE TABLESPACE TEST_TBS;
```

Database altered.

- Manual recovery after restoring data files

The followings describe how to execute recovery using the syntax of recovery after restoring data files.

```
gSQL> ALTER DATABASE RECOVER;
```

Database altered.

```
gSQL> ALTER DATABASE RECOVER TABLESPACE TEST_TBS;
```

Database altered.

Incomplete Recovery

If the restart recovery is not available due to a user mistake during operation, corrupted control files, or corrupted redo log files and archive log files nor can the recovery restore consistency of database, then execute the incomplete recovery. The incomplete recovery restores data only until the point-in-time.

The followings are when the incomplete recovery is required.

Corrupted Control Files

Control files are multiplexed, so they can be recovered using uncorrupted files if not all of the multiplexed files are corrupted.

However, if all control files are corrupted, recovery should be executed using the backup control files. In this case, the complete recovery is impossible because the log information of the control files can be changed. The recovery restores only until point-in-time.

Restoring Backup Control File

When control files are corrupted, copy other multiplexed control files to keep control files up-to-date. However, when all multiplexed control files are corrupted, restore the backup control files, then perform the recovery. The log information which is changed after the backup can not be recovered when executing recovery using the backup data files.

Corrupted Redo Log File

GOLDDILOCKS consists redo log files with several log members in a log group to prevent log file corruption. However, if all log members in a log group are corrupted, it can not be recovered using redo log file. In this case, an incomplete recovery should be executed until uncorrupted log file.

Corrupted Archive Log File

In recovery, if archive log file is corrupted, then incomplete recovery should be executed until uncorrupted log file. The process is as same as when redo log file is corrupted.

User's Mistake

When a user dropped an important table by mistake, or inserted, updated, deleted wrong data, it should be recovered back to the point before the mistake.

Incomplete Recovery of GOLDDILOCKS Database

GOLDDILOCKS supports two types of incomplete recovery. One of the recovery is executed until the point which an operator specified. The other recovery is executed in log file unit interactively between an operator and system.

The incomplete recovery until a specified point can specify the point-in-time by using a specified log's LSN, specified time, or a specified SCN.

Incomplete recovery is executed for the entire database only on MOUNT phase. Incomplete recovery in the specific tablespace unit is not supported due to the database consistency problem.

- Incomplete recovery until specified LSN

It searches for log which will complete the incomplete recovery, then executes the recovery until the log's LSN.

The following is an example of executing the incomplete recovery until log LSN 1000.

```
gSQL> ALTER DATABASE RECOVER UNTIL CHANGE 1000;
Database altered;
gSQL> ALTER DATABASE RECOVER UNTIL CHANGE LSN 1000;
Database altered;
```

- Incomplete recovery until specified SCN

It searches for SCN which will complete the incomplete recovery, then executes the recovery until the log's SCN.

The following is an example of executing the incomplete recovery until SCN 300.

```
gSQL> ALTER DATABASE RECOVER UNTIL CHANGE SCN 300;
Database altered;
```

Note

SCN is not sequentially recorded so even when the incomplete recovery is executed until SCN 300, it may be recovered beyond SCN 300. The following is an example of the recovery when SCN is reversed.

Log: --- LSN 90 (SCN 3) -- LSN 91 (SCN 5) -- LSN 92 (SCN 4)

```
gSQL> ALTER DATABASE RECOVER UNTIL CHANGE SCN 3;
```

→ It is recovered until LSN 90.

```
gSQL> ALTER DATABASE RECOVER UNTIL CHANGE SCN 4;
```

→ It is recovered until LSN 92. (It is recovered until LSN 92 in which SCN 4 is.)

```
gSQL> ALTER DATABASE RECOVER UNTIL CHANGE SCN 5;
```

→ It is recovered until LSN 92. (Both SCN 4, SCN 5 are arbitrarily recovered until SCN5)

- Incomplete recovery until specified time

It searches for the time which will complete the incomplete recovery, then executes the recovery until the specified time.

The following is an example of executing the incomplete recovery until '2017-05-18 16:10:10.000000'.

```
gSQL> ALTER DATABASE RECOVER UNTIL TIME '2017-05-18 16:10:10.000000';
Database altered;
```

- Interactive incomplete recovery

If the log file is corrupted, it executes the recovery until just before the corrupted log file. For that, GOLDILOCKS suggests an operator the required log files, and the operator executes the incomplete recovery by using the GOLDILOCKS' recommended log file or a new log file.

The following is an example of executing the interactive incomplete recovery of GOLDDILOCKS. GOLDDILOCKS suggests log files required for the recovery when executing BEGIN for the incomplete recovery. The operator executes the incomplete recovery by using the GOLDDILOCKS' recommended log file, or may describe the log file for the recovery.

```
gSQL> ALTER DATABASE BEGIN INCOMPLETE RECOVERY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_0.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 139992)
Database altered.
gSQL> ALTER DATABASE RECOVER AUTOMATICALLY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_1.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 144143)
Database altered.
gSQL> ALTER DATABASE END INCOMPLETE RECOVERY;
Database altered.
```

Restarting Database after Incomplete Recovery

After the incomplete recovery is completed, a user can not restart database in a normal way. It is because the recovered GOLDDILOCKS database by the incomplete recovery has nothing to do with the current redo log files. A user should reset the redo log file to restart database because database is at the previous point, and the current redo log file is about the log after then. Use *RESETLOGS* option when restarting GOLDDILOCKS database after the incomplete recovery.

```
gSQL> ALTER SYSTEM OPEN DATABASE;
ERR-HY000(14083): must use RESETLOGS option for database open
gSQL> ALTER SYSTEM OPEN DATABASE RESETLOGS;
System altered.
```

Cautions for Incomplete Recovery

Incomplete recovery is executed until the specific point to create consistent database, but it is not easy to find the specific point. All redo log files are reset after the incomplete recovery. Therefore, all the control files, data files, redo log files in database should be backed up offline before the incomplete recovery. Then the incomplete recovery should be executed several times to find the correct point.

Archive log files are needed during the incomplete recovery. However, the newly recovered database is different from the previous database, so drop the archive redo log file created by the previous database.

Recovery Examples

Corrupted Control File

GOLDILOCKS database control files store the important information about the physical structure of database and the database consistency. If it is corrupted or dropped by mistake, the database can not be operated.

GOLDILOCKS database multiplexes at least 2 up to 8 control files. If there is at least one valid control file, the remaining control files are restored, then the database can be restarted.

When a valid multiplexed control file exists

If the multiplexed control file `'/goldilocks_data/wal/control_1.ctl'` is corrupted, restarting database fails as follows.

```
gSQL> \STARTUP
ERR-HY000(14097): control file is corrupted - '/goldilocks_data/wal/control_1.ctl'
```

Copy the valid control file `'/goldilocks_data/wal/control_0.ctl'` to `'/goldilocks_data/wal/control_1.ctl'`, and drop the shared memory which failed to restart. Then restart the database.

```
$ cp /goldilocks_data/wal/control_0.ctl /goldilocks_data/wal/control_1.ctl
gSQL> \SHUTDOWN
Shutdown success
gSQL> \STARTUP
Startup success
```

When all multiplexed control files are corrupted

If all multiplexed control files are corrupted, a user can restart the database using backup control files after incomplete recovery. The database's physical structure can be changed after backing up control files. Therefore, the incomplete recovery should be executed when restoring control files using backup control files. Archive log files and redo log files still exist even after incomplete recovery. Therefore, an administrator executes GOLDILOCKS interactive incomplete recovery to manually restore until 'CURRENT' state redo log file.

The backup control file can be copied to multiplexed control files by operating system's file copy feature, or they can be restored by GOLDILOCKS database's recovery feature as follows. The control file recovery can be executed only in NOMOUNT phase of GOLDILOCKS multilevel startup.

```
gSQL> \STARTUP NOMOUNT
Startup success
gSQL> ALTER DATABASE RESTORE CONTROLFILE FROM '/goldilocks_data/backup/backup.ctl';
Database altered.
```

After restoring the backup control files, execute the incomplete recovery in MOUNT phase as follows.

```
gSQL> ALTER SYSTEM MOUNT DATABASE;
System altered.
gSQL> ALTER DATABASE BEGIN INCOMPLETE RECOVERY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_0.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 137499)
Database altered.
gSQL> ALTER DATABASE RECOVER AUTOMATICALLY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_1.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 137667)
Database altered.
gSQL> ALTER DATABASE RECOVER '/goldilocks/wal/redo_1_0.log';
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_2.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 137672)
Database altered.
gSQL> ALTER DATABASE END INCOMPLETE RECOVERY;
Database altered.
gSQL> ALTER SYSTEM OPEN DATABASE RESETLOGS;
System altered.
```

Corrupted Data File

If a data file is corrupted or dropped, the complete recovery is executed by using the backup data files. The full backup restores the data files by copying the backup files, and the incremental backup restores the data files by using the GOLDDILOCKS' restoring syntax.

The restoration and recovery of data files are executed in database unit or in tablespace unit. It can also be executed in the tablespace unit of the corresponding data file. The recovery in tablespace unit can be executed in MOUNT phase or OPEN phase. The tablespace should be in OFFLINE state to restore and recover data files on OPEN phase.

- Recovering the corrupted data files using full backup in MOUNT phase

Execute the complete recovery after copying the backup data file */goldilocks/backup/test.dbf* to */goldilocks/db/test.dbf*.

```
$ cp /goldilocks/backup/test.dbf /goldilocks/db/test.dbf
gSQL> \STARTUP MOUNT
System altered.
gSQL> ALTER DATABASE RECOVER;
Database altered.
gSQL> ALTER SYSTEM OPEN DATABASE;
```

System altered.

- Recovering the corrupted data files using full backup in OPEN phase

```
gSQL> SELECT IS_ONLINE FROM V$TABLESPACE WHERE TBS_NAME = 'TEST_TBS';
IS_ONLINE
-----
FALSE
1 row selected.
$ cp /goldilocks/backup/test.dbf /goldilocks/db/test.dbf
gSQL> ALTER DATABASE RECOVER TABLESPACE TEST_TBS;
Database altered.
gSQL> ALTER TABLESPACE TEST_TBS ONLINE;
Tablespace altered.
```

- Recovering the corrupted data files using incremental backup in MOUNT phase

```
gSQL> \STARTUP MOUNT
System altered.
gSQL> ALTER DATABASE RESTORE;
Database altered.
gSQL> ALTER SYSTEM OPEN DATABASE;
System altered.
```

- Recovering the corrupted data files using incremental backup in OPEN phase

```
gSQL> SELECT IS_ONLINE FROM V$TABLESPACE WHERE TBS_NAME = 'TEST_TBS';
IS_ONLINE
-----
FALSE
1 row selected.
gSQL> ALTER DATABASE RESTORE TABLESPACE TEST_TBS;
Database altered.
gSQL> ALTER TABLESPACE TEST_TBS ONLINE;
Tablespace altered.
```

User's Mistake (Table Dropping or Wrong Insert/drop/update)

GOLDILOCKS database supports DDL rollback of table and index if the table *TEST* is dropped by mistake. Namely, a user can rollback to cancel the table dropping instead of committing as follows even if a user dropped the table.

```

gSQL> DROP TABLE TEST;
Table dropped.
gSQL> ROLLBACK;
Rollback complete.
gSQL> \DESC TEST
COLUMN_NAME  TYPE          IS_NULLABLE
-----
I1           NUMBER(10,0)  TRUE
I2           CHARACTER(10) TRUE
gSQL> DROP TABLE TEST;
Table dropped.
gSQL> COMMIT;
Commit complete.
gSQL> \DESC TEST
ERR-42000(16040): table or view does not exist :
SELECT *      FROM TEST  WHERE 1 = 0
          *
ERROR at line 1:

```

If table dropping is committed it can not be rolled back. Therefore, execute GOLDDILOCKS incomplete recovery to recover until the specific point of the database using backup. Then, the data is recovered until the time before the table dropping. Restart the database after that.

The backup file at the point before the table dropping is used to restore the table in incomplete media recovery. The correct point can be found, as described above, by repeating the recovery several times to find the time of table dropped. At that time, the gdump tool is used to dump the log file and analyze it.

Assuming LSN is 1000 at the time after table dropping, the incomplete recovery is executed as follows.

```

gSQL> \STARTUP MOUNT
System altered.
gSQL> ALTER DATABASE RECOVER UNTIL CHANGE 1000;
Database altered.
gSQL> ALTER SYSTEM OPEN DATABASE RESETLOGS;
System altered
gSQL> \DESC TEST
COLUMN_NAME  TYPE          IS_NULLABLE
-----
I1           NUMBER(10,0)  TRUE
I2           CHARACTER(10) TRUE

```

Corrupted Log Files (Archive File, Redo Log File)

- Corrupted archive log file during recovery

Assume that the data files are corrupted and a user are executing recovery using the backup data files. Also, assume that the specific archive log file is corrupted during the recovery so that the recovery can not be completed.

For example, there are archive log files such as 'archive_0.log', 'archive_1.log', 'archive_2.log', 'archive_3.log'. An 'archive_3.log' is corrupted, and the recovery can not be executed. In this case, incomplete recovery is executed until 'archive_2.log', and the database is restarted.

```
gSQL> \STARTUP MOUNT
System altered
gSQL> ALTER DATABASE BEGIN INCOMPLETE RECOVERY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_0.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 139992)
Database altered.
gSQL> ALTER DATABASE RECOVER AUTOMATICALLY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_3.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 194143)
Database altered.
gSQL> ALTER DATABASE END INCOMPLETE RECOVERY;
Database altered.
gSQL> ALTER SYSTEM OPEN DATABASE RESETLOGS;
System altered
```

- Corrupted redo log file

Assume that a failure occurs when operating database so the CURRENT log group in which logs are flushed is corrupted.

For example, when an abnormal termination occurs in the state of the following log groups, the manual recovery is executed and completes the incomplete recovery. It is because the log group 3, 0 is not archived yet.

Table 7-5 Log group state

Log group	Log group state	Log file sequence no.	Prev last LSN
Log group 0	ACTIVE	8	80000
Log group 1	CURRENT	9	90000
Log group 2	INACTIVE	6	60000
Log group 3	ACTIVE	7	70000

```

gSQL> \STARTUP MOUNT
System altered
gSQL> ALTER DATABASE BEGIN INCOMPLETE RECOVERY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_0.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 1000)
Database altered.
gSQL> ALTER DATABASE RECOVER AUTOMATICALLY;
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_7.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 70001)
Database altered.
gSQL> ALTER DATABASE RECOVER '/goldilocks/wal/redo_3_0.log';
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_8.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 80001)
Database altered.
gSQL> ALTER DATABASE RECOVER '/goldilocks/wal/redo_0_0.log';
ERR-01000(14104): Warning: suggestion '/goldilocks/archive_log/archive_9.log'
ERR-01000(14103): Warning: media recovery needs a logfile including log (Lsn 90001)
Database altered.
gSQL> ALTER DATABASE END INCOMPLETE RECOVERY;
Database altered.
gSQL> ALTER SYSTEM OPEN DATABASE RESETLOGS;
System altered

```

More Recent Datafile Than Log

All tablespaces created in GOLDDILOCKS database consists of pages, and each page set the log LSN which was recorded by a transaction having updated that page last is set as the page LSN. Therefore, all page LSNs in the datafile have the same or smaller value than the LSN of the latest log recorded in the redo log file of the log group.

When restarting the database, if a specific page's LSN of the data file has a bigger value than the latest log's LSN, then it corrupts the database consistency and the normal service is not available. GOLDDILOCKS database checks the data file and log when restarting so that this abnormal situation does not happen.

If any page whose LSN has bigger value than the latest log's LSN is in the data file, then restarting the database fails as follows.

```

gSQL> \STARTUP
ERR-HY000(14114): exist inconsistent datafiles; need to restore more older backup datafiles or
more recent redo logfiles

```

To solve this problem, restore the backup data file consisting of LSNs smaller than the latest log LSN. Or, restart the database after restoring the log file on which the LSN log bigger than the data file is recorded.

Check the trace file to find the data file to restore.

For example, if the following messages are output on the trace file when restarting fails, then the page whose LSN is '126787' in '/data/db/system_dic.dbf' data file, and this value is bigger than the latest log LSN of the log file '126652'. Therefore, for the restart, restore the previous backup data file, or restore the log file on which the log LSN same or bigger than '126787' is recorded. Also, if several pages of the data file has a LSN value bigger than the log file LSN, then restore the log file bigger than the maximum value among them to restart and provide the service.

```
[2016-01-15 12:41:14.045679 THREAD(10581,139799401453312)] [INFORMATION]
[STARTUP_SM] the max page lsn '126787' of datafile '/data/db/system_dict.dbf' is more recent
than the latest redo log lsn '126652'.
[2016-01-15 12:41:14.045705 THREAD(10581,139799401453312)] [INFORMATION]
[STARTUP_SM] the max page lsn '126830' of datafile '/data/db/system_undo.dbf' is more recent
than the latest redo log lsn '126652'.
[2016-01-15 12:41:14.045729 THREAD(10581,139799401453312)] [INFORMATION]
[STARTUP_SM] the max page lsn '126829' of datafile '/data/db/test_log.dbf' is more recent than
the latest redo log lsn '126652'.
```

in doubt Transaction Recovery in Cluster Environment

The transactions in the cluster environment are divided into global transaction, domain transaction and local transaction. The global transaction is performed in two or more cluster groups, the domain transaction is performed in a single cluster group and the local transaction is performed in a single cluster member.

The local transaction uses only the local member's log when performing the recovery. The domain transaction uses the local member's log when performing the recovery, and performs the rollback when an abnormal termination occurs without completing the transaction, and performs the synchronization with a group member through the rebalance if needed.

The global transaction uses 2 phase commit protocol to commit. 2 phase commit is performed as follows for GOLDDLOCKS global transaction.

- PREPARE phase
 - It transfers PREPARE messages from the driver member to all members, and waits for the respond message.
 - It moves on to COMMIT phase when it receives the respond message of PREPARE from all members, or it rolls back when at least one member fails or does not respond.
- COMMIT phase
 - It transfers COMMIT messages from the driver member to all members, and waits for the respond message.
 - It commits even when a member fails.

If a member is abnormally terminated without recording the commit log on COMMIT phase, it should obtain the state information from other members when restarting. It is because it is unable to know if the global transaction in 'PREPARE' state was committed or rolled back, when restarting.

For that, GOLDBLOCKS records the committed global transaction information in transaction record form in MEM_TRANS_TBS. Also, when recording a new record in that record, the previous record is recorded in commit.log if needed. Later, the abnormally terminated member performs the restart recovery or the manual recovery by using the log. It performs the recovery by obtaining the transaction COMMIT/ROLLBACK information from members in service when *in doubt* transaction in 'PREPARE' state is remained.

8.

GOLDILOCKS Database Replication

8.1 Overview

This chapter describes CYCLONE and LOGMIRROR.

GOLDBLOCKS supports two types of replication, and they are CYCLONE and LOGMIRROR. CYCLONE replicates transactions using CDC, and LOGMIRROR replicates redo log files in the source database.

Table 8-1 Replication tool

Tool	Replication target	Description
CYCLONE	Transaction	It uses CDC method, and replicates the transaction reflected in master, then reflect it to slave.
LOGMIRROR	Redo log file	It identically replicates redo file in master database to slave.

- CYCLONE
 - It uses Change Data Capture (CDC) method to analyze and treat redo log files of the source database, then applies them to a remote database.
 - It supports only asynchronous (async) method because it analyzes contents stored in database's redo log file.
- LOGMIRROR
 - It replicates redo log files stored in the source database to a remote database.
 - It is used to avoid the data loss of CYCLONE which is executed in async method.

8.2 Operating Method

CYCLONE

For more information about general operating method and option, refer to **CYCLONE**.

Adding and Deleting Nodes

CYCLONE is performed in a group unit, and it is as same as the replication nodes. Add a group when adding nodes, drop a group when deleting nodes.

Examples of Adding Nodes

- Record the group 2 to be added in master configuration file.
 - Set a unique port per each group.
 - The default master configuration file is \$GOLDILOCKS_DATA/conf/cyclone.master.conf.
 - The following is an example of group 1 node in operation.

```
...
...
GROUP_NAME = Group1
{
    PORT = 21102
    CAPTURE_TABLE =
    (
        testTable1,
        testTable2
    )
}
```

- The following is an example of group 2 node to be added.

```
GROUP_NAME = Group2
{
    PORT = 21103
    CAPTURE_TABLE =
    (
        testTable5,
```

```

        testTable6
    )
}

```

- Record the group 2 to be added in slave configuration file.
 - The port of group 2 should be as same as the port added to the existing master.
 - The default slave configuration file is \$GOLDBLOCKS_DATA/conf/cyclone.slave.conf.
 - The following is an example of group 1 node in operation.

```

...
...
GROUP_NAME = Group1
{
    PORT = 21102
    APPLY_TABLE =
    (
        testTable1 To testTable3,
        testTable2 To testTable4
    )
}

```

- The following is an example of group 2 node to be added.

```

GROUP_NAME = Group2
{
    PORT = 21103
    APPLY_TABLE =
    (
        testTable5 To testTable7,
        testTable6 To testTable8
    )
}

```

- Execute and check the added group 2 node in the master device as follows.

```

prompt> cyclone --master --start --group Group2
[GROUP2] Startup done as Master.
prompt> cyclone --master --status
=====
|      CYCLONE STATUS - MASTER      |
=====

```

```
GROUP1 Running...
GROUP2 Running...
-----
```

- Execute and check the added group 2 node in the slave device as follows.

```
prompt> cyclone --slave --start --group Group2
[GROUP2] Startup done as Slave.
prompt> cyclone --slave --status
=====
          CYCLONE STATUS - SLAVE
=====
GROUP1 Running...
GROUP2 Running...
-----
```

Examples of Deleting Nodes

- Terminate the group 2 node to be deleted in the slave device as follows.

```
prompt> cyclone --slave --stop --group Group2
stop done.
prompt> cyclone --slave --status
=====
CYCLONE STATUS - SLAVE
=====
GROUP1 Running...
-----
```

- Terminate the group 2 node to be deleted in the master device as follows.

```
prompt> cyclone --master --stop --group Group2
stop done.
prompt> cyclone --master --status
=====
CYCLONE STATUS - MASTER
=====
GROUP1 Running...
-----
```

- Drop the group 2 node to be deleted from the master configuration file.
 - The default master configuration file is \$GOLDILOCKS_DATA/conf/cyclone.master.conf.

- The following is an example of group 1 node in operation.

```
...
...
GROUP_NAME = Group1
{
    PORT = 21102
    CAPTURE_TABLE =
    (
        testTable1,
        testTable2
    )
}
```

- The following is an example of deleting group 2 node.

```
GROUP_NAME = Group2
{
    PORT = 21103
    CAPTURE_TABLE =
    (
        testTable5,
        testTable6
    )
}
```

- Drop the group 2 node to be deleted from the slave configuration file as follows.
 - The default slave configuration file is \$GOLDBLOCKS_DATA/conf/cyclone.slave.conf.
 - The following is an example of group 1 node in operation.

```
...
...
GROUP_NAME = Group1
{
    PORT = 21102
    APPLY_TABLE =
    (
        testTable1 To testTable3,
        testTable2 To testTable4
    )
}
```

- The following is an example of deleting group 2 node.

```
GROUP_NAME = Group2
{
  PORT = 21103
  APPLY_TABLE =
  (
    testTable5 To testTable7,
    testTable6 To testTable8
  )
}
```

Initializing Replication

Initializing replication is executed when existing replication nodes or a group's table gives up execution due to DDL operation. A specific node or entire node can be initialized.

The initializing replication is performed by restarting replication being operated in slave using --reset option.

On the other hand, master does not require any operation.

Examples of Initializing Replication on a Specific Node

- Terminate the group 2 node to be initialized in the slave device as follows.

```
prompt> cyclone --slave --stop --group Group2
stop done.
prompt> cyclone --slave --status
=====
          CYCLONE STATUS - SLAVE
=====
GROUP1 Running...
-----
```

- Restart group 2 node in slave device using --reset option.
 - Master device does not require any operation.
 - Replication restarts from the current point.

```
prompt> cyclone --slave --start --reset --group Group2
[GROUP2] Startup done as Slave.
prompt> cyclone --slave --status
=====
```

```

CYCLONE STATUS - SLAVE
=====

```

```

GROUP1 Running...

```

```

GROUP2 Running...
-----

```

Examples of Initializing Replication of All Nodes

- Terminate all CYCLONE in operation in the slave device as follows.

```
prompt> cyclone --stop --slave
```

- Restart CYCLONE in slave device using --reset option.
 - Master device does not require any operation.
 - Replication starts from the current point.

```
prompt> cyclone --slave --start --reset
```

```
[GROUP1] Startup done as Slave.
```

```
[GROUP2] Startup done as Slave.
```

```
prompt> cyclone --slave --status
```

```

CYCLONE STATUS - SLAVE
=====

```

```

GROUP1 Running...

```

```

GROUP2 Running...
-----

```

LOGMIRROR

For more information about general operation method and options, refer to **LOGMIRROR**.

Retrieving LOGMIRROR State

GOLDDILOCKS includes the response waiting procedure of LOGMIRROR when GOLDDILOCKS interworks with LOGMIRROR. If LOGMIRROR is waiting for response, GOLDDILOCKS is also waiting in a blocked state. This state can be retrieved in v\$system_stat.

```
gSQL> SELECT * FROM V$SYSTEM_STAT WHERE STAT_NAME='LOG_MIRROR_SYNC_STATE';
```

```
STAT_NAME          STAT_VALUE COMMENTS
```

```
-----
```

```
LOG_MIRROR_SYNC_STATE      0 logmirror sync state( 0 : sync, 1 : blocked )
1 row selected.
```

If STAT_VALUE is 0, it is not a standby state but an ordinary state. If STAT_VALUE is 1, it is a blocked state waiting for a response. To restart GOLDILOCKS service while LOGMIRROR is waiting for a response, LOG MIRROR service can be stopped by modifying LOG_MIRROR_TIMEOUT as follows.

```
gSQL> ALTER SYSTEM SET LOG_MIRROR_TIMEOUT = 20;
System altered.
```

Initializing Replication

Initializing replication of LOGMIRROR should be done manually. This is to prevent data dropping or the unrecoverable situation driven by the user's incorrect option usage.

Note

Control files and redo log files are stored in LOGMIRROR slave. The required information for the operation is stored and updated in the control files.

Examples of Initializing Replication

- Terminate LOGMIRROR in operation in the slave device as follows.

```
prompt> logmirror --slave --stop
stop done.
```

- Terminate LOGMIRROR in operation in the master device as follows.

```
prompt> logmirror --master --stop
stop done.
```

- Drop the replicated control files and redo log files from the slave device.
 - For more information about the path, refer to 'LOG_PATH' option described in the slave configuration file.
 - The default LOGMIRROR slave configuration file is \$GOLDILOCKS_DATA/conf/logmirror.slave.conf.

8.3 Trace Log

The followings are detailed information about the trace log.

Table 8-2 Trace log

Name	Category	File name
CYCLONE	Master	cyclone_master_GROUP_NAME.trc
	Slave	cyclone_slave_GROUP_NAME.trc
LOGMIRROR	Master	LogMirror_master.trc
	Slave	LogMirror_slave.trc

Troubleshooting of CYCLONE

The followings are error messages and troubleshooting of CYCLONE.

Table 8-3 Troubleshooting of CYCLONE

Error message	Solution
Service is not available	Ensure that GOLDBLOCKS is normally running.
table does not exist	Check the table name described in the configuration file.
schema does not exist	Check the schema name described in the configuration file.
previously added. Maybe duplicated	Check if a table is duplicated in the configuration file.
table must have a primary key	Ensure that a table in the configuration file has the primary key.
internal error occurred.	Check the error details.
table must set supplemental log	Ensure that supplemental logging is executed in GOLDBLOCKS.
group XXX is already running	Check if the corresponding group is already running.
GOLDBLOCKS_DATA system environment is invalid	Ensure that GOLDBLOCKS_DATA environment variable is set.
log file reused or invalid. restart cyclone with '--reset' option	This error occurs when the redo log file is reused or archived redo log file does not exist. In this case, initialize CYCLONE and restart it.
fail to analyze flow	This error occurs when analyzing an abnormal redo log file. Ensure that the release version between master and slave are same.
Communication link failure	Check the network state. Restart CYCLONE.
Master disconnect abnormally	Check the network state. Restart CYCLONE.
Protocol error occurred	Check the error details.
Already slave connected	Check if the slave is already running.
Invalid group name	Check the specified group name at the startup/termination. The group name should be same as described in the configuration file.

Error message	Solution
Invalid capture information	This error occurs when the existing operating information is abnormal. In this case, initialize CYCLONE and restart it.
Redo log file read timeout	Ensure that the archived redo log files normally exist.
Invalid archive log file	The archived redo log file is not normal. In this case, initialize CYCLONE and restart it.
Fail to write file	Check the available space in the disk, and restart CYCLONE.
Invalid Meta File	This error occurs when the meta files which are managed by CYCLONE are corrupted. In this case, initialize CYCLONE and restart it.
Redo log file does not exist	Ensure that GOLDILOCKS which is operated as master is normally running.
[APPLIER-INSERT] XXX	INSERT is failed due to XXX.
[APPLIER-DELETE] XXX	DELETE is failed due to XXX.
[APPLIER-UPDATE] XXX	UPDATE is failed due to XXX.

Troubleshooting of LOGMIRROR

The followings are error messages and troubleshooting of LOGMIRROR.

Table 8-4 Troubleshooting of LOGMIRROR

Error message	Solution
Service is not available	Ensure that GOLDILOCKS is normally running.
Invalid Protocol value	Check the error details.
file does not exist	Ensure that the corresponding file normally exists.
invalid Control file	The control file is corrupted. Initialize and restart LOGMIRROR.
Communication link failure	Check the network state. Restart LOGMIRROR.
GOLDILOCKS_DATA system environment is invalid	Ensure that GOLDILOCKS_DATA environment variable is set.
There is no Shared Memory Area for LogMirror	Ensure that LOG_MIRROR_MODE property is normally set to 'enabled' in properties of GOLDILOCKS which is operated as master.
Master disconnect abnormally	Check the network state. Restart LOGMIRROR.
Invalid Log File	Ensure that the corresponding file normally exists.
Connection Information does not exist	Ensure that GOLDILOCKS connecting information in configuration files is normal.
Archive Log File does not exist	Ensure that ARCHIVELOG_MODE in GOLDILOCKS which is operated as master is normally set.

9.

Database Information

9.1 DICTIONARY_SCHEMA

DICTIONARY_SCHEMA contains views or tables to get SQL objects and their information in the system.

Note

The views and tables in DICTIONARY_SCHEMA can be retrieved from the open phase.

Execute *DictionarySchema.sql* as follows to use the views.

- For standalone

```
% gsql sys gliese --as sysdba --import $GOLDILOCKS_HOME/admin/standalone/DictionarySchema.sql
```

- For cluster

```
% gsql sys gliese --as sysdba --import $GOLDILOCKS_HOME/admin/cluster/DictionarySchema.sql
```

Information is retrieved as follows according to the names of views or tables.

- ALL-family view
 - The view name begins with ALL_
 - Information about accessible objects by a current user
- DBA-family view
 - The view name begins with DBA_
 - Information about all objects whose current user has DBA privileges (ACCESS CONTROL ON DATABASE).
- USER-family view
 - The view name begins with USER_
 - Information about objects which are owned by the current user

Views of ALL_family

It retrieves information about objects accessible by a current user.

ALL_ALL_TABLES

ALL_ALL_TABLES describes the object tables and relational tables accessible to the current user.

Table 9-1 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the table
CLUSTER_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the cluster
IOT_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the index-organized table
STATUS	VARCHAR(32)	If a previous DROP TABLE operation failed, indicates whether the table is unusable (UNUSABLE) or valid (VALID)
PCT_FREE	NUMBER	Minimum percentage of free space in a block
PCT_USED	NUMBER	Minimum percentage of used space in a block
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent (in bytes)
NEXT_EXTENT	NUMBER	Size of secondary extents (in bytes)
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to the segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to the segment
LOGGING	VARCHAR(3)	Indicates whether or not changes to the table are logged
BACKED_UP	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table has been backed up since the last modification (Y) or not (N)
NUM_ROWS	NUMBER	Number of rows in the table

Column name	Data type	Description
BLOCKS	NUMBER	Number of used blocks in the table
EMPTY_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of empty (never used) blocks in the table
AVG_SPACE	NUMBER	<ul style="list-style-type: none"> reserved Average available free space in the table
CHAIN_CNT	NUMBER	<ul style="list-style-type: none"> reserved Number of rows in the table that are chained from one data block to another or that have migrated to a new block, requiring a link to preserve the old rowid
AVG_ROW_LEN	NUMBER	<ul style="list-style-type: none"> reserved Average row length, including row overhead
AVG_SPACE_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Average freespace of all blocks on a freelist
NUM_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of blocks on the freelist
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the table, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the table is to be scanned, or DEFAULT
CACHE	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is to be cached in the buffer cache (Y) or not (N)
TABLE_LOCK	VARCHAR(32)	Indicates whether table locking is enabled (ENABLED) or disabled (DISABLED)
SAMPLE_SIZE	NUMBER	Sample size used in analyzing the table
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which the table was most recently analyzed
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is partitioned (YES) or not (NO)
IOT_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved If the table is an index-organized table, then IOT_TYPE is IOT, IOT_OVERFLOW, or IOT_MAPPING.
OBJECT_ID_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the object ID (OID) is USER-DEFINED or SYSTEM GENERATED
TABLE_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved If an object table, owner of the type from which the table is created
TABLE_TYPE	VARCHAR(128)	<ul style="list-style-type: none"> reserved If an object table, type of the table
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
TEMPORARY	VARCHAR(1)	Indicates whether the table is temporary (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is a secondary object created by cartridge
NESTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is a nested table (YES) or not (NO)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for table blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for table blocks
CELL_FLASH_CACHE	VARCHAR(32)	Cell flash cache hint to be used for table blocks
ROW_MOVEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a partitioned table, indicates whether row movement is enabled (ENABLED) or disabled (DISABLED)
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether statistics for the table as a whole (global statistics) are accurate (YES)
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
SKIP_CORRUPT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether Database ignores blocks marked corrupt during table and index scans (ENABLED) or raises an error (DISABLED)
MONITORING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has the MONITORING attribute set (YES) or not (NO)
CLUSTER_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the cluster, if any
DEPENDENCIES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether table compression is enabled (ENABLED) or not (DISABLED)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Default compression for what kind of operations
DROPPED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has been dropped and is in the recycle bin (YES) or not (NO)

Column name	Data type	Description
READ_ONLY	VARCHAR(3)	Indicates whether the table IS READ-ONLY (YES) or not (NO)
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the table segment has been created (YES) or not (NO)

ALL_ARGUMENTS

ALL_ARGUMENTS lists all arguments of functions, procedures.

Table 9-2 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of function, procedures or package
SCHEMA_NAME	VARCHAR(128)	Schema Name of function, procedures or package
OBJECT_NAME	VARCHAR(128)	Name of function, procedures
PACKAGE_NAME	VARCHAR(128)	Package Name of function, procedures
OBJECT_ID	NUMBER	ID of a function, procedures
SUBPROGRAM_ID	NUMBER	ID of procedures in package
ARGUMENT_NAME	VARCHAR(128)	Name of argument or attribute name of record type argument
POSITION	NUMBER	Position of argument or position of attribute in record type
SEQUENCE	NUMBER	Sequential order of argument and its attributes
DATA_LEVEL	NUMBER	Nesting depth of the argument for composite types
DATA_TYPE	VARCHAR(128)	Data type of the argument
DEFAULTED	VARCHAR(1)	Whether or not the argument is defaulted
DEFAULT_VALUE	VARCHAR(1)	Reserved for future use
DEFAULT_LENGTH	VARCHAR(1)	Reserved for future use
IN_OUT	VARCHAR(32)	Direction of the argument (IN, OUT, IN/OUT)
DATA_LENGTH	NUMBER	Length of the column(in bytes)
DATA_PRECISION	NUMBER	Length in decimal digits(NUMBER) or binary digits(FLOAT)
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
RADIX	NUMBER	Argument radix for a number
CHARACTER_SET_NAME	VARCHAR(128)	Character set name for the argument
TYPE_OWNER	VARCHAR(128)	Owner of the type of the argument
TYPE_NAME	VARCHAR(128)	Name of the type of the argument
TYPE_SUBNAME	VARCHAR(128)	Name of the type of the argument declared in package
TYPE_LINK	VARCHAR(128)	Name of the type of the argument declared in a remote package
PLS_TYPE	VARCHAR(128)	Name of the type of the argument at PSM
CHAR_LENGTH	NUMBER	Character limit for string datatypes
CHAR_USED	VARCHAR(1)	Whether the byte limit(B) or char limit(C) is official for the string
ORIGIN_CON_ID	VARCHAR(256)	ID of the container where the data originates

ALL_CATALOG

ALL_CATALOG displays the tables, views, synonyms, and sequences accessible to the current user.

Table 9-3 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_SCHEMA	VARCHAR(128)	Schema of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_NAME	VARCHAR(128)	Name of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_TYPE	VARCHAR(32)	Type of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED

ALL_CLUSTER_TABLES

ALL_CLUSTER_TABLES describes all cluster tables accessible to the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-4 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
SHARD_STRATEGY	VARCHAR(32)	Sharding strategy of the table: the value in (CLONED, HASH SHARDING, RANGE SHARDING, LIST S HARDING)
SHARD_PLACEMENT	VARCHAR(32)	Shard placement of the table: the value in (AT CLUSTER WIDE or AT CLUSTER GROUP)
SHARD_COUNT	NUMBER	Shard count of the table (if cloned table, the value is null)
SHARD_KEY_COUNT	NUMBER	Shard key column count of the table (if cloned table, the value is nul l)
HAS_GSI	VARCHAR(3)	Indicate whether the table has global secondary index: (YES) or (NO)
DROPPED	VARCHAR(3)	Indicates whether the table has been dropped and is in the recycle b in (YES) or not (NO)

ALL_COL_COMMENTS

ALL_COL_COMMENTS displays comments on the columns of the tables and views accessible to the current user.

Table 9-5 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
COMMENTS	VARCHAR(1024)	Comment on the column

ALL_COL_PRIVS

ALL_COL_PRIVS describes the object grants, for which the current user is the object owner, grantor, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-6 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
PRIVILEGE	VARCHAR(32)	Privilege on the column
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_COL_PRIVS_MADE

ALL_COL_PRIVS_MADE describes the column object grants for which the current user is the object owner or grantor.

Table 9-7 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the column
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_COL_PRIVS_RECD

ALL_COL_PRIVS_RECD describes the column object grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-8 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the column
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_CONSTRAINTS

ALL_CONSTRAINTS describes constraint definitions on tables accessible to the current user.

Table 9-9 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the constraint definition
CONSTRAINT_SCHEMA	VARCHAR(128)	Schema of the constraint definition
CONSTRAINT_NAME	VARCHAR(128)	Name of the constraint definition
CONSTRAINT_TYPE	VARCHAR(1)	Type of the constraint definition: the value in (C: check constraint, P: Primary key, U: Unique Key, R: Referential integrity)
TABLE_OWNER	VARCHAR(128)	Owner of the table (or view) associated with the constraint definition
TABLE_SCHEMA	VARCHAR(128)	Schema of the table (or view) associated with the constraint definition
TABLE_NAME	VARCHAR(128)	Name of the table (or view) associated with the constraint definition
SEARCH_CONDITION	LONG VARCHAR	Text of search condition for a check constraint
R_OWNER	VARCHAR(128)	Owner of the unique constraint definition for the referenced table
R_SCHEMA	VARCHAR(128)	Schema of the unique constraint definition for the referenced table
R_CONSTRAINT_NAME	VARCHAR(128)	Name of the unique constraint definition for the referenced table
DELETE_RULE	VARCHAR(32)	Delete rule for a referential constraint: the value in (NO ACTION, RESTRICT, CASCADE, SET NULL, SET DEFAULT)
UPDATE_RULE	VARCHAR(32)	Update rule for a referential constraint: the value in (NO ACTION, RESTRICT, CASCADE, SET NULL, SET DEFAULT)
STATUS	VARCHAR(32)	Enforcement status of the constraint: the value in (ENABLED, DISABLE)
DEFERRABLE	VARCHAR(32)	Indicates whether the constraint is deferrable (DEFERRABLE) or not (NOT DEFERRABLE)
DEFERRED	VARCHAR(32)	Indicates whether the constraint was initially deferred (DEFERRED) or not (IMMEDIATE)
VALIDATED	VARCHAR(32)	Indicates whether all data may obey the constraint or not: the value in (VALIDATED, NOT VALIDATED)
GENERATED	VARCHAR(32)	Indicates whether the name of the constraint is user-generated (USER NAME) or system-generated (GENERATED NAME)
BAD	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether this constraint specifies a century in an ambiguous manner (BAD) or not (NULL)
RELY	VARCHAR(32)	<ul style="list-style-type: none"> reserved When NOT VALIDATED, indicates whether the constraint is to be taken into account for query rewrite (RELY) or not (NULL)
LAST_CHANGE	TIMESTAMP(2) WITHOUT TIME ZONE	When the constraint was last enabled or disabled

Column name	Data type	Description
INDEX_OWNER	VARCHAR(128)	Owner of the index associated with the key constraint
INDEX_SCHEMA	VARCHAR(128)	Schema of the index associated with the key constraint
INDEX_NAME	VARCHAR(128)	Name of the index associated with the key constraint
INVALID	VARCHAR(32)	Indicates whether the constraint is invalid (INVALID) or not (NULL)
VIEW_RELATED	VARCHAR(32)	Indicates whether the constraint depends on a view (DEPEND ON VIEW) or not (NULL)
COMMENTS	VARCHAR(1024)	Comments of the constraint definition

ALL_CONS_COLUMNS

ALL_CONS_COLUMNS describes columns that are accessible to the current user and that are specified in constraints.

Table 9-10 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the constraint definition
CONSTRAINT_SCHEMA	VARCHAR(128)	Schema of the constraint definition
CONSTRAINT_NAME	VARCHAR(128)	Name of the constraint definition
TABLE_OWNER	VARCHAR(128)	Owner of the table with the constraint definition
TABLE_SCHEMA	VARCHAR(128)	Schema of the table with the constraint definition
TABLE_NAME	VARCHAR(128)	Name of the table with the constraint definition
COLUMN_NAME	VARCHAR(128)	Name of the column or attribute of the object type column specified in the constraint definition
POSITION	NUMBER	Original position of the column or attribute in the definition of the object

ALL_DB_PRIVS

ALL_DB_PRIVS describes the database grants, for which the current user is the grantor, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-11 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PRIVILEGE	VARCHAR(32)	Privilege on the database
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_DB_PRIVS_MADE

ALL_DB_PRIVS_MADE describes the database grants for which the current user is the grantor.

Table 9-12 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the database
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_DB_PRIVS_RECD

ALL_DB_PRIVS_RECD describes the database grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-13 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the database
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_DEPENDENCIES

ALL_DEPENDENCIES describes dependencies between objects accessible to the current user

Table 9-14 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of object
SCHEMA_NAME	VARCHAR(128)	Schema Name of object
NAME	VARCHAR(128)	Name of object
TYPE	VARCHAR(32)	Type of object: FUNCTION, PROCEDURE, VIEW, PACKAGE, PACKAGE BODY, TRIGGER
REFERENCED_OWNER	VARCHAR(128)	Owner of the referenced object
REFERENCED_SCHEMA_NAME	VARCHAR(128)	Schema Name of the referenced object
REFERENCED_TYPE	VARCHAR(32)	Type of the referenced object: FUNCTION, PROCEDURE, TABLE, VIEW, SEQUENCE, PACKAGE, PACKAGE BODY, TRIGGER
REFERENCED_LINK_NAME	VARCHAR(128)	Name of the link to the parent object
REFERENCED_NAME	VARCHAR(128)	Name of the referenced object
DEPENDENCY_TYPE	VARCHAR(32)	Indicates whether the dependency is a REF dependency (REF) or not (HARD)

ALL_GLOBAL_SECONDARY_INDEXES

ALL_GLOBAL_SECONDARY_INDEXES describes the global secondary indexes on the tables accessible to the current user.

Note

It is available only on a cluster.

Table 9-15 Column information

Column name	Data type	Description
TABLE_OWNER	VARCHAR(128)	Owner of the global secondary indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the global secondary indexed object
TABLE_NAME	VARCHAR(128)	Name of the global secondary indexed object
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the global secondary index
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent
NEXT_EXTENT	NUMBER	Size of secondary extents
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_FREE	NUMBER	Minimum percentage of free space in a block
LOGGING	VARCHAR(3)	Indicates whether or not changes to the global secondary index are logged: (YES) or (NO)
BLOCKS	NUMBER	Number of used blocks in the global secondary index

ALL_GSI_PLACE

ALL_GSI_PLACE describes node placement of all global secondary indexes on the tables accessible to the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-16 Column information

Column name	Data type	Description
TABLE_OWNER	VARCHAR(128)	Owner of the global secondary indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the global secondary indexed object
TABLE_NAME	VARCHAR(128)	Name of the global secondary indexed object
GROUP_ID	NUMBER	Group identifier of the node where the global secondary index placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the global secondary index placed
MEMBER_ID	NUMBER	Member identifier of the node where the global secondary index placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the global secondary index placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
BLOCKS	NUMBER	Number of used blocks of the node where the global secondary index placed

ALL_INDEXES

ALL_INDEXES describes the indexes on the tables accessible to the current user.

Table 9-17 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the index
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
INDEX_TYPE	VARCHAR(32)	Type of the index: the value in (NORMAL, NORMAL/REV, BITMAP, FUNCTION-BASED NORMAL, FUNCTION-BASED NORMAL/REV, FUNCTION-BASED BITMAP, IOT - TOP, DOMAIN)
TABLE_OWNER	VARCHAR(128)	Owner of the indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the indexed object
TABLE_NAME	VARCHAR(128)	Name of the indexed object
TABLE_TYPE	VARCHAR(32)	Type of the indexed object: the value in (NEXT OBJECT, INDEX, TABLE, VIEW, SYNONYM, SEQUENCE)
UNIQUENESS	VARCHAR(32)	Indicates whether the index is unique (UNIQUE) or nonunique (NON UNIQUE)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether index compression is enabled (ENABLED) or not (DISABLED)
PREFIX_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Number of columns in the prefix of the compression key
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the index
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent
NEXT_EXTENT	NUMBER	Size of secondary extents
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
PCT_THRESHOLD	NUMBER	<ul style="list-style-type: none"> reserved Threshold percentage of block space allowed per index entry
INCLUDE_COLUMN	NUMBER	<ul style="list-style-type: none"> reserved Column ID of the last column to be included in index-organized table primary key (non-overflow) index
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to this segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to this segment

Column name	Data type	Description
PCT_FREE	NUMBER	Minimum percentage of free space in a block
LOGGING	VARCHAR(3)	Indicates whether or not changes to the index are logged: (YES) or (NO)
BLOCKS	NUMBER	Number of used blocks in the index
BLEVEL	NUMBER	<ul style="list-style-type: none"> reserved B-Tree level (depth of the index from its root block to its leaf blocks)
LEAF_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of leaf blocks in the index
DISTINCT_KEYS	NUMBER	Number of distinct indexed values.
AVG_LEAF_BLOCKS_PER_KEY	NUMBER	<ul style="list-style-type: none"> reserved Average number of leaf blocks in which each distinct value in the index appears, rounded to the nearest integer
AVG_DATA_BLOCKS_PER_KEY	NUMBER	<ul style="list-style-type: none"> reserved Average number of data blocks in the table that are pointed to by a distinct value in the index rounded to the nearest integer
CLUSTERING_FACTOR	NUMBER	<ul style="list-style-type: none"> reserved Indicates the amount of order of the rows in the table based on the values of the index
STATUS	VARCHAR(32)	Indicates whether a nonpartitioned index is VALID or UNUSABLE
NUM_ROWS	NUMBER	<ul style="list-style-type: none"> reserved Number of rows in the index
SAMPLE_SIZE	NUMBER	Size of the sample used to analyze the index
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which this index was most recently analyzed
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the index, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the indexes to be scanned, or DEFAULT
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is partitioned (YES) or not (NO)
TEMPORARY	VARCHAR(1)	Indicates whether the index is on a temporary table (Y) or not (N)
GENERATED	VARCHAR(1)	Indicates whether the name of the index is system-generated (Y) or not (N)
SECONDARY	VARCHAR(1)	Indicates whether the index is a secondary object created by the method of the Data Cartridge (Y) or not (N)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for index blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for index blocks
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
CELL_FLASH_CACHE	VARCHAR(32)	Cell flash cache hint to be used for index blocks
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
PCT_DIRECT_ACCESS	NUMBER	<ul style="list-style-type: none"> reserved For a secondary index on an index-organized table, the percentage of rows with VALID guess
ITYP_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved For a domain index, the owner of the indextype
ITYP_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved For a domain index, the name of the indextype
PARAMETERS	VARCHAR(1024)	<ul style="list-style-type: none"> reserved For a domain index, the parameter string
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned indexes, indicates whether statistics were collected by analyzing the index as a whole (YES) or were estimated from statistics on underlying index partitions and subpartitions (NO)
DOMIDX_STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of a domain index
DOMIDX_OPSTATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of the operation on a domain index
FUNCIDX_STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of a function-based index
JOIN_INDEX	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is a join index (YES) or not (NO)
IOT_REDUNDANT_PKEY_ELIM	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether redundant primary key columns are eliminated from secondary indexes on index-organized tables (YES) or not (NO)
DROPPED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index has been dropped and is in the recycle bin (YES) or not (NO)
VISIBILITY	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is VISIBLE or INVISIBLE to the optimizer
DOMIDX_MANAGEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved If this is a domain index, indicates whether the domain index is system-managed (SYSTEM_MANAGED) or user-managed (USER_MANAGED)
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the index segment has been created (YES) or not (NO)

Column name	Data type	Description
COMMENTS	VARCHAR(1024)	Comments of the index
EMPTY_BLOCKS	NUMBER	Number of empty blocks in the index

ALL_IND_COLUMNS

ALL_IND_COLUMNS describes the columns of indexes on all tables accessible to the current user.

Table 9-18 Column information

Column name	Data type	Description
INDEX_OWNER	VARCHAR(128)	Owner of the index
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
TABLE_OWNER	VARCHAR(128)	Owner of the table or cluster
TABLE_SCHEMA	VARCHAR(128)	Schema of the table or cluster
TABLE_NAME	VARCHAR(128)	Name of the table or cluster
COLUMN_NAME	VARCHAR(128)	Column name or attribute of the object type column
COLUMN_POSITION	NUMBER	Position of the column or attribute within the index
COLUMN_LENGTH	NUMBER	Indexed length of the column
CHAR_LENGTH	NUMBER	Maximum codepoint length of the column
DESCEND	VARCHAR(32)	Indicates whether the column is sorted in descending order (DESC) or ascending order (ASC)
NULL_ORDER	VARCHAR(32)	Indicates whether the null value of the column is sorted in nulls first order (NULLS FIRST) or nulls last order (NULLS LAST)

ALL_IND_PLACE

ALL_IND_PLACE describes node placement of the indexes on the tables accessible to the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-19 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the index
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
TABLE_OWNER	VARCHAR(128)	Owner of the indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the indexed object
TABLE_NAME	VARCHAR(128)	Name of the indexed object
GROUP_ID	NUMBER	Group identifier of the node where the index placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the index placed
MEMBER_ID	NUMBER	Member identifier of the node where the index placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the index placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
DISTINCT_KEYS	NUMBER	(deprecated)
SAMPLE_SIZE	NUMBER	(deprecated)
BLOCKS	NUMBER	Number of used blocks of the node where the index placed
LAST_ANALYZED	TIMESTAMP(2) WITH OUT TIME ZONE	(deprecated)

ALL_NONSCHEMA_COMMENTS

ALL_NONSCHEMA_COMMENTS displays comments on all non-schema objects (database, authorizations, schemas, tablespaces) accessible to the current user.

Table 9-20 Column information

Column name	Data type	Description
OBJECT_NAME	VARCHAR(128)	Name of the non-schema object
OBJECT_TYPE	VARCHAR(32)	Type of the non-schema object: DATABASE, AUTHORIZATION, SCHEMA, TABLESPACE
COMMENTS	VARCHAR(1024)	Comments of the non-schema object

ALL_OBJECTS

ALL_OBJECTS describes all objects accessible to the current user.

Table 9-21 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
SCHEMA_NAME	VARCHAR(128)	Schema of the object
OBJECT_NAME	VARCHAR(128)	Name of the object
SUBOBJECT_NAME	VARCHAR(128)	Name of the subobject (for example, partition)
OBJECT_ID	NUMBER	Dictionary object number of the object
DATA_OBJECT_ID	NUMBER	Dictionary object number of the segment that contains the object
OBJECT_TYPE	VARCHAR(32)	Type of the object (such as TABLE, INDEX)
CREATED	TIMESTAMP(2) WITHOUT TIME ZONE	Timestamp for the creation of the object
LAST_DDL_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	Timestamp for the last modification of the object resulting from a DDL statement
TIMESTAMP	VARCHAR(32)	Timestamp for the specification of the object (character data)
STATUS	VARCHAR(32)	Status of the object: the value in (VALID, INVALID, N/A)
TEMPORARY	VARCHAR(1)	Indicates whether the object is temporary (the current session can see only data that it placed in this object itself) (Y) or not (N)
GENERATED	VARCHAR(1)	* reserved Indicates whether the name of this object was system-generated (Y) or not (N)
SECONDARY	VARCHAR(1)	• reserved Indicates whether this is a secondary object created by the ODCIIndexCreate method of the Oracle Data Cartridge (Y) or not (N)
NAMESPACE	NUMBER	Namespace for the object
EDITION_NAME	VARCHAR(128)	• reserved Name of the edition in which the object is actual

ALL_PROCEEDURES

ALL_PROCEEDURES lists all function, procedures or package

Table 9-22 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of function, procedures or package
SCHEMA_NAME	VARCHAR(128)	Schema Name of function, procedures or package
OBJECT_NAME	VARCHAR(128)	Name of function, procedures or package
PROCEDURE_NAME	VARCHAR(128)	Name when a procedures in package
OBJECT_ID	NUMBER	ID of a function, procedures or package
SUBPROGRAM_ID	NUMBER	ID of procedures in package
OVERLOAD	VARCHAR(32)	ID of overloading procedure in package
OBJECT_TYPE	VARCHAR(32)	Type of function, procedures or package
AGGREGATE	VARCHAR(3)	Indicate whether the procedure is an aggregate function(YES) or not (NO)
PIPELINED	VARCHAR(3)	Indicate whether the procedure is a pipelined table function(YES) or not(NO)
IMPLTYPEOWNER	VARCHAR(128)	Name of the owner of the implementation type, if any
IMPLTYPENAME	VARCHAR(128)	Name of the implementation type, if any
PARALLEL	VARCHAR(3)	Indicates whether the procedure or function is parallel-enabled (YES) or not (NO)
INTERFACE	VARCHAR(3)	YES, if the procedure/function is a table function implemented using the SQLCLI interface; otherwise NO
DETERMINISTIC	VARCHAR(3)	YES, if the procedure/function is declared to be deterministic; otherwise NO
AUTHID	VARCHAR(32)	Indicates whether the procedure/function is declared to execute as DEFINER or CURRENT_USER (invoker)

ALL_PROC_PRIVS

ALL_PROC_PRIVS describes the procedure grants, for which the current user is the procedure owner, grantor, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-23 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PROCEDURE_OWNER	VARCHAR(128)	Owner of the procedure, function or package
PROCEDURE_SCHEMA	VARCHAR(128)	Schema of the procedure, function or package
PROCEDURE_NAME	VARCHAR(128)	Name of the procedure, function or package
PRIVILEGE	VARCHAR(32)	Privilege on the procedure, function or package
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_PROC_PRIVS_MADE

ALL_PROC_PRIVS_MADE describes the procedure grants for which the current user is the procedure owner or grantor.

Table 9-24 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PROCEDURE_OWNER	VARCHAR(128)	Owner of the procedure, function or package
PROCEDURE_SCHEMA	VARCHAR(128)	Schema of the procedure, function or package
PROCEDURE_NAME	VARCHAR(128)	Name of the procedure, function or package
PRIVILEGE	VARCHAR(32)	Privilege on the procedure, function or package
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_PROC_PRIVS_RECD

ALL_PROC_PRIVS_RECD describes the procedure grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-25 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PROCEDURE_OWNER	VARCHAR(128)	Owner of the procedure, function or package
PROCEDURE_SCHEMA	VARCHAR(128)	Schema of the procedure, function or package
PROCEDURE_NAME	VARCHAR(128)	Name of the procedure, function or package
PRIVILEGE	VARCHAR(32)	Privilege on the procedure, function or package
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_SCHEMAS

ALL_SCHEMAS identifies the schemata in a catalog that are owned by given user or accessible to given user or role.

Table 9-26 Column information

Column name	Data type	Description
SCHEMA_OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
CREATED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	Created time of the schema
MODIFIED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	Last modified time of the schema
COMMENTS	VARCHAR(1024)	Comments of the schema

ALL_SCHEMA_PATH

ALL_SCHEMA_PATH describes the schema search order of the current user and PUBLIC, for naming resolution of unqualified SQL schema objects.

Table 9-27 Column information

Column name	Data type	Description
AUTH_NAME	VARCHAR(128)	Name of the authorization
SCHEMA_NAME	VARCHAR(128)	Name of the schema
SEARCH_ORDER	NUMBER	Schema search order of the authorization

ALL_SCHEMA_PRIVS

ALL_SCHEMA_PRIVS describes the schema grants, for which the current user is the schema owner, grant or, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-28 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
PRIVILEGE	VARCHAR(32)	Privilege on the schema
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_SCHEMA_PRIVS_MADE

ALL_SCHEMA_PRIVS_MADE describes the schema grants, for which the current user is the grantor.

Table 9-29 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
PRIVILEGE	VARCHAR(32)	Privilege on the schema
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_SCHEMA_PRIVS_RECD

ALL_SCHEMA_PRIVS_RECD describes the schema grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-30 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
PRIVILEGE	VARCHAR(32)	Privilege on the schema
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_SEQUENCES

ALL_SEQUENCES describes all sequences accessible to the current user.

Table 9-31 Column information

Column name	Data type	Description
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Sequence name
MIN_VALUE	NUMBER	Minimum value of the sequence
MAX_VALUE	NUMBER	Maximum value of the sequence
INCREMENT_BY	NUMBER	Value by which sequence is incremented
CYCLE_FLAG	VARCHAR(1)	Indicates whether the sequence wraps around on reaching the limit (Y) or not (N)
ORDER_FLAG	VARCHAR(1)	Indicates whether sequence numbers are generated in order (Y) or not (N)
CACHE_SIZE	NUMBER	Number of sequence numbers to cache
LAST_NUMBER	NUMBER	Last sequence number written to database. If a sequence uses caching, the number written to database is the last number placed in the sequence cache.
COMMENTS	VARCHAR(1024)	Comments of the sequence

ALL_SEQ_PRIVS

ALL_SEQ_PRIVS describes the sequence grants, for which the current user is the sequence owner, grantor, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-32 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Name of the sequence
PRIVILEGE	VARCHAR(32)	Privilege on the sequence
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_SEQ_PRIVS_MADE

ALL_SEQ_PRIVS_MADE describes the sequence grants for which the current user is the sequence owner or grantor.

Table 9-33 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Name of the sequence
PRIVILEGE	VARCHAR(32)	Privilege on the sequence
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_SEQ_PRIVS_RECD

ALL_SEQ_PRIVS_RECD describes the sequence grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-34 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Name of the sequence
PRIVILEGE	VARCHAR(32)	Privilege on the sequence
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_SHARD_KEY_COLUMNS

ALL_SHARD_KEY_COLUMNS describes shard key columns of all shareded tables accessible to the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-35 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
COLUMN_NAME	VARCHAR(128)	Column name of the shard key
COLUMN_POSITION	NUMBER	Position of the column within the shard key

ALL_SOURCE

ALL_SOURCE describes the text source of the stored objects accessible to the current user.

Table 9-36 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of object
SCHEMA_NAME	VARCHAR(128)	Schema Name of object
NAME	VARCHAR(128)	Name of object
TYPE	VARCHAR(32)	Type of object: FUNCTION, PROCEDURE, PACKAGE, PACKAGE BODY, TRIGGER
LINE	NUMBER	Line number of this line of source
TEXT	LONG VARCHAR	Text source of the stored object
ORIGIN_CON_ID	VARCHAR(256)	ID of the container where the data originates

ALL_SYNONYMS

ALL_SYNONYMS describes all synonyms.

Table 9-37 Column information

Column name	Data type	Description
SYNONYM_OWNER	VARCHAR(128)	Owner of the synonym
SYNONYM_SCHEMA	VARCHAR(128)	Schema of the synonym
SYNONYM_NAME	VARCHAR(128)	Synonym name
OBJECT_SCHEMA_NAME	VARCHAR(128)	Object schema name
OBJECT_NAME	VARCHAR(128)	Object name
DB_LINK	VARCHAR(128)	Reserved for future use

ALL_TABLES

ALL_TABLES describes the relational tables accessible to the current user.

Table 9-38 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the table
CLUSTER_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the cluster
IOT_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the index-organized table
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a previous DROP TABLE operation failed, indicates whether the table is unusable (UNUSABLE) or valid (VALID)
PCT_FREE	NUMBER	Minimum percentage of free space in a block
PCT_USED	NUMBER	Minimum percentage of used space in a block
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent (in bytes)
NEXT_EXTENT	NUMBER	Size of secondary extents (in bytes)
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to the segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to the segment
LOGGING	VARCHAR(3)	Indicates whether or not changes to the table are logged
BACKED_UP	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table has been backed up since the last modification (Y) or not (N)
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	Number of used blocks in the table
EMPTY_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of empty (never used) blocks in the table
AVG_SPACE	NUMBER	<ul style="list-style-type: none"> reserved Average available free space in the table
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
CHAIN_CNT	NUMBER	Number of rows in the table that are chained from one data block to another or that have migrated to a new block, requiring a link to preserve the old rowid
AVG_ROW_LEN	NUMBER	<ul style="list-style-type: none"> reserved Average row length, including row overhead
AVG_SPACE_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Average freespace of all blocks on a freelist
NUM_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of blocks on the freelist
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the table, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the table is to be scanned, or DEFAULT
CACHE	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is to be cached in the buffer cache (Y) or not (N)
TABLE_LOCK	VARCHAR(32)	Indicates whether table locking is enabled (ENABLED) or disabled (DISABLED)
SAMPLE_SIZE	NUMBER	Sample size used in analyzing the table
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which the table was most recently analyzed
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is partitioned (YES) or not (NO)
IOT_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved If the table is an index-organized table, then IOT_TYPE is IOT, IOT_OVERFLOW, or IOT_MAPPING.
TEMPORARY	VARCHAR(1)	Indicates whether the table is temporary (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is a secondary object created by cartridge
NESTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is a nested table (YES) or not (NO)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for table blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for table blocks
CELL_FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Cell flash cache hint to be used for table blocks
ROW_MOVEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a partitioned table, indicates whether row movement is enabled

Column name	Data type	Description
		(ENABLED) or disabled (DISABLED)
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether statistics for the table as a whole (global statistics) are accurate (YES)
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
SKIP_CORRUPT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether Database ignores blocks marked corrupt during table and index scans (ENABLED) or raises an error (DISABLED)
MONITORING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has the MONITORING attribute set (YES) or not (NO)
CLUSTER_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the cluster, if any
DEPENDENCIES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether table compression is enabled (ENABLED) or not (DISABLED)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Default compression for what kind of operations
DROPPED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has been dropped and is in the recycle bin (YES) or not (NO)
READ_ONLY	VARCHAR(3)	Indicates whether the table IS READ-ONLY (YES) or not (NO)
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the table segment has been created (YES) or not (NO)
RESULT_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Result cache mode annotation for the table: the value in (NULL, DEFAULT, FORCE, MANUAL)

ALL_TAB_COLS

ALL_TAB_COLS describes the columns (including hidden columns) of the tables, views, and clusters accessible to the current user.

Table 9-39 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Column name
DATA_TYPE	VARCHAR(128)	Datatype of the column
DATA_TYPE_MOD	VARCHAR(3)	<ul style="list-style-type: none"> reserved Datatype modifier of the column
DATA_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the datatype of the column
DATA_LENGTH	NUMBER	Length of the column (in bytes)
DATA_PRECISION	NUMBER	Decimal precision for NUMBER datatype; binary precision for FLOAT datatype; NULL for all other datatypes
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
NULLABLE	VARCHAR(1)	Indicates whether a column allows NULLs.
COLUMN_ID	NUMBER	Sequence number of the column as created
DEFAULT_LENGTH	NUMBER	Length of the default value for the column
DATA_DEFAULT	LONG VARCHAR	Default value for the column
NUM_DISTINCT	NUMBER	Number of distinct values in the column
LOW_VALUE	VARBINARY(32)	Low value in the column
HIGH_VALUE	VARBINARY(32)	High value in the column
DENSITY	NUMBER	<ul style="list-style-type: none"> reserved If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram.
NUM_NULLS	NUMBER	Number of NULLs in the column
NUM_BUCKETS	NUMBER	<ul style="list-style-type: none"> reserved Number of buckets in the histogram for the column
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER	Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the character set
CHAR_COL_DECL_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Declaration length of the character type column
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
GLOBAL_STATS	VARCHAR(3)	For partitioned tables, indicates whether column statistics were collected for the table
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER	Average length of the column (in bytes)
CHAR_LENGTH	NUMBER	Displays the length of the column in characters.
CHAR_USED	VARCHAR(1)	Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C)
V80_FMT_IMAGE	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data is in release older image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HIDDEN_COLUMN	VARCHAR(3)	Indicates whether the column is a hidden column (YES) or not (NO)
VIRTUAL_COLUMN	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column is a virtual column (YES) or not (NO)
SEGMENT_COLUMN_ID	NUMBER	Sequence number of the column in the segment
INTERNAL_COLUMN_ID	NUMBER	Internal sequence number of the column
HISTOGRAM	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates existence/type of histogram
QUALIFIED_COLUMN_NAME	VARCHAR(4000)	Qualified column name
IDENTITY_COLUMN	VARCHAR(3)	Indicates whether this is an identity column (YES) or not (NO)

ALL_TAB_COLUMNS

ALL_TAB_COLUMNS describes the columns of the tables, views, and clusters accessible to the current user.

Table 9-40 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Column name
DATA_TYPE	VARCHAR(128)	Datatype of the column
DATA_TYPE_MOD	VARCHAR(3)	<ul style="list-style-type: none"> reserved Datatype modifier of the column
DATA_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the datatype of the column
DATA_LENGTH	NUMBER	Length of the column (in bytes)
DATA_PRECISION	NUMBER	Decimal precision for NUMBER datatype; binary precision for FLOAT datatype; NULL for all other datatypes
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
NULLABLE	VARCHAR(1)	Indicates whether a column allows NULLs.
COLUMN_ID	NUMBER	Sequence number of the column as created
DEFAULT_LENGTH	NUMBER	Length of the default value for the column
DATA_DEFAULT	LONG VARCHAR	Default value for the column
NUM_DISTINCT	NUMBER	Number of distinct values in the column
LOW_VALUE	VARBINARY(32)	Low value in the column
HIGH_VALUE	VARBINARY(32)	High value in the column
DENSITY	NUMBER	<ul style="list-style-type: none"> reserved If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram.
NUM_NULLS	NUMBER	Number of NULLs in the column
NUM_BUCKETS	NUMBER	<ul style="list-style-type: none"> reserved Number of buckets in the histogram for the column
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER	Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the character set
CHAR_COL_DECL_LENGTH	NUMBER	Declaration length of the character type column
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
GLOBAL_STATS	VARCHAR(3)	For partitioned tables, indicates whether column statistics were collected for the table
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> • reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER	Average length of the column (in bytes)
CHAR_LENGTH	NUMBER	Displays the length of the column in characters.
CHAR_USED	VARCHAR(1)	Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C)
V80_FMT_IMAGE	VARCHAR(3)	<ul style="list-style-type: none"> • reserved Indicates whether the column data is in release older image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR(3)	<ul style="list-style-type: none"> • reserved Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HISTOGRAM	VARCHAR(32)	<ul style="list-style-type: none"> • reserved Indicates existence/type of histogram
IDENTITY_COLUMN	VARCHAR(3)	Indicates whether this is an identity column (YES) or not (NO)

ALL_TAB_COMMENTS

ALL_TAB_COMMENTS displays comments on the tables and views accessible to the current user.

Table 9-41 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
TABLE_TYPE	VARCHAR(32)	Type of the object
COMMENTS	VARCHAR(1024)	Comment on the object

ALL_TAB_IDENTITY_COLS

ALL_TAB_IDENTITY_COLS describes all table identity columns.

Table 9-42 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
COLUMN_NAME	VARCHAR(128)	Name of the identity column
GENERATION_TYPE	VARCHAR(32)	Generation type of the identity column. Possible values are ALWAYS or BY DEFAULT
IDENTITY_OPTIONS	VARCHAR(1024)	Options for the identity column sequence generator

ALL_TAB_PLACE

ALL_TAB_PLACE describes node placement of all cluster tables accessible to the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-43 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
GROUP_ID	NUMBER	Group identifier of the node where the table placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the table placed
MEMBER_ID	NUMBER	Member identifier of the node where the table placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the table placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
SCN	VARCHAR(64)	table scn of the node where the table placed
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	Number of used blocks of the node where the table placed
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which the table was most recently analyzed

ALL_TAB_SHARDS

ALL_TAB_SHARDS describes shard information of sharded tables accessible to the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-44 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
SHARD_STRATEGY	VARCHAR(32)	Sharding strategy of the table: the value in (HASH SHARDING, RANGE SHARDING, LIST SHARDING)
SHARD_NAME	VARCHAR(128)	Shard name
SHARD_NUMBER	NUMBER	Shard number
SHARD_DEFINITION	LONG VARCHAR	Shard definition (if hash sharded, the value is null)
GROUP_ID	NUMBER	Group identifier where the shard placed
GROUP_NAME	VARCHAR(128)	Group Name where the shard placed

ALL_TAB_PRIVS

ALL_TAB_PRIVS describes the object grants, for which the current user is the object owner, grantor, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-45 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
PRIVILEGE	VARCHAR(32)	Privilege on the object
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR(3)	Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)

ALL_TAB_PRIVS_MADE

ALL_TAB_PRIVS_MADE describes the object grants for which the current user is the object owner or grantor.

Table 9-46 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the object
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR(3)	Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)

ALL_TAB_PRIVS_RECD

ALL_TAB_PRIVS_RECD describes object grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-47 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the object
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR(3)	Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)

ALL_TBS_PRIVS

ALL_TBS_PRIVS describes the tablespace grants, for which the current user is the grantor, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-48 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace
PRIVILEGE	VARCHAR(32)	Privilege on the tablespace
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_TBS_PRIVS_MADE

ALL_TBS_PRIVS_MADE describes the tablespace grants for which the current user is the grantor.

Table 9-49 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace
PRIVILEGE	VARCHAR(32)	Privilege on the tablespace
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_TBS_PRIVS_RECD

ALL_TBS_PRIVS_RECD describes the tablespace grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-50 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace
PRIVILEGE	VARCHAR(32)	Privilege on the tablespace
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

ALL_USERS

ALL_USERS lists all users of the database visible to the current user.

Table 9-51 Column information

Column name	Data type	Description
USERNAME	VARCHAR(128)	Name of the user
USER_ID	NUMBER	ID number of the user
CREATED	TIMESTAMP(2) WITHOUT TIME ZONE	User creation timestamp

ALL_VIEWS

ALL_VIEWS describes the views accessible to the current user.

Table 9-52 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the view
VIEW_SCHEMA	VARCHAR(128)	Schema of the view
VIEW_NAME	VARCHAR(128)	Name of the view
TEXT_LENGTH	NUMBER	Length of the view text
TEXT	LONG VARCHAR	View text
TYPE_TEXT_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Length of the type clause of the typed view
TYPE_TEXT	VARCHAR(4000)	<ul style="list-style-type: none"> reserved Type clause of the typed view
OID_TEXT_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Length of the WITH OID clause of the typed view
OID_TEXT	VARCHAR(4000)	<ul style="list-style-type: none"> reserved WITH OID clause of the typed view
VIEW_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the type of the view if the view is a typed view
VIEW_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Type of the view if the view is a typed view
SUPERVIEW_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the superview
EDITIONING_VIEW	VARCHAR(1)	<ul style="list-style-type: none"> reserved Reserved for future use
READ_ONLY	VARCHAR(1)	Indicates whether the view is read-only (Y) or not (N)

Views of DBA_family

The current user has DBA privileges (ACCESS CONTROL ON DATABASE), and the user can retrieve information about all objects.

DBA_ALL_TABLES

DBA_ALL_TABLES describes all object tables and relational tables in the database.

Table 9-53 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the table
CLUSTER_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the cluster
IOT_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the index-organized table
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a previous DROP TABLE operation failed, indicates whether the table is unusable (UNUSABLE) or valid (VALID)
PCT_FREE	NUMBER	Minimum percentage of free space in a block
PCT_USED	NUMBER	Minimum percentage of used space in a block
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent (in bytes)
NEXT_EXTENT	NUMBER	Size of secondary extents (in bytes)
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to the segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to the segment
LOGGING	VARCHAR(3)	Indicates whether or not changes to the table are logged
BACKED_UP	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table has been backed up since the last modification

Column name	Data type	Description
		(Y) or not (N)
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of used blocks in the table
EMPTY_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of empty (never used) blocks in the table
AVG_SPACE	NUMBER	<ul style="list-style-type: none"> reserved Average available free space in the table
CHAIN_CNT	NUMBER	<ul style="list-style-type: none"> reserved Number of rows in the table that are chained from one data block to another or that have migrated to a new block, requiring a link to preserve the old rowid
AVG_ROW_LEN	NUMBER	<ul style="list-style-type: none"> reserved Average row length, including row overhead
AVG_SPACE_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Average freespace of all blocks on a freelist
NUM_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of blocks on the freelist
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the table, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the table is to be scanned, or DEFAULT
CACHE	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is to be cached in the buffer cache (Y) or not (N)
TABLE_LOCK	VARCHAR(32)	Indicates whether table locking is enabled (ENABLED) or disabled (DISABLED)
SAMPLE_SIZE	NUMBER	Sample size used in analyzing the table
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which the table was most recently analyzed
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is partitioned (YES) or not (NO)
IOT_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved If the table is an index-organized table, then IOT_TYPE is IOT, IOT_OVERFLOW, or IOT_MAPPING.
OBJECT_ID_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the object ID (OID) is USER-DEFINED or SYSTEM GENERATED
TABLE_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved If an object table, owner of the type from which the table is created

Column name	Data type	Description
TABLE_TYPE	VARCHAR(128)	<ul style="list-style-type: none"> reserved If an object table, type of the table
TEMPORARY	VARCHAR(1)	Indicates whether the table is temporary (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is a secondary object created by cartridge
NESTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is a nested table (YES) or not (NO)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for table blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for table blocks
CELL_FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Cell flash cache hint to be used for table blocks
ROW_MOVEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a partitioned table, indicates whether row movement is enabled (ENABLED) or disabled (DISABLED)
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether statistics for the table as a whole (global statistics) are accurate (YES)
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
SKIP_CORRUPT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether Database ignores blocks marked corrupt during table and index scans (ENABLED) or raises an error (DISABLED)
MONITORING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has the MONITORING attribute set (YES) or not (NO)
CLUSTER_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the cluster, if any
DEPENDENCIES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether table compression is enabled (ENABLED) or not (DISABLED)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Default compression for what kind of operations
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
DROPPED	VARCHAR(3)	Indicates whether the table has been dropped and is in the recycle bin (YES) or not (NO)
READ_ONLY	VARCHAR(3)	Indicates whether the table IS READ-ONLY (YES) or not (NO)
SEGMENT_CREA TED	VARCHAR(3)	Indicates whether the table segment has been created (YES) or not (NO)

DBA_ARGUMENTS

DBA_ARGUMENTS lists all arguments of functions, procedures.

Table 9-54 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of function, procedures or package
SCHEMA_NAME	VARCHAR(128)	Schema Name of function, procedures or package
OBJECT_NAME	VARCHAR(128)	Name of function, procedures
PACKAGE_NAME	VARCHAR(128)	Package Name of function, procedures
OBJECT_ID	NUMBER	ID of a function, procedures
SUBPROGRAM_ID	NUMBER	ID of procedures in package
ARGUMENT_NAME	VARCHAR(128)	Name of argument or attribute name of record type argument
POSITION	NUMBER	Position of argument or position of attribute in record type
SEQUENCE	NUMBER	Sequential order of argument and its attributes
DATA_LEVEL	NUMBER	Nesting depth of the argument for composite types
DATA_TYPE	VARCHAR(128)	Data type of the argument
DEFAULTED	VARCHAR(1)	Whether or not the argument is defaulted
DEFAULT_VALUE	VARCHAR(1)	Reserved for future use
DEFAULT_LENGTH	VARCHAR(1)	Reserved for future use
IN_OUT	VARCHAR(32)	Direction of the argument (IN, OUT, IN/OUT)
DATA_LENGTH	NUMBER	Length of the column(in bytes)
DATA_PRECISION	NUMBER	Length in decimal digits(NUMBER) or binary digits(FLOAT)
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
RADIX	NUMBER	Argument radix for a number
CHARACTER_SET_NAME	VARCHAR(128)	Character set name for the argument
TYPE_OWNER	VARCHAR(128)	Owner of the type of the argument
TYPE_NAME	VARCHAR(128)	Name of the type of the argument
TYPE_SUBNAME	VARCHAR(128)	Name of the type of the argument declared in package
TYPE_LINK	VARCHAR(128)	Name of the type of the argument declared in a remote package
PLS_TYPE	VARCHAR(128)	Name of the type of the argument at PSM
CHAR_LENGTH	NUMBER	Character limit for string datatypes
CHAR_USED	VARCHAR(1)	Whether the byte limit(B) or char limit(C) is official for the string
ORIGIN_CON_ID	VARCHAR(256)	ID of the container where the data originates

DBA_CATALOG

DBA_CATALOG lists all tables, views, synonyms, and sequences in the database.

Table 9-55 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_SCHEMA	VARCHAR(128)	Schema of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_NAME	VARCHAR(128)	Name of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_TYPE	VARCHAR(32)	Type of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED

DBA_CLUSTER

DBA_CLUSTER describes all cluster members in the cluster system.

Note

It is available only on a cluster.

Table 9-56 Column information

Column name	Data type	Description
GROUP_ID	NUMBER	Group identifier of the cluster member
GROUP_NAME	VARCHAR(128)	Group name of the cluster member
MEMBER_ID	NUMBER	Member identifier of the cluster member
MEMBER_NAME	VARCHAR(128)	Member name of the cluster member
MEMBER_HOST	VARCHAR(128)	Host address of the cluster member
MEMBER_PORT	NUMBER	Port number of the cluster member

DBA_CLUSTER_COMMENTS

DBA_CLUSTER_COMMENTS displays comments on the cluster objects in the cluster system.

Note

It is available only on a cluster.

Table 9-57 Column information

Column name	Data type	Description
OBJECT_NAME	VARCHAR(128)	Name of the cluster object
OBJECT_TYPE	VARCHAR(32)	Type of the cluster object: CLUSTER GROUP, CLUSTER MEMBER
COMMENTS	VARCHAR(1024)	Comment on the cluster object

DBA_CLUSTER_TABLES

DBA_CLUSTER_TABLES describes all cluster tables in the cluster system.

Note

It is available only on a cluster.

Table 9-58 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
SHARD_STRATEGY	VARCHAR(32)	Sharding strategy of the table: the value in (CLONED, HASH SHARDING, RANGE SHARDING, LIST S HARDING)
SHARD_PLACEMENT	VARCHAR(32)	Shard placement of the table: the value in (AT CLUSTER WIDE or AT CLUSTER GROUP)
SHARD_COUNT	NUMBER	Shard count of the table (if cloned table, the value is null)
SHARD_KEY_COUNT	NUMBER	Shard key column count of the table (if cloned table, the value is nul l)
HAS_GSI	VARCHAR(3)	Indicate whether the table has global secondary index: (YES) or (NO)

DBA_COL_COMMENTS

DBA_COL_COMMENTS displays comments on the columns of all tables and views in the database.

Table 9-59 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
COMMENTS	VARCHAR(1024)	Comment on the column

DBA_COL_PRIVS

DBA_COL_PRIVS describes all column object grants in the database.

Table 9-60 Column information

Column name	Data type	Description
GRANTOR	CHARACTER VARYING(128)	Name of the user who performed the grant
GRANTEE	CHARACTER VARYING(128)	Name of the user or role to whom access was granted
OWNER	CHARACTER VARYING(128)	Owner of the object
TABLE_SCHEMA	CHARACTER VARYING(128)	Schema of the object
TABLE_NAME	CHARACTER VARYING(128)	Name of the object
COLUMN_NAME	CHARACTER VARYING(128)	Name of the column
PRIVILEGE	CHARACTER VARYING(32)	Privilege on the column
GRANTABLE	CHARACTER VARYING(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

DBA_CONSTRAINTS

DBA_CONSTRAINTS describes all constraint definitions on all tables in the database.

Table 9-61 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the constraint definition
CONSTRAINT_SCHEMA	VARCHAR(128)	Schema of the constraint definition
CONSTRAINT_NAME	VARCHAR(128)	Name of the constraint definition
CONSTRAINT_TYPE	VARCHAR(1)	Type of the constraint definition: the value in (C: check constraint, P: Primary key, U: Unique Key, R: Referential integrity)
TABLE_OWNER	VARCHAR(128)	Owner of the table (or view) associated with the constraint definition
TABLE_SCHEMA	VARCHAR(128)	Schema of the table (or view) associated with the constraint definition
TABLE_NAME	VARCHAR(128)	Name of the table (or view) associated with the constraint definition
SEARCH_CONDITION	LONG VARCHAR	Text of search condition for a check constraint
R_OWNER	VARCHAR(128)	Owner of the unique constraint definition for the referenced table
R_SCHEMA	VARCHAR(128)	Schema of the unique constraint definition for the referenced table
R_CONSTRAINT_NAME	VARCHAR(128)	Name of the unique constraint definition for the referenced table
DELETE_RULE	VARCHAR(32)	Delete rule for a referential constraint: the value in (NO ACTION, RESTRICT, CASCADE, SET NULL, SET DEFAULT)
UPDATE_RULE	VARCHAR(32)	Update rule for a referential constraint: the value in (NO ACTION, RESTRICT, CASCADE, SET NULL, SET DEFAULT)
STATUS	VARCHAR(32)	Enforcement status of the constraint: the value in (ENABLED, DISABLE)
DEFERRABLE	VARCHAR(32)	Indicates whether the constraint is deferrable (DEFERRABLE) or not (NOT DEFERRABLE)
DEFERRED	VARCHAR(32)	Indicates whether the constraint was initially deferred (DEFERRED) or not (IMMEDIATE)
VALIDATED	VARCHAR(32)	Indicates whether all data may obey the constraint or not: the value in (VALIDATED, NOT VALIDATED)
GENERATED	VARCHAR(32)	Indicates whether the name of the constraint is user-generated (USER NAME) or system-generated (GENERATED NAME)
BAD	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether this constraint specifies a century in an ambiguous manner (BAD) or not (NULL)
RELY	VARCHAR(32)	<ul style="list-style-type: none"> reserved When NOT VALIDATED, indicates whether the constraint is to be taken into account for query rewrite (RELY) or not (NULL)
	TIMESTAMP(2) WITH	

Column name	Data type	Description
LAST_CHANGE	OUT TIME ZONE	When the constraint was last enabled or disabled
INDEX_OWNER	VARCHAR(128)	Owner of the index associated with the key constraint
INDEX_SCHEMA	VARCHAR(128)	Schema of the index associated with the key constraint
INDEX_NAME	VARCHAR(128)	Name of the index associated with the key constraint
INVALID	VARCHAR(32)	Indicates whether the constraint is invalid (INVALID) or not (NULL)
VIEW_RELATED	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the constraint depends on a view (DEPEND ON VIEW) or not (NULL)
COMMENTS	VARCHAR(1024)	Comments of the constraint definition

DBA_CONS_COLUMNS

DBA_CONS_COLUMNS describes all columns in the database that are specified in constraints.

Table 9-62 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the constraint definition
CONSTRAINT_SCHEMA	VARCHAR(128)	Schema of the constraint definition
CONSTRAINT_NAME	VARCHAR(128)	Name of the constraint definition
TABLE_OWNER	VARCHAR(128)	Owner of the table with the constraint definition
TABLE_SCHEMA	VARCHAR(128)	Schema of the table with the constraint definition
TABLE_NAME	VARCHAR(128)	Name of the table with the constraint definition
COLUMN_NAME	VARCHAR(128)	Name of the column or attribute of the object type column specified in the constraint definition
POSITION	NUMBER	Original position of the column or attribute in the definition of the object

DBA_DB_PRIVS

DBA_DB_PRIVS describes all database grants in the database.

Table 9-63 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PRIVILEGE	VARCHAR(32)	Privilege on the database
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

DBA_DEPENDENCIES

DBA_DEPENDENCIES describes all dependencies between objects in the database

Table 9-64 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of object
SCHEMA_NAME	VARCHAR(128)	Schema Name of object
NAME	VARCHAR(128)	Name of object
TYPE	VARCHAR(32)	Type of object: FUNCTION, PROCEDURE, VIEW, PACKAGE, PACKAGE BODY, TRIGGER
REFERENCED_OWNER	VARCHAR(128)	Owner of the referenced object
REFERENCED_SCHEMA_NAME	VARCHAR(128)	Schema Name of the referenced object
REFERENCED_TYPE	VARCHAR(32)	Type of the referenced object: FUNCTION, PROCEDURE, TABLE, VIEW, SEQUENCE, PACKAGE, PACKAGE BODY, TRIGGER
REFERENCED_LINK_NAME	VARCHAR(128)	Name of the link to the parent object
REFERENCED_NAME	VARCHAR(128)	Name of the referenced object
DEPENDENCY_TYPE	VARCHAR(32)	Indicates whether the dependency is a REF dependency (REF) or not (HARD)

DBA_EXTENTS

DBA_EXTENTS describes the extents comprising the segments in all tablespaces in the database.

Table 9-65 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the segment associated with the extent
SEGMENT_SCHEMA	VARCHAR(128)	Schema of the segment associated with the extent
SEGMENT_NAME	VARCHAR(128)	Name of the segment associated with the extent
PARTITION_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Object Partition Name (Set to NULL for non-partitioned objects)
SEGMENT_TYPE	VARCHAR(32)	Type of the segment: TABLE, INDEX
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the extent
EXTENT_ID	NUMBER	<ul style="list-style-type: none"> reserved Extent number in the segment
FILE_ID	NUMBER	<ul style="list-style-type: none"> reserved File identifier number of the file containing the extent
BLOCK_ID	NUMBER	<ul style="list-style-type: none"> reserved Starting block number of the extent
BYTES	NUMBER	Size of the extent in bytes
BLOCKS	NUMBER	Size of the extent in Oracle blocks
RELATIVE_FNO	NUMBER	<ul style="list-style-type: none"> reserved Relative file number of the first extent block

DBA_GLOBAL_SECONDARY_INDEXES

DBA_GLOBAL_SECONDARY_INDEXES describes all global secondary indexes in the database.

Note

It is available only on a cluster.

Table 9-66 Column information

Column name	Data type	Description
TABLE_OWNER	VARCHAR(128)	Owner of the global secondary indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the global secondary indexed object
TABLE_NAME	VARCHAR(128)	Name of the global secondary indexed object
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the global secondary index
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent
NEXT_EXTENT	NUMBER	Size of secondary extents
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_FREE	NUMBER	Minimum percentage of free space in a block
LOGGING	VARCHAR(3)	Indicates whether or not changes to the global secondary index are logged: (YES) or (NO)
BLOCKS	NUMBER	Number of used blocks in the global secondary index

DBA_GSI_PLACE

DBA_GSI_PLACE describes node placement of all global secondary indexes in the cluster system.

Note

It is available only on a cluster.

Table 9-67 Column information

Column name	Data type	Description
TABLE_OWNER	VARCHAR(128)	Owner of the global secondary indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the global secondary indexed object
TABLE_NAME	VARCHAR(128)	Name of the global secondary indexed object
GROUP_ID	NUMBER	Group identifier of the node where the global secondary index placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the global secondary index placed
MEMBER_ID	NUMBER	Member identifier of the node where the global secondary index placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the global secondary index placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
BLOCKS	NUMBER	Number of used blocks of the node where the global secondary index placed

DBA_INDEXES

DBA_INDEXES describes all indexes in the database.

Table 9-68 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the index
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
INDEX_TYPE	VARCHAR(32)	Type of the index: the value in (NORMAL, NORMAL/REV, BITMAP, FUNCTION-BASED NORMAL, FUNCTION-BASED NORMAL/REV, FUNCTION-BASED BITMAP, IOT - TOP, DOMAIN)
TABLE_OWNER	VARCHAR(128)	Owner of the indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the indexed object
TABLE_NAME	VARCHAR(128)	Name of the indexed object
TABLE_TYPE	VARCHAR(32)	Type of the indexed object: the value in (NEXT OBJECT, INDEX, TABLE, VIEW, SYNONYM, SEQUENCE)
UNIQUENESS	VARCHAR(32)	Indicates whether the index is unique (UNIQUE) or nonunique (NON UNIQUE)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether index compression is enabled (ENABLED) or not (DISABLED)
PREFIX_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Number of columns in the prefix of the compression key
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the index
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent
NEXT_EXTENT	NUMBER	Size of secondary extents
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
PCT_THRESHOLD	NUMBER	<ul style="list-style-type: none"> reserved Threshold percentage of block space allowed per index entry
INCLUDE_COLUMN	NUMBER	<ul style="list-style-type: none"> reserved Column ID of the last column to be included in index-organized table primary key (non-overflow) index
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to this segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to this segment

Column name	Data type	Description
PCT_FREE	NUMBER	Minimum percentage of free space in a block
LOGGING	VARCHAR(3)	Indicates whether or not changes to the index are logged: (YES) or (NO)
BLOCKS	NUMBER	Number of used blocks in the index
BLEVEL	NUMBER	<ul style="list-style-type: none"> reserved B-Tree level (depth of the index from its root block to its leaf blocks)
LEAF_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of leaf blocks in the index
DISTINCT_KEYS	NUMBER	Number of distinct indexed values.
AVG_LEAF_BLOCKS_PER_KEY	NUMBER	<ul style="list-style-type: none"> reserved Average number of leaf blocks in which each distinct value in the index appears, rounded to the nearest integer
AVG_DATA_BLOCKS_PER_KEY	NUMBER	<ul style="list-style-type: none"> reserved Average number of data blocks in the table that are pointed to by a distinct value in the index rounded to the nearest integer
CLUSTERING_FACTOR	NUMBER	<ul style="list-style-type: none"> reserved Indicates the amount of order of the rows in the table based on the values of the index
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether a nonpartitioned index is VALID or UNUSABLE
NUM_ROWS	NUMBER	<ul style="list-style-type: none"> reserved Number of rows in the index
SAMPLE_SIZE	NUMBER	Size of the sample used to analyze the index
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which this index was most recently analyzed
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the index, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the indexes to be scanned, or DEFAULT
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is partitioned (YES) or not (NO)
TEMPORARY	VARCHAR(1)	Indicates whether the index is on a temporary table (Y) or not (N)
GENERATED	VARCHAR(1)	Indicates whether the name of the index is system-generated (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the index is a secondary object created by the method of the Data Cartridge (Y) or not (N)
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
BUFFER_POOL	VARCHAR(32)	Buffer pool to be used for index blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for index blocks
CELL_FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Cell flash cache hint to be used for index blocks
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
PCT_DIRECT_ACCESS	NUMBER	<ul style="list-style-type: none"> reserved For a secondary index on an index-organized table, the percentage of rows with VALID guess
ITYP_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved For a domain index, the owner of the indextype
ITYP_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved For a domain index, the name of the indextype
PARAMETERS	VARCHAR(1024)	<ul style="list-style-type: none"> reserved For a domain index, the parameter string
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned indexes, indicates whether statistics were collected by analyzing the index as a whole (YES) or were estimated from statistics on underlying index partitions and subpartitions (NO)
DOMIDX_STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of a domain index
DOMIDX_OPSTATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of the operation on a domain index
FUNCIDX_STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of a function-based index
JOIN_INDEX	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is a join index (YES) or not (NO)
IOT_REDUNDANT_PKEY_ELIM	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether redundant primary key columns are eliminated from secondary indexes on index-organized tables (YES) or not (NO)
DROPPED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index has been dropped and is in the recycle bin (YES) or not (NO)
VISIBILITY	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is VISIBLE or INVISIBLE to the optimizer
DOMIDX_MANAGE		<ul style="list-style-type: none"> reserved If this is a domain index, indicates whether the domain index is syst

Column name	Data type	Description
MENT	VARCHAR(32)	em-managed (SYSTEM_MANAGED) or user-managed (USER_MANAGED)
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the index segment has been created (YES) or not (NO)
COMMENTS	VARCHAR(1024)	Comments of the index
EMPTY_BLOCKS	NUMBER	Number of empty blocks in the index

DBA_IND_COLUMNS

DBA_IND_COLUMNS describes the columns of all the indexes on all tables and clusters in the database.

Table 9-69 Column information

Column name	Data type	Description
INDEX_OWNER	VARCHAR(128)	Owner of the index
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
TABLE_OWNER	VARCHAR(128)	Owner of the table or cluster
TABLE_SCHEMA	VARCHAR(128)	Schema of the table or cluster
TABLE_NAME	VARCHAR(128)	Name of the table or cluster
COLUMN_NAME	VARCHAR(128)	Column name or attribute of the object type column
COLUMN_POSITION	NUMBER	Position of the column or attribute within the index
COLUMN_LENGTH	NUMBER	Indexed length of the column
CHAR_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Maximum codepoint length of the column
DESCEND	VARCHAR(32)	Indicates whether the column is sorted in descending order (DESC) or ascending order (ASC)
NULL_ORDER	VARCHAR(32)	Indicates whether the null value of the column is sorted in nulls first order (NULLS FIRST) or nulls last order (NULLS LAST)

DBA_IND_PLACE

DBA_IND_PLACE describes node placement of all indexes in the cluster system.

Note

It is available only on a cluster.

Table 9-70 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the index
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
TABLE_OWNER	VARCHAR(128)	Owner of the indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the indexed object
TABLE_NAME	VARCHAR(128)	Name of the indexed object
GROUP_ID	NUMBER	Group identifier of the node where the index placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the index placed
MEMBER_ID	NUMBER	Member identifier of the node where the index placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the index placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
DISTINCT_KEYS	NUMBER	(deprecated)
SAMPLE_SIZE	NUMBER	(deprecated)
BLOCKS	NUMBER	Number of used blocks of the node where the index placed
LAST_ANALYZED	TIMESTAMP(2) WITH OUT TIME ZONE	(deprecated)

DBA_NONSCHEMA_COMMENTS

DBA_NONSCHEMA_COMMENTS displays comments on all non-schema objects (database, authorizations, schemas, tablespaces).

Table 9-71 Column information

Column name	Data type	Description
OBJECT_NAME	VARCHAR(128)	Name of the non-schema object
OBJECT_TYPE	VARCHAR(32)	Type of the non-schema object: DATABASE, PROFILE, AUTHORIZATION, SCHEMA, TABLESPACE
COMMENTS	VARCHAR(1024)	Comments of the non-schema object

DBA_OBJECTS

DBA_OBJECTS describes all objects in the database.

Table 9-72 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
SCHEMA_NAME	VARCHAR(128)	Schema of the object
OBJECT_NAME	VARCHAR(128)	Name of the object
SUBOBJECT_NAME	VARCHAR(128)	Name of the subobject (for example, partition)
OBJECT_ID	NUMBER	Dictionary object number of the object
DATA_OBJECT_ID	NUMBER	Dictionary object number of the segment that contains the object
OBJECT_TYPE	VARCHAR(32)	Type of the object (such as TABLE, INDEX)
CREATED	TIMESTAMP(2) WITH OUT TIME ZONE	Timestamp for the creation of the object
LAST_DDL_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	Timestamp for the last modification of the object resulting from a DDL statement
TIMESTAMP	VARCHAR(32)	Timestamp for the specification of the object (character data)
STATUS	VARCHAR(32)	Status of the object: the value in (VALID, INVALID, N/A)
TEMPORARY	VARCHAR(1)	Indicates whether the object is temporary (the current session can see only data that it placed in this object itself) (Y) or not (N)
GENERATED	VARCHAR(1)	Indicates whether the name of this object was system-generated (Y) or not (N)
SECONDARY	VARCHAR(1)	Indicates whether this is a secondary object created by the ODCIIndexCreate method of the Oracle Data Cartridge (Y) or not (N)
NAMESPACE	NUMBER	Namespace for the object
EDITION_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the edition in which the object is actual

DBA_PROCEEDURES

DBA_PROCEEDURES lists all function, procedures or package

Table 9-73 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of function, procedures or package
SCHEMA_NAME	VARCHAR(128)	Schema Name of function, procedures or package
OBJECT_NAME	VARCHAR(128)	Name of function, procedures or package
PROCEDURE_NAME	VARCHAR(128)	Name when a procedures in package
OBJECT_ID	NUMBER	ID of a function, procedures or package
SUBPROGRAM_ID	NUMBER	ID of procedures in package
OVERLOAD	VARCHAR(32)	ID of overloading procedure in package
OBJECT_TYPE	VARCHAR(32)	Type of function, procedures or package
AGGREGATE	VARCHAR(3)	Indicate whether the procedure is an aggregate function(YES) or not (NO)
PIPELINED	VARCHAR(3)	Indicate whether the procedure is a pipelined table function(YES) or not(NO)
IMPLTYPEOWNER	VARCHAR(128)	Name of the owner of the implementation type, if any
IMPLTYPENAME	VARCHAR(128)	Name of the implementation type, if any
PARALLEL	VARCHAR(3)	Indicates whether the procedure or function is parallel-enabled (YES) or not (NO)
INTERFACE	VARCHAR(3)	YES, if the procedure/function is a table function implemented using the SQLCLI interface; otherwise NO
DETERMINISTIC	VARCHAR(3)	YES, if the procedure/function is declared to be deterministic; otherwise NO
AUTHID	VARCHAR(32)	Indicates whether the procedure/function is declared to execute as DEFINER or CURRENT_USER (invoker)

DBA_PROC_PRIVS

DBA_PROC_PRIVS describes the procedure grants, for which the current user is the procedure owner, grantor, or grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-74 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PROCEDURE_OWNER	VARCHAR(128)	Owner of the procedure, function or package
PROCEDURE_SCHEMA	VARCHAR(128)	Schema of the procedure, function or package
PROCEDURE_NAME	VARCHAR(128)	Name of the procedure, function or package
PRIVILEGE	VARCHAR(32)	Privilege on the procedure, function or package
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

DBA_PROFILES

DBA_PROFILES displays all profiles and their limits.

Table 9-75 Column information

Column name	Data type	Description
PROFILE_NAME	VARCHAR(128)	Profile name
RESOURCE_NAME	VARCHAR(128)	Resource name
RESOURCE_TYPE	VARCHAR(32)	Indicates whether the resource profile is a KERNEL or a PASSWORD parameter
LIMIT_VALUE	LONG VARCHAR	Limit placed on this resource for this profile
COMMON	VARCHAR(3)	Indicates whether a given profile is common. (YES or NO)

DBA_SCHEMAS

Identify the schemata in the database.

Table 9-76 Column information

Column name	Data type	Description
SCHEMA_OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
CREATED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	Created time of the schema
MODIFIED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	Last modified time of the schema
COMMENTS	VARCHAR(1024)	Comments of the schema

DBA_SCHEMA_PATH

DBA_SCHEMA_PATH describes the schema search order of all authorizations in the database.

Table 9-77 Column information

Column name	Data type	Description
AUTH_NAME	VARCHAR(128)	Name of the authorization
SCHEMA_NAME	VARCHAR(128)	Name of the schema
SEARCH_ORDER	NUMBER	Schema search order of the authorization

DBA_SCHEMA_PRIVS

DBA_SCHEMA_PRIVS describes all schema grants in the database.

Table 9-78 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
PRIVILEGE	VARCHAR(32)	Privilege on the schema
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

DBA_SEQUENCES

DBA_SEQUENCES describes all sequences in the database.

Table 9-79 Column information

Column name	Data type	Description
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Sequence name
MIN_VALUE	NUMBER	Minimum value of the sequence
MAX_VALUE	NUMBER	Maximum value of the sequence
INCREMENT_BY	NUMBER	Value by which sequence is incremented
CYCLE_FLAG	VARCHAR(1)	Indicates whether the sequence wraps around on reaching the limit (Y) or not (N)
ORDER_FLAG	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether sequence numbers are generated in order (Y) or not (N)
CACHE_SIZE	NUMBER	Number of sequence numbers to cache
LAST_NUMBER	NUMBER	Last sequence number written to database. If a sequence uses caching, the number written to database is the last number placed in the sequence cache.
COMMENTS	VARCHAR(1024)	Comments of the sequence

DBA_SEQ_PRIVS

DBA_SEQ_PRIVS describes all sequence grants in the database.

Table 9-80 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Name of the sequence
PRIVILEGE	VARCHAR(32)	Privilege on the sequence
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

DBA_SHARD_KEY_COLUMNS

DBA_SHARD_KEY_COLUMNS describes shard key columns of all shared tables in the cluster system.

Note

It is available only on a cluster.

Table 9-81 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
COLUMN_NAME	VARCHAR(128)	Column name of the shard key
COLUMN_POSITION	NUMBER	Position of the column within the shard key

DBA_SOURCE

DBA_SOURCE describes the text source of the stored objects accessible to the current user.

Table 9-82 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of object
SCHEMA_NAME	VARCHAR(128)	Schema Name of object
NAME	VARCHAR(128)	Name of object
TYPE	VARCHAR(32)	Type of object: FUNCTION, PROCEDURE, PACKAGE, PACKAGE BODY, TRIGGER
LINE	NUMBER	Line number of this line of source
TEXT	LONG VARCHAR	Text source of the stored object
ORIGIN_CON_ID	VARCHAR(256)	ID of the container where the data originates

DBA_STAT_SYSTEM

DBA_STAT_SYSTEM describes analyzed system statistics.

Table 9-83 Column information

Column name	Data type	Description
CPU_OPS	NATIVE_BIGINT	OPS(operations per second) of CPU
NETWORK_IOPS	NATIVE_BIGINT	IOPS(I/O operations per second) of Cluster NETWORK
NETWORK_BUFSIZE	NATIVE_BIGINT	buffer size of Cluster NETWORK when analyzed
LAST_ANALYZED	TIMESTAMP(2) WITH OUT TIME ZONE	Date on which the table was most recently analyzed

DBA_SYS_PRIVS

DBA_SYS_PRIVS describes all system (database, tablespace, schema) privileges in the database.

Table 9-84 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the grantee
PRIVILEGE	VARCHAR(256)	System(database, tablespace, schema) privilege
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
ADMIN_OPTION	VARCHAR(3)	equal to GRANTABLE column

DBA_SYNONYMS

DBA_SYNONYMS describes all synonyms in the database.

Table 9-85 Column information

Column name	Data type	Description
SYNONYM_OWNER	VARCHAR(128)	Owner of the synonym
SYNONYM_SCHEMA	VARCHAR(128)	Schema of the synonym
SYNONYM_NAME	VARCHAR(128)	Synonym name
OBJECT_SCHEMA_NAME	VARCHAR(128)	Object schema name
OBJECT_NAME	VARCHAR(128)	Object name
DB_LINK	VARCHAR(128)	Reserved for future use

DBA_TABLES

DBA_TABLES describes all relational tables in the database.

Table 9-86 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the table
CLUSTER_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the cluster
IOT_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the index-organized table
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a previous DROP TABLE operation failed, indicates whether the table is unusable (UNUSABLE) or valid (VALID)
PCT_FREE	NUMBER	Minimum percentage of free space in a block
PCT_USED	NUMBER	Minimum percentage of used space in a block
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent (in bytes)
NEXT_EXTENT	NUMBER	Size of secondary extents (in bytes)
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to the segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to the segment
LOGGING	VARCHAR(3)	Indicates whether or not changes to the table are logged
BACKED_UP	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table has been backed up since the last modification (Y) or not (N)
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of used blocks in the table
EMPTY_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of empty (never used) blocks in the table
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
AVG_SPACE	NUMBER	Average available free space in the table
CHAIN_CNT	NUMBER	<ul style="list-style-type: none"> reserved Number of rows in the table that are chained from one data block to another or that have migrated to a new block, requiring a link to preserve the old rowid
AVG_ROW_LEN	NUMBER	<ul style="list-style-type: none"> reserved Average row length, including row overhead
AVG_SPACE_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Average freespace of all blocks on a freelist
NUM_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of blocks on the freelist
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the table, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the table is to be scanned, or DEFAULT
CACHE	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is to be cached in the buffer cache (Y) or not (N)
TABLE_LOCK	VARCHAR(32)	Indicates whether table locking is enabled (ENABLED) or disabled (DISABLED)
SAMPLE_SIZE	NUMBER	Sample size used in analyzing the table
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which the table was most recently analyzed
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is partitioned (YES) or not (NO)
IOT_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved If the table is an index-organized table, then IOT_TYPE is IOT, IOT_OVERFLOW, or IOT_MAPPING.
TEMPORARY	VARCHAR(1)	Indicates whether the table is temporary (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is a secondary object created by cartridge
NESTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is a nested table (YES) or not (NO)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for table blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for table blocks
CELL_FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Cell flash cache hint to be used for table blocks
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
ROW_MOVEMENT	VARCHAR(32)	If a partitioned table, indicates whether row movement is enabled (ENABLED) or disabled (DISABLED)
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether statistics for the table as a whole (global statistics) are accurate (YES)
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
SKIP_CORRUPT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether Database ignores blocks marked corrupt during table and index scans (ENABLED) or raises an error (DISABLED)
MONITORING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has the MONITORING attribute set (YES) or not (NO)
CLUSTER_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the cluster, if any
DEPENDENCIES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether table compression is enabled (ENABLED) or not (DISABLED)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Default compression for what kind of operations
DROPPED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has been dropped and is in the recycle bin (YES) or not (NO)
READ_ONLY	VARCHAR(3)	Indicates whether the table IS READ-ONLY (YES) or not (NO)
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the table segment has been created (YES) or not (NO)
RESULT_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Result cache mode annotation for the table: the value in (NULL, DEFAULT, FORCE, MANUAL)

DBA_TABLESPACES

DBA_TABLESPACES describes all tablespaces in the database.

Table 9-87 Column information

Column name	Data type	Description
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace
BLOCK_SIZE	NUMBER	Tablespace block size
INITIAL_EXTENT	NUMBER	<ul style="list-style-type: none"> reserved Default initial extent size (in bytes)
NEXT_EXTENT	NUMBER	<ul style="list-style-type: none"> reserved Default incremental extent size (in bytes)
MIN_EXTENTS	NUMBER	<ul style="list-style-type: none"> reserved Default minimum number of extents
MAX_EXTENTS	NUMBER	<ul style="list-style-type: none"> reserved Default maximum number of extents
MAX_SIZE	NUMBER	<ul style="list-style-type: none"> reserved Default maximum size of segments
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Default percent increase for extent size
MIN_EXTLEN	NUMBER	<ul style="list-style-type: none"> reserved Minimum extent size for this tablespace (in bytes)
STATUS	VARCHAR(32)	Tablespace status: the value in (ONLINE, OFFLINE, READ ONLY)
CONTENTS	VARCHAR(32)	Tablespace contents: the value in (SYSTEM, DATA, TEMPORARY, UNDO)
LOGGING	VARCHAR(32)	Default logging attribute: LOGGING, NOLOGGING
FORCE_LOGGING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is under force logging mode (YES) or not (NO)
EXTENT_MANAGEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)
ALLOCATION_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Type of extent allocation in effect for the tablespace: the value in (SYSTEM, UNIFORM, USER)
PLUGGED_IN	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is plugged in (YES) or not (NO)
SEGMENT_SPACE_MANAGEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the free and used segment space in the tablespace is managed using free lists (MANUAL) or bitmaps (AUTO)
DEF_TAB_COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether default table compression is enabled (ENABLED)

Column name	Data type	Description
		or not (DISABLED)
RETENTION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Undo tablespace retention: the value in (GUARANTEE, NOGUARANTEE, NOT APPLY)
BIGFILE	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is a bigfile tablespace (YES) or a smallfile tablespace (NO)
PREDICATE_EVALUATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether predicates are evaluated by host (HOST) or by storage (STORAGE)
ENCRYPTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is encrypted (YES) or not (NO)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is encrypted (YES) or not (NO)

DBA_TAB_COLS

DBA_TAB_COLS describes the columns (including hidden columns) of all tables, views, and clusters in the database.

Table 9-88 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Column name
DATA_TYPE	VARCHAR(128)	Datatype of the column
DATA_TYPE_MOD	VARCHAR(3)	<ul style="list-style-type: none"> reserved Datatype modifier of the column
DATA_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the datatype of the column
DATA_LENGTH	NUMBER	Length of the column (in bytes)
DATA_PRECISION	NUMBER	Decimal precision for NUMBER datatype; binary precision for FLOAT datatype; NULL for all other datatypes
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
NULLABLE	VARCHAR(1)	Indicates whether a column allows NULLs.
COLUMN_ID	NUMBER	Sequence number of the column as created
DEFAULT_LENGTH	NUMBER	Length of the default value for the column
DATA_DEFAULT	LONG VARCHAR	Default value for the column
NUM_DISTINCT	NUMBER	Number of distinct values in the column
LOW_VALUE	VARBINARY(32)	Low value in the column
HIGH_VALUE	VARBINARY(32)	High value in the column
DENSITY	NUMBER	<ul style="list-style-type: none"> reserved If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram.
NUM_NULLS	NUMBER	Number of NULLs in the column
NUM_BUCKETS	NUMBER	<ul style="list-style-type: none"> reserved Number of buckets in the histogram for the column
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER	Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the character set
CHAR_COL_DECL_LENGTH	NUMBER	Declaration length of the character type column
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
GLOBAL_STATS	VARCHAR(3)	For partitioned tables, indicates whether column statistics were collected for the table
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER	Average length of the column (in bytes)
CHAR_LENGTH	NUMBER	Displays the length of the column in characters.
CHAR_USED	VARCHAR(1)	Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C)
V80_FMT_IMAGE	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data is in release older image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HIDDEN_COLUMN	VARCHAR(3)	Indicates whether the column is a hidden column (YES) or not (NO)
VIRTUAL_COLUMN	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column is a virtual column (YES) or not (NO)
SEGMENT_COLUMN_ID	NUMBER	Sequence number of the column in the segment
INTERNAL_COLUMN_ID	NUMBER	Internal sequence number of the column
HISTOGRAM	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates existence/type of histogram
QUALIFIED_COLUMN_NAME	VARCHAR(4000)	Qualified column name
IDENTITY_COLUMN	VARCHAR(3)	Indicates whether this is an identity column (YES) or not (NO)

DBA_TAB_COLUMNS

DBA_TAB_COLUMNS describes the columns of the tables, views, and clusters accessible to the current user.

Table 9-89 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Column name
DATA_TYPE	VARCHAR(128)	Datatype of the column
DATA_TYPE_MOD	VARCHAR(3)	<ul style="list-style-type: none"> reserved Datatype modifier of the column
DATA_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the datatype of the column
DATA_LENGTH	NUMBER	Length of the column (in bytes)
DATA_PRECISION	NUMBER	Decimal precision for NUMBER datatype; binary precision for FLOAT datatype; NULL for all other datatypes
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
NULLABLE	VARCHAR(1)	Indicates whether a column allows NULLs.
COLUMN_ID	NUMBER	Sequence number of the column as created
DEFAULT_LENGTH	NUMBER	Length of the default value for the column
DATA_DEFAULT	LONG VARCHAR	Default value for the column
NUM_DISTINCT	NUMBER	Number of distinct values in the column
LOW_VALUE	VARBINARY(32)	Low value in the column
HIGH_VALUE	VARBINARY(32)	High value in the column
DENSITY	NUMBER	<ul style="list-style-type: none"> reserved If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram.
NUM_NULLS	NUMBER	Number of NULLs in the column
NUM_BUCKETS	NUMBER	<ul style="list-style-type: none"> reserved Number of buckets in the histogram for the column
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER	Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the character set
CHAR_COL_DECL_LENGTH	NUMBER	Declaration length of the character type column
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
GLOBAL_STATS	VARCHAR(3)	For partitioned tables, indicates whether column statistics were collected for the table
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> • reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER	Average length of the column (in bytes)
CHAR_LENGTH	NUMBER	Displays the length of the column in characters.
CHAR_USED	VARCHAR(1)	Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C)
V80_FMT_IMAGE	VARCHAR(3)	<ul style="list-style-type: none"> • reserved Indicates whether the column data is in release older image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR(3)	<ul style="list-style-type: none"> • reserved Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HISTOGRAM	VARCHAR(32)	<ul style="list-style-type: none"> • reserved Indicates existence/type of histogram
IDENTITY_COLUMN	VARCHAR(3)	Indicates whether this is an identity column (YES) or not (NO)

DBA_TAB_COMMENTS

DBA_TAB_COMMENTS displays comments on all tables and views in the database.

Table 9-90 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
TABLE_TYPE	VARCHAR(32)	Type of the object
COMMENTS	VARCHAR(1024)	Comment on the object

DBA_TAB_IDENTITY_COLS

DBA_TAB_IDENTITY_COLS describes all table identity columns.

Table 9-91 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
COLUMN_NAME	VARCHAR(128)	Name of the identity column
GENERATION_TYPE	VARCHAR(32)	Generation type of the identity column. Possible values are ALWAYS or BY DEFAULT
IDENTITY_OPTIONS	VARCHAR(1024)	Options for the identity column sequence generator

DBA_TAB_PLACE

DBA_TAB_PLACE describes node placement of all cluster tables in the cluster system.

Note

It is available only on a cluster.

Table 9-92 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
GROUP_ID	NUMBER	Group identifier of the node where the table placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the table placed
MEMBER_ID	NUMBER	Member identifier of the node where the table placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the table placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
SCN	VARCHAR(64)	table scn of the node where the table placed
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	Number of used blocks of the node where the table placed
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which the table was most recently analyzed

DBA_TAB_PRIVS

DBA_TAB_PRIVS describes all object grants in the database.

Table 9-93 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the object
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR(3)	Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)

DBA_TAB_SHARDS

DBA_TAB_SHARDS describes shard information of all sharded tables in the cluster system.

Note

It is available only on a cluster.

Table 9-94 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the table
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
SHARD_STRATEGY	VARCHAR(32)	Sharding strategy of the table: the value in (HASH SHARDING, RANGE SHARDING, LIST SHARDING)
SHARD_NAME	VARCHAR(128)	Shard name
SHARD_NUMBER	NUMBER	Shard number
SHARD_DEFINITION	LONG VARCHAR	Shard definition (if hash sharded, the value is null)
GROUP_ID	NUMBER	Group identifier where the shard placed
GROUP_NAME	VARCHAR(128)	Group Name where the shard placed

DBA_TBS_PRIVS

DBA_TBS_PRIVS describes all tablespace grants in the database.

Table 9-95 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace
PRIVILEGE	VARCHAR(32)	Privilege on the tablespace
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

DBA_USERS

DBA_USERS describes all users of the database.

Table 9-96 Column information

Column name	Data type	Description
USERNAME	VARCHAR(128)	Name of the user
USER_ID	NUMBER	ID number of the user
PASSWORD	VARCHAR(128)	encrypted password
ACCOUNT_STATUS	VARCHAR(32)	Account status: the value in (OPEN, EXPIRED, EXPIRED(GRACE), LOCKED(TIMED), LOCKED, EXPIRED & LOCKED(TIMED), EXPIRED(GRACE) & LOCKED(TIMED), EXPIRED & LOCKED, EXPIRED(GRACE) & LOCKED)
LOCK_DATE	TIMESTAMP(2) WITHOUT TIME ZONE	Timestamp the account was locked if account status was LOCKED
EXPIRY_DATE	TIMESTAMP(2) WITHOUT TIME ZONE	Timestamp of expiration of the account
FAILED_LOGIN_ATTEMPTS	NUMBER	Consecutive failed login attempts count
DEFAULT_TABLESPACE	VARCHAR(128)	Default tablespace for data
TEMPORARY_TABLESPACE	VARCHAR(128)	Name of the default tablespace for temporary tables or the name of a tablespace group
INDEX_TABLESPACE	VARCHAR(128)	Default tablespace for index
CREATED	TIMESTAMP(2) WITHOUT TIME ZONE	User creation timestamp
PROFIL_NAME	VARCHAR(128)	User resource profile name
INITIAL_RESOURCE_CONSUMER_GROUP	VARCHAR(128)	<ul style="list-style-type: none"> reserved Initial resource consumer group for the user
EXTERNAL_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved User external name
PASSWORD_VERSIONS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Shows the list of versions of the password hashes (verifiers).
EDITIONS_ENABLED	VARCHAR(1)	Indicates whether editions have been enabled for the corresponding user (Y) or not (N).
AUTHENTICATION_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the authentication mechanism for the user.

DBA_VIEWS

DBA_VIEWS describes all views in the database.

Table 9-97 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the view
VIEW_SCHEMA	VARCHAR(128)	Schema of the view
VIEW_NAME	VARCHAR(128)	Name of the view
TEXT_LENGTH	NUMBER	Length of the view text
TEXT	LONG VARCHAR	View text
TYPE_TEXT_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Length of the type clause of the typed view
TYPE_TEXT	VARCHAR(4000)	<ul style="list-style-type: none"> reserved Type clause of the typed view
OID_TEXT_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Length of the WITH OID clause of the typed view
OID_TEXT	VARCHAR(4000)	<ul style="list-style-type: none"> reserved WITH OID clause of the typed view
VIEW_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the type of the view if the view is a typed view
VIEW_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Type of the view if the view is a typed view
SUPERVIEW_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the superview
EDITIONING_VIEW	VARCHAR(1)	Reserved for future use
READ_ONLY	VARCHAR(1)	Indicates whether the view is read-only (Y) or not (N)

Views of USER_family

It retrieves information about objects which are owned by current user.

USER_ALL_TABLES

USER_ALL_TABLES describes the object tables and relational tables owned by the current user.

Table 9-98 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the table
CLUSTER_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the cluster
IOT_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the index-organized table
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a previous DROP TABLE operation failed, indicates whether the table is unusable (UNUSABLE) or valid (VALID)
PCT_FREE	NUMBER	Minimum percentage of free space in a block
PCT_USED	NUMBER	Minimum percentage of used space in a block
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent (in bytes)
NEXT_EXTENT	NUMBER	Size of secondary extents (in bytes)
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to the segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to the segment
LOGGING	VARCHAR(3)	Indicates whether or not changes to the table are logged
BACKED_UP	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table has been backed up since the last modification (Y) or not (N)
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	Number of used blocks in the table

Column name	Data type	Description
EMPTY_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of empty (never used) blocks in the table
AVG_SPACE	NUMBER	<ul style="list-style-type: none"> reserved Average available free space in the table
CHAIN_CNT	NUMBER	<ul style="list-style-type: none"> reserved Number of rows in the table that are chained from one data block to another or that have migrated to a new block, requiring a link to preserve the old rowid
AVG_ROW_LEN	NUMBER	<ul style="list-style-type: none"> reserved Average row length, including row overhead
AVG_SPACE_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Average freespace of all blocks on a freelist
NUM_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of blocks on the freelist
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the table, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the table is to be scanned, or DEFAULT
CACHE	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is to be cached in the buffer cache (Y) or not (N)
TABLE_LOCK	VARCHAR(32)	Indicates whether table locking is enabled (ENABLED) or disabled (DISABLED)
SAMPLE_SIZE	NUMBER	Sample size used in analyzing the table
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which the table was most recently analyzed
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is partitioned (YES) or not (NO)
IOT_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved If the table is an index-organized table, then IOT_TYPE is IOT, IOT_OVERFLOW, or IOT_MAPPING.
OBJECT_ID_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the object ID (OID) is USER-DEFINED or SYSTEM GENERATED
TABLE_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved If an object table, owner of the type from which the table is created
TABLE_TYPE	VARCHAR(128)	<ul style="list-style-type: none"> reserved If an object table, type of the table
TEMPORARY	VARCHAR(1)	Indicates whether the table is temporary (Y) or not (N)
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
SECONDARY	VARCHAR(1)	Indicates whether the table is a secondary object created by cartridge
NESTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is a nested table (YES) or not (NO)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for table blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for table blocks
CELL_FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Cell flash cache hint to be used for table blocks
ROW_MOVEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a partitioned table, indicates whether row movement is enabled (ENABLED) or disabled (DISABLED)
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether statistics for the table as a whole (global statistics) are accurate (YES)
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
SKIP_CORRUPT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether Database ignores blocks marked corrupt during table and index scans (ENABLED) or raises an error (DISABLED)
MONITORING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has the MONITORING attribute set (YES) or not (NO)
CLUSTER_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the cluster, if any
DEPENDENCIES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether table compression is enabled (ENABLED) or not (DISABLED)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Default compression for what kind of operations
DROPPED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has been dropped and is in the recycle bin (YES) or not (NO)
READ_ONLY	VARCHAR(3)	Indicates whether the table IS READ-ONLY (YES) or not (NO)

Column name	Data type	Description
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the table segment has been created (YES) or not (NO)

USER_ARGUMENTS

USER_ARGUMENTS lists all arguments of functions, procedures.

Table 9-99 Column information

Column name	Data type	Description
SCHEMA_NAME	VARCHAR(128)	Schema Name of function, procedures or package
OBJECT_NAME	VARCHAR(128)	Name of function, procedures
PACKAGE_NAME	VARCHAR(128)	Package Name of function, procedures
OBJECT_ID	NUMBER	ID of a function, procedures
SUBPROGRAM_ID	NUMBER	ID of procedures in package
ARGUMENT_NAME	VARCHAR(128)	Name of argument or attribute name of record type argument
POSITION	NUMBER	Position of argument or position of attribute in record type
SEQUENCE	NUMBER	Sequential order of argument and its attributes
DATA_LEVEL	NUMBER	Nesting depth of the argument for composite types
DATA_TYPE	VARCHAR(128)	Data type of the argument
DEFAULTED	VARCHAR(1)	Whether or not the argument is defaulted
DEFAULT_VALUE	VARCHAR(1)	Reserved for future use
DEFAULT_LENGTH	VARCHAR(1)	Reserved for future use
IN_OUT	VARCHAR(32)	Direction of the argument (IN, OUT, IN/OUT)
DATA_LENGTH	NUMBER	Length of the column(in bytes)
DATA_PRECISION	NUMBER	Length in decimal digits(NUMBER) or binary digits(FLOAT)
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
RADIX	NUMBER	Argument radix for a number
CHARACTER_SET_NAME	VARCHAR(128)	Character set name for the argument
TYPE_OWNER	VARCHAR(128)	Owner of the type of the argument
TYPE_NAME	VARCHAR(128)	Name of the type of the argument
TYPE_SUBNAME	VARCHAR(128)	Name of the type of the argument declared in package
TYPE_LINK	VARCHAR(128)	Name of the type of the argument declared in a remote package
PLS_TYPE	VARCHAR(128)	Name of the type of the argument at PSM
CHAR_LENGTH	NUMBER	Character limit for string datatypes
CHAR_USED	VARCHAR(1)	Whether the byte limit(B) or char limit(C) is official for the string
ORIGIN_CON_ID	VARCHAR(256)	ID of the container where the data originates

USER_CATALOG

USER_CATALOG lists tables, views, synonyms, and sequences owned by the current user.

Table 9-100 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_NAME	VARCHAR(128)	Name of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED
TABLE_TYPE	VARCHAR(32)	Type of the TABLE, VIEW, SYNONYM, SEQUENCE, or UNDEFINED

USER_COL_COMMENTS

USER_COL_COMMENTS displays comments on the columns of the tables and views owned by the current user.

Table 9-101 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
COMMENTS	VARCHAR(1024)	Comment on the column

USER_CLUSTER_TABLES

USER_CLUSTER_TABLES describes all cluster tables owned by the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-102 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
SHARD_STRATEGY	VARCHAR(32)	Sharding strategy of the table: the value in (CLONED, HASH SHARDING, RANGE SHARDING, LIST S HARDING)
SHARD_PLACEMENT	VARCHAR(32)	Shard placement of the table: the value in (AT CLUSTER WIDE or AT CLUSTER GROUP)
SHARD_COUNT	NUMBER	Shard count of the table (if cloned table, the value is null)
SHARD_KEY_COUNT	NUMBER	Shard key column count of the table (if cloned table, the value is nul l)
HAS_GSI	VARCHAR(3)	Indicate whether the table has global secondary index: (YES) or (NO)

USER_COL_PRIVS

USER_COL_PRIVS describes the column object grants for which the current user is the object owner, grantor, or grantee.

Table 9-103 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the column
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_COL_PRIVS_MADE

USER_COL_PRIVS_MADE describes the column object grants for which the current user is the object owner.

Table 9-104 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the column
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_COL_PRIVS_RECD

USER_COL_PRIVS_RECD describes the column object grants for which the current user is the grantee.

Table 9-105 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Name of the column
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the column
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_CONSTRAINTS

USER_CONSTRAINTS describes all constraint definitions on tables owned by the current user.

Table 9-106 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the constraint definition
CONSTRAINT_SCHEMA	VARCHAR(128)	Schema of the constraint definition
CONSTRAINT_NAME	VARCHAR(128)	Name of the constraint definition
CONSTRAINT_TYPE	VARCHAR(1)	Type of the constraint definition: the value in (C: check constraint, P: Primary key, U: Unique Key, R: Referential integrity)
TABLE_OWNER	VARCHAR(128)	Owner of the table (or view) associated with the constraint definition
TABLE_SCHEMA	VARCHAR(128)	Schema of the table (or view) associated with the constraint definition
TABLE_NAME	VARCHAR(128)	Name of the table (or view) associated with the constraint definition
SEARCH_CONDITION	LONG VARCHAR	Text of search condition for a check constraint
R_OWNER	VARCHAR(128)	Owner of the unique constraint definition for the referenced table
R_SCHEMA	VARCHAR(128)	Schema of the unique constraint definition for the referenced table
R_CONSTRAINT_NAME	VARCHAR(128)	Name of the unique constraint definition for the referenced table
DELETE_RULE	VARCHAR(32)	Delete rule for a referential constraint: the value in (NO ACTION, RESTRICT, CASCADE, SET NULL, SET DEFAULT)
UPDATE_RULE	VARCHAR(32)	Update rule for a referential constraint: the value in (NO ACTION, RESTRICT, CASCADE, SET NULL, SET DEFAULT)
STATUS	VARCHAR(32)	Enforcement status of the constraint: the value in (ENABLED, DISABLE)
DEFERRABLE	VARCHAR(32)	Indicates whether the constraint is deferrable (DEFERRABLE) or not (NOT DEFERRABLE)
DEFERRED	VARCHAR(32)	Indicates whether the constraint was initially deferred (DEFERRED) or not (IMMEDIATE)
VALIDATED	VARCHAR(32)	Indicates whether all data may obey the constraint or not: the value in (VALIDATED, NOT VALIDATED)
GENERATED	VARCHAR(32)	Indicates whether the name of the constraint is user-generated (USER NAME) or system-generated (GENERATED NAME)
BAD	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether this constraint specifies a century in an ambiguous manner (BAD) or not (NULL)
RELY	VARCHAR(32)	<ul style="list-style-type: none"> reserved When NOT VALIDATED, indicates whether the constraint is to be taken in to account for query rewrite (RELY) or not (NULL)
LAST_CHANGE	TIMESTAMP(2) WITHOUT TIME ZONE	When the constraint was last enabled or disabled

Column name	Data type	Description
INDEX_OWNER	VARCHAR(128)	Owner of the index associated with the key constraint
INDEX_SCHEMA	VARCHAR(128)	Schema of the index associated with the key constraint
INDEX_NAME	VARCHAR(128)	Name of the index associated with the key constraint
INVALID	VARCHAR(32)	Indicates whether the constraint is invalid (INVALID) or not (NULL)
VIEW_RELATED	VARCHAR(32)	<ul style="list-style-type: none"> • reserved Indicates whether the constraint depends on a view (DEPEND ON VIEW) or not (NULL)
COMMENTS	VARCHAR(1024)	Comments of the constraint definition

USER_CONS_COLUMNS

USER_CONS_COLUMNS describes columns that are owned by the current user and that are specified in constraint definitions.

Table 9-107 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the constraint definition
CONSTRAINT_SCHEMA	VARCHAR(128)	Schema of the constraint definition
CONSTRAINT_NAME	VARCHAR(128)	Name of the constraint definition
TABLE_OWNER	VARCHAR(128)	Owner of the table with the constraint definition
TABLE_SCHEMA	VARCHAR(128)	Schema of the table with the constraint definition
TABLE_NAME	VARCHAR(128)	Name of the table with the constraint definition
COLUMN_NAME	VARCHAR(128)	Name of the column or attribute of the object type column specified in the constraint definition
POSITION	NUMBER	Original position of the column or attribute in the definition of the object

USER_DEPENDENCIES

USER_DEPENDENCIES describes dependencies between objects accessible to the current user

Table 9-108 Column information

Column name	Data type	Description
SCHEMA_NAME	VARCHAR(128)	Schema Name of object
NAME	VARCHAR(128)	Name of object
TYPE	VARCHAR(32)	Type of object: FUNCTION, PROCEDURE, VIEW, PACKAGE, PACKAGE BODY, TRIGGER
REFERENCED_OWNER	VARCHAR(128)	Owner of the referenced object
REFERENCED_SCHEMA_NAME	VARCHAR(128)	Schema Name of the referenced object
REFERENCED_TYPE	VARCHAR(32)	Type of the referenced object: FUNCTION, PROCEDURE, TABLE, VIEW, SEQUENCE, PACKAGE, PACKAGE BODY, TRIGGER
REFERENCED_LINK_NAME	VARCHAR(128)	Name of the link to the parent object
REFERENCED_NAME	VARCHAR(128)	Name of the referenced object
DEPENDENCY_TYPE	VARCHAR(32)	Indicates whether the dependency is a REF dependency (REF) or not (HARD)

USER_EXTENTS

USER_EXTENTS describes the extents comprising the segments owned by the current user's objects.

Table 9-109 Column information

Column name	Data type	Description
SEGMENT_SCHEMA	VARCHAR(128)	Schema of the segment associated with the extent
SEGMENT_NAME	VARCHAR(128)	Name of the segment associated with the extent
PARTITION_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Object Partition Name (Set to NULL for non-partitioned objects)
SEGMENT_TYPE	VARCHAR(32)	Type of the segment: TABLE, INDEX
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the extent
EXTENT_ID	NUMBER	<ul style="list-style-type: none"> reserved Extent number in the segment
BYTES	NUMBER	Size of the extent in bytes
BLOCKS	NUMBER	Size of the extent in Oracle blocks

USER_GLOBAL_SECONDARY_INDEXES

USER_GLOBAL_SECONDARY_INDEXES describes the global secondary indexes on the tables owned by the current user.

Note

It is available only on a cluster.

Table 9-110 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the global secondary indexed object
TABLE_NAME	VARCHAR(128)	Name of the global secondary indexed object
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the global secondary index
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent
NEXT_EXTENT	NUMBER	Size of secondary extents
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_FREE	NUMBER	Minimum percentage of free space in a block
LOGGING	VARCHAR(3)	Indicates whether or not changes to the global secondary index are logged: (YES) or (NO)
BLOCKS	NUMBER	Number of used blocks in the global secondary index

USER_GSI_PLACE

USER_GSI_PLACE describes node placement of all global secondary indexes on the tables owned by the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-111 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the global secondary indexed object
TABLE_NAME	VARCHAR(128)	Name of the global secondary indexed object
GROUP_ID	NUMBER	Group identifier of the node where the global secondary index placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the global secondary index placed
MEMBER_ID	NUMBER	Member identifier of the node where the global secondary index placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the global secondary index placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
BLOCKS	NUMBER	Number of used blocks of the node where the global secondary index placed

USER_INDEXES

USER_INDEXES describes indexes owned by the current user.

Table 9-112 Column information

Column name	Data type	Description
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
INDEX_TYPE	VARCHAR(32)	Type of the index: the value in (NORMAL, NORMAL/REV, BITMAP, FUNCTION-BASED NORMAL, FUNCTION-BASED NORMAL/REV, FUNCTION-BASED BITMAP, IOT - TOP, DOMAIN)
TABLE_OWNER	VARCHAR(128)	Owner of the indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the indexed object
TABLE_NAME	VARCHAR(128)	Name of the indexed object
TABLE_TYPE	VARCHAR(32)	Type of the indexed object: the value in (NEXT OBJECT, INDEX, TABLE, VIEW, SYNONYM, SEQUENCE)
UNIQUENESS	VARCHAR(32)	Indicates whether the index is unique (UNIQUE) or nonunique (NONUNIQUE)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether index compression is enabled (ENABLED) or not (DISABLED)
PREFIX_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Number of columns in the prefix of the compression key
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the index
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent
NEXT_EXTENT	NUMBER	Size of secondary extents
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
PCT_THRESHOLD	NUMBER	<ul style="list-style-type: none"> reserved Threshold percentage of block space allowed per index entry
INCLUDE_COLUMN	NUMBER	<ul style="list-style-type: none"> reserved Column ID of the last column to be included in index-organized table primary key (non-overflow) index
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to this segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to this segment

Column name	Data type	Description
PCT_FREE	NUMBER	Minimum percentage of free space in a block
LOGGING	VARCHAR(3)	Indicates whether or not changes to the index are logged: (YES) or (NO)
BLOCKS	NUMBER	Number of used blocks in the index
BLEVEL	NUMBER	<ul style="list-style-type: none"> reserved B-Tree level (depth of the index from its root block to its leaf blocks)
LEAF_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of leaf blocks in the index
DISTINCT_KEYS	NUMBER	Number of distinct indexed values.
AVG_LEAF_BLOCKS_PER_KEY	NUMBER	<ul style="list-style-type: none"> reserved Average number of leaf blocks in which each distinct value in the index appears, rounded to the nearest integer
AVG_DATA_BLOCKS_PER_KEY	NUMBER	<ul style="list-style-type: none"> reserved Average number of data blocks in the table that are pointed to by a distinct value in the index rounded to the nearest integer
CLUSTERING_FACTOR	NUMBER	<ul style="list-style-type: none"> reserved Indicates the amount of order of the rows in the table based on the values of the index
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether a nonpartitioned index is VALID or UNUSABLE
NUM_ROWS	NUMBER	<ul style="list-style-type: none"> reserved Number of rows in the index
SAMPLE_SIZE	NUMBER	Size of the sample used to analyze the index
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which this index was most recently analyzed
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the index, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the indexes to be scanned, or DEFAULT
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is partitioned (YES) or not (NO)
TEMPORARY	VARCHAR(1)	Indicates whether the index is on a temporary table (Y) or not (N)
GENERATED	VARCHAR(1)	Indicates whether the name of the index is system-generated (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the index is a secondary object created by the method of the Data Cartridge (Y) or not (N)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for index blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for index blocks
CELL_FLASH_CACHE		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
CHE	VARCHAR(32)	Cell flash cache hint to be used for index blocks
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
PCT_DIRECT_ACCESS	NUMBER	<ul style="list-style-type: none"> reserved For a secondary index on an index-organized table, the percentage of rows with VALID guess
ITYP_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved For a domain index, the owner of the indextype
ITYP_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved For a domain index, the name of the indextype
PARAMETERS	VARCHAR(1024)	<ul style="list-style-type: none"> reserved For a domain index, the parameter string
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned indexes, indicates whether statistics were collected by analyzing the index as a whole (YES) or were estimated from statistics on underlying index partitions and subpartitions (NO)
DOMIDX_STATUSES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of a domain index
DOMIDX_OPSTATS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of the operation on a domain index
FUNCIDX_STATUSES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of a function-based index
JOIN_INDEX	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is a join index (YES) or not (NO)
IOT_REDUNDANT_PKEY_ELIM	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether redundant primary key columns are eliminated from secondary indexes on index-organized tables (YES) or not (NO)
DROPPED	VARCHAR(3)	Indicates whether the index has been dropped and is in the recycle bin (YES) or not (NO)
VISIBILITY	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the index is VISIBLE or INVISIBLE to the optimizer
DOMIDX_MANAGEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved If this is a domain index, indicates whether the domain index is system-managed (SYSTEM_MANAGED) or user-managed (USER_MANAGED)
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the index segment has been created (YES) or not (NO)
COMMENTS	VARCHAR(1024)	Comments of the index
EMPTY_BLOCKS	NUMBER	Number of empty blocks in the index

USER_IND_COLUMNS

USER_IND_COLUMNS describes the columns of the indexes owned by the current user and columns of indexes on tables owned by the current user.

Table 9-113 Column information

Column name	Data type	Description
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
TABLE_SCHEMA	VARCHAR(128)	Schema of the table or cluster
TABLE_NAME	VARCHAR(128)	Name of the table or cluster
COLUMN_NAME	VARCHAR(128)	Column name or attribute of the object type column
COLUMN_POSITION	NUMBER	Position of the column or attribute within the index
COLUMN_LENGTH	NUMBER	Indexed length of the column
CHAR_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Maximum codepoint length of the column
DESCEND	VARCHAR(32)	Indicates whether the column is sorted in descending order (DESC) or ascending order (ASC)
NULL_ORDER	VARCHAR(32)	Indicates whether the null value of the column is sorted in nulls first order (NULLS FIRST) or nulls last order (NULLS LAST)

USER_IND_PLACE

USER_IND_PLACE describes node placement of the indexes owned by the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-114 Column information

Column name	Data type	Description
INDEX_SCHEMA	VARCHAR(128)	Schema of the index
INDEX_NAME	VARCHAR(128)	Name of the index
TABLE_OWNER	VARCHAR(128)	Owner of the indexed object
TABLE_SCHEMA	VARCHAR(128)	Schema of the indexed object
TABLE_NAME	VARCHAR(128)	Name of the indexed object
GROUP_ID	NUMBER	Group identifier of the node where the index placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the index placed
MEMBER_ID	NUMBER	Member identifier of the node where the index placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the index placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
DISTINCT_KEYS	NUMBER	(deprecated)
SAMPLE_SIZE	NUMBER	(deprecated)
BLOCKS	NUMBER	Number of used blocks of the node where the index placed
LAST_ANALYZED	TIMESTAMP(2) WITH OUT TIME ZONE	(deprecated)

USER_OBJECTS

USER_OBJECTS describes all objects owned by the current user.

Table 9-115 Column information

Column name	Data type	Description
SCHEMA_NAME	VARCHAR(128)	Schema of the object
OBJECT_NAME	VARCHAR(128)	Name of the object
SUBOBJECT_NAME	VARCHAR(128)	Name of the subobject (for example, partition)
OBJECT_ID	NUMBER	Dictionary object number of the object
DATA_OBJECT_ID	NUMBER	Dictionary object number of the segment that contains the object
OBJECT_TYPE	VARCHAR(32)	Type of the object (such as TABLE, INDEX)
CREATED	TIMESTAMP(2) WITH OUT TIME ZONE	Timestamp for the creation of the object
LAST_DDL_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	Timestamp for the last modification of the object resulting from a DDL statement
TIMESTAMP	VARCHAR(32)	Timestamp for the specification of the object (character data)
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved Status of the object: the value in (VALID, INVALID, N/A)
TEMPORARY	VARCHAR(1)	Indicates whether the object is temporary (the current session can see only data that it placed in this object itself) (Y) or not (N)
GENERATED	VARCHAR(1)	Indicates whether the name of this object was system-generated (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether this is a secondary object created by the ODCIIndex Create method of the Oracle Data Cartridge (Y) or not (N)
NAMESPACE	NUMBER	Namespace for the object
EDITION_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the edition in which the object is actual

USER_PROCEDURES

USER_PROCEDURES lists of procedures owned by the current user.

Table 9-116 Column information

Column name	Data type	Description
SCHEMA_NAME	VARCHAR(128)	Schema Name of function, procedures or package
OBJECT_NAME	VARCHAR(128)	Name of function, procedures or package
PROCEDURE_NAME	VARCHAR(128)	Name when a procedures in package
OBJECT_ID	NUMBER	ID of a function, procedures or package
SUBPROGRAM_ID	NUMBER	ID of procedures in package
OVERLOAD	VARCHAR(32)	ID of overloading procedure in package
OBJECT_TYPE	VARCHAR(32)	Type of function, procedures or package
AGGREGATE	VARCHAR(3)	Indicate whether the procedure is an aggregate function(YES) or not (NO)
PIPELINED	VARCHAR(3)	Indicate whether the procedure is a pipelined table function(YES) or not(NO)
IMPLTYPEOWNER	VARCHAR(128)	Name of the owner of the implementation type, if any
IMPLTYPENAME	VARCHAR(128)	Name of the implementation type, if any
PARALLEL	VARCHAR(3)	Indicates whether the procedure or function is parallel-enabled (YES) or not (NO)
INTERFACE	VARCHAR(3)	YES, if the procedure/function is a table function implemented using the SQLCLI interface; otherwise NO
DETERMINISTIC	VARCHAR(3)	YES, if the procedure/function is declared to be deterministic; otherwise NO
AUTHID	VARCHAR(32)	Indicates whether the procedure/function is declared to execute as DEFINER or CURRENT_USER (invoker)

USER_PROC_PRIVS

USER_PROC_PRIVS describes the procedure grants for which the current user is the procedure owner, grantor, or grantee.

Table 9-117 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PROCEDURE_OWNER	VARCHAR(128)	Owner of the procedure, function or package
PROCEDURE_SCHEMA	VARCHAR(128)	Schema of the procedure, function or package
PROCEDURE_NAME	VARCHAR(128)	Name of the procedure, function or package
PRIVILEGE	VARCHAR(32)	Privilege on the procedure, function or package
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_PROC_PRIVS_MADE

USER_PROC_PRIVS_MADE describes the procedure grants for which the current user is the procedure owner or grantor.

Table 9-118 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PROCEDURE_OWNER	VARCHAR(128)	Owner of the procedure, function or package
PROCEDURE_SCHEMA	VARCHAR(128)	Schema of the procedure, function or package
PROCEDURE_NAME	VARCHAR(128)	Name of the procedure, function or package
PRIVILEGE	VARCHAR(32)	Privilege on the procedure, function or package
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_PROC_PRIVS_RECD

USER_PROC_PRIVS_RECD describes the procedure grants, for which the current user is the grantee, or for which an enabled role or PUBLIC is the grantee.

Table 9-119 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
PROCEDURE_OWNER	VARCHAR(128)	Owner of the procedure, function or package
PROCEDURE_SCHEMA	VARCHAR(128)	Schema of the procedure, function or package
PROCEDURE_NAME	VARCHAR(128)	Name of the procedure, function or package
PRIVILEGE	VARCHAR(32)	Privilege on the procedure, function or package
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_SCHEMAS

USER_SCHEMAS identifies the schemata in a catalog that are owned by current user.

Table 9-120 Column information

Column name	Data type	Description
SCHEMA_OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
CREATED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	Created time of the schema
MODIFIED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	Last modified time of the schema
COMMENTS	VARCHAR(1024)	Comments of the schema

USER_SCHEMA_PATH

USER_SCHEMA_PATH describes the schema search order of the current user, for naming resolution of unqualified SQL schema objects.

Table 9-121 Column information

Column name	Data type	Description
AUTH_NAME	VARCHAR(128)	Name of the user
SCHEMA_NAME	VARCHAR(128)	Name of the schema
SEARCH_ORDER	NUMBER	Schema search order of the user

USER_SCHEMA_PRIVS

USER_SCHEMA_PRIVS describes the schema grants, for which the current user is the schema owner, grantor, or grantee.

Table 9-122 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
PRIVILEGE	VARCHAR(32)	Privilege on the schema
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_SCHEMA_PRIVS_MADE

USER_SCHEMA_PRIVS_MADE describes the schema grants for which the current user is the schema owner.

Table 9-123 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
PRIVILEGE	VARCHAR(32)	Privilege on the schema
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_SCHEMA_PRIVS_RECD

USER_SCHEMA_PRIVS_RECD describes the schema grants for which the current user is the grantee.

Table 9-124 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the schema
SCHEMA_NAME	VARCHAR(128)	Name of the schema
PRIVILEGE	VARCHAR(32)	Privilege on the schema
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_SEQUENCES

USER_SEQUENCES describes all sequences owned by the current user.

Table 9-125 Column information

Column name	Data type	Description
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Sequence name
MIN_VALUE	NUMBER	Minimum value of the sequence
MAX_VALUE	NUMBER	Maximum value of the sequence
INCREMENT_BY	NUMBER	Value by which sequence is incremented
CYCLE_FLAG	VARCHAR(1)	Indicates whether the sequence wraps around on reaching the limit (Y) or not (N)
ORDER_FLAG	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether sequence numbers are generated in order (Y) or not (N)
CACHE_SIZE	NUMBER	Number of sequence numbers to cache
LAST_NUMBER	NUMBER	Last sequence number written to database. If a sequence uses caching, the number written to database is the last number placed in the sequence cache.
COMMENTS	VARCHAR(1024)	Comments of the sequence

USER_SEQ_PRIVS

USER_SEQ_PRIVS describes the sequence grants for which the current user is the sequence owner, grant or, or grantee.

Table 9-126 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Name of the sequence
PRIVILEGE	VARCHAR(32)	Privilege on the sequence
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_SEQ_PRIVS_MADE

USER_SEQ_PRIVS_MADE describes the sequence grants for which the current user is the sequence owner.

Table 9-127 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Name of the sequence
PRIVILEGE	VARCHAR(32)	Privilege on the sequence
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_SEQ_PRIVS_RECD

USER_SEQ_PRIVS_RECD describes the sequence grants for which the current user is the grantee.

Table 9-128 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
SEQUENCE_OWNER	VARCHAR(128)	Owner of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	Schema of the sequence
SEQUENCE_NAME	VARCHAR(128)	Name of the sequence
PRIVILEGE	VARCHAR(32)	Privilege on the sequence
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)

USER_SHARD_KEY_COLUMNS

USER_SHARD_KEY_COLUMNS describes shard key columns of shared tables owned by the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-129 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
COLUMN_NAME	VARCHAR(128)	Column name of the shard key
COLUMN_POSITION	NUMBER	Position of the column within the shard key

USER_SOURCE

USER_SOURCE describes the text source of the stored objects accessible to the current user.

Table 9-130 Column information

Column name	Data type	Description
SCHEMA_NAME	VARCHAR(128)	Schema Name of object
NAME	VARCHAR(128)	Name of object
TYPE	VARCHAR(32)	Type of object: FUNCTION, PROCEDURE, PACKAGE, PACKAGE BODY, TRIGGER
LINE	NUMBER	Line number of this line of source
TEXT	LONG VARCHAR	Text source of the stored object
ORIGIN_CON_ID	VARCHAR(256)	ID of the container where the data originates

USER_SYNONYMS

USER_SYNONYMS describes all synonyms owned by the current user.

Table 9-131 Column information

Column name	Data type	Description
SYNONYM_OWNER	VARCHAR(128)	Owner of the synonym
SYNONYM_SCHEMA	VARCHAR(128)	Schema of the synonym
SYNONYM_NAME	VARCHAR(128)	Synonym name
OBJECT_SCHEMA_NAME	VARCHAR(128)	Object schema name
OBJECT_NAME	VARCHAR(128)	Object name
DB_LINK	VARCHAR(128)	Reserved for future use

USER_SYS_PRIVS

USER_SYS_PRIVS describes system (database, tablespace, schema) privileges granted to the current user or PUBLIC.

Table 9-132 Column information

Column name	Data type	Description
USERNAME	VARCHAR(128)	Name of the user, or PUBLIC
PRIVILEGE	VARCHAR(256)	System(database, tablespace, schema) privilege
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
ADMIN_OPTION	VARCHAR(3)	equal to GRANTABLE column

USER_TABLES

USER_TABLES describes the relational tables owned by the current user.

Table 9-133 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace containing the table
CLUSTER_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the cluster
IOT_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the index-organized table
STATUS	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a previous DROP TABLE operation failed, indicates whether the table is unusable (UNUSABLE) or valid (VALID)
PCT_FREE	NUMBER	Minimum percentage of free space in a block
PCT_USED	NUMBER	Minimum percentage of used space in a block
INI_TRANS	NUMBER	Initial number of transactions
MAX_TRANS	NUMBER	Maximum number of transactions
INITIAL_EXTENT	NUMBER	Size of the initial extent (in bytes)
NEXT_EXTENT	NUMBER	Size of secondary extents (in bytes)
MIN_EXTENTS	NUMBER	Minimum number of extents allowed in the segment
MAX_EXTENTS	NUMBER	Maximum number of extents allowed in the segment
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Percentage increase in extent size
FREELISTS	NUMBER	<ul style="list-style-type: none"> reserved Number of process freelists allocated to the segment
FREELIST_GROUPS	NUMBER	<ul style="list-style-type: none"> reserved Number of freelist groups allocated to the segment
LOGGING	VARCHAR(3)	Indicates whether or not changes to the table are logged
BACKED_UP	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table has been backed up since the last modification (Y) or not (N)
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	Number of used blocks in the table
EMPTY_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of empty (never used) blocks in the table
AVG_SPACE	NUMBER	<ul style="list-style-type: none"> reserved Average available free space in the table
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
CHAIN_CNT	NUMBER	Number of rows in the table that are chained from one data block to another or that have migrated to a new block, requiring a link to preserve the old rowid
AVG_ROW_LEN	NUMBER	<ul style="list-style-type: none"> reserved Average row length, including row overhead
AVG_SPACE_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Average freespace of all blocks on a freelist
NUM_FREELIST_BLOCKS	NUMBER	<ul style="list-style-type: none"> reserved Number of blocks on the freelist
DEGREE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of threads per instance for scanning the table, or DEFAULT
INSTANCES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Number of instances across which the table is to be scanned, or DEFAULT
CACHE	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is to be cached in the buffer cache (Y) or not (N)
TABLE_LOCK	VARCHAR(32)	Indicates whether table locking is enabled (ENABLED) or disabled (DISABLED)
SAMPLE_SIZE	NUMBER	Sample size used in analyzing the table
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which the table was most recently analyzed
PARTITIONED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is partitioned (YES) or not (NO)
IOT_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved If the table is an index-organized table, then IOT_TYPE is IOT, IOT_OVERFLOW, or IOT_MAPPING.
TEMPORARY	VARCHAR(1)	Indicates whether the table is temporary (Y) or not (N)
SECONDARY	VARCHAR(1)	<ul style="list-style-type: none"> reserved Indicates whether the table is a secondary object created by cartridge
NESTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table is a nested table (YES) or not (NO)
BUFFER_POOL	VARCHAR(32)	<ul style="list-style-type: none"> reserved Buffer pool to be used for table blocks
FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Database Smart Flash Cache hint to be used for table blocks
CELL_FLASH_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Cell flash cache hint to be used for table blocks
ROW_MOVEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved If a partitioned table, indicates whether row movement is enabled (ENABLED) or disabled (DISABLED)

Column name	Data type	Description
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether statistics for the table as a whole (global statistics) are accurate (YES)
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
DURATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates the duration of a temporary table
SKIP_CORRUPT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether Database ignores blocks marked corrupt during table and index scans (ENABLED) or raises an error (DISABLED)
MONITORING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has the MONITORING attribute set (YES) or not (NO)
CLUSTER_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the cluster, if any
DEPENDENCIES	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether row-level dependency tracking is enabled (ENABLED) or disabled (DISABLED)
COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether table compression is enabled (ENABLED) or not (DISABLED)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Default compression for what kind of operations
DROPPED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the table has been dropped and is in the recycle bin (YES) or not (NO)
READ_ONLY	VARCHAR(3)	Indicates whether the table IS READ-ONLY (YES) or not (NO)
SEGMENT_CREATED	VARCHAR(3)	Indicates whether the table segment has been created (YES) or not (NO)
RESULT_CACHE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Result cache mode annotation for the table: the value in (NULL, DEFAULT, FORCE, MANUAL)

USER_TABLESPACES

USER_TABLESPACES describes the tablespaces accessible to the current user.

Table 9-134 Column information

Column name	Data type	Description
TABLESPACE_NAME	VARCHAR(128)	Name of the tablespace
BLOCK_SIZE	NUMBER	Tablespace block size
INITIAL_EXTENT	NUMBER	<ul style="list-style-type: none"> reserved Default initial extent size (in bytes)
NEXT_EXTENT	NUMBER	<ul style="list-style-type: none"> reserved Default incremental extent size (in bytes)
MIN_EXTENTS	NUMBER	<ul style="list-style-type: none"> reserved Default minimum number of extents
MAX_EXTENTS	NUMBER	<ul style="list-style-type: none"> reserved Default maximum number of extents
MAX_SIZE	NUMBER	<ul style="list-style-type: none"> reserved Default maximum size of segments
PCT_INCREASE	NUMBER	<ul style="list-style-type: none"> reserved Default percent increase for extent size
MIN_EXTLEN	NUMBER	<ul style="list-style-type: none"> reserved Minimum extent size for this tablespace (in bytes)
STATUS	VARCHAR(32)	Tablespace status: the value in (ONLINE, OFFLINE, READ ONLY)
CONTENTS	VARCHAR(32)	Tablespace contents: the value in (SYSTEM, DATA, TEMPORARY, UNDO)
LOGGING	VARCHAR(32)	Default logging attribute: LOGGING, NOLOGGING
FORCE_LOGGING	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is under force logging mode (YES) or not (NO)
EXTENT_MANAGEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the extents in the tablespace are dictionary managed (DICTIONARY) or locally managed (LOCAL)
ALLOCATION_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Type of extent allocation in effect for the tablespace: the value in (SYSTEM, UNIFORM, USER)
SEGMENT_SPACE_MANAGEMENT	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the free and used segment space in the tablespace is managed using free lists (MANUAL) or bitmaps (AUTO)
DEF_TAB_COMPRESSION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether default table compression is enabled (ENABLED) or not (DISABLED)
		<ul style="list-style-type: none"> reserved

Column name	Data type	Description
RETENTION	VARCHAR(32)	Undo tablespace retention: the value in (GUARANTEE, NOGUARANTEE, NOT APPLY)
BIGFILE	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is a bigfile tablespace (YES) or a smallfile tablespace (NO)
PREDICATE_EVALUATION	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether predicates are evaluated by host (HOST) or by storage (STORAGE)
ENCRYPTED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is encrypted (YES) or not (NO)
COMPRESS_FOR	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates whether the tablespace is encrypted (YES) or not (NO)

USER_TAB_COLS

USER_TAB_COLS describes the columns (including hidden columns) of the tables, views, and clusters owned by the current user.

Table 9-135 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Column name
DATA_TYPE	VARCHAR(128)	Datatype of the column
DATA_TYPE_MOD	VARCHAR(3)	<ul style="list-style-type: none"> reserved Datatype modifier of the column
DATA_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the datatype of the column
DATA_LENGTH	NUMBER	Length of the column (in bytes)
DATA_PRECISION	NUMBER	Decimal precision for NUMBER datatype; binary precision for FLOAT datatype; NULL for all other datatypes
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
NULLABLE	VARCHAR(1)	Indicates whether a column allows NULLs.
COLUMN_ID	NUMBER	Sequence number of the column as created
DEFAULT_LENGTH	NUMBER	Length of the default value for the column
DATA_DEFAULT	LONG VARCHAR	Default value for the column
NUM_DISTINCT	NUMBER	Number of distinct values in the column
LOW_VALUE	VARBINARY(32)	Low value in the column
HIGH_VALUE	VARBINARY(32)	High value in the column
DENSITY	NUMBER	<ul style="list-style-type: none"> reserved If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram.
NUM_NULLS	NUMBER	Number of NULLs in the column
NUM_BUCKETS	NUMBER	<ul style="list-style-type: none"> reserved Number of buckets in the histogram for the column
LAST_ANALYZED	TIMESTAMP(6) WITHOUT TIME ZONE	Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER	Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the character set
CHAR_COL_DECL_LENGTH	NUMBER	Declaration length of the character type column
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether column statistics were collected for the table

Column name	Data type	Description
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER	Average length of the column (in bytes)
CHAR_LENGTH	NUMBER	Displays the length of the column in characters.
CHAR_USED	VARCHAR(1)	Indicates that the column uses BYTE length semantics (B) or CHARACTER length semantics (C)
V80_FMT_IMAGE	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data is in release older image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HIDDEN_COLUMN	VARCHAR(3)	Indicates whether the column is a hidden column (YES) or not (NO)
VIRTUAL_COLUMN	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column is a virtual column (YES) or not (NO)
SEGMENT_COLUMN_ID	NUMBER	Sequence number of the column in the segment
INTERNAL_COLUMN_ID	NUMBER	Internal sequence number of the column
HISTOGRAM	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates existence/type of histogram
QUALIFIED_COL_NAME	VARCHAR(4000)	Qualified column name
IDENTITY_COLUMN	VARCHAR(3)	Indicates whether this is an identity column (YES) or not (NO)

USER_TAB_COLUMNS

USER_TAB_COLUMNS describes the columns of the tables, views, and clusters owned by the current user.

Table 9-136 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COLUMN_NAME	VARCHAR(128)	Column name
DATA_TYPE	VARCHAR(128)	Datatype of the column
DATA_TYPE_MOD	VARCHAR(3)	<ul style="list-style-type: none"> reserved Datatype modifier of the column
DATA_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the datatype of the column
DATA_LENGTH	NUMBER	Length of the column (in bytes)
DATA_PRECISION	NUMBER	Decimal precision for NUMBER datatype; binary precision for FLOAT datatype; NULL for all other datatypes
DATA_SCALE	NUMBER	Digits to the right of the decimal point in a number
NULLABLE	VARCHAR(1)	Indicates whether a column allows NULLs.
COLUMN_ID	NUMBER	Sequence number of the column as created
DEFAULT_LENGTH	NUMBER	Length of the default value for the column
DATA_DEFAULT	LONG VARCHAR	Default value for the column
NUM_DISTINCT	NUMBER	Number of distinct values in the column
LOW_VALUE	VARBINARY(32)	Low value in the column
HIGH_VALUE	VARBINARY(32)	High value in the column
DENSITY	NUMBER	<ul style="list-style-type: none"> reserved If a histogram is available on COLUMN_NAME, then this column displays the selectivity of a value that spans fewer than 2 endpoints in the histogram.
NUM_NULLS	NUMBER	Number of NULLs in the column
NUM_BUCKETS	NUMBER	<ul style="list-style-type: none"> reserved Number of buckets in the histogram for the column
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which this column was most recently analyzed
SAMPLE_SIZE	NUMBER	Sample size used in analyzing this column
CHARACTER_SET_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the character set
CHAR_COL_DECL_LENGTH	NUMBER	Declaration length of the character type column
GLOBAL_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved For partitioned tables, indicates whether column statistics were collected for the table

Column name	Data type	Description
USER_STATS	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether statistics were entered directly by the user (YES) or not (NO)
AVG_COL_LEN	NUMBER	Average length of the column (in bytes)
CHAR_LENGTH	NUMBER	Displays the length of the column in characters.
CHAR_USED	VARCHAR(1)	Indicates that the column uses BYTE length semantics (B) or CHAR length semantics (C)
V80_FMT_IMAGE	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data is in release older image format (YES) or not (NO)
DATA_UPGRADED	VARCHAR(3)	<ul style="list-style-type: none"> reserved Indicates whether the column data has been upgraded to the latest type version format (YES) or not (NO)
HISTOGRAM	VARCHAR(32)	<ul style="list-style-type: none"> reserved Indicates existence/type of histogram
IDENTITY_COLUMN	VARCHAR(3)	Indicates whether this is an identity column (YES) or not (NO)

USER_TAB_COMMENTS

USER_TAB_COMMENTS displays comments on the tables and views owned by the current user.

Table 9-137 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
TABLE_TYPE	VARCHAR(32)	Type of the object
COMMENTS	VARCHAR(1024)	Comment on the object

USER_TAB_IDENTITY_COLS

USER_TAB_IDENTITY_COLS describes all table identity columns.

Table 9-138 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
COLUMN_NAME	VARCHAR(128)	Name of the identity column
GENERATION_TYPE	VARCHAR(32)	Generation type of the identity column. Possible values are ALWAYS or BY DEFAULT
IDENTITY_OPTIONS	VARCHAR(1024)	Options for the identity column sequence generator

USER_TAB_PLACE

USER_TAB_PLACE describes node placement of cluster tables owned by the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-139 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
GROUP_ID	NUMBER	Group identifier of the node where the table placed
GROUP_NAME	VARCHAR(128)	Group name of the node where the table placed
MEMBER_ID	NUMBER	Member identifier of the node where the table placed
MEMBER_NAME	VARCHAR(128)	Member name of the node where the table placed
MEMBER_OFFLINE	BOOLEAN	data of the cluster member is offline or not
SCN	VARCHAR(64)	table scn of the node where the table placed
NUM_ROWS	NUMBER	Number of rows in the table
BLOCKS	NUMBER	Number of used blocks of the node where the table placed
LAST_ANALYZED	TIMESTAMP(6) WITH OUT TIME ZONE	Date on which the table was most recently analyzed

USER_TAB_PRIVS

USER_TAB_PRIVS describes the object grants for which the current user is the object owner, grantor, or grantee.

Table 9-140 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the object
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR(3)	Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)

USER_TAB_PRIVS_MADE

USER_TAB_PRIVS_MADE describes the object grants for which the current user is the object owner.

Table 9-141 Column information

Column name	Data type	Description
GRANTEE	VARCHAR(128)	Name of the user or role to whom access was granted
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the object
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR(3)	Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)

USER_TAB_PRIVS_RECD

USER_TAB_PRIVS_RECD describes the object grants for which the current user is the grantee.

Table 9-142 Column information

Column name	Data type	Description
OWNER	VARCHAR(128)	Owner of the object
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
GRANTOR	VARCHAR(128)	Name of the user who performed the grant
PRIVILEGE	VARCHAR(32)	Privilege on the object
GRANTABLE	VARCHAR(3)	Indicates whether the privilege was granted with the GRANT OPTION (YES) or not (NO)
HIERARCHY	VARCHAR(3)	Indicates whether the privilege was granted with the HIERARCHY OPTION (YES) or not (NO)

USER_TAB_SHARDS

USER_TAB_SHARDS describes shard information of sharded tables owned by the current user in the cluster system.

Note

It is available only on a cluster.

Table 9-143 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the table
TABLE_NAME	VARCHAR(128)	Name of the table
SHARD_STRATEGY	VARCHAR(32)	Sharding strategy of the table: the value in (HASH SHARDING, RANGE SHARDING, LIST SHARDING)
SHARD_NAME	VARCHAR(128)	Shard name
SHARD_NUMBER	NUMBER	Shard number
SHARD_DEFINITION	LONG VARCHAR	Shard definition (if hash sharded, the value is null)
GROUP_ID	NUMBER	Group identifier where the shard placed
GROUP_NAME	VARCHAR(128)	Group Name where the shard placed

USER_USERS

USER_USERS describes the current user.

Table 9-144 Column information

Column name	Data type	Description
USERNAME	VARCHAR(128)	Name of the user
USER_ID	NUMBER	ID number of the user
ACCOUNT_STATUS	VARCHAR(32)	Account status: the value in (OPEN, EXPIRED, EXPIRED(GRACE), LOCKED(TIMED), LOCKED, EXPIRED & LOCKED(TIMED), EXPIRED(GRACE) & LOCKED(TIMED), EXPIRED & LOCKED, EXPIRED(GRACE) & LOCKED)
LOCK_DATE	TIMESTAMP(2) WITHOUT TIME ZONE	Timestamp the account was locked if account status was LOCKED
EXPIRY_DATE	TIMESTAMP(2) WITHOUT TIME ZONE	Timestamp of expiration of the account
DEFAULT_TABLESPACE	VARCHAR(128)	Default tablespace for data
TEMPORARY_TABLESPACE	VARCHAR(128)	Name of the default tablespace for temporary tables or the name of a tablespace group
INDEX_TABLESPACE	VARCHAR(128)	Default tablespace for index
CREATED	TIMESTAMP(2) WITHOUT TIME ZONE	User creation timestamp
INITIAL_RSRC_CONSUMER_GROUP	VARCHAR(128)	<ul style="list-style-type: none"> reserved Initial resource consumer group for the user
EXTERNAL_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved User external name

USER_VIEWS

USER_VIEWS describes the views owned by the current user.

Table 9-145 Column information

Column name	Data type	Description
VIEW_SCHEMA	VARCHAR(128)	Schema of the view
VIEW_NAME	VARCHAR(128)	Name of the view
TEXT_LENGTH	NUMBER	Length of the view text
TEXT	LONG VARCHAR	View text
TYPE_TEXT_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Length of the type clause of the typed view
TYPE_TEXT	VARCHAR(4000)	<ul style="list-style-type: none"> reserved Type clause of the typed view
OID_TEXT_LENGTH	NUMBER	<ul style="list-style-type: none"> reserved Length of the WITH OID clause of the typed view
OID_TEXT	VARCHAR(4000)	<ul style="list-style-type: none"> reserved WITH OID clause of the typed view
VIEW_TYPE_OWNER	VARCHAR(128)	<ul style="list-style-type: none"> reserved Owner of the type of the view if the view is a typed view
VIEW_TYPE	VARCHAR(32)	<ul style="list-style-type: none"> reserved Type of the view if the view is a typed view
SUPERVIEW_NAME	VARCHAR(128)	<ul style="list-style-type: none"> reserved Name of the superview
EDITIONING_VIEW	VARCHAR(1)	Reserved for future use
READ_ONLY	VARCHAR(1)	Indicates whether the view is read-only (Y) or not (N)

Other Views

There are other views or tables which are none of All-family, DBA-family or USER-family.

AUDIT_POLICIES

AUDIT_POLICIES contains one row for each audit policy.

Table 9-146 Column information

Column name	Data type	Description
POLICY_NAME	VARCHAR(128)	audit policy name
ENABLED	VARCHAR(3)	indicates whether the audit policy is enabled (YES) or not (NO)
CREATED_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	created time of the audit policy
MODIFIED_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	last modified time of the audit policy
COMMENTS	VARCHAR(1024)	comments of the audit policy

AUDIT_POLICY_OPTIONS

AUDIT_POLICY_OPTIONS describes all audit policies created in the database.

Table 9-147 Column information

Column name	Data type	Description
POLICY_NAME	VARCHAR(128)	audit policy name
AUDIT_OPTION	VARCHAR(32)	auditing option defined in the audit policy
AUDIT_OPTION_TYPE	VARCHAR(32)	The values of AUDIT_OPTION_TYPE_NAME in ('DATABASE PRIVILEGE', 'SYSTEM ACTION', 'OBJECT ACTION')
OBJECT_SCHEMA	VARCHAR(128)	schema name, for an object-specific auditing option
OBJECT_NAME	VARCHAR(128)	object name, for an object-specific auditing option
OBJECT_TYPE	VARCHAR(32)	object type name, for an object-specific auditing option

AUDIT_POLICY_ENABLED

AUDIT_POLICY_ENABLE describes all the audit policies that are enable in the database.

Table 9-148 Column information

Column name	Data type	Description
POLICY_NAME	VARCHAR(128)	audit policy name
ENABLED_OPT	VARCHAR(32)	enable option of the audit policy, the possible values are BY, EXCEPT
USER_NAME	VARCHAR(128)	user name for whom the audit policy is enable
WHEN_SUCCESS	VARCHAR(3)	indicates whether the audit policy is enable for auditing successful events or not
WHEN_FAILURE	VARCHAR(3)	indicates whether the audit policy is enable for auditing unsuccessful events or not

AUDIT_TRAIL

AUDIT_TRAIL displays audit records from the audit trail.

Table 9-149 Column information

Column name	Data type	Description
MEMBER_NAME	VARCHAR(128)	cluster member name
SESSION_ID	NUMBER	session identifier
SESSION_SERIAL	NUMBER	session serial number
LOGON_USERNAME	VARCHAR(128)	logon user name of the user whose actions were audited
CURRENT_USERNAME	VARCHAR(128)	effective user for the statement execution
SERVER_PROCESS	NUMBER	server process identifier for the session
CLIENT_PROGRAM_NAME	VARCHAR(128)	client program used for session
CLIENT_USERNAME	VARCHAR(128)	client operating system user name for the session
CLIENT_PROCESS	NUMBER	client process identifier for the session
CLIENT_HOST	VARCHAR(128)	client host ip address for the session
CLIENT_PORT	NUMBER	client port number for the session
CLIENT_TERMINAL	VARCHAR(128)	client terminal name for the session
TRANSACTION_ID	NUMBER	transaction identifier
SCN	VARCHAR(128)	system change number (SCN) string of the query at the time of the event
GCN	NUMBER	global change number (GCN) of the query at the time of the event
DCN	NUMBER	domain change number (DCN) of the query at the time of the event
LCN	NUMBER	local change number (LCN) of the query at the time of the event
STMT_NO	NUMBER	numeric number for each statement run in a session
SQL_TEXT	LONG VARCHAR	SQL associated with the event
SQL_BINDS	LONG VARCHAR	list of bind variables, if any, associated with SQL_TEXT
RETURN_CODE	NUMBER	error code generated by the action, zero if the action succeeded
ERROR_MESSAGE	VARCHAR(1024)	error message generated by the action, null if the action succeeded
ENTRY_ID	NUMBER	audit trail entry identifier in the session
EVENT_TIMESTAMP	TIMESTAMP(2) WITHOUT TIME ZONE	timestamp of the creation of the audit trail entry in local time zone
POLICY_NAME	VARCHAR(128)	audit policy name that caused the current audit record
PRIVILEGE_USED	VARCHAR(32)	database privilege used to execute the action
ACTION_NAME	VARCHAR(32)	action name executed by the user

Column name	Data type	Description
OBJECT_TYPE	VARCHAR(32)	object type of object affected by the action
OBJECT_SCHEMA	VARCHAR(128)	schema name of object affected by the action
OBJECT_NAME	VARCHAR(128)	object name of object affected by the action

DATABASE_PROPERTIES

DATABASE_PROPERTIES lists permanent database properties.

Table 9-150 Column information

Column name	Data type	Description
PROPERTY_NAME	VARCHAR(128)	Property name
PROPERTY_VALUE	VARCHAR(4000)	Property value
DESCRIPTION	VARCHAR(4000)	Property description

DBC_TABLE_TYPE_INFO

Identify the ODBC/JDBC table types available in this database.

Table 9-151 Column information

Column name	Data type	Description
DBC_TABLE_TYPE_ID	NUMBER	number identifier of the table type in ODBC/JDBC
DBC_TABLE_TYPE	VARCHAR(128)	name of the table type in ODBC/JDBC
IS_SUPPORTED	BOOLEAN	is supported feature
COMMENTS	VARCHAR(1024)	comments of the table type

DICTIONARY

DICTIONARY contains descriptions of data dictionary tables and views.

Table 9-152 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
COMMENTS	VARCHAR(1024)	Text comment on the object

DICT_COLUMNS

DICT_COLUMNS contains descriptions of columns in data dictionary tables and views.

Table 9-153 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the object that contains the column
TABLE_NAME	VARCHAR(128)	Name of the object that contains the column
COLUMN_NAME	VARCHAR(128)	Name of the column
COMMENTS	VARCHAR(1024)	Text comment on the column

IMPLEMENTATION_INFO

IMPLEMENTATION_INFO contains information about various aspects that are left implementation-defined.

Table 9-154 Column information

Column name	Data type	Description
IMPLEMENTATION_INFO_ID	NUMBER	identifier of the implementation item
IMPLEMENTATION_INFO_NAME	VARCHAR(1024)	descriptive name of the implementation item
INTEGER_VALUE	NUMBER	Value of the implementation item, or null if the value is contained in the column CHARACTER_VALUE
CHARACTER_VALUE	VARCHAR(1024)	Value of the implementation item, or null if the value is contained in the column INTEGER_VALUE
COMMENTS	VARCHAR(1024)	possibly a comment pertaining to the implementation item

IMPLEMENTATION_INFO_BASE

The IMPLEMENTATION_INFO_BASE table has one row for each implementation information item.

Table 9-155 Column information

Column name	Data type	Description
ID	VARCHAR(32)	identifier string of the implementation item
SUB_ID	VARCHAR(32)	identifier string of the implementation item
NAME	VARCHAR(1024)	descriptive name of the implementation item
SUB_NAME	VARCHAR(1024)	descriptive name of the implementation item
IS_SUPPORTED	BOOLEAN	TRUE if the implementation item is supported, FALSE if not
INTEGER_VALUE	NUMBER	Value of the implementation item, or null if the value is contained in the column CHARACTER_VALUE
CHARACTER_VALUE	VARCHAR(1024)	Value of the implementation item, or null if the value is contained in the column INTEGER_VALUE
COMMENTS	VARCHAR(1024)	possibly a comment pertaining to the implementation item

JDBC_CLIENT_PROPS

JDBC_CLIENT_PROPS is the set of jdbc client properties.

Table 9-156 Column information

Column name	Data type	Description
NAME	VARCHAR(128)	property name
MAX_LEN	NATIVE_INTEGER	max length of a value
DEFAULT_VALUE	VARCHAR(128)	default value
DESCRIPTION	VARCHAR(256)	description on that property

PRODUCT

PRODUCT is about the product name, version for ODBC, JDBC interface.

Table 9-157 Column information

Column name	Data type	Description
NAME	VARCHAR(32)	the product name
VERSION	VARCHAR(128)	product full version information
PRODUCT_VERSION	NUMBER	product version
MAJOR_VERSION	NUMBER	major version
MINOR_VERSION	NUMBER	minor version
PATCH_VERSION	NUMBER	patch version

SESSION_PRIVS

SESSION_PRIVS describes the privileges that are currently available to the user.

Table 9-158 Column information

Column name	Data type	Description
PRIVILEGE	VARCHAR(256)	Name of the privilege

SUPPLEMENTAL_LOG_TABLE_INFO

SUPPLEMENTAL_LOG_TABLE_INFO describes table-level supplemental logging status.

Table 9-159 Column information

Column name	Data type	Description
TABLE_SCHEMA	VARCHAR(128)	Schema of the object
TABLE_NAME	VARCHAR(128)	Name of the object
SUPPLEMENTAL_LOG_DATA_PK	VARCHAR(32)	Status of table-level PRIMARY KEY COLUMNS supplemental logging: IMPLICIT, EXPLICIT, NO

Aliased Synonym

It is the public synonym which indicates the view or table in DICTIONARY_SCHEMA.

COLS

COLS is a public synonym for USER_TAB_COLUMNS.

DICT

DICT is a public synonym for DICTIONARY.

IND

IND is a public synonym for USER_INDEXES.

OBJ

OBJ is a public synonym for USER_OBJECTS.

SEQ

SEQ is a public synonym for USER_SEQUENCES.

TABS

TABS is a public synonym for USER_TABLES.

9.2 INFORMATION_SCHEMA

Views of INFORMATION_SCHEMA schema provides the same information as those defined in the SQL standard.

Execute *InformationSchema.sql* as follows to use the views.

- For standalone

```
% gsql sys gliese --as sysdba --import  
$GOLDILOCKS_HOME/admin/standalone/InformationSchema.sql
```

- For cluster

```
% gsql sys gliese --as sysdba --import $GOLDILOCKS_HOME/admin/cluster/InformationSchema.sql
```

Note

Views and tables of INFORMATION_SCHEMA can be retrieved from OPEN phase.

COLUMNS

Identify the columns of tables defined in this catalog that are accessible to given user or role.

Table 9-160 Column information

Column name	Data type	Description
TABLE_CATALOG	VARCHAR(128)	catalog name of the column
TABLE_OWNER	VARCHAR(128)	owner name of the column
TABLE_SCHEMA	VARCHAR(128)	schema name of the column
TABLE_NAME	VARCHAR(128)	table name of the column
COLUMN_NAME	VARCHAR(128)	column name
ORDINAL_POSITION	NUMBER	the ordinal position (> 0) of the column in the table
COLUMN_DEFAULT	LONG VARCHAR	the default for the column
IS_NULLABLE	BOOLEAN	is nullable of the column
DATA_TYPE	VARCHAR(128)	the standard name of the data type
CHARACTER_MAXIMUM_LENGTH	NUMBER	the maximum length in characters
CHARACTER_OCTET_LENGTH	NUMBER	the maximum length in octets
NUMERIC_PRECISION	NUMBER	the numeric precision of the numerical Data type
NUMERIC_PRECISION_RADIX	NUMBER	the radix (2 or 10) of the precision of the numerical data type
NUMERIC_SCALE	NUMBER	the numeric scale of the exact numerical data type
DATETIME_PRECISION	NUMBER	for a datetime or interval type, the value is the fractional seconds precision
INTERVAL_TYPE	VARCHAR(32)	for a interval type, the value is in (YEAR, MONTH, DAY, HOUR, MINUTE, SECOND, YEAR TO MONTH, DAY TO HOUR, DAY TO MINUTE, DAY TO SECOND, HOUR TO MINUTE, HOUR TO SECOND, MINUTE TO SECOND)
INTERVAL_PRECISION	NUMBER	for a interval type, the value is the leading precision
CHARACTER_SET_CATALOG	VARCHAR(128)	catalog name of the character set if is is a character string type
CHARACTER_SET_SCHEMA	VARCHAR(128)	schema name of the character set if is is a character string type
CHARACTER_SET_NAME	VARCHAR(128)	character set name of the character set if is is a character string type
COLLATION_CATALOG	VARCHAR(128)	catalog name of the applicable collation if is is a character string type
COLLATION_SCHEMA	VARCHAR(128)	schema name of the applicable collation if is is a character string type
COLLATION_NAME	VARCHAR(128)	collation name of the applicable collation if is is a character

Column name	Data type	Description
		string type
DOMAIN_CATALOG	VARCHAR(128)	catalog name of the domain used by the column being described
DOMAIN_SCHEMA	VARCHAR(128)	schema name of the domain used by the column being described
DOMAIN_NAME	VARCHAR(128)	domain name of the domain used by the column being described
UDT_CATALOG	VARCHAR(128)	catalog name of the user-defined type of the data type being described
UDT_SCHEMA	VARCHAR(128)	schema name of the user-defined type of the data type being described
UDT_NAME	VARCHAR(128)	user-defined type name of the user-defined type of the data type being described
SCOPE_CATALOG	VARCHAR(128)	catalog name of the referenceable table if DATA_TYPE is REF
SCOPE_SCHEMA	VARCHAR(128)	schema name of the referenceable table if DATA_TYPE is REF
SCOPE_NAME	VARCHAR(128)	scope name of the referenceable table if DATA_TYPE is REF
MAXIMUM_CARDINALITY	NUMBER	maximum cardinality if DATA_TYPE is ARRAY
DTD_IDENTIFIER	NUMBER	data type descriptor identifier
IS_SELF_REFERENCING	BOOLEAN	is a self-referencing column
IS_IDENTITY	BOOLEAN	is an identity column
IDENTITY_GENERATION	VARCHAR(32)	for an identity column, the value is in (ALWAYS, BY DEFAULT)
IDENTITY_START	NUMBER	for an identity column, the start value of the identity column
IDENTITY_INCREMENT	NUMBER	for an identity column, the increment of the identity column
IDENTITY_MAXIMUM	NUMBER	for an identity column, the maximum value of the identity column
IDENTITY_MINIMUM	NUMBER	for an identity column, the minimum value of the identity column
IDENTITY_CYCLE	BOOLEAN	for an identity column, the cycle option
IS_GENERATED	BOOLEAN	is a generated column
GENERATION_EXPRESSION	VARCHAR(128)	for a generated column, the text of the generation expression
IS_SYSTEM_VERSION_START	BOOLEAN	is a system-version start column
IS_SYSTEM_VERSION_END	BOOLEAN	is a system-version end column
SYSTEM_VERSION_TIMESTAMP_GENERATION	VARCHAR(32)	for a system-version column, the value is ALWAYS
IS_UPDATABLE	BOOLEAN	is an updatable column
DECLARED_DATA_TYPE	VARCHAR(128)	the data type name that a user declared

Column name	Data type	Description
DECLARED_NUMERIC_PRECISION	NUMBER	the precision value that a user declared
DECLARED_NUMERIC_SCALE	NUMBER	the scale value that a user declared
COMMENTS	VARCHAR(1024)	comments of the column

COLUMN_PRIVILEGES

Identify the privileges on columns of tables defined in this catalog that are available to or granted by a given user or role.

Table 9-161 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	authorization name of the user who granted column privileges
GRANTEE	VARCHAR(128)	authorization name of some user or role, or PUBLIC to indicate all users, to whom the column privilege being described is granted
TABLE_CATALOG	VARCHAR(128)	catalog name of the column on which the privilege being described was granted
TABLE_OWNER	VARCHAR(128)	table owner name of the column on which the privilege being described was granted
TABLE_SCHEMA	VARCHAR(128)	schema name of the column on which the privilege being described was granted
TABLE_NAME	VARCHAR(128)	table name of the column on which the privilege being described was granted
COLUMN_NAME	VARCHAR(128)	column name of the column on which the privilege being described was granted
PRIVILEGE_TYPE	VARCHAR(32)	the value is in (SELECT, INSERT, UPDATE, REFERENCES)
IS_GRANTABLE	BOOLEAN	is grantable

CONSTRAINT_COLUMN_USAGE

Identify the columns used by referential constraints, unique constraints, check constraints, and assertions defined in this catalog and owned by a given user or role.

Table 9-162 Column information

Column name	Data type	Description
TABLE_CATALOG	VARCHAR(128)	catalog name of the column that participates in the constraint being described
TABLE_OWNER	VARCHAR(128)	owner name of the column that participates in the constraint being described
TABLE_SCHEMA	VARCHAR(128)	schema name of the column that participates in the constraint being described
TABLE_NAME	VARCHAR(128)	table name of the column that participates in the constraint being described
COLUMN_NAME	VARCHAR(128)	column name that participates in the constraint being described
CONSTRAINT_CATALOG	VARCHAR(128)	catalog name of the constraint
CONSTRAINT_OWNER	VARCHAR(128)	owner name of the constraint
CONSTRAINT_SCHEMA	VARCHAR(128)	schema name of the constraint
CONSTRAINT_NAME	VARCHAR(128)	constraint name

CONSTRAINT_TABLE_USAGE

Identify the tables that are used by referential constraints, unique constraints, check constraints, and assertions defined in this catalog and owned by a given user or role.

Table 9-163 Column information

Column name	Data type	Description
TABLE_CATALOG	VARCHAR(128)	catalog name of the table that participates in the constraint being described
TABLE_OWNER	VARCHAR(128)	owner name of the table that participates in the constraint being described
TABLE_SCHEMA	VARCHAR(128)	schema name of the table that participates in the constraint being described
TABLE_NAME	VARCHAR(128)	table name that participates in the constraint being described
CONSTRAINT_CATALOG	VARCHAR(128)	catalog name of the constraint
CONSTRAINT_OWNER	VARCHAR(128)	owner name of the constraint
CONSTRAINT_SCHEMA	VARCHAR(128)	schema name of the constraint
CONSTRAINT_NAME	VARCHAR(128)	constraint name

INFORMATION_SCHEMA_CATALOG_NAME

Identify the catalog that contains the Information Schema

Table 9-164 Column information

Column name	Data type	Description
CATALOG_NAME	VARCHAR(128)	the name of catalog in which this Information Schema resides

KEY_COLUMN_USAGE

Identify the columns defined in this catalog that are constrained as keys and that are accessible by a given user or role.

Table 9-165 Column information

Column name	Data type	Description
CONSTRAINT_CATALOG	VARCHAR(128)	catalog name of the constraint
CONSTRAINT_OWNER	VARCHAR(128)	owner name of the constraint
CONSTRAINT_SCHEMA	VARCHAR(128)	schema name of the constraint
CONSTRAINT_NAME	VARCHAR(128)	constraint name
TABLE_CATALOG	VARCHAR(128)	catalog name of the column that participates in the constraint being described
TABLE_OWNER	VARCHAR(128)	owner name of the column that participates in the constraint being described
TABLE_SCHEMA	VARCHAR(128)	schema name of the column that participates in the constraint being described
TABLE_NAME	VARCHAR(128)	table name of the column that participates in the constraint being described
COLUMN_NAME	VARCHAR(128)	column name that participates in the constraint being described
ORDINAL_POSITION	NUMBER	the ordinal position of the specific column in the constraint being described. If the constraint described is a key of cardinality 1 (one), then the value of ORDINAL_POSITION is always 1 (one).
POSITION_IN_UNIQUE_CONSTRAINT	NUMBER	If the constraint being described is a foreign key constraint, then the value of POSITION_IN_UNIQUE_CONSTRAINT is the ordinal position of the referenced column corresponding to the referencing column being described, in the corresponding unique key constraint.

PARAMETERS

Identify the SQL parameters of SQL-invoked routines defined in this catalog that are accessible to a given user or role.

Table 9-166 Column information

Column name	Data type	Description
SPECIFIC_CATALOG	VARCHAR(128)	catalog name of the specific name of the SQL- invoked routine that contains the SQL parameter being described
SPECIFIC_OWNER	VARCHAR(128)	owner name of the specific name of the SQL- invoked routine that contains the SQL parameter being described
SPECIFIC_SCHEMA	VARCHAR(128)	schema name of the specific name of the SQL- invoked routine that contains the SQL parameter being described
SPECIFIC_NAME	VARCHAR(128)	specific name of the SQL- invoked routine that contains the SQL parameter being described
ORDINAL_POSITION	NUMBER	ordinal position of the SQL- invoked routine that contains the SQL parameter being described
PARAMETER_MODE	VARCHAR(32)	parameter mode of the SQL parameter being described
IS_RESULT	BOOLEAN	the parameter is RESULT parameter of type-preserving function
AS_LOCATOR	BOOLEAN	the parameter is passed as locator
PARAMETER_NAME	VARCHAR(128)	name of the SQL parameter being described
FROM_SQL_SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of the from-sql routine for the input parameter being described
FROM_SQL_SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of the from-sql routine for the input parameter being described
FROM_SQL_SPECIFIC_NAME	VARCHAR(128)	specific name of the from-sql routine for the input parameter being described
TO_SQL_SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of the to-sql routine for the input parameter being described
TO_SQL_SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of the to-sql routine for the input parameter being described
TO_SQL_SPECIFIC_NAME	VARCHAR(128)	specific name of the to-sql routine for the input parameter being described
DATA_TYPE	VARCHAR(128)	data type of the SQL parameter being described
CHARACTER_MAXIMUM_LENGTH	NUMBER	maximum length of the SQL parameter being described
		maximum length in octets of the SQL parameter being

Column name	Data type	Description
CHARACTER_OCTET_LENGTH	NUMBER	g described
CHARACTER_SET_CATALOG	VARCHAR(128)	character set catalog name of the data type of the SQL parameter being described
CHARACTER_SET_SCHEMA	VARCHAR(128)	character set schema name of the data type of the SQL parameter being described
CHARACTER_SET_NAME	VARCHAR(128)	character set name of the data type of the SQL parameter being described
COLLATION_CATALOG	VARCHAR(128)	collation catalog name of the data type of the SQL parameter being described
COLLATION_SCHEMA	VARCHAR(128)	collation schema name of the data type of the SQL parameter being described
COLLATION_NAME	VARCHAR(128)	collation name of the data type of the SQL parameter being described
NUMERIC_PRECISION	NUMBER	precision of the data type of the SQL parameter being described
NUMERIC_PRECISION_RADIX	NUMBER	precision radix of the data type of the SQL parameter being described
NUMERIC_SCALE	NUMBER	scale of the data type of the SQL parameter being described
DATETIME_PRECISION	NUMBER	fractional second precisions of the data type of the SQL parameter being described
INTERVAL_TYPE	VARCHAR(32)	interval qualifier of the data type of the SQL parameter being described
INTERVAL_PRECISION	NUMBER	interval precision of the data type of the SQL parameter being described
UDT_CATALOG	VARCHAR(128)	catalog name of UDT of the data type of the SQL parameter being described
UDT_SCHEMA	VARCHAR(128)	schema name of UDT of the data type of the SQL parameter being described
UDT_NAME	VARCHAR(128)	name of UDT of the data type of the SQL parameter being described
SCOPE_CATALOG	VARCHAR(128)	catalog name of referenceable tables of the data type of the SQL parameter being described
SCOPE_SCHEMA	VARCHAR(128)	schema name of referenceable tables of the data type of the SQL parameter being described
SCOPE_NAME	VARCHAR(128)	name of referenceable tables of the data type of the SQL parameter being described
MAXIMUM_CARDINALITY	NUMBER	maximum cardinality of the data type of the SQL parameter being described
DTD_IDENTIFIER	NUMBER	dtd identifier of the data type of the SQL parameter being described
		declared data type of the SQL parameter being described

Column name	Data type	Description
DECLARED_DATA_TYPE	VARCHAR(128)	bed
DECLARED_NUMERIC_PRECISION	NUMBER	precision of declared data type of the SQL parameter being described
DECLARED_NUMERIC_SCALE	NUMBER	scale of declared data type of the SQL parameter being described
PARAMETER_DEFAULT	LONG VARCHAR	default value of the SQL parameter being described

REFERENTIAL_CONSTRAINTS

Identify the referential constraints defined on tables in this catalog that are accessible to a given user or role.

Table 9-167 Column information

Column name	Data type	Description
CONSTRAINT_CATALOG	VARCHAR(128)	catalog name of the referential constraint
CONSTRAINT_OWNER	VARCHAR(128)	owner name who owns the referential constraint
CONSTRAINT_SCHEMA	VARCHAR(128)	schema name of the referential constraint being described
CONSTRAINT_NAME	VARCHAR(128)	referential constraint name
CONSTRAINT_TABLE_NAME	VARCHAR(128)	name of the table to which the referential constraint being described applies
CONSTRAINT_COLUMN_NAME	VARCHAR(128)	column name of the table to which the referential constraint being described applies
ORDINAL_POSITION	NUMBER	the ordinal position of the specific column in the referential constraint being described.
UNIQUE_CONSTRAINT_CATALOG	VARCHAR(128)	catalog name of the unique or primary key constraint applied to the referenced column list being described
UNIQUE_CONSTRAINT_OWNER	VARCHAR(128)	owner name of the unique or primary key constraint applied to the referenced column list being described
UNIQUE_CONSTRAINT_SCHEMA	VARCHAR(128)	schema name of the unique or primary key constraint applied to the referenced column list being described
UNIQUE_CONSTRAINT_NAME	VARCHAR(128)	constraint name of the unique or primary key constraint applied to the referenced column list being described
UNIQUE_CONSTRAINT_TABLE_NAME	VARCHAR(128)	table name of the unique or primary key constraint applied to the referenced column list being described
UNIQUE_CONSTRAINT_COLUMN_NAME	VARCHAR(128)	column name of the unique or primary key constraint applied to the referenced column list being described
IS_PRIMARY_KEY	BOOLEAN	whether the constraint applied to the referenced column list being described, is primary key or not
MATCH_OPTION	VARCHAR(32)	the referential constraint that has a match option: the value in (SIMPLE, PARTIAL, FULL)
UPDATE_RULE	VARCHAR(32)	the referential constraint that has an update rule: the value in (NO ACTION, RESTRICT, CASCADE, SET NULL, SET DEFAULT)
		the referential constraint that has a delete rule: the value in (NO ACTION, R

Column name	Data type	Description
DELETE_RULE	VARCHAR(32)	ESTRICT, CASCADE, SET NULL, SET DEFAULT)
IS_DEFERRABLE	BOOLEAN	is a deferrable constraint
INITIALLY_DEFERRED	BOOLEAN	is an initially deferred constraint

ROUTINES

Identify the SQL-invoked routines in this catalog that are accessible to a given user or role.

Table 9-168 Column information

Column name	Data type	Description
SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of the routine
SPECIFIC_OWNER	VARCHAR(128)	specific owner name of the routine
SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of the routine
SPECIFIC_NAME	VARCHAR(128)	specific name of the routine
ROUTINE_CATALOG	VARCHAR(128)	catalog name of the routine
ROUTINE_OWNER	VARCHAR(128)	owner name of the routine
ROUTINE_SCHEMA	VARCHAR(128)	schema name of the routine
ROUTINE_NAME	VARCHAR(128)	null
ROUTINE_TYPE	VARCHAR(128)	name of the routine
MODULE_CATALOG	VARCHAR(128)	module name of the routine
MODULE_SCHEMA	VARCHAR(128)	schema name of the module in which the routine is defined
MODULE_NAME	VARCHAR(128)	name of the module in which the routine is defined
UDT_CATALOG	VARCHAR(128)	catalog name of the user-defined data type which defined the routine as a method function
UDT_SCHEMA	VARCHAR(128)	schema name of the user-defined data type which defined the routine as a method function
UDT_NAME	VARCHAR(128)	name of the user-defined data type which defined the routine as a method function
DATA_TYPE	VARCHAR(128)	data type the routine returns
CHARACTER_MAXIMUM_LENGTH	NUMBER	maximum character length of data type the routine returns
CHARACTER_OCTET_LENGTH	NUMBER	maximum character length in octets of data type the routine returns
CHARACTER_SET_CATALOG	VARCHAR(128)	character set catalog name of data type the routine returns
CHARACTER_SET_SCHEMA	VARCHAR(128)	character set schema name of data type the routine returns
CHARACTER_SET_NAME	VARCHAR(128)	character set name of data type the routine returns
COLLATION_CATALOG	VARCHAR(128)	collation catalog name of data type the routine returns
COLLATION_SCHEMA	VARCHAR(128)	collation schema name of data type the routine returns
COLLATION_NAME	VARCHAR(128)	collation name of data type the routine returns
NUMERIC_PRECISION	NUMBER	precision of data type the routine returns
NUMERIC_PRECISION_RADIX	NUMBER	precision radix of data type the routine returns
NUMERIC_SCALE	NUMBER	scale of data type the routine returns

Column name	Data type	Description
DATETIME_PRECISION	NUMBER	fractional seconds precision of data type the routine returns
INTERVAL_TYPE	VARCHAR(32)	interval qualifier for data type the routine returns
INTERVAL_PRECISION	NUMBER	interval leading field precision of data type the routine returns
TYPE_UDT_CATALOG	VARCHAR(128)	catalog name of the user-defined data type, which is the data type the routine returns
TYPE_UDT_SCHEMA	VARCHAR(128)	schema name of the user-defined data type, which is the data type the routine returns
TYPE_UDT_NAME	VARCHAR(128)	name of the user-defined data type, which is the data type the routine returns
SCOPE_CATALOG	VARCHAR(128)	catalog name of referenceable table
SCOPE_SCHEMA	VARCHAR(128)	schema name of referenceable table
SCOPE_NAME	VARCHAR(128)	name of referenceable table
MAXIMUM_CARDINALITY	NUMBER	maximum cardinality of data type the routine returns
DTD_IDENTIFIER	NUMBER	dtd identifier of data type the routine returns
ROUTINE_BODY	VARCHAR(32)	type of the routine body
ROUTINE_DEFINITION	LONG VARCHAR	catalog name of the routine
EXTERNAL_NAME	VARCHAR(128)	external name of the external routine
EXTERNAL_LANGUAGE	VARCHAR(32)	language of the external routine
PARAMETER_STYLE	VARCHAR(32)	SQL parameter passing style of the external routine
IS_DETERMINISTIC	BOOLEAN	the routine is deterministic or not
SQL_DATA_ACCESS	VARCHAR(32)	routine possibly contains SQL or access data
IS_NULL_CALL	BOOLEAN	routine returns NULL if any of parameter values are NULL
SQL_PATH	VARCHAR(1024)	described SQL PATH when the routine is defined
SCHEMA_LEVEL_ROUTINE	BOOLEAN	the routine is schema-level routine
MAX_DYNAMIC_RESULT_SETS	NUMBER	max result set count of the routine
IS_USER_DEFINED_CAST	BOOLEAN	the routine is a function that is a user-defined cast function
IS_IMPLICITLY_INVOCABLE	BOOLEAN	the user-defined cast function is implicitly invocable
SECURITY_TYPE	VARCHAR(32)	security type of the routine(DEFINER/INVOKER)
TO_SQL_SPECIFIC_CATALOG	VARCHAR(128)	catalog name of the to-sql routine of the result type of routine
TO_SQL_SPECIFIC_SCHEMA	VARCHAR(128)	schema name of the to-sql routine of the result type of routine
TO_SQL_SPECIFIC_NAME	VARCHAR(128)	name of the to-sql routine of the result type of routine
AS_LOCATOR	BOOLEAN	return value of the routine is passed as locator
CREATED	TIMESTAMP(2) WITHOUT TIME ZONE	creation time of the routine
LAST_ALTERED	TIMESTAMP(2) WITHOUT TIME ZONE	most lately altered time of the routine
NEW_SAVEPOINT_LEVEL	BOOLEAN	specify new savepoint level or not

Column name	Data type	Description
IS_UDT_DEPENDENT	BOOLEAN	routine is dependent
RESULT_CAST_FROM_DATA_TYPE	VARCHAR(128)	data type which is specified in result cast clause of the routine definition
RESULT_CAST_AS Locator	BOOLEAN	locator indication which is specified in result cast clause of the routine definition
RESULT_CAST_CHAR_MAX_LENGTH	NUMBER	maximum character length of data type which is specified in result cast clause of the routine definition
RESULT_CAST_CHAR_OCTET_LENGTH	NUMBER	maximum character length in octets of data type which is specified in result cast clause of the routine definition
RESULT_CAST_CHAR_SET_CATALOG	VARCHAR(128)	character set catalog name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_CHAR_SET_SCHEMA	VARCHAR(128)	character set schema name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_CHARACTER_SET_NAME	VARCHAR(128)	character set name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_COLLATION_CATALOG	VARCHAR(128)	collation catalog name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_COLLATION_SCHEMA	VARCHAR(128)	collation schema name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_COLLATION_NAME	VARCHAR(128)	collation name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_NUMERIC_PRECISION	NUMBER	precision of data type which is specified in result cast clause of the routine definition
RESULT_CAST_NUMERIC_RADIX	NUMBER	precision radix of data type which is specified in result cast clause of the routine definition
RESULT_CAST_NUMERIC_SCALE	NUMBER	scale of data type which is specified in result cast clause of the routine definition
RESULT_CAST_DATETIME_PRECISION	NUMBER	fractional seconds precision of data type which is specified in result cast clause of the routine definition
RESULT_CAST_INTERVAL_TYPE	VARCHAR(32)	interval qualifier of data type which is specified in result cast clause of the routine definition
RESULT_CAST_INTERVAL_PRECISION	NUMBER	interval precision of data type which is specified in result cast clause of the routine definition
RESULT_CAST_TYPE_UDT_CATALOG	VARCHAR(128)	UDT catalog name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_TYPE_UDT_SCHEMA	VARCHAR(128)	UDT schema name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_TYPE_UDT_NAME	VARCHAR(128)	UDT name of data type which is specified in result cast clause of the routine definition
RESULT_CAST_SCOPE_CATALOG	VARCHAR(128)	catalog name of referenceable table described in result cast clause of the routine definition
RESULT_CAST_SCOPE_SCHEMA		schema name of referenceable table described in result cast clause of the routine definition

Column name	Data type	Description
EMA	VARCHAR(128)	ause of the routine definition
RESULT_CAST_SCOPE_NAME	VARCHAR(128)	name of referenceable table described in result cast clause of the routine definition
RESULT_CAST_MAX_CARDINALITY	NUMBER	maximum cardinality of data type which is specified in result cast clause of the routine definition
RESULT_CAST_DTD_IDENTIFIER	NUMBER	dtd identifier of data type which is specified in result cast clause of the routine definition
DECLARED_DATA_TYPE	VARCHAR(128)	declared data type of the routine returns
DECLARED_NUMERIC_PRECISION	NUMBER	declared data type precision of the routine returns
DECLARED_NUMERIC_SCALE	NUMBER	declared data type scale of the routine returns
RESULT_CAST_FROM_DECLARED_DATA_TYPE	VARCHAR(128)	declared data type which is specified in result cast clause of the routine definition
RESULT_CAST_DECLARED_NUMERIC_PRECISION	NUMBER	declared data type precision which is specified in result cast clause of the routine definition
RESULT_CAST_DECLARED_NUMERIC_SCALE	NUMBER	declared data type scale which is specified in result cast clause of the routine definition

ROUTINE_PRIVILEGES

Identify the privileges on SQL-invoked routines defined in this catalog that are available to or granted by a given user or role.

Table 9-169 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	authorization name of the user who granted routine privileges
GRANTEE	VARCHAR(128)	authorization name of some user or role, or PUBLIC to indicate all users, to whom the routine privilege being described is granted
SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of the SQL-invoked routine on which the privilege being described was granted
SPECIFIC_OWNER	VARCHAR(128)	specific owner name of the the SQL-invoked routine on which the privilege being described was granted
SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of the the SQL-invoked routine on which the privilege being described was granted
SPECIFIC_NAME	VARCHAR(128)	specific name of the the SQL-invoked routine on which the privilege being described was granted
ROUTINE_CATALOG	VARCHAR(128)	routine catalog name of the SQL-invoked routine on which the privilege being described was granted
ROUTINE_OWNER	VARCHAR(128)	null
ROUTINE_SCHEMA	VARCHAR(128)	routine schema name of the the SQL-invoked routine on which the privilege being described was granted
ROUTINE_NAME	VARCHAR(128)	routine name of the the SQL-invoked routine on which the privilege being described was granted
PRIVILEGE_TYPE	VARCHAR(32)	the value is in (EXECUTE)
IS_GRANTABLE	BOOLEAN	is grantable

ROUTINE_ROUTINE_USAGE

Identify each SQL-invoked routine owned by a given user or role on which an SQL routine defined in this catalog is dependent.

Table 9-170 Column information

Column name	Data type	Description
SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of the routine
SPECIFIC_OWNER	VARCHAR(128)	specific owner name of the routine
SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of the routine
SPECIFIC_NAME	VARCHAR(128)	specific name of the routine
ROUTINE_CATALOG	VARCHAR(128)	routine catalog name of a routine contained in routine body of the SQL-invoked routine
ROUTINE_OWNER	VARCHAR(128)	routine owner name of a routine contained in routine body of the SQL-invoked routine
ROUTINE_SCHEMA	VARCHAR(128)	routine schema name of a routine contained in routine body of the SQL-invoked routine
ROUTINE_NAME	VARCHAR(128)	routine name of a routine contained in routine body of the SQL-invoked routine

ROUTINE_SEQUENCE_USAGE

Identify each external sequence generator owned by a given user or role on which some SQL routine defined in this catalog is dependent.

Table 9-171 Column information

Column name	Data type	Description
SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of the routine
SPECIFIC_OWNER	VARCHAR(128)	specific owner name of the routine
SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of the routine
SPECIFIC_NAME	VARCHAR(128)	specific name of the routine
SEQUENCE_CATALOG	VARCHAR(128)	catalog name of the sequence of contained in routine body of the SQL-invoked routine
SEQUENCE_OWNER	VARCHAR(128)	owner name of the sequence of contained in routine body of the SQL-invoked routine
SEQUENCE_SCHEMA	VARCHAR(128)	schema name of the sequence of contained in routine body of the SQL-invoked routine
SEQUENCE_NAME	VARCHAR(128)	sequence name of contained in routine body of the SQL-invoked routine

ROUTINE_TABLE_USAGE

Identify the tables owned by a given user or role on which SQL routines defined in this catalog are dependent.

Table 9-172 Column information

Column name	Data type	Description
SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of the routine
SPECIFIC_OWNER	VARCHAR(128)	specific owner name of the routine
SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of the routine
SPECIFIC_NAME	VARCHAR(128)	specific name of the routine
TABLE_CATALOG	VARCHAR(128)	catalog name of the table of contained in routine body of the SQL-invoked routine
TABLE_OWNER	VARCHAR(128)	owner name of the table of contained in routine body of the SQL-invoked routine
TABLE_SCHEMA	VARCHAR(128)	schema name of the table of contained in routine body of the SQL-invoked routine
TABLE_NAME	VARCHAR(128)	table name of contained in routine body of the SQL-invoked routine

SCHEMATA

Identify the schemata in a catalog that are owned by given user or accessible to given user or role.

Table 9-173 Column information

Column name	Data type	Description
CATALOG_NAME	VARCHAR(128)	catalog name of the schema
SCHEMA_NAME	VARCHAR(128)	schema name
SCHEMA_OWNER	VARCHAR(128)	authorization name who owns the schema
DEFAULT_CHARACTER_SET_CATALOG	VARCHAR(128)	catalog name of the default character set for columns and domains in the schemata
DEFAULT_CHARACTER_SET_SCHEMA	VARCHAR(128)	schema name of the default character set for columns and domains in the schemata
DEFAULT_CHARACTER_SET_NAME	VARCHAR(128)	character set name of the default character set for columns and domains in the schemata
SQL_PATH	VARCHAR(1024)	character representation of schema path specification
CREATED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	created time of the schema
MODIFIED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	last modified time of the schema
COMMENTS	VARCHAR(1024)	comments of the schema

SEQUENCES

Identify the external sequence generators defined in this catalog that are accessible to a given user or role.

Table 9-174 Column information

Column name	Data type	Description
SEQUENCE_CATALOG	VARCHAR(128)	catalog name of the sequence
SEQUENCE_OWNER	VARCHAR(128)	owner name of the sequence
SEQUENCE_SCHEMA	VARCHAR(128)	schema name of the sequence
SEQUENCE_NAME	VARCHAR(128)	sequence name
DATA_TYPE	VARCHAR(128)	the standard name of the data type
NUMERIC_PRECISION	NUMBER	the numeric precision of the numerical data type
NUMERIC_PRECISION_RADIX	NUMBER	the radix (2 or 10) of the precision of the numerical data type
NUMERIC_SCALE	NUMBER	the numeric scale of the exact numerical data type
START_VALUE	NUMBER	the start value of the sequence generator
MINIMUM_VALUE	NUMBER	the minimum value of the sequence generator
MAXIMUM_VALUE	NUMBER	the maximum value of the sequence generator
INCREMENT	NUMBER	the increment of the sequence generator
CYCLE_OPTION	BOOLEAN	cycle option
CACHE_SIZE	NATIVE_INTEGER	number of sequence numbers to cache
DECLARED_DATA_TYPE	VARCHAR(128)	the data type name that a user declared
DECLARED_NUMERIC_PRECISION	NUMBER	the precision value that a user declared
DECLARED_NUMERIC_SCALE	NUMBER	the scale value that a user declared
CREATED_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	created time of the sequence generator
MODIFIED_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	last modified time of the sequence generator
COMMENTS	VARCHAR(1024)	comments of the sequence generator

SQL_FEATURES

List the features and subfeatures of this ISO/IEC 9075 standard, and indicate which of these the SQL-impl
ementation supports.

Table 9-175 Column information

Column name	Data type	Description
FEATURE_ID	VARCHAR(32)	identifier string of the conformance element
FEATURE_NAME	VARCHAR(1024)	descriptive name of the conformance element
SUB_FEATURE_ID	VARCHAR(32)	identifier string of the subfeature, or a single space if not a subfeature
SUB_FEATURE_NAME	VARCHAR(1024)	descriptive name of the subfeature, or a single space if not a subfeature
IS_SUPPORTED	BOOLEAN	TRUE if an SQL-implementation fully supports that conformance element described when SQL-data in the identified catalog is accessed through that implementation, FALSE if not
IS_VERIFIED_BY	VARCHAR(1024)	If full support for the conformance element described has been verified by testing, then the IS_VERIFIED_BY column shall contain information identifying the conformance test used to verify the conformance claim; otherwise, IS_VERIFIED_BY shall be the null value
COMMENTS	VARCHAR(1024)	possibly a comment pertaining to the conformance element

SQL_IMPLEMENTATION_INFO

List the SQL-implementation information items defined in this ISO/IEC 9075 standard and, for each of these, indicate the value supported by the SQL-implementation.

Table 9-176 Column information

Column name	Data type	Description
IMPLEMENTATION_INFO_ID	VARCHAR(32)	identifier string of the implementation information item
IMPLEMENTATION_INFO_NAME	VARCHAR(1024)	descriptive name of the implementation information item
INTEGER_VALUE	NATIVE_INTEGER	value of the implementation information item, or null if the value is contained in the column CHARACTER_VALUE
CHARACTER_VALUE	VARCHAR(32)	value of the implementation information item, or null if the value is contained in the column INTEGER_VALUE
COMMENTS	VARCHAR(1024)	possibly a comment pertaining to the implementation information item

SQL_PACKAGES

List the packages of this ISO/IEC 9075 standard, and indicate which of these the SQL-implementation supports.

Table 9-177 Column information

Column name	Data type	Description
ID	VARCHAR(32)	identifier string of the conformance element
NAME	VARCHAR(1024)	descriptive name of the conformance element
IS_SUPPORTED	BOOLEAN	TRUE if an SQL-implementation fully supports that conformance element described when SQL-data in the identified catalog is accessed through that implementation, FALSE if not
IS_VERIFIED_BY	VARCHAR(1024)	If full support for the conformance element described has been verified by testing, then the IS_VERIFIED_BY column shall contain information identifying the conformance test used to verify the conformance claim; otherwise, IS_VERIFIED_BY shall be the null value
COMMENTS	VARCHAR(1024)	possibly a comment pertaining to the conformance element

SQL_PARTS

List the parts of this ISO/IEC 9075 standard, and indicate which of these the SQL-implementation supports.

Table 9-178 Column information

Column name	Data type	Description
ID	VARCHAR(32)	identifier string of the conformance element
NAME	VARCHAR(1024)	descriptive name of the conformance element
IS_SUPPORTED	BOOLEAN	TRUE if an SQL-implementation fully supports that conformance element described when SQL-data in the identified catalog is accessed through that implementation, FALSE if not
IS_VERIFIED_BY	VARCHAR(1024)	If full support for the conformance element described has been verified by testing, then the IS_VERIFIED_BY column shall contain information identifying the conformance test used to verify the conformance claim; otherwise, IS_VERIFIED_BY shall be the null value
COMMENTS	VARCHAR(1024)	possibly a comment pertaining to the conformance element

SQL_SIZING

List the sizing items of this ISO/IEC 9075 standard, for each of these, indicate the size supported by the SQL-implementation.

Table 9-179 Column information

Column name	Data type	Description
SIZING_ID	NATIVE_INTEGER	identifier of the sizing item
SIZING_NAME	VARCHAR(1024)	descriptive name of the sizing item
SUPPORTED_VALUE	NATIVE_INTEGER	value of the sizing item, or 0 if the size is unlimited or cannot be determined, or null if the features for which the sizing item is applicable are not supported
COMMENTS	VARCHAR(1024)	possibly a comment pertaining to the sizing item

STATISTICS

Provide a list of statistics about a single table and the indexes associated with the table that are accessible to a given user or role.

Table 9-180 Column information

Column name	Data type	Description
TABLE_CATALOG	VARCHAR(128)	catalog name of the table
TABLE_OWNER	VARCHAR(128)	owner name of the table
TABLE_SCHEMA	VARCHAR(128)	schema name of the table
TABLE_NAME	VARCHAR(128)	table name of the table
STAT_TYPE	VARCHAR(32)	statistics type: the value in (TABLE STAT, INDEX CLUSTERED, INDEX HASHED, INDEX OTHER)
NON_UNIQUE	BOOLEAN	indicates whether the index does not allow duplicate values
INDEX_CATALOG	VARCHAR(128)	catalog name of the index
INDEX_OWNER	VARCHAR(128)	owner name of the index
INDEX_SCHEMA	VARCHAR(128)	schema name of the index
INDEX_NAME	VARCHAR(128)	name of the index
COLUMN_NAME	VARCHAR(128)	column name that participates in the index
ORDINAL_POSITION	NUMBER	ordinal position of the specific column in the index described
IS_ASCENDING_ORDER	BOOLEAN	index key column being described is sorted in ASCENDING(TRUE) or DESCENDING(FALSE) order
IS_NULLS_FIRST	BOOLEAN	the null values of the key column are sorted before(TRUE) or after(FALSE) non-null values
CARDINALITY	NUMBER	if STAT_TYPE is (TABLE TYPE), then this is the number of rows in the table; otherwise, it is the number of unique values in the index
PAGES	NUMBER	if STAT_TYPE is (TABLE TYPE), then this is the number of pages used for the table; otherwise, it is the number of pages used for the current index.
FILTER_CONDITION	VARCHAR(1024)	filter condition, if any.
COMMENTS	VARCHAR(1024)	if STAT_TYPE is (TABLE TYPE), then this is the table comments; otherwise, it is the index comments.

TABLES

Identify the tables defined in this catalog that are accessible to a given user or role

Table 9-181 Column information

Column name	Data type	Description
TABLE_CATALOG	VARCHAR(128)	catalog name of the table
TABLE_OWNER	VARCHAR(128)	owner name of the table
TABLE_SCHEMA	VARCHAR(128)	schema name of the table
TABLE_NAME	VARCHAR(128)	table name of the table
TABLE_TYPE	VARCHAR(32)	the value is in (BASE TABLE, VIEW, GLOBAL TEMPORARY, LOCAL TEMPORARY, SYSTEM VERSIONED, FIXED TABLE, DUMP TABLE)
DBC_TABLE_TYPE	VARCHAR(32)	ODBC/JDBC table type: the value is in (TABLE, VIEW, GLOBAL TEMPORARY, LOCAL TEMPORARY, SYSTEM TABLE, ALIAS, SYNONYM)
TABLESPACE_NAME	VARCHAR(128)	tablespace name of the table, NULL if view
SYSTEM_VERSION_START_COLUMN_NAME	VARCHAR(128)	if the table is a system-versioned table, then the name of the system-version start column of the table
SYSTEM_VERSION_END_COLUMN_NAME	VARCHAR(128)	if the table is a system-versioned table, then the name of the system-version end column of the table
SYSTEM_VERSION_RETENTION_PERIOD	VARCHAR(32)	if the table is a system-versioned table, then the character representation of the value of the retention period of the table
SELF_REFERENCING_COLUMN_NAME	VARCHAR(128)	if the table is a typed table, then the name of the self-referencing column of the table
REFERENCE_GENERATION	VARCHAR(32)	if the table has a self-referencing column, the value is in (SYSTEM GENERATED, USER GENERATED, DERIVED)
USER_DEFINED_TYPE_CATALOG	VARCHAR(128)	if the table being described is a table of a structured type, the catalog name of the structured type
USER_DEFINED_TYPE_SCHEMA	VARCHAR(128)	if the table being described is a table of a structured type, the schema name of the structured type
USER_DEFINED_TYPE_NAME	VARCHAR(128)	if the table being described is a table of a structured type, the name of the structured type
IS_INSERTABLE_INTO	BOOLEAN	is an insertable-into table
IS_TYPED	BOOLEAN	is a typed table
COMMIT_ACTION	VARCHAR(32)	if the table is a temporary table, the value is in (DELETE, PRESERVE)
CREATED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	created time of the table
MODIFIED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	last modified time of the table
COMMENTS	VARCHAR(1024)	comments of the table

TABLE_CONSTRAINTS

Identify the table constraints defined on tables in this catalog that are accessible to a given user or role

Table 9-182 Column information

Column name	Data type	Description
CONSTRAINT_CATALOG	VARCHAR(128)	catalog name of the constraint
CONSTRAINT_OWNER	VARCHAR(128)	authorization name who owns the constraint
CONSTRAINT_SCHEMA	VARCHAR(128)	schema name of the constraint being described
CONSTRAINT_NAME	VARCHAR(128)	constraint name
TABLE_CATALOG	VARCHAR(128)	catalog name of the table to which the table constraint being described applies
TABLE_OWNER	VARCHAR(128)	authorization name who owns the table to to which the table constraint being described applies
TABLE_SCHEMA	VARCHAR(128)	schema name of the table to to which the table constraint being described applies
TABLE_NAME	VARCHAR(128)	table name of the table to to which the table constraint being described applies
CONSTRAINT_TYPE	VARCHAR(32)	the value is in (PRIMARY KEY, UNIQUE, FOREIGN KEY, NOT NULL, CHECK)
IS_DEFERRABLE	BOOLEAN	is a deferrable constraint
INITIALLY_DEFERRED	BOOLEAN	is an initially deferred constraint
ENFORCED	BOOLEAN	is an enforced constraint
CREATED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	created time of the constraint
MODIFIED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	last modified time of the constraint
COMMENTS	VARCHAR(1024)	comments of the constraint

TABLE_PRIVILEGES

Identify the privileges on tables of tables defined in this catalog that are available to or granted by a given user or role.

Table 9-183 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	authorization name of the user who granted table privileges
GRANTEE	VARCHAR(128)	authorization name of some user or role, or PUBLIC to indicate all users, to whom the table privilege being described is granted
TABLE_CATALOG	VARCHAR(128)	catalog name of the table on which the privilege being described was granted
TABLE_OWNER	VARCHAR(128)	table owner name of the table on which the privilege being described was granted
TABLE_SCHEMA	VARCHAR(128)	schema name of the table on which the privilege being described was granted
TABLE_NAME	VARCHAR(128)	table name on which the privilege being described was granted
PRIVILEGE_TYPE	VARCHAR(32)	the value is in (CONTROL, SELECT, INSERT, UPDATE, DELETE, REFERENCES, LOCK, INDEX, ALTER)
IS_GRANTABLE	BOOLEAN	is grantable
WITH_HIERARCHY	BOOLEAN	whether the privilege was granted WITH HIERARCHY OPTION or not

USAGE_PRIVILEGES

Identify the USAGE privileges on objects defined in this catalog that are available to or granted by a given user or role.

Table 9-184 Column information

Column name	Data type	Description
GRANTOR	VARCHAR(128)	authorization name of the user who granted usage privileges, on the object of the type identified by OBJECT_TYPE
GRANTEE	VARCHAR(128)	authorization identifier of some user or role, or PUBLIC to indicate all users, to whom the usage privilege being described is granted
OBJECT_CATALOG	VARCHAR(128)	catalog name of the object of the type identified by OBJECT_TYPE on which the privilege being described was granted
OBJECT_OWNER	VARCHAR(128)	owner name of the object of the type identified by OBJECT_TYPE on which the privilege being described was granted
OBJECT_SCHEMA	VARCHAR(128)	schema name of the object of the type identified by OBJECT_TYPE on which the privilege being described was granted
OBJECT_NAME	VARCHAR(128)	object name of the type identified by OBJECT_TYPE on which the privilege being described was granted
OBJECT_TYPE	VARCHAR(32)	the value is in (DOMAIN, CHARACTER SET, COLLATION, TRANSLATION, SEQUENCE)
PRIVILEGE_TYPE	VARCHAR(32)	the value is in (USAGE)
IS_GRANTABLE	BOOLEAN	is grantable

VIEWS

Identify the viewed tables defined in this catalog that are accessible to a given user or role.

Table 9-185 Column information

Column name	Data type	Description
TABLE_CATALOG	VARCHAR(128)	catalog name of the viewed table
TABLE_OWNER	VARCHAR(128)	owner name of the viewed table
TABLE_SCHEMA	VARCHAR(128)	schema name of the viewed table
TABLE_NAME	VARCHAR(128)	view name of the viewed table
VIEW_DEFINITION	LONG VARCHAR	the character representation of the user-specified query expression contained in the corresponding view descriptor
CHECK_OPTION	VARCHAR(32)	the value is in (CASCADED, LOCAL, NONE)
IS_UPDATABLE	BOOLEAN	is an updatable view
INSERTABLE_INTO	BOOLEAN	is an insertable view
IS_TRIGGER_UPDATABLE	BOOLEAN	whether an update INSTEAD OF trigger is defined on the view or not
IS_TRIGGER_DELETABLE	BOOLEAN	whether a delete INSTEAD OF trigger is defined on the view or not
IS_TRIGGER_INSERTABLE_INTO	BOOLEAN	whether an insert INSTEAD OF trigger is defined on the view or not
IS_COMPILED	BOOLEAN	whether the view is compiled or not
IS_AFFECTED	BOOLEAN	whether the view is affected by modification of underlying object or not
COMMENTS	VARCHAR(1024)	comments of the view

VIEW_ROUTINE_USAGE

Identify each routine owned by a given user or role on which a view defined in this catalog is dependent.

Table 9-186 Column information

Column name	Data type	Description
TABLE_CATALOG	VARCHAR(128)	catalog name of the viewed table
TABLE_OWNER	VARCHAR(128)	owner name of the viewed table
TABLE_SCHEMA	VARCHAR(128)	schema name of the viewed table
TABLE_NAME	VARCHAR(128)	view name of the viewed table
SPECIFIC_CATALOG	VARCHAR(128)	specific catalog name of a routine contained in the query expression of the view being described
SPECIFIC_OWNER	VARCHAR(128)	specific owner name of a routine contained in the query expression of the view being described
SPECIFIC_SCHEMA	VARCHAR(128)	specific schema name of a routine contained in the query expression of the view being described
SPECIFIC_NAME	VARCHAR(128)	specific name of a routine contained in the query expression of the view being described

VIEW_TABLE_USAGE

Identify the tables on which viewed tables defined in this catalog and owned by a given user or role are dependent.

Table 9-187 Column information

Column name	Data type	Description
VIEW_CATALOG	VARCHAR(128)	catalog name of the viewed table
VIEW_OWNER	VARCHAR(128)	owner name of the viewed table
VIEW_SCHEMA	VARCHAR(128)	schema name of the viewed table
VIEW_NAME	VARCHAR(128)	view name of the viewed table
TABLE_CATALOG	VARCHAR(128)	catalog name of a table that is explicitly or implicitly referenced in the original query expression of the compiled view being described
TABLE_OWNER	VARCHAR(128)	owner name of a table that is explicitly or implicitly referenced in the original query expression of the compiled view being described
TABLE_SCHEMA	VARCHAR(128)	schema name of a table that is explicitly or implicitly referenced in the original query expression of the compiled view being described
TABLE_NAME	VARCHAR(128)	table name of a table that is explicitly or implicitly referenced in the original query expression of the compiled view being described

9.3 PERFORMANCE_VIEW_SCHEMA

PERFORMANCE_VIEW_SCHEMA schema consists of views which can retrieve the current state of the system.

Execute *PerformanceViewSchema.sql* as follows to use the views.

- For standalone

```
% gsql sys gliese --as sysdba --import
$GOLDILOCKS_HOME/admin/standalone/PerformanceViewSchema.sql
```

- For cluster

```
% gsql sys gliese --as sysdba --import
$GOLDILOCKS_HOME/admin/cluster/PerformanceViewSchema.sql
```

The retrievable Information of PERFORMANCE_VIEW_SCHEMA views vary upon its phase of the startup. (nomount, mount, open)

Execute the followings to figure out the startup phase in which each views are retrieved.

```
gSQL> select table_name, startup_phase from v$tables order by 1;
```

GV\$ Global View

The cluster provides GV\$ view corresponding to almost every V\$ views.

V\$ view retrieves the information of the currently connected server, but GV\$ view retrieves the information of all servers.

GV\$ view includes all column information of V\$ view, and it additionally has ORIGIN_MEMBER_NAME column which is a server having acquired the data (cluster member).

Note

It is available only on a cluster.

For example, V\$TRANSACTION information retrieves the transaction information of the currently connected server as follows.

```
gSQL> SELECT TRANS_ID, SESSION_ID, TRANS_VIEW_SCN, START_TIME FROM V$TRANSACTION;
```

TRANS_ID	SESSION_ID	TRANS_VIEW_SCN	START_TIME
40501296	48	1098.1.26	2017-04-07 17:14:01.912637

On the other hand, GV\$TRANSACTION information retrieves the transaction information of all servers as follows.

```
gSQL> SELECT ORIGIN_MEMBER_NAME, TRANS_ID, SESSION_ID, TRANS_VIEW_SCN, START_TIME FROM GV$TRANSACTION;
```

ORIGIN_MEMBER_NAME	TRANS_ID	SESSION_ID	TRANS_VIEW_SCN	START_TIME
G1N1	40501296	48	1098.1.26	2017-04-07 17:14:01.912637
G2N2	40304688	48	1098.0.888	2017-04-07 17:14:55.134015
G2N1	42205232	48	1098.0.888	2017-04-07 17:14:55.135996
G1N2	40435760	48	1098.1.889	2017-04-07 17:14:01.910138

In the example above, the ORIGIN_MEMBER_NAME information indicates that the transaction information were obtained from the cluster members corresponding to G1N1, G2N1, G1N2, G2N2 each.

The information of a specific remote server can be retrieved by using the condition for ORIGIN_MEMBER_NAME column as follows.

gSQL>

```
SELECT ORIGIN_MEMBER_NAME, TRANS_ID, SESSION_ID, TRANS_VIEW_SCN, START_TIME  
FROM GV$TRANSACTION
```

```
WHERE ORIGIN_MEMBER_NAME IN ( 'G2N1', 'G3N2' );
```

```
ORIGIN_MEMBER_NAME TRANS_ID SESSION_ID TRANS_VIEW_SCN START_TIME
```

```
-----  
G3N2          32178224          48 1099.0.888      2017-04-07 17:33:10.934752  
G2N1          42270768          48 1099.0.888      2017-04-07 17:31:14.726007
```

2 rows selected.

V\$AGABLE_INFO

The V\$AGABLE_INFO displays the system agable information.

Table 9-188 Column information

Column name	Data type	Description
SCN	VARCHAR(32)	system scn
AGABLE_SCN	VARCHAR(32)	system agable scn
AGABLE_SCN_GAP	VARCHAR(32)	gap between system scn and agable scn
OLDEST_SESSION_ID	NUMBER	identifier of session blocking aging

V\$ARCHIVELOG

The V\$ARCHIVELOG displays information of log archiving.

Table 9-189 Column information

Column name	Data type	Description
ARCHIVELOG_MODE	VARCHAR(32)	database log mode: the value in (NOARCHIVELOG, ARCHIVELOG)
LAST_ARCHIVED_LOG	NUMBER	sequence number of last archived log file
ARCHIVELOG_DIR	VARCHAR(1024)	archive destination path
ARCHIVELOG_FILE_PREFIX	VARCHAR(128)	file prefix name of the archived log

V\$AUDITABLE_DB_PRIVILEGES

The V\$AUDITABLE_DB_PRIVILEGES displays auditable database privileges.

Table 9-190 Column information

Column name	Data type	Description
PRIVILEGE_ID	NUMBER	database privilege identifier
PRIVILEGE_NAME	VARCHAR(128)	database privilege name

V\$AUDITABLE_SYSTEM_ACTIONS

The V\$AUDITABLE_SYSTEM_ACTIONS displays auditable system actions.

Table 9-191 Column information

Column name	Data type	Description
ACTION_ID	NUMBER	auditable system action identifier
ACTION_NAME	VARCHAR(128)	auditable system action name

V\$BACKUP

The V\$BACKUP displays information of backup.

Table 9-192 Column information

Column name	Data type	Description
TBS_NAME	VARCHAR(128)	tablespace name
BACKUP_STATUS	VARCHAR(16)	indicates whether the tablespace begin backup (ACTIVE) or not (I NACTIVE)
BACKUP_LSN	NUMBER	the last checkpoint lsn of tablespace when backup started

V\$BALANCER

The V\$BALANCER displays information of balancer.

Table 9-193 Column information

Column name	Data type	Description
PROCESS_ID	NUMBER	balancer process identifier
CUR_CONNECTIONS	NUMBER	current number of connections
CONNECTIONS	NUMBER	total number of connections
CONNECTIONS_HIGHWATER	NUMBER	highest number of connections
MAX_CONNECTIONS	NUMBER	maximum connections
STATUS	VARCHAR(16)	status

V\$CLUSTER_DISPATCHER

The V\$CLUSTER_DISPATCHER displays cluster dispatcher information.

Note

It is available only on a cluster.

Table 9-194 Column information

Column name	Data type	Description
DISPATCHER_ID	NUMBER	dispatcher identifier
IS_SYNC	BOOLEAN	whether the dispatcher is sync or not
RX_BYTES	NUMBER	total amount of data that has received through the dispatcher
TX_BYTES	NUMBER	total amount of data that has transmitted through the dispatcher
RX_JOBS	NUMBER	the total number of jobs received
TX_JOBS	NUMBER	the total number of jobs transmitted

V\$CLUSTER_LOCATION

The V\$CLUSTER_LOCATION displays cluster location information.

Note

It is available only on a cluster.

Table 9-195 Column information

Column name	Data type	Description
MEMBER_NAME	VARCHAR(128)	member name
HOST	VARCHAR(128)	host address of a member
PORT	NUMBER	host port of a member

V\$CLUSTER_MEMBER

The V\$CLUSTER_MEMBER displays cluster member information.

Note

It is available only on a cluster.

Table 9-196 Column information

Column name	Data type	Description
MEMBER_ID	NUMBER	member identifier
MEMBER_POSITION	NUMBER	member position
STATUS	VARCHAR(64)	status of the member: the value in (ACTIVE, INACTIVE)
IS_GLOBAL_COORD	BOOLEAN	indicates whether a member is global coordnator (TRUE) or not (FALSE)
IS_GROUP_COORD	BOOLEAN	indicates whether a member is group coordnator (TRUE) or not (FALSE)

V\$COLUMNS

The V\$COLUMNS has one row for each column of all the performance views (views beginning with V\$).

Execute \desc as follows to retrieve the column information of performance view in nomount or mount phase in which V\$COLUMNS is not available.

```
gSQL> \desc V$INSTANCE
COLUMN_NAME      TYPE                                IS_NULLABLE
-----
RELEASE_VERSION  VARCHAR(64)                        FALSE
STARTUP_TIME     TIMESTAMP(2) WITHOUT TIME ZONE    FALSE
INSTANCE_STATUS  VARCHAR(16)                        FALSE
```

Table 9-197 Column information

Column name	Data type	Description
TABLE_OWNER	VARCHAR(128)	owner name who owns the performance view
TABLE_SCHEMA	VARCHAR(128)	schema name of the performance view
TABLE_NAME	VARCHAR(128)	name of the performance view
COLUMN_NAME	VARCHAR(128)	column name
ORDINAL_POSITION	NUMBER	the ordinal position (> 0) of the column in the performance view
DATA_TYPE	VARCHAR(128)	the data type name that a user declared
DATA_PRECISION	NUMBER	the precision value that a user declared
DATA_SCALE	NUMBER	the scale value that a user declared
COMMENTS	VARCHAR(1024)	comments of the column

V\$CONTROLFILE

This view displays information about GOLDILOCKS control files.

Table 9-198 Column information

Column name	Data type	Description
STATUS	VARCHAR(16)	control file status (VALID, CORRUPTED)
CONTROLFILE_NAME	VARCHAR(1152)	control file name (absolute path)
LAST_CHECKPOINT_LSN	NATIVE_BIGINT	the last checkpoint lsn
IS_PRIMARY	BOLLEAN	indicates whether the control file is primary

V\$DATAFILE

The V\$DATAFILE displays information of all datafiles.

Table 9-199 Column information

Column name	Data type	Description
TBS_NAME	VARCHAR(128)	tablespace name
DATAFILE_NAME	VARCHAR(1024)	datafile name (absolute path)
CHECKPOINT_LSN	NUMBER	LSN at last checkpoint (null if temporary tablespace)
CREATION_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	timestamp of the datafile creation
FILE_SIZE	NUMBER	datafile size (in bytes)
LOADED_CHECKPOINT_LSN	NUMBER	checkpoint LSN of the datafile loaded in memory
CORRUPT_PAGE_COUNT	NUMBER	number of corrupt pages in the datafile

V\$DB_FILE

The V\$DB_FILE displays a list of all files using in database.

Table 9-200 Column information

Column name	Data type	Description
FILE_NAME	VARCHAR(1024)	file name
FILE_TYPE	VARCHAR(16)	file type

V\$DISPATCHER

The V\$DISPATCHER displays information of dispatchers.

Table 9-201 Column information

Column name	Data type	Description
PROCESS_ID	NUMBER	dispatcher process identifier
RESPONSE_JOB_COUNT	NUMBER	response job count
ACCEPT	NUMBER	indicates whether this dispatcher is accepting new connections
START_TIME	NUMBER	process start time
CUR_CONNECTIONS	NUMBER	current number of connections
CONNECTIONS	NUMBER	total number of connections
CONNECTIONS_HIGHWATER	NUMBER	highest number of connections
MAX_CONNECTIONS	NUMBER	maximum connections
RECV_STATUS	VARCHAR(16)	receive status
RECV_BYTES	NUMBER	total bytes of received
RECV_UNITS	NUMBER	total units of received
RECV_IDLE	NUMBER	total idle time of receive (1/100 second)
RECV_BUSY	NUMBER	total busy time of receive (1/100 second)
SEND_STATUS	VARCHAR(16)	send status
SEND_BYTES	NUMBER	total bytes of sent
SEND_UNITS	NUMBER	total units of sent
SEND_IDLE	NUMBER	total idle time of send (1/100 second)
SEND_BUSY	NUMBER	total busy time of send (1/100 second)

V\$ERROR_CODE

The V\$ERROR_CODE displays a list of all GOLDDILOCKS error codes.

Table 9-202 Column information

Column name	Data type	Description
ERROR_CODE	NUMBER	GOLDDILOCKS error code
SQL_STATE	VARCHAR(32)	standard SQLSTATE code
ERROR_MESSAGE	VARCHAR(1024)	error message

V\$GLOBAL_TRANSACTION

The V\$GLOBAL_TRANSACTION displays information on the currently active global transactions.

Table 9-203 Column information

Column name	Data type	Description
GLOBAL_TRANS_ID	VARCHAR(1024)	global transaction identifier
LOCAL_TRANS_ID	NUMBER	local transaction identifier
GLOBAL_TRANS_STATE	VARCHAR(32)	state of the global transaction: the value in (NOTR, ACTIVE, I DLE, PREPARED, ROLLBACK_ONLY, HEURISTIC_COMPLETED)
ASSO_STATE	VARCHAR(32)	associate state of the global transaction: the value in (NOT_A SSOCIATED, ASSOCIATED, ASSOCIATION_SUSPENDED)
START_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	global transaction start time
IS_REPREPARABLE	BOOLEAN	indicates whether the global transaction is reparable

V\$INCREMENTAL_BACKUP

The V\$INCREMENTAL_BACKUP displays information about control files and datafiles in backup sets from the control file.

Table 9-204 Column information

Column name	Data type	Description
BACKUP_NAME	VARCHAR(1024)	backup file name (absolute path)
BACKUP_SCOPE	VARCHAR(128)	incremental backup scope: the value in (database, tablespace, control)
INCREMENTAL_LEVEL	NUMBER	incremental backup level: the value in (0, 1, 2, 3, 4)
INCREMENTAL_TYPE	VARCHAR(32)	incremental backup type: the value in (DIFFERENTIAL, CUMULATIVE)
LSN	NUMBER	all changes up to checkpoint LSN are included in this backup
BEGIN_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	incremental backup beginning time
COMPLETION_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	incremental backup completion time

V\$INSTANCE

This view displays the state of the current instance.

Note

When database is transited to open phase, it is possible to select *READ ONLY* or *READ WRITE*. If not selected, *DATA_ACCESS_MODE* is determined by the value of *DATABASE_ACCESS_MODE* property. *DATA_ACCESS_MODE* is displayed as *NONE* in nomount or mount phase.

Table 9-205 Column information

Column name	Data type	Description
RELEASE_VERSION	VARCHAR(64)	release version
STARTUP_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	time when the instance was started
INSTANCE_STATUS	VARCHAR(16)	status of the instance: the value in (STARTED, MOUNTED, OPEN)
DATA_ACCESS_MODE	VARCHAR(16)	data access mode of the instance: the value in (NONE, READ_ONLY, READ_WRITE)

V\$JOURNALING

The V\$JOURNALING displays journaling information.

Note
It is available only on a cluster.

Table 9-206 Column information

Column name	Data type	Description
TABLE_NAME	VARCHAR(128)	table name
SHARD_ID	NUMBER	shard identifier
RECORD_COUNT	NUMBER	journaled record count
TOTAL_SIZE	NUMBER	total size of journaled records (byte)

V\$KEYWORDS

The V\$KEYWORDS displays a list of all SQL keywords.

Table 9-207 Column information

Column name	Data type	Description
KEYWORD_NAME	VARCHAR(128)	name of keyword
KEYWORD_LENGTH	NUMBER	length of the keyword
IS_RESERVED	BOOLEAN	indicates whether the keyword cannot be used as an identifier (TRUE) or whether the keyword is not reserved (FALSE)

V\$LATCH

The V\$LATCH shows latch information.

Table 9-208 Column information

Column name	Data type	Description
LATCH_DESCRIPTION	VARCHAR(64)	latch description
REF_COUNT	NUMBER	reference count
SPIN_LOCK	VARCHAR(3)	indicates whether the spin lock is locked (YES) or not (NO)
WAIT_COUNT	NUMBER	wait count
CURRENT_MODE	VARCHAR(32)	current latch mode: the value in (INITIAL, SHARED, EXCLUSIVE)

V\$LOGFILE

The V\$LOGFILE displays information of all redo log members.

Table 9-209 Column information

Column name	Data type	Description
GROUP_ID	NUMBER	redo log group identifier
FILE_NAME	VARCHAR(1024)	name of the log member
GROUP_STATE	VARCHAR(32)	state of the log group: the value in (UNUSED, ACTIVE, CURRENT, IN ACTIVE)
FILE_SEQ	NUMBER	file sequence number of the log member
FILE_SIZE	NUMBER	file size of the log member (in bytes)

V\$LOCK_WAIT

This view lists the locks currently held and outstanding requests for a lock.

Table 9-210 Column information

Column name	Data type	Description
GRANT_TRANS_ID	NUMBER	transaction identifier that holds the lock
REQUEST_TRANS_ID	NUMBER	transaction identifier that requests the lock

V\$PROCESS_STAT

The V\$PROCESS_STAT displays goldilocks process statistics.

Table 9-211 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
PROC_ID	NUMBER	goldilocks process identifier
STAT_VALUE	NUMBER	statistic value

V\$PROCESS_MEM_STAT

The V\$PROCESS_MEM_STAT displays goldilocks process memory statistics.

Table 9-212 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
PROC_ID	NUMBER	goldilocks process identifier
STAT_VALUE	NUMBER	statistic value

V\$PROCESS_SQL_STAT

The V\$PROCESS_SQL_STAT displays goldilocks process SQL statistics.

Table 9-213 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
PROC_ID	NUMBER	goldilocks process identifier
STAT_VALUE	NUMBER	statistic value

V\$PROPERTY

The V\$PROPERTY displays a list of all properties at current session. Otherwise, the instance-wide value.

Table 9-214 Column information

Column name	Data type	Description
PROPERTY_NAME	VARCHAR(128)	name of the property
DESCRIPTION	VARCHAR(2048)	description of the property
DATA_TYPE	VARCHAR(32)	data type of the property
STARTUP_PHASE	VARCHAR(32)	modifiable startup-phase: the value IN (NO MOUNT / MOUNT / OPEN & [BELOW ABOVE])
VALUE_UNIT	VARCHAR(32)	unit of the property value: the value in (NONE, BYTE, MS(milisc))
PROPERTY_VALUE	VARCHAR(2048)	property value for the session. otherwise, the instance-wide value
PROPERTY_SOURCE	VARCHAR(32)	source of the current property value: the value IN (USER, DEFAULT, ENV_VAR, BINARY_FILE, FILE, SYSTEM)
INIT_VALUE	VARCHAR(2048)	property init value for the session
INIT_SOURCE	VARCHAR(32)	source of the current property INIT_VALUE: the value IN (USER, DEFAULT, ENV_VAR, BINARY_FILE, FILE, SYSTEM)
MIN_VALUE	NUMBER	minimum value for property. null if type is varchar
MAX_VALUE	NUMBER	maximum value for property. null if type is varchar
SES_MODIFIABLE	VARCHAR(32)	property can be changed with ALTER SESSION or not: the value in (TRUE, FALSE)
SYS_MODIFIABLE	VARCHAR(32)	property can be changed with ALTER SYSTEM and when the change takes effect: the value in (NONE, FALSE, IMMEDIATE, DEFERRED)
IS_MODIFIABLE	VARCHAR(32)	property can be changed or not: the value in (TRUE, FALSE)

V\$PSM_RESERVED_WORDS

The V\$PSM_RESERVED_WORDS displays a list of all PSM reserved keywords. Reserved words cannot be used in variable name or procedure name.

Table 9-215 Column information

Column name	Data type	Description
KEYWORD_NAME	VARCHAR(128)	name of keyword
KEYWORD_LENGTH	NUMBER	length of the keyword

V\$QUEUE

The V\$QUEUE displays information of queue.

Table 9-216 Column information

Column name	Data type	Description
TYPE	NUMBER	queue type (COMMON or DISPATCHER)
INDEX	NUMBER	index
QUEUED	NUMBER	number of items in the queue
WAIT	NUMBER	total time that all items in this queue have waited (1/100 second)
TOTALQ	VARCHAR(128)	total number of items that have ever been in the queue

V\$RESERVED_WORDS

The V\$RESERVED_WORDS displays a list of all SQL reserved keywords. Reserved words cannot be used in table name or column name.

Table 9-217 Column information

Column name	Data type	Description
KEYWORD_NAME	VARCHAR(128)	name of keyword
KEYWORD_LENGTH	NUMBER	length of the keyword

V\$SESSION

The V\$SESSION displays session information for each current session.

Table 9-218 Column information

Column name	Data type	Description
SESSION_ID	NUMBER	session identifier
SERIAL_NO	NUMBER	session serial number
TRANS_ID	NUMBER	transaction identifier (-1 if inactive transaction)
CONNECTION_TYPE	VARCHAR(32)	connection type: the value in (DA, TCP)
USER_NAME	VARCHAR(128)	user name
SESSION_STATUS	VARCHAR(32)	status of the session: the value in (CONNECTED, SIGNALED, SNIPED, DEAD)
SERVER_TYPE	VARCHAR(32)	server type: the value in (DEDICATED, SHARED)
PROCESS_ID	NUMBER	client process identifier
LOGON_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	logon time
PROGRAM_NAME	VARCHAR(128)	program name
CLIENT_ADDRESS	VARCHAR(1024)	client address (null if DA)
CLIENT_PORT	NUMBER	client port (0 if DA)
FAILOVER_TYPE	VARCHAR(13)	indicates whether and to what extent transparent application failover (TAF) is enabled for the session (NONE, SESSION)
FAILED_OVER	VARCHAR(3)	indicates whether the session is running in failover mode and failover has occurred (YES) or not (NO)
IS_AUDITED	VARCHAR(3)	indicates whether the session is audited (YES) or not (NO)

V\$SESSION_AUDIT

The V\$SESSION_AUDIT displays audited session information.

Table 9-219 Column information

Column name	Data type	Description
SESSION_ID	NUMBER	session identifier
SERIAL_NO	NUMBER	session serial number
POLICY_NAME	VARCHAR(128)	active audit policy name
WHEN_SUCCESS	VARCHAR(3)	indicates whether the audit policy is enable for auditing successful events or not
WHEN_FAILURE	VARCHAR(3)	indicates whether the audit policy is enable for auditing unsuccessful events or not

V\$SESSION_CONNECT_INFO

The V\$SESSION_CONNECT_INFO displays information about network connections for the current session.

Table 9-220 Column information

Column name	Data type	Description
SESSION_ID	NUMBER	session identifier
SERIAL_NO	NUMBER	session serial number
CLIENT_CHARSET	VARCHAR(40)	client character set

V\$SESSION_EVENT

The V\$SESSION_EVENT displays information on waits for an event by a session.

Table 9-221 Column information

Column name	Data type	Description
SESSION_ID	NUMBER	ID of the session
WAIT_EVENT_ID	NUMBER	Identifier of the wait event
WAIT_EVENT_NAME	VARCHAR(64)	Name of the wait event
TOTAL_WAITS	NUMBER	Total number of waits for the event
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event
TIME_WAITED	NUMBER	Total amount of time waited for the event (microsecond)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event (microsecond)
MAX_WAIT	NUMBER	Maximum time waited for the event by the session (microsecond)
CLASS_NAME	VARCHAR(64)	Name of the class of the wait event

V\$SESSION_STAT

The V\$SESSION_STAT displays session statistics.

Table 9-222 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
SESS_ID	NUMBER	session identifier
STAT_VALUE	NUMBER	statistic value

V\$SESSION_MEM_STAT

The V\$SESSION_MEM_STAT displays session memory statistics.

Table 9-223 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
SESS_ID	NUMBER	session identifier
STAT_VALUE	NUMBER	statistic value

V\$SESSION_SQL_STAT

The V\$SESSION_SQL_STAT displays session SQL statistics.

Table 9-224 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
SESS_ID	NUMBER	session identifier
STAT_VALUE	NUMBER	statistic value

V\$SESSION_WAIT

The V\$SESSION_WAIT displays the current or last wait for each session.

Table 9-225 Column information

Column name	Data type	Description
SESSION_ID	NUMBER	ID of the session
SEQ_NO	NUMBER	Identifier of the wait event
WAIT_EVENT_ID	NUMBER	Name of the wait event
WAIT_EVENT_NAME	VARCHAR(64)	A number that uniquely identifies the current or last wait (incremented for each wait)
P1TEXT	VARCHAR(64)	Description of the first parameter for the wait event
P1	NUMBER	First wait event parameter (in decimal)
P1HEX	VARCHAR(32)	First wait event parameter (in hex)
P2TEXT	VARCHAR(64)	Description of the second parameter for the wait event
P2	NUMBER	Second wait event parameter (in decimal)
P2HEX	VARCHAR(32)	Second wait event parameter (in hex)
P3TEXT	VARCHAR(64)	Description of the third parameter for the wait event
P3	NUMBER	Third wait event parameter (in decimal)
P3HEX	VARCHAR(32)	Third wait event parameter (in hex)
STATE	VARCHAR(64)	Wait state
WAIT_TIME	NUMBER	If the session is currently waiting, then the value is time waited for the current wait. If the session is not in a wait, then the value is the duration of the last wait (in microseconds)
TIME_SINCE_LAST_WAIT	NUMBER	Time elapsed since the end of the last wait (in microseconds). If the session is currently in a wait, then the value is 0.
CLASS_NAME	VARCHAR(64)	Name of the class of the wait event

V\$SHARED_MODE

The V\$SHARED_MODE displays information of shared mode.

Table 9-226 Column information

Column name	Data type	Description
NAME	VARCHAR(128)	name
VALUE	VARCHAR(128)	value

V\$SHARED_SERVER

The V\$SHARED_SERVER displays information of shared servers.

Table 9-227 Column information

Column name	Data type	Description
PROCESS_ID	NUMBER	shared server process identifier
PROCESSED_JOB_COUNT	NUMBER	processed job count
STATUS	VARCHAR(128)	status
IDLE	NUMBER	total idle time (1/100 second)
BUSY	NUMBER	total busy time (1/100 second)

V\$SHM_SEGMENT

The V\$SHM_SEGMENT displays a list of all shared memory segments.

Table 9-228 Column information

Column name	Data type	Description
SHM_NAME	VARCHAR(32)	shared memory segment name
SHM_ID	NUMBER	shared memory segment identifier
SHM_SIZE	NUMBER	shared memory segment size (in bytes)
SHM_KEY	NUMBER	shared memory segment key
SHM_SEQ	NUMBER	shared memory segment sequence
SHM_ADDR	VARCHAR(32)	start address of the shared memory segment

V\$SPROPERTY

The V\$SPROPERTY displays a list of Properties. This is store a binary property file.

Table 9-229 Column information

Column name	Data type	Description
PROPERTY_NAME	VARCHAR(128)	name of the property
DESCRIPTION	VARCHAR(2048)	description of the property
DATA_TYPE	VARCHAR(32)	data type of the property
STARTUP_PHASE	VARCHAR(32)	modifiable startup-phase: the value IN (NO MOUNT / MOUNT / OPEN & [BELOW ABOVE])
VALUE_UNIT	VARCHAR(32)	unit of the property value: the value in (NONE, BYTE, MS(milisec))
PROPERTY_VALUE	VARCHAR(2048)	property value stored in the binary property file
PROPERTY_SOURCE	VARCHAR(32)	source of the current property value: the value is BINARY_FILE
INIT_VALUE	VARCHAR(2048)	property init value for the system
INIT_SOURCE	VARCHAR(32)	source of the current property INIT_VALUE: the value IN (USER, DEFAULT, ENV_VAR, BINARY_FILE, FILE, SYSTEM)
MIN_VALUE	NUMBER	minimum value for property. null if type is varchar
MAX_VALUE	NUMBER	maximum value for property. null if type is varchar
SES_MODIFIABLE	VARCHAR(32)	property can be changed with ALTER SESSION or not: the value in (TRUE, FALSE)
SYS_MODIFIABLE	VARCHAR(32)	property can be changed with ALTER SYSTEM and when the change takes effect: the value in (NONE, FALSE, IMMEDIATE, DEFERRED)
IS_MODIFIABLE	VARCHAR(32)	property can be changed or not: the value in (TRUE, FALSE)

V\$SQLFN_METADATA

The V\$SQLFN_METADATA contains metadata about operators and built-in functions

Table 9-230 Column information

Column name	Data type	Description
FUNC_NAME	VARCHAR(128)	name of the built-in function
MINARGS	NUMBER	minimum number of arguments for the function
MAXARGS	NUMBER	maximum number of arguments for the function
IS_AGGREGATE	BOOLEAN	indicates whether the function is an aggregate function (TRUE) or not (FALSE)

V\$SQL_CACHE

The V\$SQL_CACHE lists statistics of shared SQL plan.

Table 9-231 Column information

Column name	Data type	Description
SQL_HANDLE	NUMBER	SQL handle
HASH_VALUE	NUMBER	hash value of the SQL statement
REF_COUNT	NUMBER	count of prepared statements referencing the statement
PLAN_SIZE	NUMBER	the total plan size of the SQL statement (in bytes)
CLOCK_ID	NUMBER	clock identifier
PLAN_AGE	NUMBER	plan age
USER_NAME	VARCHAR(128)	user name
BIND_PARAM_COUNT	NUMBER	count of bind parameters
SQL_TEXT	LONG VARCHAR	SQL full text
PLAN_COUNT	NUMBER	physical plan count of the SQL statement
PLAN_ID	NUMBER	plan identifier
PLAN_SIZE	NUMBER	the total plan size of the SQL statement (in bytes)
PLAN_IS_ATOMIC	BOOLEAN	plan is atomic array insert or not
PLAN_TEXT	LONG VARCHAR	plan text for SQL statement

V\$SQL_COMMAND

The V\$SQL_COMMAND lists attribute information of each SQL command.

Table 9-232 Column information

Column name	Data type	Description
COMMAND	VARCHAR(128)	SQL command
FROM_PHASE	VARCHAR(32)	executable from start-up phase
UNTIL_PHASE	VARCHAR(32)	executable until start-up phase
ACCESS_MODE	VARCHAR(32)	database access mode: values in (NONE, READ & WRITE, READ, READ & LOCK)
NEED_FETCH	VARCHAR(32)	the command is a query which has result set and need fetch
IS_DDL	VARCHAR(3)	the command is a DDL(Data Defintion Language) or not
AUTO_COMMIT	VARCHAR(3)	the command is auto-commit or not
IS_CACHEABLE	VARCHAR(3)	the command is plan-cacheable or not
AUDIT_ACTION	VARCHAR(128)	auditable action name for the SQL command

V\$SQL_HISTORY

The V\$SQL_HISTORY displays information of SQLs.

Table 9-233 Column information

Column name	Data type	Description
DRIVER_MEMBER_POS	NUMBER	driver member position
SESSION_ID	NUMBER	session identifier
START_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	statement start time
EXEC_TIME	NUMBER	execution time(us)
PREPARED	BOOLEAN	indicates whether the statement is prepared (YES) or not (NO)
SUCCESS	BOOLEAN	indicates whether the statement is success (YES) or not (NO)
STATUS	CHARACTER VARYING(16)	status of the statement: the value in (RUNNING, DONE)
SQL_TEXT	CHARACTER VARYING(1024)	first 1024 bytes of the SQL text for the statement

V\$STATEMENT

The V\$STATEMENT lists all statements.

Table 9-234 Column information

Column name	Data type	Description
SESSION_ID	NUMBER	session identifier
STMT_ID	NUMBER	statement identifier in a session
STMT_VIEW_SCN	NUMBER	statement view scn
SQL_TEXT	VARCHAR(1024)	first 1024 bytes of the SQL text for the statement
START_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	statement start time

V\$SYSTEM_EVENT

The V\$SYSTEM_EVENT displays information on total waits for an event.

Table 9-235 Column information

Column name	Data type	Description
WAIT_EVENT_ID	NUMBER	Identifier of the wait event
WAIT_EVENT_NAME	VARCHAR(64)	Name of the wait event
TOTAL_WAITS	NUMBER	Total number of waits for the event
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event
TIME_WAITED	NUMBER	Total amount of time waited for the event (microsecond)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event (microsecond)
CLASS_NAME	VARCHAR(64)	Name of the class of the wait event

V\$SYSTEM_STAT

The V\$SYSTEM_STAT displays system statistics.

Table 9-236 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
STAT_VALUE	NUMBER	statistic value
COMMENTS	VARCHAR(1024)	comments

V\$SYSTEM_MEM_STAT

The V\$SYSTEM_MEM_STAT displays system memory statistics.

Table 9-237 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
STAT_VALUE	NUMBER	statistic value
COMMENTS	VARCHAR(1024)	comments

V\$SYSTEM_SQL_STAT

The V\$SYSTEM_SQL_STAT displays system SQL statistics.

Table 9-238 Column information

Column name	Data type	Description
STAT_NAME	VARCHAR(128)	statistic name
STAT_VALUE	NUMBER	statistic value
COMMENTS	VARCHAR(1024)	comments

V\$TABLES

The V\$TABLES contains the definitions of all the performance views (views beginning with V\$).

Table 9-239 Column information

Column name	Data type	Description
TABLE_OWNER	VARCHAR(128)	owner name who owns the performance view
TABLE_SCHEMA	VARCHAR(128)	schema name of the performance view
TABLE_NAME	VARCHAR(128)	name of the performance view
STARTUP_PHASE	VARCHAR(32)	visible startup phase of the performance view
CREATED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	<ul style="list-style-type: none">available only in OPEN phase created time of the performance view
MODIFIED_TIME	TIMESTAMP(2) WITHOUT TIME ZONE	<ul style="list-style-type: none">available only in OPEN phase modified time of the performance view
COMMENTS	VARCHAR(1024)	<ul style="list-style-type: none">available only in OPEN phase comments of the performance view

V\$TABLESPACE

This view displays tablespace information.

Table 9-240 Column information

Column name	Data type	Description
TBS_NAME	VARCHAR(128)	tablespace name
TBS_ID	NUMBER	tablespace identifier
TBS_ATTR	VARCHAR(128)	tablespace attribute: the value in (device attribute (MEMORY) temporary attribute (TEMPORARY, PERSISTENT) usage attribute(DICT, UNDO, DATA, TEMPORARY))
IS_LOGGING	BOOLEAN	indicates whether the tablespace is a logging tablespace (YES) or not (NO)
IS_ONLINE	BOOLEAN	indicates whether the tablespace is ONLINE (YES) or OFFLINE (NO)
OFFLINE_STATE	VARCHAR(32)	indicates whether the tablespace can be taken online normally (CONSISTENT) or not (INCONSISTENT). null if the tablespace is ONLINE
EXTENT_SIZE	NUMBER	extent size of the tablespace (in bytes)
PAGE_SIZE	NUMBER	page size of the tablespace (in bytes)

V\$TABLESPACE_STAT

This view displays tablespace statistical information.

Table 9-241 Column information

Column name	Data type	Description
TBS_NAME	VARCHAR(128)	tablespace name
TBS_ID	NUMBER	tablespace identifier
TOTAL_EXT_COUNT	NUMBER	total extent count of the tablespace
USED_META_EXT_COUNT	NUMBER	meta extent count currently used on the tablespace
USED_DATA_EXT_COUNT	NUMBER	data extent count currently used on the tablespace
FREE_EXT_COUNT	NUMBER	free extent count of the tablespace
EXTENT_SIZE	NUMBER	extent size of the tablespace (in bytes)

V\$TRANSACTION

The V\$TRANSACTION lists the active transactions in the system.

Table 9-242 Column information

Column name	Data type	Description
TRANS_ID	NUMBER	transaction identifier
SESSION_ID	NUMBER	session identifier (null if the global transaction is unassociated
TRANS_SLOT_ID	NUMBER	transaction slot identifier
PHYSICAL_TRANS_ID	NUMBER	physical transaction identifier
TRANS_STATE	VARCHAR(32)	transaction state: the value in (ACTIVE, BLOCK, PREPARE, COMMIT, ROLLBACK, IDLE, PRECOMMIT)
IS_GLOBAL	BOOLEAN	indicates whether the transaction is global or not
TRANS_ATTRIBUTE	VARCHAR(32)	transaction attribute: the value in (READ_ONLY, UPDATABLE, LOCKABLE, UPDATABLE LOCKABLE)
ISOLATION_LEVEL	VARCHAR(32)	transaction isolation level: the value in (READ COMMITTED, SERIALI ZABLE)
TRANS_VIEW_SCN	NUMBER	transaction view scn
TCN	NUMBER	transaction change number
TRANS_SEQ	NUMBER	transaction sequence number
START_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	transaction start time

V\$WAIT_EVENT_CLASS_NAME

The V\$WAIT_EVENT_CLASS_NAME displays information about Class of wait event.

Table 9-243 Column information

Column name	Data type	Description
CLASS_ID	NUMBER	Identifier of the class of the wait event
NAME	VARCHAR(64)	Name of the class of the wait event
DESCRIPTION	VARCHAR(128)	Description of the class of the wait event

V\$WAIT_EVENT_NAME

The V\$WAIT_EVENT_NAME displays information about wait events.

Table 9-244 Column information

Column name	Data type	Description
CLASS_ID	NUMBER	Identifier of the wait event
NAME	VARCHAR(64)	Name of the wait event
DESCRIPTION	VARCHAR(128)	Description of the wait event
PARAMETER1	NUMBER	Description of the first parameter for the wait event
PARAMETER1	NUMBER	Description of the second parameter for the wait event
PARAMETER1	NUMBER	Description of the third parameter for the wait event
CLASS_ID	NUMBER	Identifier of the class of the wait event
CLASS_NAME	VARCHAR(64)	Name of the class of the wait event

V\$XA_TRANSACTION

The V\$XA_TRANSACTION displays information on the currently active XA transactions.

Table 9-245 Column information

Column name	Data type	Description
XA_TRANS_ID	VARCHAR(1024)	XA transaction identifier
LOCAL_TRANS_ID	NUMBER	local transaction identifier
XA_TRANS_STATE	VARCHAR(32)	state of the XA transaction: the value in (NOTR, ACTIVE, IDLE, PREPARED, ROLLBACK_ONLY, HEURISTIC_COMPLETED)
ASSO_STATE	VARCHAR(32)	associate state of the XA transaction: the value in (NOT_ASSOCIATED, ASSOCIATED, ASSOCIATION_SUSPENDED)
START_TIME	TIMESTAMP(2) WITH OUT TIME ZONE	XA transaction start time
IS_REPREPARABLE	BOOLEAN	indicates whether the XA transaction is reparable

10.

Server Property

10.1 Server Property Information

For more information about SQL syntax to change properties, refer to the followings.

- **ALTER SYSTEM SET property_name**
- **ALTER SESSION SET property_name**

For more information about property types, refer to the followings.

- **V\$PROPERTY**
- **V\$SPROPERTY**

The followings describe basic information items of property in this manual.

Item	Description
Name	Property name
Summary	Short description of the property
Data type	Data type of the property value
Applicable phase	A startup phase which can be updated with ALTER SYSTEM or ALTER SESSION <ul style="list-style-type: none"> • NONE: Applicable phase does not exist. (If it can be updated, but applicable phase is NONE, then use <i>SCOPE = FILE</i> option.)
Updatable	Whether property is updatable or not <ul style="list-style-type: none"> • If the property value is TRUE, it is updatable. • If the property value is FALSE, only the read-only is possible.
ALTER SESSION	Whether property is updatable or not by using ALTER SESSION SET property_name
ALTER SYSTEM	Whether property is updatable or not by using ALTER SYSTEM SET property_name <ul style="list-style-type: none"> • IMMEDIATE: The updated value is immediately reflected in all session after execution. • DEFERRED: The updated value is reflected only in the session which is connected after execution. However, it is not reflected in already connected session. • FALSE: The updated value is not reflected in the session during execution. However, the updated value is reflected after restart, (Properties are updatable by using only <i>SCOPE=FILE</i> option.) • NONE: It is not updatable.
MIN	If the data type is BIGINT, it is the minimum value of property. If the data type is VARCHAR, the minimum value of property is N/A.
MAX	If the data type is BIGINT, it is the maximum value of property. If the data type is VARCHAR, the maximum value of property is N/A.
Default value	Default value of the property

10.2 AGING_INTERVAL

Basic Information

Item	Description
Name	AGING_INTERVAL
Summary	aging interval time(ms)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	100000000
Default value	10

Description

It sets the idle time (second) when an ager thread which deletes the previous version data does not have a job to process in MVCC based database.

10.3 AGING_PLAN_INTERVAL

Basic Information

Item	Description
Name	AGING_PLAN_INTERVAL
Summary	aging plan interval time(s)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	31536000
Default value	0

Description

The SQL plan which is older than AGING_PLAN_INTERVAL becomes the aging target.

10.4 ARCHIVELOG_DIR_1 ~ ARCHIVELOG_DIR_10

Basic Information

Item	Description
Name	ARCHIVELOG_DIR_1 ~ ARCHIVELOG_DIR_10
Summary	archive log directory
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE(ARCHIVELOG_DIR_1), TRUE(ARCHIVELOG_DIR_2 ~ ARCHIVELOG_DIR_10)
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/archive_log

Description

It specifies archiving directory of GOLDILOCKS database's online redo log file. Also, it specifies where to read of archive redo log file at media recovery. The online redo log file creates archive redo log file only in ARCHIVELOG_DIR_1.

ARCHIVELOG_DIR_1 sets only the system, but ARCHIVELOG_DIR_2 ~ ARCHIVELOG_DIR_10 sets the session.

10.5 ARCHIVELOG_FILE

Basic Information

Item	Description
Name	ARCHIVELOG_FILE
Summary	default archive log file
Data type	VARCHAR
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	archive

Description

It sets the prefix of the targeted file name stored in the archive directory when archiving the online redo log file. The archive logfile's name consists of the prefix defined in ARCHIVELOG_FILE, followed by '_', the file sequence and the file extension 'log'. For example, the online logfile with a sequence number of 0 is archived as 'archive_0.log'.

10.6 ARCHIVELOG_MODE

Basic Information

Item	Description
Name	ARCHIVELOG_MODE
Summary	archive log mode(0:disable, 1:enable)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	0

Description

The property is applied at database creation. The archivelog mode can be set to one of the following value.

- 0: NOARCHIVELOG
- 1: ARCHIVELOG

It does not affect archive log mode during operation after database is created. The archive log mode can be modified by using *ALTER DATABASE {ARCHIVELOG | NOARCHIVELOG}* in MOUNT phase.

10.7 BACKUP_DIR_1 ~ BACKUP_DIR_10

Basic Information

Item	Description
Name	BACKUP_DIR_1 ~ BACKUP_DIR_10
Summary	backup directory
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE(BACKUP_DIR_1), TRUE(BACKUP_DIR_2 ~ BACKUP_DIR_10)
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/backup

Description

A backup file is created when incremental backup is executed. Then it sets a directory of backup file to be read when restoring files using incremental backup. Incremental backups are created only in the directory set in BACKUP_DIR_1.

BACKUP_DIR_1 sets only the system, but BACKUP_DIR_2 ~ BACKUP_DIR_10 sets the session.

10.8 BLOCK_READ_COUNT

Basic Information

Item	Description
Name	BLOCK_READ_COUNT
Summary	value count for a block read
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	65536
Default value	20

Description

The SQL executes operation by reading row in the unit of BLOCK_READ_COUNT which is a row bundle. BLOCK_READ_COUNT means the number of rows to be processed at a time when operation is executed. It is a basic unit of pipe-lining process of execution nodes which are used in SQL query processing.

If BLOCK_READ_COUNT value is big the processing performance improves, but many memory resources are used.

The value between 10 and 100 is recommended.

If the value becomes bigger than 100 the resource usage increases proportionately, but the performance improvement does not increase proportionately.

10.9 BULK_IO_PAGE_COUNT

Basic Information

Item	Description
Name	BULK_IO_PAGE_COUNT
Summary	page count for bulk IO operation
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	128
MAX	131072
Default value	3840

Description

It is used when IO READ of the data file occurs during server restart, or when IO WRITE occurs during creating a data file.

The heap memory is allocated as big as $BULK_IO_PAGE_COUNT * 8192$ when server restarts or data file is created. If the session's `PRIVATE_STATIC_AREA_SIZE` is smaller than the heap memory size, an error of insufficient memory may occur. In this case, extend `PRIVATE_STATIC_AREA_SIZE`.

10.10 CDISPATCHER_HOT_POLICY_INTERVAL

Basic Information

Item	Description
Name	CDISPATCHER_HOT_POLICY_INTERVAL
Summary	cdispatcher dequeue interval for busy waiting (micro second)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	86400000000 (1day)
Default value	100000

Description

It is the time of the busy waiting when performing the dequeue in the cdispatcher. It is a micro second unit. If this value is big, it uses more cpu but the user response time (latency) is decreased.

10.11 CDISPATCHER_SOCKET_BUFFER_SIZE

Basic Information

Item	Description
Name	CDISPATCHER_SOCKET_BUFFER_SIZE
Summary	cdispatcher socket buffer(sender, receiver) size
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	64
MAX	100 Mega
Default value	32768

Description

It is the socket buffer(sender, receiver) size of cdispatcher.

10.12 CDISPATCHER_SYNC_THREADS

Basic Information

Item	Description
Name	CDISPATCHER_SYNC_THREADS
Summary	cdispatcher sync thread count
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	32
Default value	1

Description

It is the thread count of cdispatcher sync.

10.13 CDISPATCHER_THREADS

Basic Information

Item	Description
Name	CDISPATCHER_THREADS
Summary	cdispatcher sender, receiver thread count
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	32
Default value	1

Description

It is the thread count of cdispatcher sender and receiver.

10.14 CHARACTER_SET

Basic Information

Item	Description
Name	CHARACTER_SET
Summary	character set
Data type	VARCHAR
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	UTF8

Description

It is a character set of database, and it is applied when database is created.

The property is set to one of the following values.

Character set	Description
SQL_ASCII	ASCII standards
UTF8	Unicode, 8-bit
UHC	Unified Hangul code
GB18030	Chinese government standards

10.15 CHAR_LENGTH_UNITS

Basic Information

Item	Description
Name	CHAR_LENGTH_UNITS
Summary	char length units
Data type	VARCHAR
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	OCTETS

Description

It is the value of char length units used when defining character string such as CHAR, VARCHAR and omitting char length unit as follows.

```
CREATE TABLE t1
(
  id   CHAR( 10 OCTETS ),
  name VARCHAR( 128 CHARACTERS ),
  addr VARCHAR( 128 )
);
```

- id CHAR(10 OCTETS) means 10 bytes.
- name VARCHAR(128 CHARACTERS) means 128 characters.
- addr VARCHAR(128) means that this value is referenced when char length unit is omitted.

When database is created, the property is set to either OCTETS or CHARACTERS. OCTETS is the number of bytes, and CHARACTERS is the number of characters.

Note

The SQL standard defines CHARACTERS as default value. Other DBMS defines the default value of char length unit as follows.

- Oracle and DB2 define OCTETS as default value.
- MS-SQL, MySQL, PostgreSQL define CHARACTERS as default value.

10.16 CHECK_DEDICATE_CONNECTION_INTERVAL

Basic Information

Item	Description
Name	CHECK_DEDICATE_CONNECTION_INTERVAL
Summary	check dedicate socket
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000
Default value	1000

Description

It is the interval of checking for when the client forcibly cut the connection in C/S dedicate environment. The dedicate server(gserver) checks the socket, and it terminates it if it was cut. The default value is 1,000 millisecond (1 second).

10.17 CLIENT_MAX_COUNT

Basic Information

Item	Description
Name	CLIENT_MAX_COUNT
Summary	maximum session count
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	12
MAX	65535
Default value	128

Description

It sets the maximum number of sessions to connect.

10.18 CLIENT_NUMA_POLICY

Basic Information

Item	Description
Name	CLIENT_NUMA_POLICY
Summary	client numa policy(0: by modular, 1: by statistics , 2: by manual)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	2
Default value	0

Description

It determines the policy to distribute client processes to NUMA nodes. This property is operated when NUMA property is set to on.

- 0: It determines the NUMA node to be connected by modularizing the session ID.
- 1: It connects to the NUMA node of which is the least connected based on the statistics information.
- 2: C/S client is determined by TCP_CLIENT_NUMA_NODE property, D/A client is determined by DA_CLIENT_NUMA_NODE property.

10.19 CLOSE_PSM_CHILD_STMTS

Basic Information

Item	Description
Name	CLOSE_PSM_CHILD_STMTS
Summary	close child statements of PSM at the end of each execution
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	NO

Description

It closes the child statement of PSM at the end of each execution.

10.20 CLUSTER_ASYNC_COMMIT

Basic Information

Item	Description
Name	CLUSTER_ASYNC_COMMIT
Summary	enable asynchronous commit in cluster system
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	YES

Description

It determines whether to internally process the commit protocol on an async mode in cluster system.

Note

If this property is set to on, it asynchronously commits each node, so the temporary inconsistency among nodes may occur. On the other hand, if it is set to off, it synchronizes everytime it commits, so it may reduce the performance. Therefore, it is required to determine the appropriate property depending on the purpose.

10.21 CLUSTER_ASYNC_REPLICATION

Basic Information

Item	Description
Name	CLUSTER_ASYNC_REPLICATION
Summary	enable asynchronous replication
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	YES

Description

It determines whether to internally process the replication on an async mode in cluster system.

Note

If this property is set to on, it asynchronously reflects the data on each node, so the response time varies upon on which node is connected during the operation. On the other hand, if it is set to off, it synchronizes everytime the data is updated, so it may reduce the performance. Therefore, it is required to determine the appropriate property depending on the purpose.

10.22 CLUSTER_CM_BUFFER_COUNT

Basic Information

Item	Description
Name	CLUSTER_CM_BUFFER_COUNT
Summary	communication buffer count for cluster
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	256
Default value	4

Description

It is the communication buffer count for cluster.

10.23 CLUSTER_CM_BUFFER_SIZE

Basic Information

Item	Description
Name	CLUSTER_CM_BUFFER_SIZE
Summary	communication buffer size for cluster
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	10 Mega
MAX	32 Giga
Default value	10 Mega

Description

It is the communication buffer size for cluster.

10.24 CLUSTER_CM_READ_BUFFER_SIZE

Basic Information

Item	Description
Name	CLUSTER_CM_READ_BUFFER_SIZE
Summary	communication read block size
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	8192
MAX	10485,760
Default value	65536

Description

It is the communication read block size.

10.25 CLUSTER_COMMIT_SLAVES

Basic Information

Item	Description
Name	CLUSTER_COMMIT_SLAVES
Summary	number of commit slaves
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	8
Default value	1

Description

It is the number of commit slaves.

10.26 CLUSTER_COMMIT_STREAM_ISOLATION

Basic Information

Item	Description
Name	CLUSTER_COMMIT_STREAM_ISOLATION
Summary	isolate cluster dispatcher stream for commit protocol
Data type	BOOLEAN
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	0

Description

It determines whether to internally perform the commit process flow in the cluster system separately from other protocol process. The performance may be improved when separating the commit process according to the system environment.

10.27 CLUSTER_CONNECTION

Basic Information

Item	Description
Name	CLUSTER_CONNECTION
Summary	connection mode for cluster (socket:0, rdma:1)
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	0: socket

Description

It is the connection mode for cluster. (socket:0, rdma:1)

10.28 CLUSTER_CONNECTION_TIMEOUT_SEC

Basic Information

Item	Description
Name	CLUSTER_CONNECTION_TIMEOUT_SEC
Summary	connection timeout for cluster
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	86400
Default value	5

Description

It is the connection timeout for cluster.

10.29 CLUSTER_DATA_SYNC_SERVERS

Basic Information

Item	Description
Name	CLUSTER_DATA_SYNC_SERVERS
Summary	count of data synchronization server
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	128
Default value	3

Description

It is the count of data synchronization server.

10.30 CLUSTER_DISPATCHER_IN_QUEUE_SIZE

Basic Information

Item	Description
Name	CLUSTER_DISPATCHER_IN_QUEUE_SIZE
Summary	in-queue size for cluster dispatcher
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1024
MAX	32768
Default value	1024

Description

It is the in-queue size for cluster dispatcher.

10.31 CLUSTER_DISPATCHER_NUMA_STREAM_MAP

Basic Information

Item	Description
Name	CLUSTER_DISPATCHER_NUMA_STREAM_MAP
Summary	numa stream map for cluster dispatcher
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	'x' : no binding

Description

It determines a NUMA node to which the cluster dispatcher is to be connected. This property is operated when NUMA property is set to on.

Note

If CLUSTER_COMMIT_STREAM_ISOLATION property is set to on, then the 0 stream is set to NUMA node of a commit stream.

The following is an example of three dispatchers. It connects number 0 stream to number 0 NUMA node, connects number 1 stream to number 1 NUMA node, and number 2 stream to number 2 NUMA node.

```
CLUSTER_DISPATCHER_NUMA_STREAM_MAP = '0:1:2'
```

10.32 CLUSTER_DISPATCHER_OUT_QUEUE_SIZE

Basic Information

Item	Description
Name	CLUSTER_DISPATCHER_OUT_QUEUE_SIZE
Summary	out-queue size for cluster dispatcher
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1024
MAX	32768
Default value	1024

Description

It is the out-queue size for cluster dispatcher.

10.33 CLUSTER_HEARTBEAT_INTERVAL

Basic Information

Item	Description
Name	CLUSTER_HEARTBEAT_INTERVAL
Summary	interval seconds for health checking of cluster
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	86400
Default value	3

Description

It is the interval seconds for health checking of cluster. 0 means that it is disabled.

10.34 CLUSTER_HEARTBEAT_RETRY_COUNT

Basic Information

Item	Description
Name	CLUSTER_HEARTBEAT_RETRY_COUNT
Summary	retry count for health checking of cluster
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	65536
Default value	5

Description

It is the retry count for health checking of cluster.

10.35 CLUSTER_IGNORE_INACTIVE_MEMBER

Basic Information

Item	Description
Name	CLUSTER_IGNORE_INACTIVE_MEMBER
Summary	ignore in-active member for cluster
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	NO

Description

It ignores in-active member for cluster.

10.36 CLUSTER_MAX_PACKET_SIZE

Basic Information

Item	Description
Name	CLUSTER_MAX_PACKET_SIZE
Summary	maximum packet size for cluster session
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	10 Mega
MAX	32 Giga
Default value	100 Mega

Description

It sets the maximum packet size of which the remote protocol can transfer at a time. If the column size to be remotely transferred exceeds the property size, then the property size should be set bigger than the column size.

10.37 CLUSTER_MAX_PAYLOAD_SIZE

Basic Information

Item	Description
Name	CLUSTER_MAX_PAYLOAD_SIZE
Summary	maximum packet payload size for cluster session (byte)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	524288
MAX	33554432
Default value	524288

Description

The cluster packet which is remotely transferred may be delivered in pieces, and this property sets the maximum size of data to be stored in a piece.

10.38 CLUSTER_PACKET_ALLOCATION_TIMEOUT

Basic Information

Item	Description
Name	CLUSTER_PACKET_ALLOCATION_TIMEOUT
Summary	a time limit (sec) for how long statemets will wait to allocate packet memory
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	100000000
Default value	3

Description

It sets the maximum time (second) of waiting when allocating memory required for cluster packet configuration.

10.39 CLUSTER_PROTOCOL_SESSION_FATAL_POLICY_TIMEOUT

Basic Information

Item	Description
Name	CLUSTER_PROTOCOL_SESSION_FATAL_POLICY_TIMEOUT
Summary	a time limit of session fatal policy to wait for a response from the cluster protocol
Data type	BIGINT
Applicable phase	NO_MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000000
Default value	0

Description

It is the maximum time of when waiting for the response after transferring the protocol in cluster. If it does not respond within the specified time, then GOLDILOCKS, depending on the protocol, may terminate the protocol or make the remote cluster member which does not respond to be failover. Specify the time limit by using `CLUSTER_PROTOCOL_SESSION_FATAL_POLICY_TIMEOUT` property to use the policy terminating the session. However, specify the time limit by using `CLUSTER_PROTOCOL_FAILOVER_POLICY_TIMEOUT` property to use the failover policy.

10.40 CLUSTER_PROTOCOL_FAILOVER_POLICY_TIMEOUT

Basic Information

Item	Description
Name	CLUSTER_PROTOCOL_FAILOVER_POLICY_TIMEOUT
Summary	a time limit of failover policy to wait for a response from the cluster protocol
Data type	BIGINT
Applicable phase	NO_MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000000
Default value	0

Description

It is the maximum time of when waiting for the response after transferring the protocol in cluster. If it does not respond within the specified time, then GOLDILOCKS, depending on the protocol, may terminate the protocol or make the remote cluster member which does not respond to be failover. Specify the time limit by using `CLUSTER_PROTOCOL_FAILOVER_POLICY_TIMEOUT` property to use the failover policy. However, specify the time limit by using `CLUSTER_PROTOCOL_SESSION_FATAL_POLICY_TIMEOUT` property to use the policy terminating the session.

10.41 CLUSTER_SERVER_RESPONSE_QUEUE_SIZE

Basic Information

Item	Description
Name	CLUSTER_SERVER_RESPONSE_QUEUE_SIZE
Summary	response queue size for cluster server
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	30
MAX	32768
Default value	30

Description

It sets the maximum queue size to get response from the remote server.

10.42 CLUSTER_SPLIT_BRAIN_RESOLUTION_POLICY

Basic Information

Item	Description
Name	CLUSTER_SPLIT_BRAIN_RESOLUTION_POLICY
Summary	split brain resolution policy for cluster system
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	2
Default value	0

Description

It sets the policy to resolve split-brain situation in the cluster system. If the value is set to 1 or over, it enquires the solution of a locator.

Note

If the query for a locator is timed out, it tries to enquire as many times as CLUSTER_SPLIT_BRAIN_RETRY_COUNT. If the property value after the retry failure is 1, then it forcibly proceeds the failover. If it is 2, then it terminates the fatal.

10.43 CLUSTER_SPLIT_BRAIN_RETRY_COUNT

Basic Information

Item	Description
Name	CLUSTER_SPLIT_BRAIN_RETRY_COUNT
Summary	retry count for split brain resolution policy(1 ~ 65536)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	65536
Default value	4

Description

It is used when CLUSTER_SPLIT_BRAIN_RESOLUTION_POLICY is set to 1 or over in cluster system. It sets the times of retrying to enquire when the query to a locator does not respond.

10.44 COMMITTER_HOT_POLICY_INTERVAL

Basic Information

Item	Description
Name	COMMITTER_HOT_POLICY_INTERVAL
Summary	committer deque interval for busy waiting
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	86400000000 (1 day)
Default value	0 (cold policy)

Description

It sets the timezone interval of busy waiting when the commit cserver is dequeing to read the commit protocol message. If it is set to 1,000,000 (1 second), and the time is not passed over 1 second from the last deque success to another deque retry, then it sets the timeout in deque to 0 and performs the busy waiting.

10.45 CONTROL_FILE_0 ~ CONTROL_FILE_7

Basic Information

Item	Description
Name	CONTROL_FILE_0
Summary	control file name
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/wal/control_0.ctl

Description

If a control file is corrupted, database can not be used. Therefore, the control file is multiplexed for stability of database. It specifies the directory and file name of which stores each control file.

10.46 CONTROL_FILE_COUNT

Basic Information

Item	Description
Name	CONTROL_FILE_COUNT
Summary	control file count
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	2
MAX	8
Default value	2

Description

If a control file is corrupted, database can not be used. The control file is multiplexed for stability of database. CONTROL_FILE_COUNT specifies the multiplexing number of control files. A control file is multiplexed at least 2 up to 8.

10.47 CONTROL_FILE_TEMP_NAME

Basic Information

Item	Description
Name	CONTROL_FILE_TEMP_NAME
Summary	temporary file name for control file
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/backup/control.tmp

Description

During database operation, a control file is frequently changed, and its temporary copy can be made if necessary. CONTROL_FILE_TEMP_NAME specifies the directory and its file name to temporarily store the control file.

10.48 COORDINATOR_COMMIT_WRITE_MODE

Basic Information

Item	Description
Name	COORDINATOR_COMMIT_WRITE_MODE
Summary	coordinator commit write mode(0:disable, 1:wait mode)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	0

Description

It is a commit write mode applied to a coordinator. If TRANSACTION_COMMIT_WRITE_MODE is *no wait*, and its property is *wait*, then the coordinator node is operated as *wait*, and other nodes are operated as *no wait*.

10.49 CSERVERS

Basic Information

Item	Description
Name	CSERVERS
Summary	number of cserver processes
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	512
Default value	10

Description

It is a number of cserver process.

10.50 DATABASE_ACCESS_MODE

Basic Information

Item	Description
Name	DATABASE_ACCESS_MODE
Summary	database access mode (0: read only, 1: read write)
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	1

Description

When database starts, it sets the access mode.

- 0: It is able to read operation, but unable to insert/ update/ delete operations on database.
- 1: It is able to read/ insert/ update/ delete operations on database.

10.51 DATABASE_INSTANCE_NAME

Basic Information

Item	Description
Name	DATABASE_INSTANCE_NAME
Summary	database instance name
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	GOLDILOCKS

Description

It is the database instance name.

10.52 DATA_STORE_MODE

Basic Information

Item	Description
Name	DATA_STORE_MODE
Summary	data store mode(cds:1,tds:2)
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	2
Default value	2

Description

It sets the storing method of database.

- 1: CDS mode supports the concurrency for multiple users but it does not guarantee the durability. It does not record logs for all update operations such as insert/ delete/ update data, consequentially a failure can not be recovered.
- 2: TDS mode guarantees the concurrency for multiple users and the durability using logs.

10.53 DA_CLIENT_NUMA_NODE

Basic Information

Item	Description
Name	DA_CLIENT_NUMA_NODE
Summary	numa node for DA clients
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	-1
MAX	63
Default value	-1

Description

It sets the NUMA node ID to which the direct access (D/A) session is to be bound. This property is operated when NUMA property is set to ON.

10.54 DDL_AUTOCOMMIT

Basic Information

Item	Description
Name	DDL_AUTOCOMMIT
Summary	DDL auto commit
Data type	BOOL
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It sets whether to autocommit DDL operations which is not autocommitted yet. For example, autocommit is not applied to the operations such as creating/altering a table, so if DDL_AUTOCOMMIT is 0, a table creation and alteration can be undone by the rollback. On the other hand, if DDL_AUTOCOMMIT is 1, DDL to which autocommit is not applied is committed immediately.

10.55 DDL_LOCK_TIMEOUT

Basic Information

Item	Description
Name	DDL_LOCK_TIMEOUT
Summary	a time limit (sec) for how long DDL statemets will wait
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000000
Default value	0

Description

It means the lock wait time when DDL operations occur to the same object at the same time. The default value is 0 second, and it does not wait for a lock when the DDL operation occurs.

When operations of altering a table structure simultaneously occur, they wait for the time specified in DDL_LOCK_TIMEOUT, without waiting for other transactions termination as follows.

- Transaction A

```
ALTER TABLE t1 ADD COLUMN ( new_column NUMBER );
```

- Transaction B

```
TRUNCATE TABLE t1;
```

If the waiting time exceeds DDL_LOCK_TIMEOUT, an error occurs as follows.

```
gSQL> TRUNCATE TABLE t1;
ERR-HYT00(14026): resource busy or timeout expired
```

10.56 DEFAULT_GLOBAL_SECONDARY_INDEX_CREATION

Basic Information

Item	Description
Name	DEFAULT_GLOBAL_SECONDARY_INDEX_CREATION
Summary	specifies whether or not create global secondary index at table creation
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	YES

Description

It sets whether to create the global secondary index when creating a table in cluster system. A non-deterministic query for the table which did not created the global secondary index fails. The global secondary index can be separately created after creating the table when the property is set to NO.

10.57 DEFAULT_INDEX_LOGGING

Basic Information

Item	Description
Name	DEFAULT_INDEX_LOGGING
Summary	default logging flag of indexes
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

If LOGGING property is not explicitly set by a user when an index is created, then it is set to DEFAULT_INDEX_LOGGING value. If an index is created in LOGGING tablespace, the LOGGING property should be set.

10.58 DEFAULT_INDEX_PCTFREE

Basic Information

Item	Description
Name	DEFAULT_INDEX_PCTFREE
Summary	default pctfree value of indexes (%)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	99
Default value	0

Description

If a user does not explicitly specify PCTFREE syntax when creating an index. The PCTFREE is set to DEFAULT_INDEX_PCTFREE property value.

10.59 DEFAULT_INITRANS

Basic Information

Item	Description
Name	DEFAULT_INITRANS
Summary	default initrans value of tables
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	32
Default value	4

Description

If a user does not explicitly set INITRANS syntax when creating a table or an index, then it is set to DEFAULT_INITRANS property value.

10.60 DEFAULT_MAXTRANS

Basic Information

Item	Description
Name	DEFAULT_MAXTRANS
Summary	default maxtrans value of tables
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	32
Default value	8

Description

If a user does not explicitly set the MAXTRANS syntax when creating a table or an index, then it is set to DEFAULT_MAXTRANS property value.

10.61 DEFAULT_PCTFREE

Basic Information

Item	Description
Name	DEFAULT_PCTFREE
Summary	default pctfree value of tables (%)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	99
Default value	10

Description

If a user does not explicitly set the PCTFREE property when creating a table, it is set to DEFAULT_PCTFREE property value.

10.62 DEFAULT_PCTUSED

Basic Information

Item	Description
Name	DEFAULT_PCTUSED
Summary	default pctused value of tables (%)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	99
Default value	60

Description

If a user does not explicitly set the PCTUSED property when creating a table, it is set to DEFAULT_PCTUSED value.

10.63 DEFAULT_REMOVAL_BACKUP_FILE

Basic Information

Item	Description
Name	DEFAULT_REMOVAL_BACKUP_FILE
Summary	default removal flag of incremental backup files
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It specifies whether to delete the backup file when deleting the backup list.

10.64 DEFAULT_REMOVAL_OBSOLETE_BACKUP_LIST

Basic Information

Item	Description
Name	DEFAULT_REMOVAL_OBSOLETE_BACKUP_LIST
Summary	default removal flag of obsolete incremental backup lists
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It specifies whether to delete the previous obsoleted backup list when executing INCREMENTAL BACKUP.

10.65 DEFAULT_SHARDING

Basic Information

Item	Description
Name	DEFAULT_SHARDING
Summary	default sharding strategy (0: cloned, 1: hash sharding)
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	NO

Description

It sets the default sharding strategy to be used if the sharding strategy is not determined when creating a table.

The following is an example of executing CREATE TABLE statement.

```
CREATE TABLE t1
(
    id    INTEGER,
    name  VARCHAR(128)
);
```

If DEFAULT_SHARDING value is 0 (cloned), the table is created as a cloned table as follows.

```
CREATE TABLE t1
(
    id    INTEGER,
    name  VARCHAR(128)
)
CLONED
```

```
AT CLUSTER WIDE
;
```

If DEFAULT_SHARDING value is 1 (hash sharding), the table is created as a hash-sharded table as follows.

```
CREATE TABLE t1
(
    id    INTEGER,
    name  VARCHAR(128)
)
SHARDING BY HASH (id)
SHARD COUNT 24
AT CLUSTER WIDE
;
```

If DEFAULT_SHARDING is 1 (hash sharding) and <table sharding strategy> is not described, then the hash sharding key is determined based on the following order.

1. If PRIMARY KEY constraint is defined, primary key is used as a sharding key.

- The original message

```
CREATE TABLE t1 ( id INTEGER PRIMARY KEY, name VARCHAR(128) );
```

- Translation

```
CREATE TABLE t1 ( id INTEGER PRIMARY KEY, name VARCHAR(128) )
SHARDING BY HASH(id)
SHARD COUNT 24
AT CLUSTER WIDE;
```

2. If UNIQUE constraint is defined, the firstly described UNIQUE constraint is used as the sharding key.

- The original message

```
CREATE TABLE t1 ( id INTEGER, name VARCHAR(128) UNIQUE );
```

- Translation

```
CREATE TABLE t1 ( id INTEGER, name VARCHAR(128) UNIQUE )
SHARDING BY HASH(name)
SHARD COUNT 24
AT CLUSTER WIDE;
```

3. If key constraint is not defined, the first column except for the following excluded data type is used as a sharding key.
- The excluded data type: LONG VARCHAR, LONG VARBINARY, BOOLEAN
- The original message

```
CREATE TABLE t1 ( is_man BOOLEAN, id INTEGER, name VARCHAR(128) );
```

- Translation

```
CREATE TABLE t1 ( is_man BOOLEAN, id INTEGER, name VARCHAR(128) )  
    SHARDING BY HASH(id)  
    SHARD COUNT 24  
    AT CLUSTER WIDE;
```

10.66 DISABLE_DDL_CDC_GIVEUP

Basic Information

Item	Description
Name	DISABLE_DDL_CDC_GIVEUP
Summary	disable DDL which causing CDC give-up
Data type	BOOLEAN
Applicable phase	OPEN
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	TRUE
MIN	0
MAX	1
Default value	NO

Description

It prohibits DDL operation on the table of supplemental log, because it affects CDC's give up.

For more information, refer to **Table 44-1 The occurrence of give up and whether to allow DDL statement according to DDL category**.

10.67 DISABLE_UPDATE_PK_CDC_GIVEUP

Basic Information

Item	Description
Name	DISABLE_UPDATE_PK_CDC_GIVEUP
Summary	disable UPDATE primary key which caused CDC give-up
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It disables UPDATE primary key which caused CDC give up.

10.68 DISALLOWED_PROTOCOL_TARGETTYPE

Basic Information

Item	Description
Name	DISALLOWED_PROTOCOL_TARGETTYPE
Summary	disallowed TARGETTYPE protocol
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	NO

Description

It disallows TARGETTYPE protocol.

10.69 DISALLOWED_PROTOCOL_TARGETTYPE_WITH_ALL

Basic Information

Item	Description
Name	DISALLOWED_PROTOCOL_TARGETTYPE_WITH_ALL
Summary	disallowed TARGETTYPE_WITH_ALL protocol
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	NO

Description

It disallows TARGETTYPE_WITH_ALL protocol.

10.70 DISALLOWED_PROTOCOL_TARGETTYPE_WITH_NAME

Basic Information

Item	Description
Name	DISALLOWED_PROTOCOL_TARGETTYPE_WITH_NAME
Summary	disallowed TARGETTYPE_WITH_NAME protocol
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	NO

Description

It disallows TARGETTYPE_WITH_NAME protocol.

10.71 DISPATCHER_CM_BUFFER_SIZE

Basic Information

Item	Description
Name	DISPATCHER_CM_BUFFER_SIZE
Summary	communication buffer size
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	10485760
MAX	34359738368
Default value	31457280

Description

It is the size of entire communication buffer used in shared mode. It is allocated to and used in Shared Static Area (SSA).

10.72 DISPATCHER_CM_UNIT_SIZE

Basic Information

Item	Description
Name	DISPATCHER_CM_UNIT_SIZE
Summary	communication unit size
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1024
MAX	10485760
Default value	1024

Description

It is the unit size managed by dispatcher in shared mode. If the size is large, the memory is wasted. If it is small, the performance is degraded. It is set to the maximum communication packet size in the shared mode.

10.73 DISPATCHER_CONNECTIONS

Basic Information

Item	Description
Name	DISPATCHER_CONNECTIONS
Summary	maximum number of connections for each dispatcher
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	10
MAX	32768
Default value	950

Description

It is the maximum number of connection (client) which a dispatcher can manage in shared mode.

If the system- supported maximum value is smaller than the set value, it is internally set to the system maximum.

10.74 DISPATCHER_HOT_POLICY_INTERVAL

Basic Information

Item	Description
Name	DISPATCHER_HOT_POLICY_INTERVAL
Summary	dispatcher dequeue interval for busy waiting
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	86400000000: 1 day
Default value	100000: 0.1 second

Description

It is the dispatcher dequeue interval for busy waiting. (micro second)

10.75 DISPATCHER_LOAD_BALANCING

Basic Information

Item	Description
Name	DISPATCHER_LOAD_BALANCING
Summary	load balancing algorithm for shared mode (0: number of clients, 1: round robin)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	0

Description

It is an algorithm allocating a dispatcher when connecting to a client in the shared mode.

- 0: It is allocated to a dispatcher of which the number of currently attached clients are small.
- 1: It is sequentially allocated to a dispatcher.

10.76 DISPATCHER_NUMA_STREAM_MAP

Basic Information

Item	Description
Name	DISPATCHER_NUMA_STREAM_MAP
Summary	numa stream map for dispatcher
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	'x' : no binding

Description

It determines NUMA node to which dispatchers are to be connected. This property is operated when NUMA property is set to on.

The following is an example of three dispatchers. It connects number 0 stream to number 0 NUMA node, connects number 1 stream to number 1 NUMA node, and number 2 stream to number 2 NUMA node.

```
DISPATCHER_NUMA_STREAM_MAP = '0:1:2'
```

10.77 DISPATCHER_QUEUE_SIZE

Basic Information

Item	Description
Name	DISPATCHER_QUEUE_SIZE
Summary	dispatcher queue size
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1024
MAX	32768
Default value	1024

Description

In shared mode, it sets the queue size for the communication between the dispatcher and the shared-server.

10.78 DISPATCHER_REQUEST_MINI_QUEUE_COUNT

Basic Information

Item	Description
Name	DISPATCHER_REQUEST_MINI_QUEUE_COUNT
Summary	count of mini queue per request queue
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	16
Default value	4

Description

It is the count of mini queue per request queue.

10.79 DISPATCHER_RESPONSE_MINI_QUEUE_COUNT

Basic Information

Item	Description
Name	DISPATCHER_RESPONSE_MINI_QUEUE_COUNT
Summary	count of mini queue per response queue
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	16
Default value	4

Description

It is the count of mini queue per response queue.

10.80 DISPATCHERS

Basic Information

Item	Description
Name	DISPATCHERS
Summary	number of dispatcher processes
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	256
Default value	2

Description

It sets the number of dispatcher processes when using the shared mode.
It can not reduce the value by using alter system on open phase.

10.81 FETCH_FAILOVER

Basic Information

Item	Description
Name	FETCH_FAILOVER
Summary	enable fetch failover
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	NO

Description

It enables the fetch failover.

10.82 GLOBAL_CONNECTION_ALLOW_SESSION_DEPENDENCY

Basic Information

Item	Description
Name	GLOBAL_CONNECTION_ALLOW_SESSION_DEPENDENCY
Summary	allowed session dependent features in global connection
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	TRUE
MIN	0
MAX	1
Default value	NO

Description

It sets whether to support the query execution including the session dependent information in the global connection.

10.83 GLOBAL_JOURNAL_BUFFER_SIZE

Basic Information

Item	Description
Name	GLOBAL_JOURNAL_BUFFER_SIZE
Summary	global journal buffer size
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1024
MAX	10 Giga
Default value	1 Mega

Description

It is the size of global journal buffer.

10.84 GLOBAL_JOURNAL_BUFFER_TOTAL_MAX_SIZE

Basic Information

Item	Description
Name	GLOBAL_JOURNAL_BUFFER_TOTAL_MAX_SIZE
Summary	global journal buffer total max size
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1 Mega
MAX	100 Giga
Default value	64 Mega

Description

It is the total max size of global journal buffer.

10.85 GLOBAL_PROPERTY_LOCK_TIMEOUT

Basic Information

Item	Description
Name	GLOBAL_PROPERTY_LOCK_TIMEOUT
Summary	a time limit(second) for how long global property lock statements will wait
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0 (infinite)
MAX	100000000
Default value	0

Description

When changing the global property, it performs the lock to control the concurrency. In this case, the waiting time to perform the lock is set.

10.86 GLOBAL_TRANSACTION_COMMIT_WRITE_MODE

Basic Information

Item	Description
Name	GLOBAL_TRANSACTION_COMMIT_WRITE_MODE
Summary	global transaction commit write mode (0: no_wait, 1: wait, 2: disable)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	2
Default value	2

Description

It is a property to change the commit write mode of the global transaction. TRANSACTION_COMMIT_WRITE_MODE property is applied to all transactions, but GLOBAL_TRANSACTION_COMMIT_WRITE_MODE property is applied only to a global transaction. If the property is set to 2, then it follows the TRANSACTION_COMMIT_WRITE_MODE.

- 0: It does not wait.
- 1: It waits.
- 2: It follows the value of TRANSACTION_COMMIT_WRITE_MODE.

10.87 GLOBAL_TRANSACTION_ISOLATION_SCOPE

Basic Information

Item	Description
Name	GLOBAL_TRANSACTION_ISOLATION_SCOPE
Summary	isolation scope for global transaction(0: system, 1: group)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	0

Description

It determines whether to process the data with a global transaction or with multiple domain transactions when the transaction changed the data through two cluster groups.

- 0: It processes with a global transaction.
- 1: It processes with multiple domain transactions.

Note

If this property is set to 1, it commits each cluster group with a separate transaction, so it does not guarantees the transaction atomicity.

10.88 GLOBAL_TRANSACTION_LOG_DIR

Basic Information

Item	Description
Name	GLOBAL_TRANSACTION_LOG_DIR
Summary	default global transaction log directory
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/wal

Description

It is the default directory of global transaction log.

10.89 GLOBAL_TRANSACTION_LOG_FILE_SIZE

Basic Information

Item	Description
Name	GLOBAL_TRANSACTION_LOG_FILE_SIZE
Summary	global transaction log file size
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	20 Mega
MAX	10 Giga
Default value	100 Mega

Description

It is the file size of global transaction log.

10.90 GMASTER_NUMA_NODE

Basic Information

Item	Description
Name	GMASTER_NUMA_NODE
Summary	numa node for gmaster process
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	-1
MAX	63
Default value	-1

Description

It sets the ID of NUMA node to be used by gmaster daemon. This property is operated when NUMA property is set to on.

10.91 GMON_AUTOSTART

Basic Information

Item	Description
Name	GMON_AUTOSTART
Summary	Indicate whether gmon process automatically starts or not (0 1)
Data type	BOOLEAN
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	1

Description

It sets whether to start gmon process automatically.

10.92 HINT_ERROR

Basic Information

Item	Description
Name	HINT_ERROR
Summary	enable hint error
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	NO

Description

It sets whether to check syntax error and validation error for hint syntax.

10.93 IDLE_TIMEOUT

Basic Information

Item	Description
Name	IDLE_TIMEOUT
Summary	idle timeout(s)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10000000
Default value	0

Description

It sets the maximum IDLE time possible to wait in C/S session. If it exceeds the specified idle time, TIMEOUT error occurs.

- 0: It means infinite waiting, and TIMEOUT error does not occur.

10.94 INDEX_BUILD_PARALLEL_FACTOR

Basic Information

Item	Description
Name	INDEX_BUILD_PARALLEL_FACTOR
Summary	index build parallel factor
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	64
Default value	0

Description

When creating an index, it specifies the number of parallel factor.

- 0: It is specified as the number of the core factor in the system.

10.95 INDEX_TREE_MERGE_PARALLEL_FACTOR

Basic Information

Item	Description
Name	INDEX_TREE_MERGE_PARALLEL_FACTOR
Summary	parallel factor for merging sub-trees
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	64
Default value	0

Description

When creating an index, it specifies the number of parallel factor to merge the sub-tree.

If that value is bigger than INDEX_BUILD_PARALLEL_FACTOR, then INDEX_BUILD_PARALLEL_FACTOR is used.

- 0: It follows INDEX_BUILD_PARALLEL_FACTOR.

10.96 INST_ALLOCATOR_COUNT

Basic Information

Item	Description
Name	INST_ALLOCATOR_COUNT
Summary	memory allocator count for instant tables or indexes
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	3
MAX	128
Default value	3

Description

This property increases the parallel property of operation allocating or deleting an instant block.

10.97 INST_TABLE_BLOCK_SIZE

Basic Information

Item	Description
Name	INST_TABLE_BLOCK_SIZE
Summary	a block size of instant tables or indexes
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	8192
MAX	1048576
Default value	16384

Description

It determines the size of an instant block. If the anchor area of an instant record is bigger than an instant block, then the following error occurs.

```
gSQL> SELECT DISTINCT * FROM T1, T1, T1, T1, T1, T1, T1, T1, T1, T1;  
ERR-HY000(14098): maximum record length(16360) exceeds
```

10.98 IN_DOUBT_DECISION

Basic Information

Item	Description
Name	IN_DOUBT_DECISION
Summary	decision for in-doubt transaction
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	2
Default value	2

Description

It determines whether to commit or to rollback the in-doubt transaction of distributed transactions.

- 1: Commit
- 2: Rollback

10.99 JOURNAL_TEMP_DIR

Basic Information

Item	Description
Name	JOURNAL_TEMP_DIR
Summary	journaling temporary directory
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/journal

Description

It is the temporary directory of journaling.

10.100 KEEPALIVE_IDLE_TIME

Basic Information

Item	Description
Name	KEEPALIVE_IDLE_TIME
Summary	tcp keepalive idle time for checking dead client session (sec)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	16383
Default value	300

Description

It means the idle duration between the server and client without tcp packet exchange before sending keep alive packet. If there is not tcp packet exchange for seconds (KEEPALIVE_IDLE_TIME), keep alive mechanism starts execution to detect the dead connection on the server side.

10.101 LOCAL_CLUSTER_MEMBER

Basic Information

Item	Description
Name	LOCAL_CLUSTER_MEMBER
Summary	local cluster member name
Data type	VARCHAR
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	N/A
MAX	N/A
Default value	'G1N1'

Description

It is the local cluster member name.

10.102 LOCAL_CLUSTER_MEMBER_HOST

Basic Information

Item	Description
Name	LOCAL_CLUSTER_MEMBER_HOST
Summary	host name of local cluster member
Data type	VARCHAR
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	N/A
MAX	N/A
Default value	'127.0.0.1'

Description

It is host name of local cluster member.

10.103 LOCAL_CLUSTER_MEMBER_PORT

Basic Information

Item	Description
Name	LOCAL_CLUSTER_MEMBER_PORT
Summary	listen port of local cluster member
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	1024
MAX	49151
Default value	10101

Description

It is listen port of local cluster member.

10.104 LOCAL_JOURNAL_BUFFER_SIZE

Basic Information

Item	Description
Name	LOCAL_JOURNAL_BUFFER_SIZE
Summary	local journal buffer size
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1024
MAX	10737418240 (10 Giga)
Default value	65536

Description

It is the local journal buffer size.

10.105 LOCATION_FILE

Basic Information

Item	Description
Name	LOCATION_FILE
Summary	location file name
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/wal/location.ctl

Description

It is the location file name.

10.106 LOCATOR_QUERY_TIMEOUT

Basic Information

Item	Description
Name	LOCATOR_QUERY_TIMEOUT
Summary	timeout for waiting locator response (sec)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10000000
Default value	20

Description

It sets the time (second) waiting for the response after the cluster system enquires of a locator about the solution of split-brain situation. This property is used only when CLUSTER_SPLIT_BRAIN_RESOLUTION_POLICY is set to 1 or more.

10.107 LOCK_HASH_TABLE_SIZE

Basic Information

Item	Description
Name	LOCK_HASH_TABLE_SIZE
Summary	lock manager hash table size (The number of buckets)
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	2
MAX	1000000
Default value	65519

Description

It specifies the maximum hash table size managed by a lock manager.

10.108 LOG_BLOCK_SIZE

Basic Information

Item	Description
Name	LOG_BLOCK_SIZE
Summary	log block size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	512
MAX	4096
Default value	512

Description

It means the minimum size of what log buffer is flushed to the log file of the disk. Its value should be set to one of 512, 1024, 2048, 4096.

10.109 LOG_BUFFER_SIZE

Basic Information

Item	Description
Name	LOG_BUFFER_SIZE
Summary	default log buffer size (byte)
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1048576
MAX	10737418240
Default value	10485760

Description

A log buffer is the shared memory space in which the redo logs generated in database by the DML/DDL operations are stored. LOG_BUFFER_SIZE is referenced to set the memory size for the log buffer.

10.110 LOG_DIR

Basic Information

Item	Description
Name	LOG_DIR
Summary	default log directory
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/wal

Description

The log recorded in the log buffer is flushed to the logfile which exists in a non-volatile storage device to ensure the database durability. LOG_DIR sets the path to the log file.

10.111 LOG_FILE_SIZE

Basic Information

Item	Description
Name	LOG_FILE_SIZE
Summary	log file size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	20 Mbytes
MAX	60 Gbytes
Default value	100 Mbytes

Description

It sets the size of the logfile used in database. It is referenced only when creating the database, then log file size can not be updated after then.

10.112 LOG_GROUP_COUNT

Basic Information

Item	Description
Name	LOG_GROUP_COUNT
Summary	initial count of log group
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	4
MAX	254
Default value	4

Description

It sets the number of log group used in database. It is referenced only when creating the database, but after that, it does not affect any operations. After creating database, the operation to add or remove a log group is supported by a separate syntax.

10.113 LOG_MIRROR_MODE

Basic Information

Item	Description
Name	LOG_MIRROR_MODE
Summary	LogMirror Mode (1:Enable, 0:Disable)
Data type	BOOLEAN
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It is the property to configure the required shared memory when operating LogMirror, the redo log replication tool, at database startup.

It should be enabled to execute the LogMirror.

The size of the shared Memory can be changed using LOG_MIRROR_SHARED_MEMORY_STATIC_SIZE.

10.114 LOG_MIRROR_SHARED_MEMORY_STATIC_SIZE

Basic Information

Item	Description
Name	LOG_MIRROR_SHARED_MEMORY_STATIC_SIZE
Summary	shared memory size for LogMirror (byte)
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	10485760 (10 M)
MAX	1073741824 (1 G)
Default value	104857600 (100 M)

Description

It sets the size of the shared memory used in LogMirror, the redo-log replication tool.

It is applied in the state which LOG_MIRROR_MODE is enabled.

10.115 LOG_MIRROR_TIMEOUT

Basic Information

Item	Description
Name	LOG_MIRROR_TIMEOUT
Summary	logmirror retry timeout (sec)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000000
Default value	0

Description

It is the response waiting time of the LogMirror.

If its value is 0, it waits indefinitely. Otherwise, it waits as long as the value set, then TIMEOUT occurs, and it stops LogMirror service. Later, the server is operated normally.

It is applied in the state which LOG_MIRROR_MODE is enabled.

10.116 LOG_SYNC_INTERVAL

Basic Information

Item	Description
Name	LOG_SYNC_INTERVAL
Summary	interval for synchronize log (s)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	10000
Default value	3

Description

Log flusher of GOLDILOCKS is a system thread which flushes the log buffer contents to disk logfile. When log flusher wakes up in the idle phase, it checks if log to flush exists. Then it flushes the log if any. If the log flusher did not flush within the time set in LOG_SYNC_INTERVAL, it synchronizes the log buffer and the log file by performing a flush until the last block of the current log buffer.

10.117 LOG_SYNC_INTERVAL_MSEC

Basic Information

Item	Description
Name	LOG_SYNC_INTERVAL_MSEC
Summary	milli-second interval for synchronize log
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10000000
Default value	0

Description

It is the millisecond interval for synchronize log.

10.118 MAX_GROUP_COUNT

Basic Information

Item	Description
Name	MAX_GROUP_COUNT
Summary	maximum group count
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	0
MAX	8192
Default value	32

Description

It is the maximum group count.

10.119 MAX_JOURNAL_FILE_SIZE

Basic Information

Item	Description
Name	MAX_JOURNAL_FILE_SIZE
Summary	maximum journal file size
Data type	BIGINT
Applicable phase	MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1099511627776 (1 Terabytes)
Default value	0 (no limit)

Description

It sets the maximum size (quota) of the global journaling file which internally stores journaling data when a journaling occurs in cluster system.

10.120 MAX_NODE_COUNT

Basic Information

Item	Description
Name	MAX_NODE_COUNT
Summary	maximum node count
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	1
MAX	8192
Default value	64

Description

It is the maximum node count.

10.121 MAXIMUM_CONCURRENT_ACTIVITIES

Basic Information

Item	Description
Name	MAXIMUM_CONCURRENT_ACTIVITIES
Summary	maximum number of active statements that the driver can support for a connection
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	65535
Default value	1024

Description

It sets the number of statements which can be executed simultaneously.

10.122 MAXIMUM_FLANGE_COUNT

Basic Information

Item	Description
Name	MAXIMUM_FLANGE_COUNT
Summary	maximum flange count in a plan clock
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	128
MAX	65535
Default value	1024

Description

It is the maximum number of flanges which can be expanded in plan clock.

10.123 MAXIMUM_FLUSH_LOG_BLOCK_COUNT

Basic Information

Item	Description
Name	MAXIMUM_FLUSH_LOG_BLOCK_COUNT
Summary	maximum number of log block count to be flushing
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1000
MAX	2000000
Default value	100000

Description

When flushing the contents of the log buffer to disk log file, it sets the maximum number of log blocks to be flushed with a single writing operation.

10.124 MAXIMUM_FLUSH_PAGE_COUNT

Basic Information

Item	Description
Name	MAXIMUM_FLUSH_PAGE_COUNT
Summary	maximum number of page count to be flushing
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	8192
Default value	1024

Description

GOLDILOCKS datafiles are flushed to the disk by the checkpoint and certain DDL statements. For flushing datafiles, it sets the maximum number of data pages to be flushed with a single writing operation.

10.125 MAXIMUM_JOURNAL_REPLAY_COUNT

Basic Information

Item	Description
Name	MAXIMUM_JOURNAL_REPLAY_COUNT
Summary	maximum number of replaying journals for rebalance table
Data type	BIGINT
Applicable phase	NO_MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	2
MAX	1024
Default value	2

Description

The table rebalancing online can be performed together with dml in the cluster environment, and dml records the updates on the journal log at that moment. The table rebalancing initially applies the journal logs which occurred during synchronizing tables, then applies journal logs which were accumulated while applying the journal logs. This property sets how many times the journal logs are applied in this way.

10.126 MAXIMUM_NAMED_CURSOR_COUNT

Basic Information

Item	Description
Name	MAXIMUM_NAMED_CURSOR_COUNT
Summary	maximum number of named cursor that the driver can support for a connection
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	100000
Default value	128

Description

It is the maximum number of named cursor which can be used within a single session.

A named cursor is created in the following cases.

- When a named cursor is declared using functions like `SQLSetCursorName()`, `SQLGetCursorName()`

```
{  
    ...  
    SQLSetCursorName( stmt,  
                      "my_cursor",  
                      SQL_NTS );  
    ...  
}
```

- When the DECLARE cursor syntax is used by a function such as `SQLExecDirect ()`, `SQLPrepare ()`

```
{  
    ...  
    SQLExecDirect( stmt,  
                  "DECLARE my_cursor CURSOR FOR SELECT col_name FROM tab_name",
```

```

        SQL_NTS );
    ...
}

```

- When DECLARE cursor FOR UPDATE syntax is used in an embedded SQL

```

{
    ...
    EXEC SQL DECLARE my_cursor CURSOR FOR SELECT col_name FROM tab_name FOR UPDATE;
    ...
    EXEC SQL OPEN my_cursor;
    ...
    EXEC SQL FETCH my_cursor INTO :data;
    EXEC SQL DELETE FROM tab_name WHERE CURRENT OF my_cursor;
    ...
    EXEC SQL CLOSE my_cursor;
}

```

Note

In an embedded SQL, DECLARE CURSOR syntax without FOR UPDATE as follows does not create a named cursor on the session.

```

{
    ...
    EXEC SQL DECLARE my_cursor CURSOR FOR SELECT col_name FROM tab_name;
    ...
}

```

10.127 MAXIMUM_SESSION_CM_BUFFER_SIZE

Basic Information

Item	Description
Name	MAXIMUM_SESSION_CM_BUFFER_SIZE
Summary	maximum communication bytes per shared mode session
Data type	BIGINT
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	1048576
MAX	1073741824
Default value	20971520

Description

It sets the maximum buffer size available in a single session which is connected to shared mode. For more information, refer to **DISPATCHER_CM_BUFFER_SIZE**.

10.128 MEASURE_CLUSTER_LATENCY

Basic Information

Item	Description
Name	MEASURE_CLUSTER_LATENCY
Summary	measure cluster latency
Data type	BOOL
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It is the measure cluster latency.

10.129 MEMORY_MERGE_RUN_COUNT

Basic Information

Item	Description
Name	MEMORY_MERGE_RUN_COUNT
Summary	merge run count for memory index
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	2
MAX	64
Default value	32

Description

Memory B-tree index of bottom-up approach is created by extracting all keys from a table, sorting them in certain block size (MEMORY_SORT_RUN_SIZE) units, merging the sorted blocks, and generating the internal node. MEMORY_MERGE_RUN_COUNT sets the number of the sorted blocks to be merged at a time.

10.130 MEMORY_SORT_RUN_SIZE

Basic Information

Item	Description
Name	MEMORY_SORT_RUN_SIZE
Summary	sort run size for memory index (byte)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	8192
MAX	32768
Default value	8192

Description

Memory B-tree index of bottom-up approach is created by extracting all keys from a table, sorting them in a certain block size (MEMORY_SORT_RUN_SIZE) unit, merging the sorted blocks, and generating the internal node. MEMORY_SORT_RUN_SIZE sets the size of a single block to be sorted.

10.131 MINIMUM_UNDO_PAGE_COUNT

Basic Information

Item	Description
Name	MINIMUM_UNDO_PAGE_COUNT
Summary	minimum undo page count
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	16
MAX	1048576
Default value	16

Description

DML uses the undo page to store the previous image. Undo page is consumed by using a single undo segment per DML. If all allocated pages of undo segments are consumed, the page of another undo segment can be used. MINIMUM UNDO PAGE_COUNT is the minimum number of undo page to specify the undo segment to import page when undo pages are insufficient. If the undo pages are insufficient, the pages can be imported only from the undo segment having more pages than MINIMUM UNDO PAGE_COUNT.

10.132 MIN_SAMPLE_ROW_COUNT

Basic Information

Item	Description
Name	MIN_SAMPLE_ROW_COUNT
Summary	minimum sampling row count for analyze table
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	9223372036854775807 (INT64_MAX)
Default value	100000

Description

It is the minimum number of sampling rows when executing **ANALYZE TABLE** by using the sampling.

10.133 NET_BUFFER_SIZE

Basic Information

Item	Description
Name	NET_BUFFER_SIZE
Summary	TCP network buffer size (byte)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	1024
MAX	1073741824
Default value	32768

Description

It sets the TCP communications buffer size.

In the dedicated mode, it is set to the maximum communication packet size.

In the shared mode, it is set to **DISPATCHER_CM_UNIT_SIZE**.

10.134 NLS_DATE_FORMAT

Basic Information

Item	Description
Name	NLS_DATE_FORMAT
Summary	nls date format
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	YYYY-MM-DD

Description

NLS_DATE_FORMAT specifies the default date format of TO_CHAR and TO_DATE functions.

10.135 NLS_TIME_FORMAT

Basic Information

Item	Description
Name	NLS_TIME_FORMAT
Summary	nls time format
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	HH24:MI:SS.FF6

Description

NLS_DATE_FORMAT specifies the default time format of TO_CHAR and TO_DATE functions.

10.136 NLS_TIME_WITH_TIME_ZONE_FORMAT

Basic Information

Item	Description
Name	NLS_TIME_WITH_TIME_ZONE_FORMAT
Summary	nls time with time zone format
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	HH24:MI:SS.FF6 TZh:TzM

Description

NLS_TIME_WITH_TIME_ZONE_FORMAT specifies the default time with time zone format of TO_CHAR and TO_TIME_WITH_TIME_ZONE functions.

10.137 NLS_TIMESTAMP_FORMAT

Basic Information

Item	Description
Name	NLS_TIMESTAMP_FORMAT
Summary	nls timestamp format
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	YYYY-MM-DD HH24:MI:SS.FF6

Description

NLS_TIMESTAMP_FORMAT specifies the default timestamp format of TO_CHAR and TO_TIMESTAMP functions.

10.138 NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT

Basic Information

Item	Description
Name	NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT
Summary	nls timestamp with time zone format
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	YYYY-MM-DD HH24:MI:SS.FF6 TZH:TZM

Description

NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT specifies the default timestamp with time zone format of TO_CHAR and TO_TIMESTAMP WITH TIMEZONE functions.

10.139 NUMA

Basic Information

Item	Description
Name	NUMA
Summary	enable numa
Data type	BOOLEAN
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	0
MAX	1
Default value	NO

Description

It enables NUMA.

Note

To use the NUMA property in AIX, the user account should be modified. Execute the following command as a root user.

```
# chuser "capabilities=CAP_NUMA_ATTACH,CAP_PROPAGATE" <username>
```

<username> is not a root but it is a user account of AIX.

Logout then login again to apply the modifications.

10.140 NUMA_MAP

Basic Information

Item	Description
Name	NUMA_MAP
Summary	numa node map
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	'x' : no binding

Description

It sets the map to connect cores of the system to NUMA node. This property is operated when NUMA property is set to on.

The following is an example of the system having four cores.

- Connect core 0 and 1 to number 0 NUMA node, and core 2 and 3 to number 1 NUMA node.

NUMA_MAP = '0:0:1:1' # core

- Connect core 0 and 1 to number 0 NUMA node, and core 2 and 3 to number 1 NUMA node, and core 1 and 3 to number 2 NUMA node.

NUMA_MAP = '0:0,2:1:1,2' # core

10.141 OFFLINE_MEMBER_AFTER_FAILOVER

Basic Information

Item	Description
Name	OFFLINE_MEMBER_AFTER_FAILOVER
Summary	Automatically offline member after failover
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	YES

Description

The background process automatically takes the errored member offline after completing the failover caused by the node error.

If it is not possible to take the errored member offline because it is set to *NO*, then execute the following syntax before the errored member joins the system again.

```
gSQL> ALTER DATABASE OFFLINE INACTIVE CLUSTER MEMBERS;  
Database altered.
```

10.142 ONLINE_JOURNAL_REPLAY_THRESHOLD

Basic Information

Item	Description
Name	ONLINE_JOURNAL_REPLAY_THRESHOLD
Summary	threshold bytes for replaying journals without table lock
Data type	BIGINT
Applicable phase	NO_MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10737418240 (10G)
Default value	1048576 (1M)

Description

The table rebalancing online applies journal logs several times which were recorded by dml occurred during the performance in the cluster environment. MAXIMUM_JOURNAL_REPLAY_COUNT sets how many times to apply the journal logs. However, if the amount of journal logs to be applied are small, then it is not repeated as many as it is set to be, but instantly set the table the EXCLUSIVE lock, and uses it as the threshold value to apply the last journal log.

10.143 OS_GROUP_ACCESS

Basic Information

Item	Description
Name	OS_GROUP_ACCESS
Summary	enable access database with OS group permission
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	NO

Description

To connect to DA with another user of the same group, this property should be set to *YES*. Also, the uma sk of the system should be modified to *0002*.

10.144 PACKET_COMPRESSION_THRESHOLD

Basic Information

Item	Description
Name	PACKET_COMPRESSION_THRESHOLD
Summary	The size limit at which packets are compressed(bytes)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	32
MAX	2113929216
Default value	2113929216

Description

If the data size to be sent to the client is bigger than PACKET_COMPRESSION_THRESHOLD, it compresses the communication data.

10.145 PAGE_CHECKSUM_TYPE

Basic Information

Item	Description
Name	PAGE_CHECKSUM_TYPE
Summary	page checksum type (0:LSN, 1:CRC)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	0

Description

A checksum is used to guarantee the physical consistency for each page of the datafile. GOLDILOCKS supports a page checksum of LSN, CRC scheme.

- 0: LSN
- 1: CRC

10.146 PARALLEL_IO_FACTOR

Basic Information

Item	Information
Name	PARALLEL_IO_FACTOR
Summary	parallel load factor
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	16
Default value	1

Description

It sets the number of threads for the parallel loading of data file when starting database and the number of threads for parallel recording of data file at checkpoint.

10.147 PARALLEL_IO_GROUP_1 ~ PARALLEL_IO_GROUP_16

Basic Information

Item	Description
Name	PARALLEL_IO_GROUP_1
Summary	parallel load group 1
Data type	VARCHAR
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/db

Description

It sets the group directory for parallel I/O of data file. It sets the number of group as many as PARALLEL_I
O_FACTOR, then parallel I/O is performed in data file unit which belongs to each group.

10.148 PARALLEL_LOAD_FACTOR

Basic Information

Item	Description
Name	PARALLEL_LOAD_FACTOR
Summary	parallel load factor
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	64
Default value	1

Description

When starting database, it sets the number of threads for parallel operation after loading the memory of a data file.

10.149 PENDING_LOG_BUFFER_COUNT

Basic Information

Item	Description
Name	PENDING_LOG_BUFFER_COUNT
Summary	default pending log buffer count
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	32
Default value	4

Description

When multiple transactions are simultaneously running, the pending log buffer is used to reduce the competition for the log buffer. PENDING LOG_BUFFER COUNT sets the number of pending log buffer which can be used simultaneously.

10.150 PLAN_CACHE

Basic Information

Item	Description
Name	PLAN_CACHE
Summary	caching sql plan
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	YES

Description

It determines whether to use the plan cache.

10.151 PLAN_CACHE_SIZE

Basic Information

Item	Description
Name	PLAN_CACHE_SIZE
Summary	sql plan cache size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	20971520
MAX	1099511627776
Default value	104857600

Description

It sets the memory size to be used for the plan cache.

10.152 PRIVATE_STATIC_AREA_SIZE

Basic Information

Item	Description
Name	PRIVATE_STATIC_AREA_SIZE
Summary	Shared Static Area Size (byte)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	104857600
MAX	34359738368
Default value	104857600

Description

It specifies the maximum heap memory size to be allocated by the session.

10.153 PROCESS_MAX_COUNT

Basic Information

Item	Description
Name	PROCESS_MAX_COUNT
Summary	Process Max Count
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	12
MAX	65535
Default value	128

Description

It specifies the maximum number of processes (threads) available on the system.

Creating system process

- The process is created each time of connection to D/A mode or C/S dedicated mode.
- In C/S shared mode, processes are basic balancer, dispatcher and shared-server. A process is not created when connecting from client.

10.154 QUERY_TIMEOUT

Basic Information

Item	Description
Name	QUERY_TIMEOUT
Summary	query timeout (s)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10000000
Default value	0

Description

It specifies the maximum time which a command received from the session can be executed. If the execution time exceeds, the TIMEOUT error occurs.

- 0: It means infinite waiting, and TIMEOUT error does not occur.

10.155 READABLE_ARCHIVELOG_DIR_COUNT

Basic Information

Item	Description
Name	READABLE_ARCHIVELOG_DIR_COUNT
Summary	readable archive log directory count
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	10
Default value	1

Description

It sets the number of directories in which archive redo logs exist when executing media recovery.

10.156 READABLE_BACKUP_DIR_COUNT

Basic Information

Item	Description
Name	READABLE_BACKUP_DIR_COUNT
Summary	readable backup directory count
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	10
Default value	1

Description

It sets the number of directories in which incremental backups exist when restoring files using incremental backups.

10.157 REBALANCE_BLOCK_READ_COUNT

Basic Information

Item	Description
Name	REBALANCE_BLOCK_READ_COUNT
Summary	block read count for rebalance
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	DEFERRED
MIN	1
MAX	65536
Default value	1

Description

It is the block read count for rebalance.

10.158 RECOMPILE_CHECK_MINIMUM_PAGE_COUNT

Note

It is not supported after 3.1.

Basic Information

Item	Description
Name	RECOMPILE_CHECK_MINIMUM_PAGE_COUNT
Summary	minimum page count for recompile check
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	10000
Default value	64

Description

It sets the minimum page count to check if the plan is recompiled due to the page count modification.

10.159 RECOMPILE_PAGE_PERCENT

Note

It is not supported after 3.1.

Basic Information

Item	Description
Name	RECOMPILE_PAGE_PERCENT
Summary	recompile page percent
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1000
Default value	30

Description

It sets the page percentage when recompiles the plan due to the page count modification. If its value is 0, it does not recompile due to the page count modification.

10.160 RECOVERY_LOG_BUFFER_SIZE

Basic Information

Item	Description
Name	RECOVERY_LOG_BUFFER_SIZE
Summary	default log buffer size for recovery
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	786432
MAX	32 Mega
Default value	10 Mega

Description

It is the default log buffer size for recovery.

10.161 REDO_LOG_COMPRESSION_THRESHOLD

Basic Information

Item	Description
Name	REDO_LOG_COMPRESSION_THRESHOLD
Summary	The size limit at which redo log are compressed(bytes)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	32
MAX	2113929216
Default value	256

Description

If the size of the created REDO LOG is bigger than REDO_LOG_COMPRESSION_THRESHOLD value, it compresses REDO LOG.

10.162 REFINERELATION

Basic Information

Item	Description
Name	REFINE_RELATION
Summary	refine aged relations
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	YES

Description

If this property is set to NO, then REFINERELATION process is not preformed when restarting the server.

This property can be used when an error occurs during the REFINERELATION process. However, segments of RELATIONS (tables or indexes) which were dropped but not REFINED can not be reused. When resolving the error then setting this property to YES and restarting, it tries to REFINERELATIONS which were not dropped.

10.163 SESSION_FATAL_BEHAVIOR

Basic Information

Item	Description
Name	SESSION_FATAL_BEHAVIOR
Summary	session fatal behavior
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	0

Description

When session fatal occurs, it determines whether to terminate only the thread which caused the fatal or to terminate the process.

- 0: It terminates only the thread which caused fatal.
- 1: It terminates the process.

If multiple sessions are simultaneously performed in the process, the process is terminated after all sessions finish using database.

10.164 SESSION_MEMORY_INIT_SIZE

Basic Information

Item	Description
Name	SESSION_MEMORY_INIT_SIZE
Summary	initial memory size for session
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	131072 (128K)
MAX	1073741824 (1G)
Default value	131072 (128K)

Description

It sets the shared memory size to be allocated in advance so that it can be used in the session.

10.165 SESSION_MEMORY_SHRINK_THRESHOLD

Basic Information

Item	Description
Name	SESSION_MEMORY_SHRINK_THRESHOLD
Summary	threshold bytes to attempt to shrink session memory allocator (byte)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	131072 (128K)
MAX	1073741824 (1G)
Default value	131072 (128K)

Description

It sets the threshold value to determine whether to return the dynamic shared memory which is not used by the session to the system when releasing the dynamic shared memory used in the session. In other words, if the memory chunk which is bigger than the set value among unused memory exists, then it is returned to the system.

10.166 SHARED_MEMORY_ADDRESS

Basic Information

Item	Description
Name	SHARED_MEMORY_ADDRESS
Summary	shared memory address
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	1610612736

Description

It specifies the address of Shared Static Area (SSA).

10.167 SHARED_MEMORY_STATIC_KEY

Basic Information

Item	Description
Name	SHARED_MEMORY_STATIC_KEY
Summary	Shared Memory Static KEY
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	542353

Description

When running server, it specifies the shared memory key values which are used to allocate Static Shared Area (SSA) space.

10.168 SHARED_MEMORY_STATIC_NAME

Basic Information

Item	Description
Name	SHARED_MEMORY_STATIC_NAME
Summary	Shared Memory Static Name
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	_STATIC

Description

When running server, it specifies the shared memory name which is used to allocate Static Shared Area (S SA) space.

10.169 SHARED_MEMORY_STATIC_SIZE

Basic Information

Item	Description
Name	SHARED_MEMORY_STATIC_SIZE
Summary	Shared Memory Static Size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	104857600
MAX	1099511627776
Default value	629145600

Description

It specifies the size of the Shared Static Area (SSA).

10.170 SHARED_REQUEST_QUEUE_COUNT

Basic Information

Item	Description
Name	SHARED_REQUEST_QUEUE_COUNT
Summary	count of global request queue
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	1
MAX	16
Default value	1

Description

In shared mode, it sets the number of queues of which the dispatcher requests to the shared-server. A queue is used when multiple dispatchers allocate user's requests to the shared-server. Generally, a single queue is used for the load-balance.

However, SHARED_REQUEST_QUEUE_COUNT value is increased because if the number of dispatchers and shared-servers increase, then a conflict to the queue causes performance degradation.

If the value becomes bigger, the load-balance can be inefficient and the possibility of deadlock increases.

10.171 SHARED_SERVERS

Basic Information

Item	Description
Name	SHARED_SERVERS
Summary	number of shared-server processes
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	2048
Default value	10

Description

It sets the number of shared-server processes on shared mode.

At open phase, the value can not be decreased by using alter system.

10.172 SHARED_SESSION

Basic Information

Item	Description
Name	SHARED_SESSION
Summary	to enable shared session
Data type	BOOL
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	YES

Description

It sets whether to activate shared mode. If the value is set to *NO*, load-balancer (gbalancer), dispatcher (g dispatcher), shared-server (gserver) are not executed.

10.173 SNAPSHOT_STATEMENT_TIMEOUT

Basic Information

Item	Description
Name	SNAPSHOT_STATEMENT_TIMEOUT
Summary	snapshot statement timeout (s)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	22118400 (1 year)
Default value	22118400 (1 year)

Description

It sets the maximum holding time of the statement required for the snapshot read. TIMEOUT error occurs for a snapshot statement which exceeds the time.

10.174 SQL_HISTORY_SIZE

Basic Information

Item	Description
Name	SQL_HISTORY_SIZE
Summary	history size for SQLs
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	100000
Default value	0

Description

It is the history size for SQLs.

10.175 SQL_HISTORY_TYPE

Basic Information

Item	Description
Name	SQL_HISTORY_TYPE
Summary	history type for SQLs
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	2
Default value	0

Description

It is the history type for SQLs.

- 0: Direct-execute
- 1: Prepare-execute
- 2: All

10.176 SUPPLEMENTAL_LOG_DATA_PRIMARY_KEY

Basic Information

Item	Description
Name	SUPPLEMENTAL_LOG_DATA_PRIMARY_KEY
Summary	supplemental log data of primary key columns be logged in redo log files
Data type	BOOLEAN
Applicable phase	MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It records supplemental log for all changes in the database.

10.177 SYSTEM_LOGGER_DIR

Basic Information

Item	Description
Name	SYSTEM_LOGGER_DIR
Summary	system logger directory
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/trc

Description

It sets the disk path on which the trace log message is recorded.

10.178 SYSTEM_MEMORY_AUX_TABLESPACE_SIZE

Basic Information

Item	Description
Name	SYSTEM_MEMORY_AUX_TABLESPACE_SIZE
Summary	default system memory auxiliary tablespace size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	32 Mega
MAX	30 Giga
Default value	200 Mega

Description

It determines the size of initial MEM_AUX_TBS tablespace when creating the database.

10.179 SYSTEM_MEMORY_DATA_TABLESPACE_SIZE

Basic Information

Item	Description
Name	SYSTEM_MEMORY_DATA_TABLESPACE_SIZE
Summary	default system memory data tablespace size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	32 Mega
MAX	30 Giga
Default value	200 Mega

Description

It determines the initial tablespace size of MEM_DATA_TBS when creating database.

10.180 SYSTEM_MEMORY_DICT_TABLESPACE_SIZE

Basic Information

Item	Description
Name	SYSTEM_MEMORY_DICT_TABLESPACE_SIZE
Summary	default dictionary tablespace size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	256 Mega
MAX	30 Giga
Default value	256 Mega

Description

It determines the initial tablespace size of DICTIONARY_TBS when creating database.

10.181 SYSTEM_MEMORY_TEMP_TABLESPACE_SIZE

Basic Information

Item	Description
Name	SYSTEM_MEMORY_TEMP_TABLESPACE_SIZE
Summary	default system memory temporary tablespace size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	32 Mega
MAX	30 Giga
Default value	200 Mega

Description

It determines the initial tablespace size of MEM_TEMP_TBS when creating database.

10.182 SYSTEM_MEMORY_UNDO_TABLESPACE_SIZE

Basic Information

Item	Description
Name	SYSTEM_MEMORY_UNDO_TABLESPACE_SIZE
Summary	default system memory undo tablespace size (byte)
Data type	BIGINT
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	NONE
MIN	32 Mega
MAX	30 Giga
Default value	32 Mega

Description

It determines the initial tablespace size of MEM_UNDO_TBS when creating database.

10.183 SYSTEM_TABLESPACE_DIR

Basic Information

Item	Description
Name	SYSTEM_TABLESPACE_DIR
Summary	system tablespace directory
Data type	VARCHAR
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	N/A
MAX	N/A
Default value	<GOLDILOCKS_DATA>/db

Description

It sets the path to which the initial system tablespaces are stored when creating database.

10.184 SYSTEM_UDS_DIR

Basic Information

Item	Description
Name	SYSTEM_UDS_DIR
Summary	system unix domain socket directory
Data type	VARCHAR
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	'/tmp'

Description

It sets a directory on which the unix domain socket file is created.

Setting the directory for the unix domain socket except for DB system, such asglsnr, is managed by a separate configuration file.

The maximum setting value is 60 bytes. (The maximum size of the absolute path (directory + file name) for the unix domain socket file varies according to OS, but generally it is around 100 bytes.)

10.185 TCP_CLIENT_NUMA_NODE

Basic Information

Item	Description
Name	TCP_CLIENT_NUMA_NODE
Summary	numa node for TCP clients
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	-1
MAX	63
Default value	-1

Description

It sets the NUMA node ID to which the client server session is bound. This property is operated when NUMA property is set to on.

10.186 TCP_NODELAY

Basic Information

Item	Description
Name	TCP_NODELAY
Summary	no delays in buffer flushing within the TCP/IP protocol stack
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	1
Default value	YES

Description

It sets TCP_NODELAY option of the socket when transferring the data to a client in C/S method (TCP socket).

Set it to *NO* when fast latency is not required and reducing the network load is needed.

10.187 TEMP_SEGMENT_CACHE_SIZE

Basic Information

Item	Description
Name	TEMP_SEGMENT_CACHE_SIZE
Summary	the number of segments to be cached for global temporary tables and indexes in each session
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	DEFERRED
MIN	0
MAX	4294967295
Default value	3

Description

It sets the number of segments to be cached in a session instead of returning them to a tablespace when dropping a global temporary table or a global temporary index segment. Segments in the segment cache are reused later in a global temporary table or a global temporary index.

- 0: It does not use a segment cache of a global temporary table or of a global temporary index in a session.
- 1 ~ 4294967295: It keeps the specific number of segment caches of a global temporary table or a global temporary index in a session.

10.188 TEMP_UNDO_ENABLED

Basic Information

Item	Description
Name	TEMP_UNDO_ENABLED
Summary	enables writing undo records of global temporary tables to the temp table space
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	0

Description

It defines the location of logging undo records for a global temporary table.

- 0 (FALSE): It records the undo records in the default undo tablespace of database.
- 1 (TRUE): It records the undo records in the default temporary tablespace of database.

10.189 TIMED_STATISTICS

Basic Information

Item	Description
Name	TIMED_STATISTICS
Summary	timed statistics
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	2
Default value	0

Description

It is whether to check the wait event.

To record the statistics related to wait event on v\$system_event, v\$session_event and v\$session_wait table, set this property.

- 0: It does not record the statistics.
- 1: It records the statistics.
- 2: It records the statistics by using the high precision timer.

10.190 TIMEZONE

Basic Information

Item	Description
Name	TIMEZONE
Summary	timezone
Data type	VARCHAR
Applicable phase	NONE
Updatable	FALSE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	N/A
MAX	N/A
Default value	+09:00

Description

It is a time zone value of database.

It is applied when creating database, and it uses the value of the range from '-14:00' to '+14:00'.

10.191 TRACE_ALTER_SYSTEM

Basic Information

Item	Description
Name	TRACE_ALTER_SYSTEM
Summary	write trace messages for ALTER SYSTEM
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It records the SQL statements in trace file (<GOLDILOCKS_DATA>/trc/system.trc) when executing ALTER SYSTEM syntax.

Set TRACE_ALTER_SYSTEM property to *ON* to record system changes.

SELECT inquiry, and execution of INSERT, UPDATE, DELETE syntax have nothing to do with TRACE_ALTER_SYSTEM property, so they do not affect the performance of TRACE_ALTER_SYSTEM.

10.192 TRACE_DDL

Basic Information

Item	Description
Name	TRACE_DDL
Summary	write trace messages for DDL
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

When executing DDL, it records the executed SQL statements in trace file (<GOLDILOCKS_DATA>/trc/system.trc).

Set *TRACE_ALTER_SYSTEM* property to *ON* to record SQL statements execution such as CREATE/DROP/ALTER table.

TRACE_DDL property affects only to DDL statements. However, it has nothing to do with SELECT inquiry, and execution of INSERT, UPDATE, DELETE syntax. Therefore, it does not affect the performance.

10.193 TRACE_LOG_ID

Basic Information

Item	Description
Name	TRACE_LOG_ID
Summary	trace log ID
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000000
Default value	0

Description

The execution plan for the query, and other related information are recorded in the trace file (opt_p[process ID]_s [session ID].trc) under the trace directory (<GOLDILOCKS_DATA>/trc/) when processing queries.

To record SQL statement for the query, the execution plan and the execution time, refer to the following flag information.

Table 10-1 Flag information for TRACE_LOG_ID

Information	Flag(on)	Flag(off)
Whether to output the successful SQL query	100000	0
Whether to output the failed SQL query	10000	0
Whether to output the execution plan	1000	0
Whether to output the execution type (direct/prepare)	100	0
Whether to output the bind value	10	0
Whether to output the execution time per section	1	0

To set it in a form of "output the successful SQL query" + "output the execution plan" + "output the bind value", set the TRACE_LOG_ID value to 101010.

10.194 TRACE_LOG_MSGBUF_SIZE

Basic Information

Item	Description
Name	TRACE_LOG_MSGBUF_SIZE
Summary	memory buffer size for trace log message
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	FALSE
MIN	8192
MAX	10485760
Default value	8192

Description

It sets the size of the heap memory buffer which is used to configure the log message to be recorded in the trace logfile.

10.195 TRACE_LOG_TIME_DETAIL

Basic Information

Item	Description
Name	TRACE_LOG_TIME_DETAIL
Summary	detail trace log time
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It sets whether to increase the time accuracy when recording trace log.

If the value is ON, it has an accuracy of 1 us.

If the value is OFF, it has an accuracy of 10 ms.

10.196 TRACE_LOGGER

Basic Information

Item	Description
Name	TRACE_LOGGER
Summary	trace log type (1:file, 2:file & remote)
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	2
Default value	1

Description

It sets the target on which the trace log is written.

If it is 1, then it is recorded in a file, and if it is 2, then it is remotely recorded in a file.

When it is remotely written, then it remotely collects trace logs from gtrclogger and records in a file.

10.197 TRACE_LOGGER_REMOTE_HOST

Basic Information

Item	Description
Name	TRACE_LOGGER_REMOTE_HOST
Summary	remote host for trace logger
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	255255255255
Default value	127000000001

Description

It sets the host to which the trace log is remotely transferred by setting TRACE_LOGGER to 2.

10.198 TRACE_LOGGER_REMOTE_PORT

Basic Information

Item	Description
Name	TRACE_LOGGER_REMOTE_PORT
Summary	remote port for trace logger
Data type	BIGINT
Applicable phase	NONE
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1024
MAX	49151
Default value	21470

Description

It sets the port to which the trace log is remotely transferred by setting TRACE_LOGGER to 2.

10.199 TRACE_LOGIN

Basic Information

Item	Description
Name	TRACE_LOGIN
Summary	write login trace messages for user
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It records the related access information in trace file (<GOLDILOCKS_DATA>/trc/login.trc) on login. Set TRACE_LOGIN property to *ON* to record the related information on login.

10.200 TRACE_LONG_RUN_CURSOR

Basic Information

Item	Description
Name	TRACE_LONG_RUN_CURSOR
Summary	write trace SQL for cursor life-time over specific time (mili-sec. 0 ~ 10000000)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10000000
Default value	0

Description

When cursor life-time is longer than the specified property time, then it records the SQL statement of the cursor in the trace file (<GOLDILOCKS_DATA>/trc/system.trc).

- Description of value
 - Unit: millisecond
 - Value 0: It does not record information.
 - Recommended value: 20 (millisecond) or longer
 - The value of 20 or longer is recommended because the execution time is measured using the time in 10 ms period.
- The following is an example of recording the SQL statement whose cursor life-time is longer than 1 second.

```
gSQL> ALTER SYSTEM SET TRACE_LONG_RUN_CURSOR = 1000;
```

- The following is an example of restoring to the default value.

```
gSQL> ALTER SYSTEM SET TRACE_LONG_RUN_CURSOR TO DEFAULT;
```

It is used to trace the user program maintaining the cursor for a long time as follows.

```
int main()
{
    ...
    EXEC SQL DECLARE cur1 CURSOR FOR SELECT name FROM t1 WHERE pk = :s_id;
    EXEC SQL OPEN cur1
    EXEC SQL FETCH cur1 INTO :s_name;
```

- Due to the user logic, ager fails to clean up resources for a long time.

```
long_run_user_logic( s_name );
    EXEC SQL CLOSE cur1;
    ...
}
```

10.201 TRACE_LONG_RUN_SQL

Basic Information

Item	Description
Name	TRACE_LONG_RUN_SQL
Summary	write trace for long-run SQL over specific execution time (mili-sec. 0 ~ 10000000)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10000000
Default value	0

Description

It records the SQL statement whose execution time is longer than the specified property time in the trace file (<GOLDILOCKS_DATA>/trc/system.trc).

- Description of value
 - Unit: millisecond
 - Value 0: It does not record information.
 - Recommended value: 20 (millisecond) or longer
 - The value of 20 or longer is recommended because the execution time is measured using the time tic in 10 ms period.

The following is an example of recording the SQL statement whose execution time is longer than 1 second.

```
gSQL> ALTER SYSTEM SET TRACE_LONG_RUN_SQL = 1000;
```

The following is an example of restoring to the default value.

```
gSQL> ALTER SYSTEM SET TRACE_LONG_RUN_SQL TO DEFAULT;
```

10.202 TRACE_XA

Basic Information

Item	Description
Name	TRACE_XA
Summary	logging trace log for xa interfaces
Data type	BOOLEAN
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	NO

Description

It specifies whether to output trace messages when using XA interface. Message is output to the 'SYSTEM_LOGGER_DIR / xa.trc'.

10.203 TRANSACTION_ALLOCATION_TIMEOUT

Basic Information

Item	Description
Name	TRANSACTION_ALLOCATION_TIMEOUT
Summary	a time limit (sec) for allocating transaction slot
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000000
Default value	3

Description

It is the maximum waiting time when allocating transaction slots.

The following error occurs when the waiting time exceeds TRANSACTION_ALLOCATION_TIMEOUT.

```
gSQL> insert into t1 values(1);  
ERR-HYT00(14129): transaction allocation time exceeded
```

10.204 TRANSACTION_COMMIT_WRITE_MODE

Basic Information

Item	Description
Name	TRANSACTION_COMMIT_WRITE_MODE
Summary	transaction commit write mode (0: no_wait, 1: wait)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	1
Default value	0

Description

TRANSACTION_COMMIT_WRITE_MODE specifies whether a log generated by the transaction is flushed to the disk log file, when the transaction is committed. If TRANSACTION_COMMIT_WRITE_MODE is '1', the log should be flushed to the disk log file at the time of the transaction commit. Otherwise the transaction is committed regardless of log flush.

If the system is operated when TRANSACTION_COMMIT_WRITE_MODE is set to '0', the latest data will be lost when GOLDILOCKS is abnormally terminated without log flush after COMMIT transaction. It is because the logs are not recorded in this case.

Therefore, if all committed transactions should be remained (stored) in database, the system should be operated after setting TRANSACTION_COMMIT_WRITE_MODE to '1'. Or, 'ALTER SYSTEM FLUSH LOGS' statement should be explicitly performed at the time of transaction commit in order to flush log after TRANSACTION_COMMIT_WRITE_MODE is set to '0'.

- 0: no wait
- 1: wait

10.205 TRANSACTION_MAXIMUM_UNDO_PAGE_COUNT

Basic Information

Item	Description
Name	TRANSACTION_MAXIMUM_UNDO_PAGE_COUNT
Summary	The maximum number of undo pages that a transaction can write.
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	1
MAX	838860800
Default value	838860800

Description

It means the maximum number of undo pages which the transaction can record. The minimum value is 1 (8 Kbytes) and the maximum value is 838860800 (100 Gbytes).

10.206 TRANSACTION_TABLE_SIZE

Basic Information

Item	Description
Name	TRANSACTION_TABLE_SIZE
Summary	transaction table size
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	64
MAX	10240
Default value	1024

Description

It sets the maximum number of transaction tables that can be executed in the database. These tables are allocated to ensure the ACID properties of transactions when updating the database. The database should restart to modify the number of transaction tables, and the number can be modified only to the number bigger than the previously specified number.

If it is modified to a smaller number, then the restart fails. For example, if the value set as 1,024 is modified to 512, then the restart fails as follows. In this case, modify it to 1,024 or bigger, then the restart succeeds.

```
gSQL> ALTER SYSTEM SET TRANSACTION_TABLE_SIZE = 512 SCOPE = FILE;
```

```
System altered.
```

```
gSQL> \CONNECT sys gliese as sysdba
```

```
gSQL> \SHUTDOWN
```

```
Shutdown success
```

- The restart fails.

```
gSQL> \STARTUP
```

```
ERR-HY000(14118): TRANSACTION_TABLE_SIZE property value must be equal to or greater than
```

'1024'

```
gSQL> ALTER SYSTEM SET TRANSACTION_TABLE_SIZE = 1024 SCOPE = FILE;
```

System altered.

```
gSQL> \SHUTDOWN
```

Shutdown success

```
gSQL> \STARTUP
```

Startup success

10.207 TRANSACTION_TIMEOUT

Basic Information

Item	Description
Name	TRANSACTION_TIMEOUT
Summary	transaction timeout (s)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	10000000
Default value	0

Description

It sets the duration of when the transaction is activated. It is used to prevent the side effects of when the transaction is activated for a long time. If a transaction exceeds the specified time, then gmaster daemon automatically terminates the session owned by that transaction.

10.208 UNDO_RELATION_ALLOCATION_TIMEOUT

Basic Information

Item	Description
Name	UNDO_RELATION_ALLOCATION_TIMEOUT
Summary	a time limit (sec) for allocating undo relation
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	TRUE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	100000000
Default value	3

Description

It is the maximum waiting time when allocating undo relations.

The following error occurs when the waiting time exceeds UNDO_RELATION_ALLOCATION_TIMEOUT.

```
gSQL> insert into t1 values(1);  
ERR-HYT00(14130): undo relation allocation time exceeded
```

10.209 UNDO_RELATION_COUNT

Basic Information

Item	Description
Name	UNDO_RELATION_COUNT
Summary	undo relation count
Data type	BIGINT
Applicable phase	NO MOUNT or below
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	8
MAX	10240
Default value	128

Description

It sets the number of undo relation to be used in database. Undo relation is allocated for the purpose that the transaction executing DML uses undo segment. The database should restart to modify the number of undo relations, and the number can be modified only to the number bigger than the previously specified number.

If it is modified to a smaller number, then the restart fails. For example, if the value set as 128 is modified to 64, then the restart fails as follows. In this case, modify it to 128 or bigger, then the restart succeeds.

```
gSQL> ALTER SYSTEM SET UNDO_RELATION_COUNT = 64 SCOPE = FILE;
```

```
System altered.
```

```
gSQL> \CONNECT sys gliese as sysdba
```

```
gSQL> \SHUTDOWN
```

```
Shutdown success
```

- The restart fails.

```
gSQL> \STARTUP
```

```
ERR-HY000(14119): UNDO_RELATION_COUNT property value must be equal to or greater than '128'
```

```
gSQL> ALTER SYSTEM SET UNDO_RELATION_COUNT = 128 SCOPE = FILE;
```

```
System altered.  
gSQL> \SHUTDOWN  
Shutdown success  
gSQL> \STARTUP  
Startup success
```

10.210 UNDO_SHRINK_THRESHOLD

Basic Information

Item	Description
Name	UNDO_SHRINK_THRESHOLD
Summary	threshold bytes to attempt to shrink undo segment (byte)
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	1048576
MAX	107374182400
Default value	10485760

Description

Ager thread periodically (10 seconds) checks the undo segment space. If an undo segment uses too much space, a part of it is returned to the tablespace. The property specifies the size (in bytes) of the space to be returned at a time.

10.211 USE_LARGE_PAGES

Basic Information

Item	Description
Name	USE_LARGE_PAGES
Summary	use large pages
Data type	BIGINT
Applicable phase	NO MOUNT or above
Updatable	TRUE
ALTER SESSION	FALSE
ALTER SYSTEM	IMMEDIATE
MIN	0
MAX	2
Default value	0

Description

It uses HugePage. HugePage should be set in the device beforehand to use USE_LARGE_PAGES.

- 0: It does not use the large page.
- 1: It uses the large page. If it fails to allocate the shared memory, then an error occurs.
- 2: It tries to allocate the shared memory by using the large page. If it fails to allocate the shared memory, then it allocates the memory by using the regular page.

Note

It can be used only in Linux kernel 2.6.32-573 or higher.

Part III.

16. SQL References	1,501
16.1 ALTER AUDIT POLICY	1,502
Function	1,502
Syntax	1,502
Invocation and Access Rules	1,502
Syntax Rules and Parameters	1,503
Description	1,503
Examples	1,504
Compatibility	1,504
For More Information	1,504
16.2 ALTER CLUSTER GROUP name ADD MEMBER	1,505
Function	1,505
Syntax	1,505
Invocation and Access Rules	1,505
Syntax Rules and Parameters	1,505
Description	1,506
Examples	1,506
Compatibility	1,507
For More Information	1,507
16.3 ALTER CLUSTER GROUP name OFFLINE MEMBER	1,508
Function	1,508
Syntax	1,508
Invocation and Access Rules	1,508
Syntax Rules and Parameters	1,508
Description	1,509
Examples	1,509
Compatibility	1,509
For More Information	1,510
16.4 ALTER CLUSTER LOCATION	1,511
Function	1,511
Syntax	1,511
Invocation and Access Rules	1,511
Syntax Rules and Parameters	1,511
Description	1,512
Examples	1,512

Compatibility	1,512
For More Information	1,512
16.5 ALTER DATABASE ADD LOGFILE	1,513
Function	1,513
Syntax	1,513
Invocation and Access Rules	1,513
Syntax Rules and Parameters	1,513
Description	1,514
Examples	1,515
Compatibility	1,515
For More Information	1,515
16.6 ALTER DATABASE ARCHIVELOG	1,516
Function	1,516
Syntax	1,516
Invocation and Access Rules	1,516
Syntax Rules and Parameters	1,516
Description	1,516
Example	1,517
Compatibility	1,517
For More Information	1,517
16.7 ALTER DATABASE BACKUP	1,518
Function	1,518
Syntax	1,518
Invocation and Access Rules	1,518
Syntax Rules and Parameters	1,519
Description	1,520
Examples	1,520
Compatibility	1,521
For More Information	1,521
16.8 ALTER DATABASE CLEAR AUDIT TRAIL	1,522
Function	1,522
Syntax	1,522
Invocation and Access Rules	1,522
Description	1,522
Storing Audit Trail	1,522
Examples	1,523
Compatibility	1,523
For More Information	1,523
16.9 ALTER DATABASE CLEAR PASSWORD HISTORY	1,524

Function	1,524
Syntax	1,524
Invocation and Access Rules	1,524
Description	1,524
Examples	1,525
Compatibility	1,525
For More Information	1,525
16.10 ALTER DATABASE DELETE BACKUP	1,526
Function	1,526
Syntax	1,526
Invocation and Access Rules	1,526
Syntax Rules and Parameters	1,526
Description	1,527
Example	1,527
Compatibility	1,528
For More Information	1,528
16.11 ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS	1,529
Function	1,529
Syntax	1,529
Invocation and Access Rules	1,529
Description	1,529
Examples	1,530
Compatibility	1,530
For More Information	1,530
16.12 ALTER DATABASE DROP LOGFILE	1,531
Function	1,531
Syntax	1,531
Invocation and Access Rules	1,531
Syntax Rules and Parameters	1,531
Description	1,532
Examples	1,532
Compatibility	1,532
For More Information	1,533
16.13 ALTER DATABASE MOVE SHARD	1,534
Function	1,534
Syntax	1,534
Invocation and Access Rules	1,534
Syntax Rules and Parameters	1,534
Description	1,535

Examples	1,536
Compatibility	1,536
For More Information	1,536
16.14 ALTER DATABASE OFFLINE INACTIVE CLUSTER MEMBERS	1,537
Function	1,537
Syntax	1,537
Invocation and Access Rules	1,537
Syntax Rules and Parameters	1,537
Description	1,538
Examples	1,538
Compatibility	1,538
For More Information	1,538
16.15 ALTER DATABASE REBALANCE	1,539
Function	1,539
Syntax	1,539
Invocation and Access Rules	1,539
Syntax Rules and Parameters	1,539
Description	1,540
Examples	1,540
Compatibility	1,541
For More Information	1,541
16.16 ALTER DATABASE REBALANCE EXCLUDE CLUSTER GROUP	1,542
Function	1,542
Syntax	1,542
Invocation and Access Rules	1,542
Syntax Rules and Parameters	1,542
Description	1,543
Examples	1,543
Compatibility	1,544
For More Information	1,544
16.17 ALTER DATABASE RENAME LOGFILE	1,545
Function	1,545
Syntax	1,545
Invocation and Access Rules	1,545
Syntax Rules and Parameters	1,545
Description	1,546
Example	1,546
Compatibility	1,546
For More Information	1,546

16.18 ALTER DATABASE RECOVER	1,547
Function	1,547
Syntax	1,547
Invocation and Access Rules	1,548
Syntax Rules and Parameters	1,548
Description	1,550
Examples	1,550
Compatibility	1,551
For More Information	1,551
16.19 ALTER DATABASE REGISTER	1,552
Function	1,552
Syntax	1,552
Invocation and Access Rules	1,552
Syntax Rules and Parameters	1,552
Description	1,553
Example	1,553
Compatibility	1,553
For More Information	1,553
16.20 ALTER DATABASE RESET LOCAL CLUSTER MEMBER	1,554
Function	1,554
Syntax	1,554
Invocation and Access Rules	1,554
Description	1,554
Examples	1,555
Compatibility	1,555
For More Information	1,555
16.21 ALTER DATABASE RESTORE	1,556
Function	1,556
Syntax	1,556
Invocation and Access Rules	1,556
Syntax Rules and Parameters	1,556
Description	1,557
Examples	1,557
Compatibility	1,558
For More Information	1,558
16.22 ALTER INDEX	1,559
Function	1,559
Syntax	1,559
Invocation and Access Rules	1,559

Syntax Rules and Parameters	1,559
Description	1,560
Examples	1,560
Compatibility	1,560
16.23 ALTER INDEX name AGING	1,561
Function	1,561
Syntax	1,561
Invocation and Access Rules	1,561
Syntax Rules and Parameters	1,561
Description	1,561
Examples	1,562
Compatibility	1,562
For More Information	1,562
16.24 ALTER INDEX name STORAGE	1,564
Function	1,564
Syntax	1,564
Invocation and Access Rules	1,564
Syntax Rules and Parameters	1,565
Description	1,567
Examples	1,567
Compatibility	1,567
For More Information	1,567
16.25 ALTER INDEX name RENAME TO	1,568
Function	1,568
Syntax	1,568
Invocation and Access Rules	1,568
Syntax Rules and Parameters	1,568
Description	1,569
Examples	1,569
Compatibility	1,569
For More Information	1,569
16.26 ALTER PROFILE	1,570
Function	1,570
Syntax	1,570
Invocation and Access Rules	1,570
Syntax Rules and Parameters	1,571
Examples	1,572
Compatibility	1,573
For More Information	1,573

16.27 ALTER SEQUENCE	1,574
Function	1,574
Syntax	1,574
Invocation and Access Rules	1,575
Syntax Rules and Parameters	1,575
Description	1,577
Examples	1,578
Compatibility	1,578
For More Information	1,579
16.28 ALTER SESSION CLEANUP GLOBAL TEMPORARY SEGMENT POOL;	1,580
Function	1,580
Syntax	1,580
Description	1,580
Examples	1,580
Compatibility	1,580
For More Information	1,581
16.29 ALTER SESSION SET property_name	1,582
Function	1,582
Syntax	1,582
Syntax Rules and Parameters	1,582
Description	1,582
Examples	1,583
Compatibility	1,583
For More Information	1,583
16.30 ALTER SYSTEM CHECKPOINT	1,584
Function	1,584
Syntax	1,584
Invocation and Access Rules	1,584
Syntax Rules and Parameters	1,584
Description	1,585
Example	1,585
Compatibility	1,585
16.31 ALTER SYSTEM CLEANUP PLAN	1,586
Function	1,586
Syntax	1,586
Invocation and Access Rules	1,586
Syntax Rules and Parameters	1,586
Description	1,586
Examples	1,587

Compatibility	1,587
16.32 ALTER SYSTEM IRRECOVERABLE CLUSTER MEMBER	1,588
Function	1,588
Syntax	1,588
Invocation and Access Rules	1,588
Syntax Rules and Parameters	1,588
Description	1,589
Examples	1,589
Compatibility	1,589
16.33 ALTER SYSTEM JOIN DATABASE	1,590
Function	1,590
Syntax	1,590
Invocation and Access Rules	1,590
Description	1,590
Examples	1,591
Compatibility	1,591
For More Information	1,592
16.34 ALTER SYSTEM {MOUNT OPEN} DATABASE	1,593
Function	1,593
Syntax	1,593
Invocation and Access Rules	1,593
Syntax Rules and Parameters	1,593
Examples	1,594
Compatibility	1,594
For More Information	1,595
16.35 ALTER SYSTEM [KILL DISCONNECT] SESSION	1,596
Function	1,596
Syntax	1,596
Invocation and Access Rules	1,596
Syntax Rules and Parameters	1,596
Description	1,597
Example	1,597
Compatibility	1,598
16.36 ALTER SYSTEM RECONNECT GLOBAL CONNECTION	1,599
Function	1,599
Syntax	1,599
Invocation and Access Rules	1,599
Description	1,599
Examples	1,600

Compatibility	1,600
16.37 ALTER SYSTEM RESET property_name	1,601
Function	1,601
Syntax	1,601
Invocation and Access Rules	1,601
Syntax Rules and Parameters	1,601
Description	1,602
Examples	1,602
Compatibility	1,603
For More Information	1,603
16.38 ALTER SYSTEM SET property_name	1,604
Function	1,604
Syntax	1,604
Invocation and Access Rules	1,604
Syntax Rules and Parameters	1,604
Description	1,606
Examples	1,606
Compatibility	1,606
For More Information	1,607
16.39 ALTER SYSTEM SWITCH LOGFILE	1,608
Function	1,608
Syntax	1,608
Invocation and Access Rules	1,608
Syntax Rules and Parameters	1,608
Description	1,609
Example	1,609
Compatibility	1,609
For More Information	1,609
16.40 ALTER TABLE	1,610
Function	1,610
Syntax	1,610
Invocation and Access Rules	1,610
Syntax Rules and Parameters	1,611
Description	1,613
Example	1,613
Compatibility	1,613
16.41 ALTER TABLE name ADD COLUMN	1,615
Function	1,615
Syntax	1,615

Invocation and Access Rules	1,615
Syntax Rules and Parameters	1,616
Description	1,617
Examples	1,617
Compatibility	1,618
For More Information	1,618
16.42 ALTER TABLE name SET UNUSED COLUMN	1,619
Function	1,619
Syntax	1,619
Invocation and Access Rules	1,619
Syntax Rules and Parameters	1,619
Description	1,620
Example	1,620
Compatibility	1,621
For More Information	1,621
16.43 ALTER TABLE name ALTER COLUMN	1,622
Function	1,622
Syntax	1,622
Invocation and Access Rules	1,623
Syntax Rules and Parameters	1,623
Description	1,631
Examples	1,632
Compatibility	1,633
For More Information	1,633
16.44 ALTER TABLE name RENAME COLUMN	1,634
Function	1,634
Syntax	1,634
Invocation and Access Rules	1,634
Syntax Rules and Parameters	1,634
Description	1,635
Example	1,635
Compatibility	1,635
For More Information	1,635
16.45 ALTER TABLE name ADD CONSTRAINT	1,636
Function	1,636
Syntax	1,636
Invocation and Access Rules	1,636
Syntax Rules and Parameters	1,637
Description	1,637

Examples	1,637
Compatibility	1,638
For More Information	1,638
16.46 ALTER TABLE name DROP CONSTRAINT	1,639
Function	1,639
Syntax	1,639
Invocation and Access Rules	1,639
Syntax Rules and Parameters	1,640
Description	1,640
Examples	1,640
Compatibility	1,641
For More Information	1,641
16.47 ALTER TABLE name ALTER CONSTRAINT	1,642
Function	1,642
Syntax	1,642
Invocation and Access Rules	1,642
Syntax Rules and Parameters	1,643
Description	1,644
Example	1,644
Compatibility	1,644
16.48 ALTER TABLE name RENAME CONSTRAINT	1,645
Function	1,645
Syntax	1,645
Invocation and Access Rules	1,645
Syntax Rules and Parameters	1,645
Description	1,646
Examples	1,646
Compatibility	1,646
For More Information	1,647
16.49 ALTER TABLE name ADD GLOBAL SECONDARY INDEX	1,648
Function	1,648
Syntax	1,648
Invocation and Access Rules	1,649
Syntax Rules and Parameters	1,649
Description	1,652
Examples	1,652
Compatibility	1,653
For More Information	1,653
16.50 ALTER TABLE name DROP GLOBAL SECONDARY INDEX	1,654

Function	1,654
Syntax	1,654
Invocation and Access Rules	1,654
Syntax Rules and Parameters	1,654
Description	1,655
Examples	1,655
Compatibility	1,655
For More Information	1,655
16.51 ALTER TABLE name ALTER GLOBAL SECONDARY INDEX	1,656
Function	1,656
Syntax	1,656
Invocation and Access Rules	1,656
Syntax Rules and Parameters	1,657
Description	1,659
Examples	1,659
Compatibility	1,659
For More Information	1,660
16.52 ALTER TABLE name MOVE SHARD	1,661
Function	1,661
Syntax	1,661
Invocation and Access Rules	1,661
Syntax Rules and Parameters	1,661
Description	1,662
Examples	1,662
Compatibility	1,663
For More Information	1,663
16.53 ALTER TABLE name REBALANCE	1,664
Function	1,664
Syntax	1,664
Invocation and Access Rules	1,664
Syntax Rules and Parameters	1,664
Description	1,665
Examples	1,665
Compatibility	1,665
16.54 ALTER TABLE name REBALANCE EXCLUDE CLUSTER GROUP cluster_group_list	1,666
Function	1,666
Syntax	1,666
Invocation and Access Rules	1,666
Syntax Rules and Parameters	1,666

Description	1,667
Examples	1,667
Compatibility	1,668
16.55 ALTER TABLE name SPLIT SHARD	1,669
Function	1,669
Syntax	1,669
Invocation and Access Rules	1,669
Syntax Rules and Parameters	1,670
Description	1,671
Examples	1,672
Compatibility	1,672
For More Information	1,672
16.56 ALTER TABLE name RENAME SHARD	1,673
Function	1,673
Syntax	1,673
Invocation and Access Rules	1,673
Syntax Rules and Parameters	1,673
Description	1,674
Examples	1,674
Compatibility	1,674
For More Information	1,675
16.57 ALTER TABLE name READ { ONLY WRITE }	1,676
Function	1,676
Syntax	1,676
Invocation and Access Rules	1,676
Syntax Rules and Parameters	1,676
Description	1,677
Examples	1,677
Compatibility	1,678
For More Information	1,678
16.58 ALTER TABLE name RENAME TO	1,679
Function	1,679
Syntax	1,679
Invocation and Access Rules	1,679
Syntax Rules and Parameters	1,679
Description	1,680
Example	1,680
Compatibility	1,680
For More Information	1,680

16.59 ALTER TABLE name STORAGE	1,681
Function	1,681
Syntax	1,681
Invocation and Access Rules	1,681
Syntax Rules and Parameters	1,682
Description	1,682
Example	1,682
Compatibility	1,683
For More Information	1,683
16.60 ALTER TABLE name ADD SUPPLEMENTAL LOG	1,684
Function	1,684
Syntax	1,684
Invocation and Access Rules	1,684
Syntax Rules and Parameters	1,684
Description	1,685
Example	1,685
Compatibility	1,685
For More Information	1,685
16.61 ALTER TABLE name DROP SUPPLEMENTAL LOG	1,686
Function	1,686
Syntax	1,686
Invocation and Access Rules	1,686
Syntax Rules and Parameters	1,686
Description	1,687
Example	1,687
Compatibility	1,687
16.62 ALTER TABLESPACE	1,688
Function	1,688
Syntax	1,688
Invocation and Access Rules	1,688
Syntax Rules and Parameters	1,688
Description	1,689
Example	1,689
Compatibility	1,689
For More Information	1,690
16.63 ALTER TABLESPACE name RENAME TO	1,691
Function	1,691
Syntax	1,691
Invocation and Access Rules	1,691

Syntax Rules and Parameters	1,691
Description	1,692
Example	1,692
Compatibility	1,692
For More Information	1,692
16.64 ALTER TABLESPACE name BACKUP	1,693
Function	1,693
Syntax	1,693
Invocation and Access Rules	1,693
Syntax Rules and Parameters	1,693
Description	1,695
Examples	1,695
Compatibility	1,695
For More Information	1,695
16.65 ALTER TABLESPACE name [ONLINE OFFLINE]	1,696
Function	1,696
Syntax	1,696
Invocation and Access Rules	1,696
Syntax Rules and Parameters	1,696
Description	1,697
Examples	1,697
Compatibility	1,698
For More Information	1,698
16.66 ALTER TABLESPACE name ADD [DATAFILE MEMORY]	1,699
Function	1,699
Syntax	1,699
Invocation and Access Rules	1,699
Syntax Rules and Parameters	1,699
Description	1,701
Example	1,701
Compatibility	1,701
For More Information	1,701
16.67 ALTER TABLESPACE name DROP [DATAFILE MEMORY]	1,702
Function	1,702
Syntax	1,702
Invocation and Access Rules	1,702
Syntax Rules and Parameters	1,702
Description	1,703
Example	1,703

Compatibility	1,703
For More Information	1,703
16.68 ALTER TABLESPACE name RENAME DATAFILE	1,705
Function	1,705
Syntax	1,705
Invocation and Access Rules	1,705
Syntax Rules and Parameters	1,705
Description	1,706
Example	1,706
Compatibility	1,706
For More Information	1,706
16.69 ALTER USER	1,707

11.

SQL Elements

11.1 Syntax Elements

Identifiers

Identifier is divided into an ordinary identifier and a delimited identifier.

An ordinary identifier consists of letters or a combination of letters and numbers, and it is used by internally substituting all characters to uppercase letters. Therefore, an ordinary identifier is not case-sensitive.

The following is an example of an ordinary identifier.

```
GOLDILOCKS  
GoldiLocks
```

A delimited identifier consists of letters or a combination of letters and numbers enclosed in double quotes ("). All the characters are used as internally described. Therefore, a delimited identifier is case-sensitive.

The following is an example of a delimited identifier.

```
"GOLDILOCKS"  
"GoldiLocks"
```

Literals

Literals mean representation of non-null value.

Text Literals

Text literals mean representation of strings and binary strings.

Use single quote (') at the beginning and end of a string to write string of text literals.

Not only the double quotes (") string but also all strings except for the single quote (') string can be written within a single quote (').

Use a single quote twice without white spaces in between to write a single quote (') in a string.

A maximum of 4000 characters can be written in a string.

The followings are examples of text literals for a string.

```
'GOLDILOCKS'
'Sunje' 's DBMS'
```

A binary string of text literals is a string of hexadecimal numbers which starts with x'(X') and ends with '. Only the characters corresponding to 0 ~ 9, A (a) ~ F (f) can be written in each position of a hexadecimal string. The length of a hexadecimal string should always be an even number because its two digits mean one byte. A maximum of 4,000 characters can be written in a binary string.

The followings are examples of text literals for a binary string.

```
x'001f'
X'FF0A'
x'aF37BBc013'
```

Numeric Literals

Numeric literals mean literals of numeric type, and integers or the number with decimal point can be written. The syntax for numeric literals is as follows.

```
[ + | - ] <digits> [ . <digits> ] [ E | e [ + | - ] <digits> ] [ f | F | d | D ]
```

- The first +/- means a positive or negative value of the entire number, and it can be omitted. If omitted, the default value is a positive value.
- In <digits>, numbers from 0 to 9 can be listed without white space, the number with decimal point can be written by using decimal point (.).
- An exponent form can be written after the first <digits>, and E or e is written, and it stands for exponent. Then +/- is written according to exponent sign, and <digits> is written. +/- of exponent can be omitted. If omitted, the default value is a positive value.
- Lastly, character such as f, F, d, D can be written after numbers. It means that it is a number of BINARY_FLOAT, BINARY_DOUBLE. If the corresponding character is omitted, the number is considered as NUMBER type.

The followings are examples of numeric literals.

```
20
+123.45
0.03
+1.23E-02
-1.5
10f
+123.45F
1.2E-3F
-22d
```

123.45D

-1.23E+05D

Datetime Literals

Datetime literals are representation of date/time type.

Datetime value is specified using string literal, or by converting character or numeric value to datetime value using TO_*function (TO_DATE, etc).

Datetime data types are DATE, TIME, TIME WITH TIME ZONE, TIMESTAMP, TIMESTAMP WITH TIME ZONE.

Date Literals

Date literals are written in a form of DATE'string literal' or TO_DATE(string_literal [, format]).

- DATE'string literal'
 - The format of date type is ' SYYYY-MM-DD'.
 - DATE'2002-07-15'
- TO_DATE(string_literal [, format])
 - If the format is not specified, the format of date type is NLS_DATE_FORMAT by default.
 - If the format is specified, the specified format is applied.
- The date type includes year, month, day, hour, minute, second (except for fractional seconds).
- If the date is omitted, the default value is the first day of the current month.
- If the hour, minute, second are omitted, the default value is midnight.
 - HH24 format: '00:00:00'
 - HH12 format: '12:00:00'
- To set the hour, minute, second to the default value (midnight) when the date value includes hour, minute, second, then use the TRUNC(date) function.
- For example, in TRUNC(SYSDATE), SYSDATE includes the values of the year, month, day, hour, minute, second.
- To compare only the values of the year, month, day among date values, then set the values of the hour, minute, second are set to midnight using the TRUNC function.

For more information, refer to **TO_DATE**, **Datetime Format String**, **NLS_DATE_FORMAT**.

- The following is an example of date literals.

DATE'2002-07-15'

- The following is an example of when the format is not specified, so NLS_DATE_FORMAT is 'YYYY-MM-DD'.

```
TO_DATE( '2002-07-15' )
```

- The followings are examples of when the format is specified.

```
TO_DATE( '15-JUL-02', 'DD-MON-RR' )
TO_DATE( '2002-07-15 00:00:00', 'YYYY-MM-DD HH24:MI:SS' )
TO_DATE( '2002-07-15 13:25:30', 'YYYY-MM-DD HH24:MI:SS' )
```

- The following is an example of when the date is omitted. (It is set to the first day of the current month).

```
gSQL> SELECT TO_DATE( '2000-07', 'YYYY-MM' ) FROM DUAL;
TO_DATE( '2000-07', 'YYYY-MM' )
-----
2000-07-01
```

- The following is an example of when the hour, minute, second are omitted. (It is set to the midnight).

```
gSQL> SELECT
      TO_CHAR( DATE'2002-07-15', 'YYYY-MM-DD HH24:MI:SS' ) AS RESULT
    FROM DUAL;
RESULT
-----
2002-07-15 00:00:00
```

- The following is an example of setting the hour, minute, second of DATE value (SYSDATE) to the default value (midnight).

```
gSQL> SELECT
      TO_CHAR( SYSDATE,
              'YYYY-MM-DD HH24:MI:SS' ) AS RESULT_SYSDATE,
      TO_CHAR( TRUNC( SYSDATE ),
              'YYYY-MM-DD HH24:MI:SS' ) AS RESULT_TRUNC_SYSDATE
    FROM DUAL;
RESULT_SYSDATE      RESULT_TRUNC_SYSDATE
-----
2014-08-19 10:06:49 2014-08-19 00:00:00
```

- The following is an example of comparing only the values of the year, month, day among date values.

```
gSQL> SELECT
      TO_DATE( '2002-08-12' ) =
```

```

TRUNC( TO_DATE( '2002-08-12 23:59:59', 'YYYY-MM-DD HH24:MI:SS' ) )
AS RESULT FROM DUAL;

RESULT
-----
TRUE

```

Time Literals

Time literals are written in a form of `TIME'string literal'` or `TO_TIME(string_literal [, format])`.

- `TIME'string literal'`
 - The format of time type is `'HH24:MI:SS[.FF6]'`.
 - `TIME'15:30:59.999999'`
- `TO_TIME(string_literal [, format])`
 - If the format is not specified, the format of time type is `NLS_TIME_FORMAT` by default.
 - If the format is specified, the specified format is applied.

The time type includes hour, minute, second (fractional seconds).

Fractional seconds can be specified to maximum six digits numbers format.

For more information, refer to **TO_TIME**, **Datetime Format String**, **NLS_TIME_FORMAT**.

- The following is an example of time literals.

```
TIME'15:30:59.999999'
```

- The following is an example of when the format is not specified, so `NLS_TIME_FORMAT` is `'HH24:MI:SS.FF6'`.

```
TO_TIME( '15:30:59.999999' )
```

- The following is an example of when the format is specified.

```
TO_TIME( '09.45.03.546873 AM', 'HH12.MI.SS.FF6 AM' )
TO_TIME( '09:45:03', 'HH12:MI:SS' )
```

Time with Time Zone Literals

Time with time zone literals is written in a form of `TIME'string literal'`, `TIME WITH TIME ZONE'string literal'`, `TO_TIME_WITH_TIME_ZONE(string_literal [, format])`, or `TO_TIME_TZ(string_literal [, format])`.

- `TIME'string literal'` or `TIME WITH TIME ZONE'string literal'`
 - The format of time with time zone type is `'HH24:MI:SS[.FF6] TZh:TzM'`.

- `TIME'15:30:59.999999 +09:00'`
- `TIME WITH TIME ZONE'15:30:59.999999 +09:00'`
- `TO_TIME_WITH_TIME_ZONE(string_literal [, format])`
 - If the format is not specified, the format of time with time zone type is `NLS_TIME_WITH_TIME_ZONE_FORMAT` by default.
 - If the format is specified, the specified format is applied.

Time with time zone type includes hour, minute, second (fractional seconds), and time zone offset (time zone hour, time zone minute).

Fractional seconds can be specified to maximum six digits numbers format.

For more information, refer to `TO_TIME_WITH_TIME_ZONE`, `Datetime Format String`, `NLS_TIME_WITH_TIME_ZONE_FORMAT`.

- The followings are examples of time with time zone literals.

```
TIME'15:30:59.999999 +09:00'
TIME WITH TIME ZONE'15:30:59.999999 +09:00'
```

- The following is an example of when the format is not specified, so `NLS_TIME_WITH_TIME_ZONE_FORMAT` is `'HH24:MI:SS.FF6 TZh:TZM'`.

```
TO_TIME_WITH_TIME_ZONE( '15:30:59.999999 +09:00' )
TO_TIME_TZ( '15:30:59.999999 +09:00' )
```

- The following is an example of when the format is specified.

```
TO_TIME_WITH_TIME_ZONE( '09.45.03.546873 +09:00 AM',
                        'HH12.MI.SS.FF6 TZh:TZM AM' )
```

Timestamp Literals

Timestamp literals are written in a form of `TIMESTAMP'string literal'` or `TO_TIMESTAMP(string_literal [, format])`.

- `TIMESTAMP'string literal'`
 - The format of timestamp type is `'YYYY-MM-DD HH24:MI:SS[.FF6]'`.
 - `TIMESTAMP'2002-07-15 15:39:59.999999'`
- `TO_TIMESTAMP(string_literal [, format])`
 - If the format is not specified, the format of timestamp type is `NLS_TIMESTAMP_FORMAT` by default.
 - If the format is specified, the specified format is applied.

Timestamp type includes year, month, day, hour, minute, second (fractional seconds).

Fractional seconds can be specified to maximum six digits numbers format.

For more information, refer to **TO_TIMESTAMP**, **Datetime Format String**, **NLS_TIMESTAMP_FORMAT**.

- The following is an example of timestamp literals.

```
Timestamp '2002-07-15 15:39:59.999999'
```

- The following is an example of when the format is not specified, so **NLS_TIMESTAMP_FORMAT** is 'YYYY-MM-DD HH24:MI:SS.FF6'.

```
TO_TIMESTAMP( '2002-07-15 15:39:59.999999' )
```

- The following is an example of when the format is specified.

```
TO_TIMESTAMP( '15-JUL-02 11.06.30.123456 AM' ,  
              'DD-MON-RR HH12.MI.SS.FF6 AM' )
```

Timestamp with Time Zone Literals

Timestamp with time zone literals is written in a form of **TIMESTAMP**'string literal', **TIMESTAMP WITH TIME_ZONE**'string literal', **TO_TIMESTAMP_WITH_TIME_ZONE**(string_literal [, format]), or **TO_TIMESTAMP_TZ**(string_literal [, format]).

- **TIMESTAMP**'string literal' or **TIMESTAMP WITH TIME_ZONE**'string literal'
 - The format of timestamp with time zone type is 'SYYYY-MM-DD HH24:MI:SS[.FF6]] TZh:TzM'.
 - **TIMESTAMP**'2002-07-15 15:39:59.999999 +09:00'
 - **TIMESTAMP WITH TIME_ZONE**'2002-07-15 15:39:59.999999 +09:00'
- **TO_TIMESTAMP_WITH_TIME_ZONE**(string_literal [, format])
 - If the format is not specified, the format of timestamp with time zone type is **NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT** by default.
 - If the format is specified, the specified format is applied.

Timestamp with time zone type includes year, month, day, hour, minute, second (fractional seconds), time zone offset (time zone hour, time zone minute).

Fractional seconds can be specified to maximum six digits numbers format.

For more information, refer to **TO_TIMESTAMP_WITH_TIME_ZONE**, **Datetime Format String** , **NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT**.

- The following is an example of timestamp with time zone literals.

```

TIMESTAMP'2002-07-15 15:39:59.999999 +09:00'
TIMESTAMP WITH TIME ZONE'2002-07-15 15:39:59.999999 +09:00'

```

- The following is an example of when the format is not specified, so NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT is 'YYYY-MM-DD HH24:MI:SS.FF6 TZh:TZM'.

```

TO_TIMESTAMP_WITH_TIME_ZONE( '2002-07-15 15:39:59.999999 +09:00' )
TO_TIMESTAMP_TZ( '2002-07-15 15:39:59.999999 +09:00' )

```

- The following is an example of when the format is specified.

```

TO_TIMESTAMP_WITH_TIME_ZONE( '15-JUL-02 11.06.30.123456 +09:00 AM',
                              'DD-MON-RR HH12.MI.SS.FF6 TZh:TZM AM' )
TO_TIMESTAMP_TZ( '15-JUL-02 11.06.30.123456 +09:00 AM',
                  'DD-MON-RR HH12.MI.SS.FF6 TZh:TZM AM' )

```

Interval Literals

The interval literals specify the time interval.

Intervals are classified and expressed as follows.

- Year-month INTERVAL values
 - It includes YEAR and MONTH.
 - Display string expression: 'year-month'
- Day-time INTERVAL values
 - It includes DAY, HOUR, MINUTE, SECOND (fractional seconds).
 - Display string expression: 'day hour:minute:second.fractional_seconds'
- The interval value's sign is specified only once at the beginning of the string representation.
 e.g. INTERVAL'+3 11:22:33.999999'DAY TO SECOND (O)
 INTERVAL'-3 +11:22:33.999999'DAY TO SECOND (X)

The followings are the list of interval types.

- INTERVAL YEAR (leading precision)
- INTERVAL MONTH (leading precision)
- INTERVAL YEAR (leading precision) TO MONTH
- INTERVAL DAY (leading precision)
- INTERVAL HOUR (leading precision)
- INTERVAL MINUTE (leading precision)
- INTERVAL SECOND (leading precision[, fractional seconds precision])
- INTERVAL DAY (leading precision) TO HOUR

- INTERVAL DAY (leading precision) TO MINUTE
- INTERVAL DAY (leading precision) TO SECOND (fractional seconds precision)
- INTERVAL HOUR (leading precision) TO MINUTE
- INTERVAL HOUR (leading precision) TO SECOND (fractional seconds precision)
- INTERVAL MINUTE (leading precision) TO SECOND (fractional seconds precision)

Leading precision

- It is the digit number of the field, it can be specified from 2 to 6. If it is not specified, the default value is set to 2.
- If the leading field value exceeds the leading precision, then an error is returned.

Fractional seconds precision

- It is the digit number of fractional seconds, and it can be specified from 0 to 6. If it is not specified, the default value is set to 6.
- If the fractional second field value exceeds the fractional seconds precision, then it is rounded off.

For more information, refer to **INTERVAL, Precisions and value range of the second or later field in INTERVAL * TO ***.

Examples of Using Interval Literals.

The followings are examples of using interval literals.

Interval YEAR

The followings are examples of using interval YEAR literals.

Example	Description	Display string
INTERVAL'1'YEAR INTERVAL'01-00'YEAR	1 year	+01-00
INTERVAL'100'YEAR	It exceeds the leading precision 2, so it returns the error.	-
INTERVAL'100'YEAR(3)	100 year	+100-00
INTERVAL'+999999'YEAR(6)	999999 year	+999999-00
INTERVAL'-999999'YEAR(6)	-(999999 year)	-999999-00

Interval MONTH

The followings are examples of using interval MONTH literals.

Example	Description	Display string
INTERVAL'1'MONTH INTERVAL'00-01'MONTH	1 month	+00-01
INTERVAL'100'MONTH	It exceeds the leading precision 2, so it returns the error.	-

Example	Description	Display string
INTERVAL'100'MONTH(3)	8 year 4 month	+008-04
INTERVAL'+999999'MONTH(6)	83333 year 3 month	+083333-03
INTERVAL'-999999'MONTH(6)	-(83333 year 3 month)	-083333-03

Interval YEAR TO MONTH

The followings are examples of using interval YEAR TO MONTH literals.

Example	Description	Display string
INTERVAL'1-06'YEAR TO MONTH	1 year 6 month	+01-06
INTERVAL'1-12'YEAR TO MONTH	The month value exceeded 11, so it returns the error.	-
INTERVAL'100-11'YEAR TO MONTH	It exceeds the leading precision 2, so it returns the error.	-
INTERVAL'100-11'YEAR(3) TO MONTH	100 year 11 month	+100-11
INTERVAL'+999999-11'YEAR(6) TO MONTH	999999 year 11 month	+999999-11
INTERVAL'-999999-11'YEAR(6) TO MONTH	-(999999 year 11 month)	-999999-11

Interval DAY

The followings are examples of using interval DAY literals.

Example	Description	Display string
INTERVAL'1'DAY INTERVAL'01 00:00:00'DAY	1 day	+01 00:00:00
INTERVAL'100'DAY	It exceeds the leading precision 2, so it returns the error.	-
INTERVAL'100'DAY(3)	100 day	+100 00:00:00
INTERVAL'+999999'DAY(6)	999999 day	+999999 00:00:00
INTERVAL'-999999'DAY(6)	-(999999 day)	-999999 00:00:00

Interval HOUR

The followings are examples of using interval HOUR literals.

Example	Description	Display string
INTERVAL'1'HOUR INTERVAL'00 01:00:00'HOUR	1 hour	+00 01:00:00
INTERVAL'1000'HOUR(3)	It exceeds the leading precision 3, so it returns the error	-
INTERVAL'1000'HOUR(4)	41 day 16 hour	+0041 16:00:00
INTERVAL'+999999'HOUR(6)	41666 day 15 hour	+041666 15:00:00
INTERVAL'-999999'HOUR(6)	-(41666 day 15 hour)	-041666 15:00:00

Interval MINUTE

The following are examples of using interval MINUTE literals.

Example	Description	Display string
INTERVAL'1'MINUTE INTERVAL'00 00:01:00'MINUTE	1 minute	+00 00:01:00
INTERVAL'12345'MINUTE(4)	It exceeds the leading precision 4, so it returns the error	-
INTERVAL'12345'MINUTE(5)	8 day 13 hour 45 minute	+00008 13:45:00
INTERVAL'+999999'MINUTE(6)	694 day 10 hour 39 minute	+000694 10:39:00
INTERVAL'-999999'MINUTE(6)	-(694 day 10 hour 39 minute)	-000694 10:39:00

Interval SECOND

The followings are examples of using interval SECOND literals.

Example	Description	Display string
INTERVAL'1'SECOND INTERVAL'00 00:00:01.000000'SECOND	1 second	+00 00:00:01.000000
INTERVAL'100'SECOND	It exceeds the leading precision 2, so it returns the error.	-
INTERVAL'99.999999'SECOND INTERVAL'99.999999'SECOND(2,6)	The fractional seconds are rounded off to become 100 second, then it exceeds the leading precision 2, so it returns the error.	-
INTERVAL'99.999999'SECOND(3)	1 minute 40 second	+000 00:01:40.000000
INTERVAL'29.506167'SECOND(2, 2)	29.51 second	+00 00:00:29.51
INTERVAL'999999.999999'SECOND(6,6)	11day 13 hour 46 minute 39.999999 second	+000011 13:46:39.999999
INTERVAL'-999999.999999'SECOND(6,6)	-(11day 13 hour 46 minute 39.999999 second)	-000011 13:46:39.999999

Interval DAY TO HOUR

The followings are examples of using interval DAY TO HOUR literals.

Example	Description	Display string
INTERVAL'1 23'DAY TO HOUR INTERVAL'01 23:00:00'DAY TO HOUR	1 day 23 hour	+01 23:00:00
INTERVAL'1 24'DAY TO HOUR	The hour value exceeds 23 (invalid), so it returns the error.	-
INTERVAL'100 23'DAY TO HOUR	It exceeds the leading precision 2, so it returns the error.	-
INTERVAL'100 23'DAY(3) TO HOUR	100 day 23 hour	+100 23:00:00

Example	Description	Display string
INTERVAL'+999999 23'DAY(6) TO HOUR	999999 day 23 hour	+999999 23:00:00
INTERVAL'-999999 23'DAY(6) TO HOUR	-(999999 day 23 hour)	-999999 23:00:00
INTERVAL'-999999 +23'DAY(6) TO HOUR	Invalid sign error	-

Interval DAY TO MINUTE

The followings are examples of using interval DAY TO MINUTE literals.

Example	Description	Display string
INTERVAL'1 23:59'DAY TO MINUTE INTERVAL'01 23:59:00'DAY TO MINUTE	1 day 23 hour 59 second	+01 23:59:00
INTERVAL'1 24:59'DAY TO MINUTE	The hour value exceeds 23 (invalid), so it returns the error.	-
INTERVAL'1 23:60'DAY TO MINUTE	The minute value exceeds 59 (invalid), so it returns the error.	-
INTERVAL'100 23:59'DAY TO MINUTE	It exceeds the leading precision 2, so it returns the error.	-
INTERVAL'100 23:59'DAY(3) TO MINUTE	100 day 23 hour 59 minute	+100 23:59:00
INTERVAL'+999999 23:59'DAY(6) TO MINUTE	999999 day 23 hour 59 minute	+999999 23:59:00
INTERVAL'-999999 23:59'DAY(6) TO MINUTE	-(999999 day 23 hour 59 minute)	-999999 23:59:00

Interval DAY TO SECOND

The followings are examples of using interval DAY TO SECOND literals.

Example	Description	display string
INTERVAL '1 23:59:59.999999'DAY TO SECOND	1 day 23 hour 59 minute 59.999999 second	+01 23:59:59.999999
INTERVAL '1 24:59:59.999999'DAY TO SECOND	The hour value exceeds 23, so it returns the error.	-
INTERVAL '1 23:60:59.999999'DAY TO SECOND	The minute value exceeds 59, so it returns the error.	-
INTERVAL '1 23:59:60.999999'DAY TO SECOND	The second value exceeds 60, so it returns the error.	-
INTERVAL '99 23:59:59.999999'DAY TO SECOND	The fractional seconds are rounded off to become 100 day, then it exceeds the leading precision 2, so it returns the error.	-

Example	Description	display string
INTERVAL '99 23:59:59.9999999'DAY(3) TO SECOND	100 day	+100 00:00:00.000000
INTERVAL '1 11:22:33.567890'DAY(2) TO SECOND(2)	1 day 11 hour 22 minute 33.57 second	+01 11:22:33.57
INTERVAL '+999999 23:59:59.999999'DAY(6) TO SECOND(6)	999999 day 23 hour 59 minute 59.999999 hour	+999999 23:59:59.999999
INTERVAL '-999999 23:59:59.999999'DAY(6) TO SECOND(6)	-(999999 day 23 hour 59 minute 59.999999 hour)	-999999 23:59:59.999999

Interval HOUR TO MINUTE

The followings are examples of using interval HOUR TO MINUTE literals.

Example	Description	Display string
INTERVAL '23:59'HOUR TO MINUTE INTERVAL '00 23:59:00'HOUR TO MINUTE	23 hour 59 minute	+00 23:59:00
INTERVAL '23:60'HOUR TO MINUTE	The minute value exceeds 59, so it returns the error.	-
INTERVAL '100:59'HOUR TO MINUTE	It exceeds the leading precision 2, so it returns the error.	-
INTERVAL '100:59'HOUR(3) TO MINUTE	4 day 4 hour 59 minute	+004 04:59:00
INTERVAL '+999999:59'HOUR(6) TO MINUTE	41666 day 15 hour 59 minute	+041666 15:59:00
INTERVAL '-999999:59'HOUR(6) TO MINUTE	-(41666 day 15 hour 59 minute)	-041666 15:59:00

Interval HOUR TO SECOND

The followings are examples of using interval HOUR TO SECOND literals.

Example	Description	Display string
INTERVAL '23:59:59.999999'HOUR TO SECOND INTERVAL '00 23:59:59.999999'HOUR TO SECOND	23 hour 59 minute 59.999999 second	+00 23:59:59.999999
INTERVAL '23:60:59.999999'HOUR TO SECOND	The minute value exceeds 59, so it returns the error.	-
INTERVAL '23:59:60.999999'HOUR TO SECOND	The second value exceeds 59, so it returns the error.	-
INTERVAL '99:59:59.999999'HOUR TO SECOND	The fractional seconds are rounded off to become 100 hour, then it exceeds the leading precision 2, so it returns the error.	-

Example	Description	Display string
INTERVAL '99:59:59.9999999'HOUR(3) TO SECOND	4 day 4 hour	+004 04:00:00.000000
INTERVAL '11:22:29.569'HOUR(3) TO SECOND(1)	11 hour 22 minute 29.6 second	+000 11:22:29.6
INTERVAL '+9999999:59:59.999999'HOUR(6) TO SECOND(6)	41666 day 15 hour 59 minute 59.999999 second	+041666 15:59:59.999999
INTERVAL '-9999999:59:59.999999'HOUR(6) TO SECOND(6)	-(41666 day 15 hour 59 minute 59.999999 second)	-041666 15:59:59.999999

Interval MINUTE TO SECOND

The followings are examples of using interval MINUTE TO SECOND literals.

Example	Description	Display string
INTERVAL '15:23.123456'MINUTE TO SECOND INTERVAL '00 00:15:23.123456'MINUTE TO SECOND	15 minute 23.123456 second	+00 00:15:23.123456
INTERVAL '15:60.123456'MINUTE TO SECOND	The second value exceeds 59, so it returns the error.	-
INTERVAL '99:59.999999'MINUTE TO SECOND(2)	The fractional seconds are rounded off to become 100 minute, then it exceeds the leading precision 2, so it returns the error.	-
INTERVAL '99:59.999999'MINUTE(3) TO SECOND(2)	1 hour 40 minute	+000 01:40:00.00
INTERVAL '+9999999:59.999999'MINUTE(6) TO SECOND(6)	694 day 10 hour 39 minute 59.999999 second	+000694 10:39:59.999999
INTERVAL '-9999999:59.999999'MINUTE(6) TO SECOND(6)	-(694 day 10 hour 39 minute 59.999999 second)	-000694 10:39:59.999999

Null Value

Null value is an unknown value or an undefined value. NULL value can be a value of any data type. The unknown value of the boolean type is represented as null value.

Null value is defined as a keyword and it is not case-sensitive.

The following is an example of null value representation.

NULL

Null

Comments

Single Line Comment

A single line comment is a comment which starts with `--` or `//`. The single line comment processes a comment from the behind of the comment's symbol to the end of the line.

The following is an example of using a single line comment.

```
gSQL> SELECT I1, -- I2, I3,
2 I4, I5
3 FROM T1;
I1      I4      I5
-----
column i1 column i4 column i5
1 row selected.
gSQL> SELECT I1, // I2, I3,
2 I4, I5
3 FROM T1;
I1      I4      I5
-----
column i1 column i4 column i5
1 row selected.
```

Multiple Line Comment

A multiple line comment is a comment which starts with `/*` and ends with `*/`. Multiple line comments specify a comment from `/*` to `*/`, and it can use multiple lines to represent comments.

The following is an example of using multiple line comment.

```
gSQL> SELECT I1, I2, I3, I4, I5
2 /* Output
3 all columns of TABLE T1 */
4 FROM T1;
I1      I2      I3      I4      I5
-----
column i1 column i2 column i3 column i4 column i5
```

1 row selected.

Hint Comment

A hint comment is a comment which starts with `/*+` and ends with `*/`. Hint comment is similar to multiple line comment, but the difference is that the hint comment has `+` at the beginning.

Do not use a space between `*` and `+`. If so, it will be treated as multiple line comment.

Unlike other comments, a hint comment is specified to be used only at the location which is right after the `SELECT` keyword. The processing method which a user specified to GOLDILOCKS optimizer is described in the hint comment. For more information, refer to **hint clause**.

The following is an example of using hint comment.

```
gSQL> SELECT /*+ FULL(T1) */ * FROM T1;
I1          I2          I3          I4          I5
-----
column i1 column i2 column i3 column i4 column i5
1 row selected.
```

SQL Reserved Words and Keywords

SQL Reserved Words

GOLDILOCKS supports reserved words which are specified as SQL reserved words. The SQL reserved word can not be used without quotation marks other than specified location. However, it is not recommended to use SQL reserved words with quotation marks.

The followings are SQL reserved words of GOLDILOCKS. * marked SQL reserved words are supported by the SQL standard.

For more information about the list, refer to **V\$RESERVED_WORDS**.

SQL Keywords

GOLDILOCKS SQL keywords are not reserved words. However, they are keywords which are internally used by GOLDILOCKS. Therefore, it is not recommended to use GOLDILOCKS SQL keywords because it can decrease the readability of the results.

GOLDILOCKS SQL keywords list can be viewed through **V\$KEYWORDS**.

Compatibility for Syntax Elements

The SQL standard compatibility for syntax element is as follows.

Table 11-1 SQL standard compatibility for syntax element

Feature ID	Description	Availability
E021-03	Character literals	O
E131	Null value support (nulls in lieu of values)	O
E161	SQL comments using leading double minus	O
F051-01	DATE data type (including support of DATE literal)	O
F051-02	TIME data type (including support of TIME literal) with fractional seconds precision of at least 0	O
F051-03	TIMESTAMP data type (including support of TIMESTAMP literal) with fractional seconds precision of at least 0 and 6	O
F271	Compound character literals	X
F383	Set column not null clause	O
F391	Long identifiers	X
F392	Unicode escapes in identifiers	X
F393	Unicode escapes in literals	X

T024	Spaces in binary literals	X
T101	Enhanced nullability determination	X
T351	Bracketed comments	X
T591	UNIQUE constraints of possibly null columns	O
X041	Basic table mapping: null absent	X
X042	Basic table mapping: null as nil	X
X051	Advanced table mapping: null absent	X
X052	Advanced table mapping: null as nil	X
X170	XML null handling options	X
X400	Name and identifier mapping	X

11.2 Data Type

Numeric Type

Numeric data types are classified according to the storage method and the fractional part representation.

- Classification by the storage method
 - Decimal numeric type
 - It stores decimal numbers in 100 digits basis.
 - Types: NUMBER, NUMERIC, FLOAT
 - Binary numeric type
 - It stores numbers of C language as it is.
 - Types: NATIVE_INTEGER, NATIVE_DOUBLE
- Classification by fractional part representation
 - Fixed point data type (exact numeric)
 - It is a numeric type whose scale is fixed.
 - Types: NUMERIC(precision, scale), NATIVE_INTEGER
 - Floating point data type (approximate numeric)
 - It is a numeric type whose scale is not fixed.
 - Types: FLOAT(precision), NATIVE_DOUBLE

Decimal Numeric Type

This type's precision and scale are based on decimal number. The precision indicates accuracy of the valid digits, and the scale indicates the range of fraction.

Decimal Fixed Point Number Type

The decimal fixed point number type is defined in SQL.

Table 11-2 Decimal fixed point number type

Type	Decimal precision	Decimal scale	Refer to
NUMBER(p)	p	0	NUMBER
NUMBER(p, s)	p	s	NUMBER
NUMERIC(p)	p	0	NUMERIC
NUMERIC(p, s)	p	s	NUMERIC
DECIMAL(p)	p	0	NUMERIC type alias
DECIMAL(p, s)	p	s	NUMERIC type alias

Type	Decimal precision	Decimal scale	Refer to
DEC(p)	p	0	NUMERIC type alias
DEC(p, s)	p	s	NUMERIC type alias
SMALLINT	5	0	NUMERIC type alias
INTEGER	10	0	NUMERIC type alias
BIGINT	19	0	NUMERIC type alias
INT2	5	0	NUMERIC type alias
INT4	10	0	NUMERIC type alias
INT8	19	0	NUMERIC type alias

Decimal Floating Point Number Type

The decimal floating point number type is defined in SQL.

Table 11-3 Decimal floating point number type

Type	Decimal precision	Decimal scale	Refer to
NUMBER	38	N/A	NUMBER
FLOAT(p)	$\text{ceil}(\log_{10} 2^p)$	N/A	FLOAT
REAL	$\text{ceil}(\log_{10} 2^{24}) = 8$	N/A	FLOAT type alias
DOUBLE	$\text{ceil}(\log_{10} 2^{53}) = 16$	N/A	FLOAT type alias
FLOAT4	$\text{ceil}(\log_{10} 2^{24}) = 8$	N/A	FLOAT type alias
FLOAT8	$\text{ceil}(\log_{10} 2^{53}) = 16$	N/A	FLOAT type alias

Binary Number Type

This type's precision and scale are based on binary number. The precision indicates accuracy of the valid digits, and the scale indicates the range of fraction.

Binary Fixed Point Number Type

The binary fixed point number type refers to the signed integer data type of C language.

1 bit is used to represent the sign bit, and other bits are used to represent the precision, but not any bit is used to represent the scale.

Table 11-4 Binary fixed point number type

Type	Binary precision	Binary scale	Refer to
NATIVE_SMALLINT	15	0	NATIVE_SMALLINT
NATIVE_INTEGER	31	0	NATIVE_INTEGER
NATIVE_BIGINT	63	0	NATIVE_BIGINT

Binary Floating Point Number Type

The binary floating point type refers to the float and double data type in C language.

1 bit is used to represent the sign bit, and other bits are used to represent the precision and scale.

Table 11-5 Binary floating point number type

Type	Binary precision	Binary scale	Refer to
NATIVE_REAL	23	8	NATIVE_REAL
NATIVE_DOUBLE	52	11	NATIVE_DOUBLE

Note

The precision and scale of binary floating point type is subject to change depending on the influence of the compiler and OS.

CHARACTER STRING Type

CHARACTER STRING data types are classified according to whether it is a variable length string and the maximum length of string.

- Classification by whether a variable length string exists
 - Fixed length string
 - Refer to **CHARACTER**.
 - Variable length string
 - Refer to **CHARACTER VARYING**, **CHARACTER LONG VARYING**.
- Classification by the maximum length of a string
 - 2000 [characters or bytes]
 - Refer to **CHARACTER**.
 - 4000 [characters or bytes]
 - Refer to **CHARACTER VARYING**.
 - 100 megabytes
 - Refer to **CHARACTER LONG VARYING**.

BINARY STRING Type

BINARY STRING data types are classified according to whether it is a variable length binary string and the maximum length of binary string.

- Classification by whether it is a variable length binary string
 - Fixed length binary string
 - Refer to **BINARY**.
 - Variable length binary string
 - Refer to **BINARY VARYING**, **BINARY LONG VARYING**.
- Classification by the maximum length of binary string
 - 2000
 - Refer to **BINARY**.
 - 4000
 - Refer to **BINARY VARYING**.
 - 100 Mega Bytes
 - Refer to **BINARY LONG VARYING**.

Date/ Time Type

Date/ time data type specifies the year, month, day, hour, minute, second, time zone offset in accordance with their representation method.

Date/ time data type has **DATE**, **TIME**, **TIMESTAMP** types.

INTERVAL Type

INTERVAL data type specifies the time interval.

It specifies the time interval of the year, month, day, hour, minute, second in accordance with their representation method.

INTERVAL data types are classified to the YEAR TO MONTH family type and the DAY TO SECOND family type, according to the range of value representation.

BOOLEAN Type

The BOOLEAN data type stores values of TRUE, FALSE, UNKNOWN. UNKNOWN value is represented as a null value. All expressions used as conditions return the BOOLEAN value and the column or the value defined as a BOOLEAN data type can be used as a condition.

For more information, refer to **BOOLEAN**.

ROWID Type

All records stored in the database have unique location information. The record identifier (ROWID) is used to distinguish each record.

ROWID data type is used to store and manage the record identifier (ROWID).

Record identifier (ROWID) is obtained by the query using the ROWID pseudo column.

For more information, refer to **ROWID**.

Type Comparison

Comparing two types is executed on the basis of one representative type. If the comparison target type is different from the representative type, then the comparison can go through a type conversion.

The representative types for type comparison defines the representative type for comparing two types.

The following table describes target type conversion for comparison per each representative type.

- Type conversion for the VC comparison
- Type conversion for the LC comparison
- Type conversion for the VB comparison
- Type conversion for the LB comparison
- Type conversion for the NB comparison
- Type conversion for the ND comparison
- Type conversion for the NU comparison
- Type conversion for the DA comparison
- Type conversion for the TI comparison
- Type conversion for the TZ comparison
- Type conversion for the TS comparison
- Type conversion for the SZ comparison

- Type conversion for the YM comparison
- Type conversion for the DS comparison
- Type conversion for the BO comparison
- Type conversion for the RI comparison

Tip

The followings are abbreviations which are used for the type comparison.

- "VC": CHARACTER VARYING
- "LC": CHARACTER LONG VARYING
- "VB": BINARY VARYING
- "LB": BINARY LONG VARYING
- "NB": NATIVE_BIGINT
- "ND": NATIVE_DOUBLE
- "NU": NUMBER
- "DA": DATE
- "TI": TIME
- "TZ": TIME WITH TIMEZONE
- "TS": TIMESTAMP
- "SZ": TIMESTAMP WITH TIMEZONE
- "YM": INTERVAL YEAR TO MONTH
- "DS": INTERVAL DAY TO SECOND
- "BO": BOOLEAN
- "RI": ROWID

Note

In the type comparison table, the built-in data types are represented by an abbreviated word enclosed in double quotes ("").

- "CHAR": CHARACTER
- "VARCHAR": CHARACTER VARYING
- "LONG VARCHAR": CHARACTER LONG VARYING
- "VARBINARY": BINARY VARYING
- "LONG VARBINARY": BINARY LONG VARYING
- "TIME_TZ": TIME WITH TIMEZONE
- "TIMESTAMP_TZ": TIMESTAMP WITH TIMEZONE

Type Conversion

Type conversions are classified into implicit type conversion and explicit type conversion.

- Implicit type conversion occurs in an expression, an operator, a function, a condition, for select, insert, delete, update.
- Explicit type conversion occurs through the CAST operator.

Table 11-23 The availability of type conversion describes the availability of data type conversion from a type to another type.

Note

In the type conversion table, the built-in data types are represented by an abbreviated string enclosed in double quotes ("").

- "CHAR": CHARACTER
- "VARCHAR": CHARACTER VARYING
- "LONG VARCHAR": CHARACTER LONG VARYING
- "VARBINARY": BINARY VARYING
- "LONG VARBINARY": BINARY LONG VARYING
- "TIME_TZ": TIME WITH TIMEZONE
- "TIMESTAMP_TZ": TIMESTAMP WITH TIMEZONE
- "INTERVAL_YM": INTERVAL YEAR TO MONTH
- "INTERVAL_DS": INTERVAL DAY TO SECOND

- Conversion to CHARACTER type
 - When the source type is CHARACTER type:
 - If the source type precision is bigger than the CHARACTER type precision, then an error occurs.
 - If the source type precision is equal to the CHARACTER type precision, then the string is not changed.
 - If the source type precision is smaller than the CHARACTER type precision, then space characters are added to the string as many as the precision difference.
 - When the source type is CHARACTER VARYING type or CHARACTER LONG VARYING type:
 - If the source type string length is bigger than the CHARACTER type precision, then an error occurs.
 - If the source type string length is equal to the CHARACTER type precision, then the string is not changed.
 - If the source type string length is smaller than the CHARACTER type precision, then space characters are added to the string as many as precision difference.
 - When the source type is numeric type, date/time type, INTERVAL type, BOOLEAN type or ROWID type:
 - If the converted string length of the source type is bigger than the CHARACTER type precision, then an error occurs.
 - If the converted string length of the source type is equal to the CHARACTER type precision, the string is not changed.

- If the converted string length of the source type is smaller than the CHARACTER type precision, then space characters are added to the string as many as precision difference.
- Conversion to CHARACTER VARYING type
 - When the source type is CHARACTER type:
 - If the source type precision is bigger than the CHARACTER VARYING type precision, then an error occurs.
 - If the source type precision is equal or smaller than the CHARACTER VARYING type precision, then the string is not changed.
 - When the source type is CHARACTER VARYING type or CHARACTER LONG VARYING type:
 - If the source type string length is bigger than the CHARACTER VARYING type precision, then an error occurs.
 - If the source type string length is equal or smaller than the CHARACTER VARYING type precision, then the string is not changed.
 - When the source type is numeric type, date/time type, INTERVAL type, BOOLEAN type or ROWID type:
 - If the converted string length of the source type is bigger than the CHARACTER VARYING type precision, then an error occurs.
 - If the converted string length of the source type is equal or smaller than the CHARACTER VARYING type precision, then the string is not changed.
- Conversion to CHARACTER LONG VARYING type
 - When the source type is CHARACTER STRING type:
 - The source type string is not changed.
 - When the source type is numeric type, date/time type, INTERVAL type, BOOLEAN type or ROWID type:
 - The converted string of the source type is not changed.
- Conversion to BINARY type
 - When the source type is BINARY type:
 - If the source type precision is bigger than the BINARY type precision, then an error occurs.
 - If the source type precision is equal to the BINARY type precision, then the binary string is not changed.
 - If the source type precision is smaller than the BINARY type precision, the X'00' characters are added to the binary string as many as the precision difference.
 - When the source type is BINARY VARYING type or BINARY LONG VARYING type:
 - If the source type binary string length is bigger than the BINARY type precision, then an error occurs.
 - If the source type binary string length is equal to the BINARY type precision, then the binary string is not changed.
 - If the source type binary string length is smaller than the BINARY type precision, the X'00' characters are added to a binary string as many as precision difference.
- Conversion to BINARY VARYING type

- When the source type is BINARY type:
 - If the source type precision is bigger than the BINARY VARYING type precision, then an error occurs.
 - If the source type precision is equal or smaller than the BINARY VARYING type precision, then the binary string is not changed.
- When the source type is BINARY VARYING type, BINARY LONG VARYING type:
 - If the source type binary string length is bigger than the BINARY VARYING type precision, then an error occurs.
 - If the source type binary string length is equal or smaller than the BINARY VARYING type precision, the binary string is not changed.
- Conversion to BINARY LONG VARYING type
 - If the source type is BINARY STRING type, the source type binary string is not changed.
- Conversion to numeric type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the numeric format, then an error occurs.
 - An overflow or rounding can occur due to the precision and scale which is defined in the converted type.
 - When the source type is numeric type:
 - An overflow or rounding can occur due to the precision and scale which is defined in the converted type.
 - When the source type is INTERVAL type:
 - It can be converted to the numeric type only when the source type is the single field (YEAR, MONTH, DAY, HOUR, MINUTE, SECOND).
 - An overflow or rounding can occur due to the precision and scale which is defined in the converted type.
- Conversion to DATE type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the DATE type format, then an error occurs.
 - An overflow can occur due to a value range which is defined in the converted type.
 - When the source type is DATE type or TIMESTAMP type:
 - The error does not occur.
 - When the source type is TIMESTAMP WITH TIME ZONE type:
 - It is converted to the DATE type value upon consideration of the time zone offset.
- Conversion to TIME type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the TIME type format, then an error occurs.
 - A rounding can occur due to a value range which is defined in the converted type.
 - When the source type is TIME type or TIMESTAMP type:
 - The error does not occur.

- When the source type is TIME WITH TIME ZONE type or TIMESTAMP WITH TIME ZONE type:
 - It is converted to the value of TIME type upon consideration of the time zone offset.
- Conversion to TIME WITH TIME ZONE type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the TIME WITH TIME ZONE type format, then an error occurs.
 - A rounding can occur due to a value range which is defined in the converted type.
 - When the source type is TIME type, TIME WITH TIME ZONE type or TIMESTAMP WITH TIME ZONE type:
 - It is converted to the value of TIME WITH TIME ZONE type upon consideration of the time zone offset.
- Conversion to TIMESTAMP type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the TIMESTAMP type format, then an error occurs.
 - An overflow or rounding can occur due to a value range which is defined in the converted type.
 - When the source type is DATE type or TIMESTAMP type:
 - The error does not occur.
 - When the source type is TIMESTAMP WITH TIME ZONE type:
 - It is converted to the TIMESTAMP type value upon consideration of the time zone offset.
- Conversion to TIMESTAMP WITH TIME ZONE type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the TIMESTAMP WITH TIME ZONE type format, then an error occurs.
 - An overflow or rounding can occur due to a value range which is defined in the converted type.
 - When the source type is DATE type, TIMESTAMP type or TIMESTAMP WITH TIME ZONE type:
 - It is converted to the value of TIMESTAMP WITH TIME ZONE type upon consideration of the time zone offset.
- Conversion to INTERVAL YEAR TO MONTH family type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the year-month interval literal format, then an error occurs.
 - For more information, refer to **Interval Literals**.
 - An overflow can occur due to a precision which is defined in the converted type.
 - When the source type is NATIVE_SMALLINT, NATIVE_INTEGER, NATIVE_BIGINT, NUMBER, NUMERIC or FLOAT type:
 - The converted type should be a single field (YEAR, MONTH).
 - An overflow can occur due to a precision which is defined in the converted type.
 - When the source type is INTERVAL YEAR TO MONTH family type:

- An overflow can occur due to a precision which is defined in the converted type.
- Conversion to INTERVAL DAY TO SECOND family type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the day-time interval literal format, then an error occurs.
 - For more information, refer to **Interval Literals**.
 - An overflow or rounding can occur due to the precision which is defined in the converted type.
 - When the source type is NATIVE_SMALLINT, NATIVE_INTEGER, NATIVE_BIGINT, NUMBER, NUMERIC, or FLOAT type:
 - The converted type should be a single field (DAY, HOUR, MINUTE, SECOND)
 - An overflow or rounding can occur due to the precision which is defined in the converted type.
 - When the source type is INTERVAL DAY TO SECOND family type:
 - An overflow or rounding can occur due to the precision which is defined in the converted type.
- Conversion to BOOLEAN type
 - When the source type is CHARACTER STRING type:
 - The conversion is available when the string is "TRUE" or "FALSE", and it is case-insensitive. (It is convertible even when the string includes a space before and after it.)
 - When the source type is BOOLEAN type:
 - The error does not occur.
- Conversion to ROWID type
 - When the source type is CHARACTER STRING type:
 - If the string does not comply with the ROWID type format, then an error occurs.
 - When the source type is ROWID type:
 - The error does not occur.

Type Combination

When Type Combination Is Required

A CASE operator and a **set operator** have many expressions as a result of operation.

Each expression can have different types each other as follows. In this case, the result type should be determined.

- The following describes an execution result of a CASE operator.

```

SELECT CASE expr WHEN expr THEN char(3)
           WHEN expr THEN char(5)
           ELSE char(1)
        END
FROM t1;

```

- The following describes an execution result of a set operator.

```

SELECT float_column
FROM t1
UNION ALL
SELECT number_precision_column
FROM t2
UNION ALL
SELECT native_integer_column
FROM t3;

```

A rule is applied to determine the result type according to the type combination. The following is an example of applying the rule.

- Result type combination rule
 - **set operator**
 - CASE operator
 - CASE Expression
 - COALESCE
 - NULLIF

Result Type Combination Rule

Each expression's data type should be the same family type which is available to combine.

- Examples of applying result type combination rule
 - **set operator**
 - CASE operator
 - CASE Expression
 - COALESCE
 - NULLIF

The result types determined by result type combination rule are described in the following table.

Tip

The following abbreviations are used to describe the result type combination rule.

- "VC": CHARACTER VARYING
- "LC": CHARACTER LONG VARYING
- "VB": BINARY VARYING
- "LB": BINARY LONG VARYING
- "NS": NATIVE_SMALLINT
- "NI": NATIVE_INTEGER
- "NB": NATIVE_BIGINT
- "NR": NATIVE_REAL
- "ND": NATIVE_DOUBLE
- "FL": FLOAT
- "NU": NUMBER
- "DA": DATE
- "TI": TIME
- "TZ": TIME WITH TIMEZONE
- "TS": TIMESTAMP
- "SZ": TIMESTAMP WITH TIMEZONE
- "YM": INTERVAL YEAR TO MONTH
- "DS": INTERVAL DAY TO SECOND
- "BO": BOOLEAN
- "RI": ROWID

Note

In result type combination table, the built-in data types are represented by an abbreviated word enclosed in double quotes ("").

- "CHAR": CHARACTER
- "VARCHAR": CHARACTER VARYING
- "LONG VARCHAR": CHARACTER LONG VARYING
- "BINARY": BINARY
- "VARBINARY": BINARY VARYING
- "LONG VARBINARY": BINARY LONG VARYING
- "TIME_TZ": TIME WITH TIMEZONE
- "TIMESTAMP_TZ": TIMESTAMP WITH TIMEZONE
- "INTERVAL_YM": INTERVAL YEAR TO MONTH

- "INTERVAL_DS": INTERVAL DAY TO SECOND

Table 11-24 The result type determined by result type combination rule

Data type	C H A R	V A R C H A R	L O N G V A R C H A R	B I N A R Y	V A R B I N A R Y	L O N G V A R B I N A R Y	N A T I V E S M A L L I N T	N A T I V E I N T E G E R	N A T I V E B I G I N T	N A T I V E R E A L	N U M B E R	N U M E R I C	F L O A T	D A T E	T I M E	T I M E Z	T I M E S T A M P	T I M E S T A M P Z	I N T E R V A L Y M	I N T E R V A L D S	B O L E A N	R O W I D

- The result type of when all is CHAR type
 - If the lengths are different, then it is VARCHAR type.
 - If the lengths are equal, then it is CHAR type.
- The result type of when all is BINARY type
 - If the lengths are different, then it is VARBINARY type.
 - If the lengths are equal, then it is BINARY type.
- The result type of INTERVAL YEAR TO MONTH type
 - If YEAR type and MONTH type are mixed, then it is INTERVAL YEAR TO MONTH type.
 - If there is only YEAR type, then it is INTERVAL YEAR type.
 - If there is only MONTH type, then it is INTERVAL MONTH type.
- The result type of INTERVAL DAY TO SECOND type
 - The start field is the biggest range field of each target expression.
 - The end field is the smallest range field of each target expression.
 - e.g. {INTERVAL DAY, INTERVAL HOUR} => INTERVAL DAY TO HOUR
- The precision, scale of the result type
 - CHARACTER STRING type
 - The maximum character length of the target expression
 - BINARY STRING type
 - The maximum character length of the target expression
 - NUMERIC type
 - It specifies an acceptable maximum range of the type's value.
 - TIME/TIMESTAMP type
 - The maximum fractional seconds precision of the target expression
 - INTERVAL YEAR TO MONTH
 - The maximum leading precision of the target expression
 - INTERVAL DAY TO SECOND
 - Leading precision is the maximum leading precision of the start field
 - Fractional seconds precision is the maximum fractional seconds precision.
- For more information, refer to **Type Comparison**.

Compatibility for Data Type

The SQL standard compatibility for data type is as follows.

Table 11-25 SQL standard compatibility for data type

Feature ID	Description	Availability
B033	Untyped SQL-invoked function arguments	X
E011-01	INTEGER and SMALLINT data types	O
E011-02	REAL, DOUBLE PRECISION, and FLOAT data types	O

Feature ID	Description	Availability
E011-03	DECIMAL and NUMERIC data types	X
E011-04	Arithmetic operators	O
E011-05	Numeric comparison	O
E011-06	Implicit casting among the numeric data types	O
E021-01	CHARACTER data type	O
E021-02	CHARACTER VARYING data type	O
E021-03	Character literals	O
E021-04	CHARACTER_LENGTH function	O
E021-05	OCTET_LENGTH function	O
E021-06	SUBSTRING function	O
E021-07	Character concatenation	O
E021-08	UPPER and LOWER functions	O
E021-09	TRIM function	O
E021-10	Implicit casting among the fixed-length and variable-length character string types	O
E021-11	POSITION function	O
E021-12	Character comparison	O
E071-05	Columns combined via table operators need not have exactly the same data type	O
F051-01	DATE data type (including support of DATE literal)	O
F051-02	TIME data type (including support of TIME literal) with fractional seconds precision of at least 0	O
F051-03	TIMESTAMP data type (including support of TIMESTAMP literal) with fractional seconds precision of at least 0 and 6	O
F051-04	Comparison predicate on DATE, TIME, and TIMESTAMP data types	X
F051-05	Explicit CAST between datetime types and character string types	O
F054	TIMESTAMP in DATE type precedence list	X
F382	Alter column data type	O
F611	Indicator data types	X
F741	Referential MATCH types	X

11.3 Format String

Format string defines the format which is used when a numeric type or date/time type is converted to a character string or when a character string is converted to a numeric types or date/time type.

- When a numeric type or date/time type is converted to a character string type, the representation format of the string is as follows.
 - Refer to **TO_CHAR(number), TO_CHAR(datetime)**.
 - Numeric type: **TO_CHAR(1234.56, 'S9,999.99')** → '+1,234.56'
 - Date/time type: **TO_CHAR(SYSDATE, 'YYYY-MM-DD')** → '2012-07-15'
- When a character string is converted to the numeric type or date/time type, the representation format of the string is as follows.
 - Refer to **TO_NUMBER, TO_NATIVE_REAL, TO_NATIVE_DOUBLE**.
 - Refer to **TO_DATE**.
 - Refer to **TO_TIMESTAMP, TO_TIMESTAMP_WITH_TIME_ZONE**.
 - Refer to **TO_TIME, TO_TIME_WITH_TIME_ZONE**.
 - Numeric type: **TO_NUMBER('+1,234.56', 'S9,999.99')** → NUMBER TYPE
 - Date/time type: **TO_DATE('2012-07-15', 'YYYY-MM-DD')** → DATE TYPE

Format strings are classified according to the type.

- Numeric data type: Refer to **Number Format String**.
- Date/time type: Refer to **Datetime Format String**.

Number Format String

Number format string defines the format which is used when a numeric type is converted to a character string type, or when a character string type is converted to a numeric type.

Number format string is used as an argument of the functions such as **TO_CHAR(number), TO_NUMBER, TO_NATIVE_REAL, TO_NATIVE_DOUBLE**.

Number format string can specify multiple format elements according to the desired format.

All number format elements are rounded off to fit the format.

If the number of digits before the decimal point of the value to be converted is bigger than the number of digits specified in the format string, then they are replaced with '#' character.

If the format element representing the sign of MI, S, PR is not specified, a negative number returns - sign and a positive number returns a white space to the front of the number.

Table 11-26 Number format elements

Format element	Example	Description
, (comma)	9,999	It returns a comma to the specified position. Multiple commas can be specified. Format string can not begin with a comma, and it can not come after the decimal point (.).
. (period)	99.99	It returns a decimal point(.) to the specified position. The decimal point in the format string can be specified only once.
\$	\$9999	It returns the \$ sign to the front of the number.
0	0999 9990	It returns zero(0) to the front of or to the end of the number. If the number of digits of the value to be converted is smaller than the number of digits to the zero position of the format string, then the gap is filled with zero(0)s and is returned.
9	9999	It returns a white space and numbers according to the sign and the number of specified 9. If the number of digits of the value to be converted is smaller than the number of the specified 9, then the gap is filled with white spaces and is returned. For a positive number, a white space is returned to the front of the number. For a negative number, '-' symbol is returned to the front of the number. If the value before the format string's decimal point is 0, then 0 is returned as a white space. e.g. TO_CHAR(0.123, '9.999') → .123 e.g. TO_CHAR(0, '9') → 0
B	B9999	If the value is zero, it returns a white space.
EEEE	9.9EEEE	It returns in exponential notation. It can be at the end of format string or it can be in front of S, MI, PR. It can not be specified together with a comma (,).
MI	9999MI	For a positive number, a white space is returned to the end of the number. For a negative number, '-' symbol is returned to the end of the number. It can be specified only at the end of format string and it can not be specified together with S, PR.
PR	9999PR	For a positive number, white spaces are returned to the beginning and end of the number. For a negative number, it returns the number into the inside of angle brackets. <number> It can be specified only at the end of format string, and it can not be specified together with S, MI.
RN rn	RN rn	Roman numerals are converted to uppercase and returned. (RN) Roman numerals are converted to lowercase and returned. (rn) Only the numbers between 1 ~ 3999 are returned. It can be specified together only with FM format element, but it can not be specified with any other format elements.

Format element	Example	Description
		It can not be used in TO_NUMBER function.
S	S9999 9999S	For a positive number, '+' symbol is returned to the front of the number. For a negative number, '-' symbol is returned to the front of the number.(S9999 For a positive number, '+' symbol is returned to the end of the number. For a negative number, '-' symbol is returned to the end of the number.(9999S) It can be specified only at the beginning of format string or at the end of format string. It can not be specified together with MI, PR.
V	999V99	10^n (n: the digit number of 9 after V format element) multiplied by the value is returned. It can not specified together with the decimal point (.). It can not be used in TO_NUMBER function.
X	XXXX xxxx	It returns the white space and hexadecimal number according to the digit number of the specified X. It converts an integer value to the hexadecimal number, and returns it. (A non-integer value is rounded off to make it to an integer value) XXX returns hexadecimal uppercase letters and xxxx returns hexadecimal lowercase letters. If the number of the converted hexadecimal digit is smaller than the number of the specified X, then the gap is filled with white spaces and is returned. Only 0 and positive integers are processed, and negative numbers are replaced with '#'. It can be specified together only with format element 0 and FM, but it can not be specified with any other format elements.
FM	FM	It removes the front and end white spaces, and returns left aligned effect. It removes the front and end white spaces of the number. It removes zero(0)s under the decimal point which are added by 9 format element.

Followings are examples of using number format string.

```

TO_CHAR( 12345, '99,999' )           : ' 12,345'

```

Datetime Format String

Datetime format string defines the format which is used when a date/time type is converted to a character string type, or when a character string type is converted to a date/time type.

Datetime format string is used as an argument of the functions such as **TO_CHAR(datetime)**, **TO_DATE**, **TO_TIMESTAMP**, **TO_TIMESTAMP_WITH_TIME_ZONE**, **TO_TIME**, **TO_TIME_WITH_TIME_ZONE**.

For datetime format string, if the format string is not specified, then the default value is used. The default value of each type is specified in the session property (NLS _ * _ FORMAT).

- DATE: Refer to **NLS_DATE_FORMAT**.

- **TIMESTAMP**: Refer to **NLS_TIMESTAMP_FORMAT**.
- **TIMESTAMP WITH TIME ZONE**: Refer to **NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT**.
- **TIME**: Refer to **NLS_TIME_FORMAT**.
- **TIME WITH TIME ZONE**: Refer to **NLS_TIME_WITH_TIME_ZONE_FORMAT**.

NLS * _FORMAT values can be changed by using **ALTER SESSION SET property_name**.

In datetime format string, multiple format elements can be specified upon the desired representation.

Table 11-27 Datetime format elements

Format element	Whether to use T O_* datetime	Description
- / , . ; : "text" Special character s	Y	It returns the format element character to the specified location.
AD A.D.	Y	AD with or without periods.
AM A.M.	Y	AM with or without periods.
BC B.C.	Y	BC with or without periods.
CC	N	Century If the last two digits of the four digits year is 01~ 99, the value which is added by one to the first two digits is returned. (e.g. If the year is 2005, 21 is returned.) If the last two digits of the four digits year is 00, the first two digits value is returned. (e.g. If the year is 2000, 20 is returned.)
D	Y	It returns the sequence of the day in a week. (1 ~ 7) Sunday is 1, saturday is 7, and so on.
DAY Day day	Y	It returns the day of the week. (e.g. SUNDAY) <ul style="list-style-type: none"> • DAY: The day which is all in uppercase is returned. • Day: The day whose first character is uppercase and others are lowercase is returned. • day: The day which is all in lowercase is returned.
DD	Y	It returns the sequence of the day in a month. (1 ~ 31)
DDD	Y	It returns the sequence of the day in a year. (1 ~ 366)
		It returns the abbreviated word for the day of the week. (e.g. SUN)

Format element	Whether to use T O_* datetime	Description
DY Dy dy	Y	<ul style="list-style-type: none"> DY: The day which is all in uppercase is returned. Dy: The day whose first character is uppercase and others are lowercase is returned. dy: The day which is all in lowercase is returned.
FF[1..6]	Y	<p>It returns fractional seconds as many as the number of the specified digits (1-6) after FF.</p> <p>If the number is not specified, the default value is 6. (FF is equal to FF6.)</p> <p>If the number of fractional seconds digit is bigger than the number specified after FF, then it is rounded down.</p> <p>If the number of fractional seconds digit is smaller than the number specified after FF, then zero(0) is added according to the specified number.</p> <p>It can not be used in DATE type.</p>
HH HH12	Y	The hour (1 ~ 12)
HH24	Y	The hour (0 ~ 23)
IW	N	<p>The week containing the first thursday of the year designated as the calendar week by ISO 8601 standards (1 ~ 52 weeks or 1 ~ 53 weeks) becomes the first week.</p> <ul style="list-style-type: none"> The calendar week starts from monday. The first calendar week includes January 4th. The first calendar week may include December 29th, 30th, and 31st. The last calendar week may include January 1st, 2nd, and 3rd.
IYYY	N	The 4 digits year embracing the calendar week defined by ISO 8601 standards.
IYY IY I	N	<p>The 3 digits year embracing the calendar week defined by ISO 8601 standards.</p> <p>The 2 digits year embracing the calendar week defined by ISO 8601 standards.</p> <p>The single digit year embracing the calendar week defined by ISO 8601 standards.</p>
J	Y	Julian day: The number of days since BC 4714-11-24
MI	Y	Minute (0 ~ 59)
MM	Y	Month (01 ~ 12), January(01)~December(12)
MON Mon mon	Y	<p>The abbreviated word for the month. (e.g. JAN)</p> <ul style="list-style-type: none"> MON: The month which is all in uppercase is returned. Mon: The month whose first character is uppercase and others are lowercase is returned. mon: The month which is all in lowercase is returned.
MONTH		<p>The month name (e.g. JANUARY)</p> <ul style="list-style-type: none"> MONTH: All uppercase month name is returned.

Format element	Whether to use T O_* datetime	Description
Month month	Y	<ul style="list-style-type: none"> Month: The month name that only the first letter is uppercase and others are lowercase is returned. month: The month of which is all in lowercase is returned.
PM P.M.	Y	PM with or without periods.
Q	N	The quarter of the year (1 ~ 4) January to March is 1 and October to December is 4.
RM Rm rm	Y	<p>It returns the roman numeral month. (e.g. I)</p> <ul style="list-style-type: none"> RM: The month which is all in uppercase is returned. Rm: The month whose first character is uppercase and others are lowercase is returned. rm: The month which is all in lowercase is returned.
RR	Y	<p>Adjusted two digit year The two digit year represented by RR can be converted to four digit year as follows.</p> <ul style="list-style-type: none"> When the two digit year represented by RR is 00~49: <ul style="list-style-type: none"> If the last two digits of the current year is 00~50, <ul style="list-style-type: none"> the four digit year is represented using the first two digits of the current year and the two digits which is represented by RR. If the last two digits of the current year is 51~99, <ul style="list-style-type: none"> the four digit year is represented using "the first two digits of the current year+1" and the two digits which is represented by RR. When the two digit year represented by RR is 50~99: <ul style="list-style-type: none"> If the last two digits of the current year is 00~50, <ul style="list-style-type: none"> the four digit year is represented using "the first two digit of the current year - 1" and the two digits which is represented by RR. If the last two digit of the current year is 51~99, <ul style="list-style-type: none"> the four digit year is expressed using the first two digit of the current year and the two digits which is represented by RR.
RRRR	Y	<p>Adjusted four digit year Two digit or four digit can be input. Two digit input is processed in the same way as RR.</p>
SS	Y	Second (0 ~ 59)
SSSSS	Y	Seconds since last midnight (0 ~ 86399)
TZH	Y	<p>Time Zone Hour It can not be used in DATE, TIMESTAMP, TIME types. It is available in TIMESTAMP WITH TIME ZONE, TIME WITH TIME ZONE types.</p>
		Time Zone Minute

Format element	Whether to use T O_* datetime	Description
TZM	Y	It can not be used in DATE, TIMESTAMP, TIME types. It can be used only in TIMESTAMP WITH TIME ZONE, TIME WITH TIME ZONE types.
WW	N	The sequence of the week in a year. (1~ 53) The first week 1 starts on the first day of the year and continues to the seventh day of the year.
W	N	The sequence of the week in a month. (1 ~ 5) The first week 1 starts on the first day of the month and ends on the seventh day.
Y,YYY	Y	It returns the year with comma in the Y,YYY form.
YYYY SYYYY	Y	Four digit year. If it is BC, SYYYY returns '-' signal.
YYY YY Y	Y	<ul style="list-style-type: none"> YYY: The last three digit year of the current year YY: The last two digit year of the current year Y: The last one digit year of the current year

The followings are examples of using datetime format string.

* - / , . ; : "text" Special character

- TO_CHAR(TO_DATE('2012-07-15 03:30:30', 'YYYY-MM-DD HH12:MI:SS'),
'YYYY/MM/DD HH12:MI:SS')
==> '2012/07/15 03:30:30'
- TO_CHAR(TO_DATE('2012-07-15', 'YYYY-MM-DD'),
'YYYY"year" DDD"th day"')
==> '2012year 197th day'

* AD

- TO_CHAR(TO_DATE('2012-07-15 AD', 'YYYY-MM-DD AD'), 'YYYY AD')
==> '2012 AD'
- TO_CHAR(TO_DATE('0001-01-01 BC', 'YYYY-MM-DD AD'), 'YYYY AD')
==> '0001 BC'

* BC

`==> '2012' ((Current year / 10 years) is 201)`
`==> '2052' ((Current year / 10 years) is 205)`

11.4 Expressions

Expression is a combination of value, operator and function for getting data values.

The following is the position of the SQL commands in which expression can be used.

- Target clause in SELECT
- GROUP BY clause in SELECT
- ORDER BY clause in SELECT
- WHERE clause and HAVING clause in SELECT
- INSERT VALUES clause
- UPDATE SET clause
- RETURN clause in INSERT, DELETE, UPDATE

Expression types are various as follows.

- Simple expression
- Compound expression
- Boolean value expression
- Case expression
- Datetime expression
- Scalar subquery expression
- Sequence manipulation expression

Simple expressions are column, pseudo columns, literals, and null value.

Compound expressions are combination of multiple expressions.

For more information, refer to the followings.

- **Null Value**
- **Literals**
- **Pseudo Columns**
- **Operators**
- **Functions**

Boolean Value Expression

Syntax

```
<boolean value expression> ::=
    <boolean term>
    | <boolean value expression> OR <boolean term>
```

```

<boolean term> ::=
    <boolean factor>
    | <boolean term> AND <boolean factor>
<boolean factor> ::=
    [ NOT ] <boolean test>
<boolean test> ::=
    <boolean primary> [ IS [ NOT ] <truth value> ]
<truth value> ::=
    TRUE
    | FALSE
    | UNKNOWN
<boolean primary> ::=
    <column>
    <condition>
    | <boolean predicand>
<boolean predicand> ::=
    <parenthesized boolean value expression>
    | <nonparenthesized value expression primary>
<parenthesized boolean value expression> ::=
    <left paren> <boolean value expression> <right paren>

```

Description

<boolean value expression> describes a boolean value. <boolean primary> with boolean value are <column>, <condition>, and <boolean predicand>. <column> should be declared as BOOLEAN type, and it is allowed to return a boolean value using CAST.

<boolean value expression> can use logical operators such as AND, OR, NOT, and the dedicated operators of boolean value such as IS, IS NOT are also supported.

IS operator and IS NOT operator which are described in <boolean test> determine whether the boolean value described in <boolean primary> matches with one of the <truth value> (TRUE, FALSE, UNKNOWN).

For more information, refer to **Conditions**.

Example

```

gSQL> SELECT * FROM T1 WHERE CAST('TRUE' AS BOOLEAN);
I1
-----
TRUE

```

```

FALSE
null
3 rows selected.
gSQL> SELECT * FROM T1 WHERE I1;
I1
----
TRUE
1 row selected.
gSQL> SELECT * FROM T1 WHERE I1 IS TRUE;
I1
----
TRUE
1 row selected.
gSQL> SELECT * FROM T1 WHERE I1 IS NOT FALSE;
I1
----
TRUE
null
2 rows selected.
gSQL> SELECT * FROM T1 WHERE I1 IS UNKNOWN;
I1
----
null
1 row selected.

```

CASE Expression

Syntax

```

<case expression> ::=
    <simple case>
  | <searched case>
<simple case> ::=
    CASE expr WHEN comparison_expr THEN result
        [ WHEN comparison_expr THEN result ... ]
        [ ELSE result ]
    END
<searched case> ::=
    CASE WHEN condition THEN result

```

```

        [ WHEN condition THEN result ... ]
        [ ELSE result ]
END

```

Description

WHEN ... THEN clause is evaluated in the order of which is described in the CASE statement.

If a comparison result is FALSE, the subsequent WHEN ... THEN clauses are evaluated until TRUE comes up.

If a comparison result is TRUE, the result is returned, and the evaluation is not executed any more.

- Simple case

The comparison_expr of CASE expr and WHEN ... THEN clause is evaluated as the equal operation. (expr = comparison_expr).

- Searched case

The condition of WHEN ... THEN clause is evaluated.

If all evaluation results of the WHEN clause are FALSE, then result of ELSE clause is returned.

If ELSE clause is omitted, NULL is returned as a result.

If there are multiple types of THEN or ELSE clause results, the result type is determined by **Result Type Combination Rule**.

For more information, refer to the followings.

- COALESCE
- NULLIF

Example

- Simple case

```

gSQL> SELECT I1,
        CASE I1 WHEN 1 THEN 'ONE'
              WHEN 2 THEN 'TWO'
              ELSE 'NUMBER'
        END AS CASE_RESULT1,
        CASE I1 WHEN 1 THEN 'ONE'
              WHEN 2 THEN 'TWO'
        END AS CASE_RESULT2
FROM T1;
I1 CASE_RESULT1 CASE_RESULT2

```

```

-- -----
1 ONE          ONE
2 TWO          TWO
3 NUMBER       null
3 rows selected.

```

- Searched case

```

gSQL> SELECT I1,
           CASE WHEN I1 = 1 THEN 'ONE'
                WHEN I1 = 2 THEN 'TWO'
                ELSE 'NUMBER'
           END AS CASE_RESULT1,
           CASE WHEN I1 = 1 THEN 'ONE'
                WHEN I1 = 2 THEN 'TWO'
           END AS CASE_RESULT2
FROM T1;
I1 CASE_RESULT1 CASE_RESULT2
-- -----
1 ONE          ONE
2 TWO          TWO
3 NUMBER       null
3 rows selected.

```

CAST Specification

Syntax

```
CAST( expression AS data_type )
```

Description

CAST converts the expression data type to the data type of the specified data_type.

Example

```

gSQL> SELECT CAST( '1-2' AS INTERVAL YEAR TO MONTH ) AS RESULT FROM DUAL;
RESULT
-----

```

+01-02

1 row selected.

Scalar Subquery Expression

Scalar subquery expression is a subquery which returns a single row with one column as a result. The scalar subquery expression result is the values described in select list of the subquery.

If the subquery does not return any row, then the result value is NULL, and if it returns two or more rows, then an error occurs.

Scalar subquery expression can be described on most position which describes expression. The subquery should be enclosed in parentheses. Even when scalar subquery expression is used as a function argument and the scalar subquery expression is enclosed in parentheses, other parentheses for the subquery is required regardless of the function parentheses. Otherwise, an error occurs

The following is an example of using scalar subquery expression.

```
gSQL> select * from dual where dummy = (select * from dual);
DUMMY
-----
X
1 row selected.
gSQL> select sum(select 1 from dual) from dual;
ERR-42000(40000): syntax error
select sum(select 1 from dual) from dual
.....^    ^
Error at line 1
gSQL> select sum((select 1 from dual)) from dual;
SUM((SELECT 1 FROM DUAL))
-----
1
1 row selected.
```

Compatibility

The SQL standard compatibility for expression is as follows.

Table 11-28 SQL standard compatibility for expression

Feature ID	Description	Availability
E121-03	Value expressions in ORDER BY clause	O
F051-05	Basic date and time Explicit CAST between datetime types and character string types	O
F201	CAST function	O
F261-01	Simple CASE	O
F261-02	Searched CASE	O
F261-03	NULLIF	O
F261-04	COALESCE	O
F263	Comma-separated predicates in simple CASE expression	X
F301	CORRESPONDING in query expressions	X
F385	Drop column generation expression clause	X
F561	Full value expressions	X
F846	Octet support in regular expression operators	X
F847	Nonconstant regular expressions	X
F850	Top-level <order by clause> in <query expression>	O
F855	Nested <order by clause> in <query expression>	O
F856	Nested <fetch first clause> in <query expression>	O
F857	Top-level <fetch first clause> in <query expression>	O
F861	Top-level <result offset clause> in <query expression>	O
F863	Nested <result offset clause> in <query expression>	O
S091-03	Arrays expressions	X
S111	ONLY in query expressions	X
T121	WITH (excluding RECURSIVE) in query expression	X
T581	Regular expression substring function	X

11.5 Pseudo Columns

Pseudo column is not only similar to function, but also it is similar to table column because it can return different value in row unit every time the pseudo column is executed.

Table 11-29 Supported pseudo column

Name	Description	Remarks
CURRVAL	It is a pseudo column which is related to a sequence.	CURRVAL
NEXTVAL	It is a pseudo column which is related to a sequence.	NEXTVAL
ROWNUM	It is the row number which satisfies the condition.	ROWNUM
ROWID	It returns the record identifier in database.	ROWID Pseudo Column
CLUSTER_GROUP_ID	It returns the group identifier in database.	CLUSTER_GROUP_ID Pseudo Column
CLUSTER_MEMBER_ID	It returns the member identifier in which the record is stored.	CLUSTER_MEMBER_ID Pseudo Column
CLUSTER_GROUP_NAME	It returns the group name in which the record is stored.	CLUSTER_GROUP_NAME Pseudo Column
CLUSTER_MEMBER_NAME	It returns the member name in which the record is stored.	CLUSTER_MEMBER_NAME Pseudo Column

ROWID Pseudo Column

ROWID pseudo column is a record identifier, and it returns the identification information of each database record.

ROWID has the following information to identify the location within the database depending on the system.

Standalone system

- OBJECT_ID
- TABLESPACE_ID
- PAGE_ID
- OFFSET in PAGE

Cluster system

- GRID_BLOCK_SEQUENCE
- GRID_BLOCK_ID

- MEMBER_ID
- SHARD_ID

The information stored inside in base 64 encoding is converted into the value such as A-Z, a-z, 0-9, +, / then output when querying ROWID.

Each information to identify the address within database stored in ROWID can be obtained using the ROWID-related functions.

The address of the deleted record can be newly reassigned to the record to be inserted.

ROWID pseudo column can be used only in SELECT operation, but it can not be used in INSERT, UPDATE, DELETE operations.

For more information, refer to **ROWID, ROWID-related Functions**.

The following is an example of querying ROWID pseudo column.

```
gSQL> SELECT ROWID FROM T1;
              ROWID
-----
AAAAAAAAAFpEAACAAEAkAAA
AAAAAAAAAFpEAACAAEAkAAB
AAAAAAAAAFpEAACAAEAkAAC
AAAAAAAAAFpEAACAAEAkAAD
AAAAAAAAAFpEAACAAEAkAAE
5 rows selected.
```

CLUSTER_GROUP_ID Pseudo Column

CLUSTER_GROUP_ID pseudo column returns the group identifier of a server in which the record is stored.

CLUSTER_GROUP_ID pseudo column can perform the SELECT, but it can not perform the INSERT, UPDATE, or DELETE.

Note

This information is valid in the cluster system.

The following is an example of retrieving CLUSTER_GROUP_ID pseudo column.

```
gSQL> SELECT T1.C1, T1.CLUSTER_GROUP_ID FROM T1;
C1 T1.CLUSTER_GROUP_ID
-- -----
A          1
B          2
C          3
3 rows selected.
```

CLUSTER_MEMBER_ID Pseudo Column

CLUSTER_MEMBER_ID pseudo column returns the member identifier of a server in which the record is stored.

CLUSTER_MEMBER_ID pseudo column can perform the SELECT, but it can not perform the INSERT, UPDATE, or DELETE.

Note

This information is valid in the cluster system.

The following is an example of retrieving CLUSTER_MEMBER_ID pseudo column.

```
gSQL> SELECT T1.C1, T1.CLUSTER_MEMBER_ID FROM T1;
C1 T1.CLUSTER_MEMBER_ID
-- -----
A          1
B          3
C          5
3 rows selected.
```

CLUSTER_GROUP_NAME Pseudo Column

CLUSTER_GROUP_NAME pseudo column returns the group name of a server in which the record is stored.

CLUSTER_GROUP_NAME pseudo column can perform the SELECT, but it can not perform the INSERT, UPDATE, or DELETE.

Note

This information is valid in the cluster system.

The following is an example of retrieving CLUSTER_GROUP_NAME pseudo column.

```
gSQL> SELECT T1.C1, T1.CLUSTER_GROUP_NAME FROM T1;
C1 T1.CLUSTER_GROUP_NAME
-- -----
A  G1
B  G2
C  G3
3 rows selected.
```

CLUSTER_MEMBER_NAME Pseudo Column

CLUSTER_MEMBER_NAME pseudo column returns the member name of a server in which the record is stored.

CLUSTER_MEMBER_NAME pseudo column can perform the SELECT, but it can not perform the INSERT, UPDATE, or DELETE.

Note

This information is valid in the cluster system.

The following is an example of retrieving CLUSTER_MEMBER_NAME pseudo column.

```
gSQL> SELECT T1.C1, T1.CLUSTER_MEMBER_NAME FROM T1;
C1 T1.CLUSTER_MEMBER_NAME
-- -----
A  G1N1
B  G2N1
C  G3N1
3 rows selected.
```

Compatibility

The SQL standard compatibility for pseudo column is as follows.

Table 11-30 SQL standard compatibility for pseudo column

Feature ID	Description	Availability
T176	Sequence generator support	O
T177	Sequence generator support: simple restart option	O

11.6 Operators

An operator is represented by one or more specific symbols or keywords, and it performs an operation using one or more arguments.

The operator types are various as follows.

- Arithmetic operator
- Concatenation operator
- Set operator

Arithmetic Operator

Syntax

```

<arithmetic operator> ::=
    <value term>
    | <expression> + <value term>
    | <expression> - <value term>
<value term> ::=
    <value factor>
    | <value term> * <value factor>
    | <value term> / <value factor>
<value factor> ::=
    <expression>
    | + <expression>
    | - <expression>

```

Description

An arithmetic operator performs an arithmetic operation of the numeric types, date/time types or interval types.

The arithmetic operator precedence is as follows.

1. **+** (POSITIVE), **-** (NEGATIVE)
2. ***** (MULTIPLICATION), **/** (DIVISION)
3. **+** (ADDITION), **-** (SUBTRACTION)

Concatenation Operator

Syntax

```
<concatenation operator> ::=
    <expression> || <expression>
```

Description

A concatenation operator returns strings which connect between values of CHARACTER STRING type or BINARY STRING type.

For more information, refer to **|| (CONCATENATE)**, **CONCATENATE**.

Set Operator

Syntax

```
<set operator> ::=
    <set operator term>
    | <subquery> UNION [ ALL | DISTINCT ] <set operator term>
    | <subquery> EXCEPT [ ALL | DISTINCT ] <set operator term>
    | <subquery> MINUS [ ALL | DISTINCT ] <set operator term>
<set operator term> ::=
    <subquery>
    | <subquery> INTERSECT [ ALL | DISTINCT ] <set operator term>
```

Description

A set operator performs a set operation of the subquery results.

For more information, refer to **set operator**.

INTERSECT ALL/DISTINCT has a higher precedence than other set operators.

Table 11-31 Set operators

Operator	Description
UNION ALL	It is the union which does not exclude duplicated rows of the subquery result.
UNION DISTINCT	It is the union which excludes duplicated rows of the subquery result.
EXCEPT ALL	It is the difference set which does not exclude duplicated rows of the subquery result.

Operator	Description
EXCEPT DISTINCT	It is the difference set which excludes duplicated rows of the subquery result.
MINUS ALL	It is as same as EXCEPT ALL.
MINUS DISTINCT	It is as same as EXCEPT DISTINCT.
INTERSECT ALL	It is the intersection which does not exclude duplicated rows of the subquery result.
INTERSECT DISTINCT	It is the intersection which excludes duplicated rows of the subquery result.

Compatibility

The SQL standard compatibility for operator is as follows.

Table 11-32 SQL standard compatibility for operator

Feature ID	Description	Availability
E011-04	Arithmetic operators	O
E021-07	Character concatenation	O
E071-01	UNION DISTINCT table operator	O
E071-02	UNION ALL table operator	O
E071-03	EXCEPT DISTINCT table operator	O
E071-05	Columns combined via table operators need not have exactly the same data type	O
E071-06	Table operators in subqueries	O
F041-08	All comparison operators are supported (rather than just =)	O
F302-01	INTERSECT DISTINCT table operator	O
F302-02	INTERSECT ALL table operator	O
F304	EXCEPT ALL table operator	O
F846	Octet support in regular expression operators	X
J571	NEW operator	X

11.7 Functions

Functions and operators are similar in features. However, to represent arguments, functions use parentheses after its name. A function can have zero or more arguments.

The function has two types as follows.

- Single row function
- Aggregate function

Single Row Function

Single row function creates a single result row for each row in the table or view.

The single row functions are as follows.

- Numeric function
- Character string function returning character values
- Character string function returning number values
- Datetime function
- General comparison function
- Conversion function
- Conditional function
- NULL-related function
- ROWID-related function
- Encryption function
- System information function

Numeric Functions

A numeric value is input in numeric function, and the numeric function returns a numeric result.

For more information about the numeric function types, refer to the followings.

- **ABS**
- **ACOS**
- **ASIN**
- **ATAN**
- **ATAN2**
- **BITAND**

- BITNOT
- BITOR
- BITXOR
- CBRT
- CEIL
- COS
- COT
- DEGREES
- EXP
- FACTORIAL
- FLOOR
- LN
- LOG
- MOD
- PI
- POWER
- RADIANS
- RANDOM
- ROUND(number)
- SHARD_ID
- SHIFT_LEFT
- SHIFT_RIGHT
- SIGN
- SIN
- SQRT
- TAN
- TRUNC(number)
- WIDTH_BUCKET

Character String Functions Returning Character Values

A character string type value is input in character string functions returning character values, and the function returns the result of character string type.

For more information about character string functions returning character values types, refer to the following.

- CHR
- CONCAT
- CONCATENATE
- INITCAP
- LOWER

- LPAD
- LTRIM
- OVERLAY
- REPEAT
- REPLACE
- REVERSE
- RPAD
- RTRIM
- SPLIT_PART
- SUBSTR
- SUBSTRB
- TRANSLATE
- TRIM
- UPPER

Character String Functions Returning Number Values

A character string type value is input in character string functions returning number values the value, and the function returns the result of number type.

For more information about character string functions returning number values types, refer to the followings.

- ASCII
- BIT_LENGTH
- BYTE_LENGTH
- CHAR_LENGTH
- INSTR
- LENGTH
- LENGTHB
- OCTET_LENGTH
- POSITION

Datetime Functions

The value of date/time/timestamp/interval type is input in datetime function, and the function returns the result of date/time/timestamp/interval type.

For more information about datetime functions types, refer to the followings.

- ADDDATE
- ADDTIME

- ADD_MONTHS
- DATEADD
- DATEDIFF
- DATE_ADD
- DATE_PART
- EXTRACT
- LAST_DAY
- MONTHS_BETWEEN

General Comparison Functions

General comparison function returns a minimum value or a maximum value for the value set.

For more information about general comparison function types, refer to the followings.

- GREATEST
- LEAST

Conversion Functions

Conversion function sets the value of a particular data type.

For more information about conversion function types, refer to the followings.

- TO_CHAR(datetime)
- TO_CHAR(number)
- TO_DATE
- TO_NATIVE_DOUBLE
- TO_NATIVE_REAL
- TO_NUMBER
- TO_TIME
- TO_TIME_TZ
- TO_TIME_WITH_TIME_ZONE
- TO_TIMESTAMP
- TO_TIMESTAMP_TZ
- TO_TIMESTAMP_WITH_TIME_ZONE

Conditional Functions

Conditional function returns a result of specific value depending on a condition.

For more information about conditional function types, refer to the followings.

- CASE2
- DECODE

NULL-related Functions

NULL-related function returns a result of specific value depending on whether the input value is a NULL value.

For more information about null-related function types, refer to the followings.

- COALESCE
- NULLIF
- NVL
- NVL2

ROWID-related Functions

ROWID-related function is used to obtain information about the ROWID.

For more information about ROWID-related function types, refer to the followings.

- Valid functions in standalone
 - ROWID_OBJECT_ID
 - ROWID_TABLESPACE_ID
 - ROWID_PAGE_ID
 - ROWID_ROW_NUMBER
- Valid functions in cluster
 - ROWID_GRID_BLOCK_ID
 - ROWID_GRID_BLOCK_SEQ
 - ROWID_MEMBER_ID
 - ROWID_SHARD_ID

Encryption Functions

encryption function encrypts, decrypts, or hashes the given plain text by using the specific algorithm, then returns the result.

For more information about the encryption function, refer to **DIGEST**.

System Information Functions

System information function is used to obtain information about sessions and the system.

For more information about system information function type, refer to the followings.

- CLOCK_DATE
- CLOCK_LOCALTIME
- CLOCK_LOCALTIMESTAMP
- CURRENT_CATALOG
- CURRENT_DATE
- CURRENT_SCHEMA
- CURRENT_TIME
- CURRENT_TIMESTAMP
- CURRENT_USER
- LAST_IDENTITY_VALUE
- LOCALTIME
- LOCALTIMESTAMP
- LOGON_USER
- SESSION_ID
- SESSION_SERIAL
- SESSION_USER
- STATEMENT_DATE
- STATEMENT_LOCALTIME
- STATEMENT_LOCALTIMESTAMP
- STATEMENT_TIME
- STATEMENT_TIMESTAMP
- STATEMENT_VIEW_SCN
- SYSDATE
- SYSTIME
- SYSTIMESTAMP
- TRANSACTION_DATE
- TRANSACTION_LOCALTIME
- TRANSACTION_LOCALTIMESTAMP
- TRANSACTION_TIME
- TRANSACTION_TIMESTAMP
- USER_ID
- VERSION

Aggregate Function

Aggregate function creates a single result row for multiple rows.

For more information about aggregate function types, refer to the followings.

- COUNT
- COUNT(*)
- SUM
- AVG
- MIN
- MAX
- STDDEV
- STDDEV_POP
- STDDEV_SAMP
- VAR_POP
- VAR_SAMP
- VARIANCE

Compatibility

The SQL standard compatibility for function is as follows.

Table 11-33 SQL standard compatibility for function

Feature ID	Description	Availability
B033	Untyped SQL-invoked function arguments	X
E021-04	CHARACTER_LENGTH function	O
E021-05	OCTET_LENGTH function	O
E021-06	SUBSTRING function	O
E021-08	UPPER and LOWER functions	O
E021-09	TRIM function	O
E021-11	POSITION function	O
E091-01	AVG	O
E091-02	COUNT	O
E091-03	MAX	O
E091-04	MIN	O
E091-05	SUM	O
E091-06	ALL quantifier	O
E091-07	DISTINCT quantifier	O

Feature ID	Description	Availability
F131-03	Set functions supported in queries with grouped views	O
F201	CAST function	O
F441	Extended set function support	X
F442	Mixed column references in set functions	X
F801	Full set function	X
F842	OCCURRENCES_REGEX function	X
F843	POSITION_REGEX function	X
S071	SQL paths in function and type name resolution	X
S201-02	Array as result type of functions	X
S211	User-defined cast functions	X
S241	Transform functions	X
T041-03	POSITION, LENGTH, LOWER, TRIM, UPPER, and SUBSTRING functions for LOB data types	X
T312	OVERLAY function	O
T321-01	User-defined functions with no overloading	X
T326	Table functions	X
T341	Overloading of SQL-invoked functions and SQL-invoked procedures	X
T433	Multiargument GROUPING function	X
T441	ABS and MOD functions	O
T571	Array-returning external SQL-invoked functions	X
T572	Multiset-returning external SQL-invoked functions	X
T581	Regular expression substring function	X
T614	NTILE function	X
T615	LEAD and LAG functions	X
T616	Null treatment option for LEAD and LAG functions	X
T617	FIRST_VALUE and LAST_VALUE functions	X
T618	NTH_VALUE function	X
T619	Nested window functions	X
T621	Enhanced numeric functions	O

11.8 Conditions

Condition

Condition is an expression which is evaluated as TRUE, FALSE, UNKNOWN.

Condition can be used in the following SQL statements.

- WHERE clauses in DELETE, UPDATE statements
- WHERE and HAVING clauses in SELECT statement
- Where the BOOLEAN TYPE can be used

The condition types are as follows.

- Comparison condition
- Logical condition
- Null condition
- Compound condition
- Pattern-matching condition
- Between condition
- In condition
- Exists condition

Table 11-34 Condition precedence

Precedence	Condition type
1	Operators in condition clauses
2	=, !=, <, >, <=, >=
3	IS [NOT] NULL, [NOT] BETWEEN, [NOT] IN, LIKE, EXISTS
4	NOT
5	AND
6	OR

Comparison Conditions

It compares both conditional expressions, and returns the boolean type of TRUE, FALSE, UNKNOWN values.

Table 11-35 Comparison conditions

Condition	Description
=	It checks if both conditions are equal.
!=, <>	It checks if both conditions are not equal.
>	It compares which one of both conditions is bigger.
<	It compares which one of both conditions is smaller.
>=	It compares which one of both conditions is bigger or equal.
<=	It compares which one of both conditions is smaller or equal.
ANY, SOME	If there is a condition whose left expr satisfies at least one of right expr_list (or subquery results), then it returns TRUE. If there is not right subquery result, then it returns FALSE.
ALL	If there is a condition whose left expr satisfies all right expr_list (or subquery results), then it returns TRUE. If there is not right subquery result, then it returns TRUE.

For more information, refer to **Type Comparison**.

< Simple Comparison Conditions >

Syntax

```
<simple_comparison_condition> ::=
    <expr>          <comparison_operator> <expr>
  | <expr>          <comparison_operator> ( <subquery> )
  | ( <subquery> ) <comparison_operator> <expr>
  | ( <subquery> ) <comparison_operator> ( <subquery> )
  | ( <expr_list> ) <comparison_operator> ( <expr_list> )
  | ( <expr_list> ) <comparison_operator> ( <subquery> )
  | ( <subquery> ) <comparison_operator> ( <expr_list> )
  | ( <subquery> ) <comparison_operator> ( <subquery> )
<comparison_operator> ::=
    < = >
  | < != >
  | < < >
  | < > >
  | < <= >
  | < >= >
<expr_list> ::=
    <expr>
  | <expr>, ... , <expr>
  | ( <expr> )
```

| (<expr> , ... , <expr>)

For more information, refer to [Scalar Subquery Expression](#).

Description

If the expr list or subquery comes to both left and right of comparison_operator, then the number of expr or subquery target to be compared should be same.

If there is a subquery, the number of result records should be one.

Example

Table 11-36 Example of simple comparison conditions

Conditional expression	Result
'abc' = 'abc'	TRUE
'abc' != 'abc'	FALSE
'abc' < 'abc'	FALSE
'abc' <= 'abc'	TRUE
'abc' > 'abc'	FALSE
'abc' >= 'abc'	TRUE
(1, 2, 3) = (1, 2, 3)	TRUE
(1, 2, 3) = (1, 2, 4)	FALSE
(1, 2, 3) != (4, 5, 6)	TRUE
(1, 2, 3) != (1, 2, 3)	FALSE
(1, 2, 3) < (1, 2, 4)	TRUE
(1, 2, 3) < (1, 2, 3)	FALSE
(1, 2, 3) <= (1, 2, 4)	TRUE
(1, 2, 3) <= (1, 2, 2)	FALSE
(1, 2, 3) > (1, 2, 2)	TRUE
(1, 2, 3) > (1, 2, 4)	FALSE
(1, 2, 3) >= (1, 2, 2)	TRUE
(1, 2, 3) >= (1, 2, 4)	FALSE

<Group Comparison Conditions>

Syntax

```

<group_comparison_condition> ::=
    <expr>                <comparison_operator> <quantifier> ( <expr_list> )
  | <expr>                <comparison_operator> <quantifier> ( <subquery> )
  | ( <expr_list> ) <comparison_operator> <quantifier> ( <expr_list_list> )

```

```

| ( <expr_list> ) <comparison_operator> <quantifier> ( <subquery> )
| ( <subquery> ) <comparison_operator> <quantifier> ( <expr_list> )
| ( <subquery> ) <comparison_operator> <quantifier> ( <expr_list_list> )
| ( <subquery> ) <comparison_operator> <quantifier> ( <subquery> )
<comparison_operator> ::=
    < = >
    | < != >
    | < < >
    | < > >
    | < <= >
    | < >= >
<quantifier> ::=
    ALL
    | ANY
    | SOME
<expr_list> ::=
    <expr>
    | <expr>, ... , <expr>
    | ( <expr> )
    | ( <expr> , ... , <expr> )
<expr_list_list> ::=
    <expr_list>
    | <expr_list>, ... , <expr_list>

```

For more information, refer to **Scalar Subquery Expression**.

Description

If the expr list or subquery comes to both left and right of comparison_operator, then the number of expr or subquery target to be compared should be same.

If a subquery comes to the left of comparison_operator, the number of result records should be one.

If a subquery comes to the right of comparison_operator, the number of result records can be multiple.

Example

Table 11-37 Example of group comparison conditions

Conditional expression	Result
1 =any (1, 2, 3, 4, 5)	TRUE
1 =any (1, 2, null, 4, 5)	TRUE
1 =any (2, null, 4, 5)	NULL
1 =any (100, 2, 3, 4, 5)	FALSE
1 =all (1, +1, 1E+0)	TRUE

Conditional expression	Result
1 =all (1, +1, 1E+0, null)	NULL
1 =all (1, 2, 3, 4, 5)	FALSE
(1, 2) =any ((0, 1), (1, 2), (3, 4))	TRUE
(1, 2) =any ((0, 1), (1, 2), (null, null))	TRUE
(1, 2) =any ((0, 1), (2, 3), (3, 4))	FALSE
(1, 2) =all ((1, 2), (+1, +2), (1E+0, 2E+0))	TRUE
(1, 2) =all ((1, 2), (+1, +2), (null, null))	NULL
(1, 2) =all ((0, 1), (2, 3), (3, 4))	FALSE
When the result record of comparison_operator's right subquery is 0	
('X') =any (select dummy from dual where dummy = 'Y')	FALSE
('X') =all (select dummy from dual where dummy = 'Y')	TRUE

Logical Conditions

Logical conditions are such as AND, OR, NOT.

AND

Syntax

| <boolean value expression> AND <boolean value expression>

Description

Table 11-38 Truth table of AND boolean operator

AND	True	False	Unknown
True	True	False	Unknown
False	False	False	False
Unknown	Unknown	False	Unknown

OR

Syntax

| <boolean value expression> OR <boolean value expression>

Description

Table 11-39 Truth table of OR boolean operator

OR	True	False	Unknown
True	True	True	True
False	True	False	Unknown
Unknown	True	Unknown	Unknown

NOT

Syntax

NOT <boolean value expression>

Description

Table 11-40 Truth table of NOT boolean operator

expr	NOT
True	False
False	True
Unknown	Unknown

Null Condition

Syntax

<expr> IS [NOT] NULL

Description

It checks whether the result value of expr is NULL.

Table 11-41 Result table of IS NULL condition

expr	IS NULL	IS NOT NULL
NULL	True	False
NOT NULL	False	True

Compound Conditions

It is a conditional expression in which multiple conditions are combined.

```
compound_condition ::=
    ( condition )
    | NOT condition
    | condition < AND | OR > condition
```

Pattern-matching Conditions

Like Condition

Syntax

```
like_condition ::=
    string [NOT] LIKE pattern [ ESCAPE escape_character ]
```

Description

It checks if a string matches the specified pattern.

Arguments such as string, pattern, escape_character can be of a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or of the type which is available to be converted to a character type.

If string, pattern, escape_character are NULL, it returns NULL.

If escape_character is omitted, there is not a default value.

If escape_character is specified, the escape_character should be one character.

If pattern does not include '_' nor '%', it is processed in the same way as equal operation(string = pattern).

If pattern includes '_' or '%', the string checks if it matches as follows.

- '_': If it corresponds to one arbitrary character.
- '%': If it corresponds to the arbitrary character string which has zero or more characters.

Use ESCAPE syntax to compare '_' or '%' included in the pattern with characters.

Specify escape_character, and describe the specified escape_character before the pattern's '_' or '%'.

Example

```
gSQL> SELECT 'hello%' LIKE 'h%o!%' ESCAPE '!' AS RESULT FROM DUAL;
RESULT
-----
TRUE
• 'represent' LIKE 'represent'    => TRUE
• 'represent' LIKE ' represent ' => FALSE
• 'represent' LIKE 'REPRESENT'    => FALSE
• 'represent' LIKE 'r_pr_s_nt'    => TRUE
• 'represent' LIKE 're%t'         => TRUE
• 'represent' LIKE 'rep'          => FALSE
• 'summer_vacation' LIKE 'summer\_vacation' ESCAPE '\\' => TRUE
• NULL LIKE 'summer\_vacation' ESCAPE '\\'              => NULL
• 'summer_vacation' LIKE NULL ESCAPE '\\'               => NULL
• 'summer_vacation' LIKE 'summer\_vacation' ESCAPE NULL => NULL
```

BETWEEN Condition

Syntax

```
<between condition> ::=
    <expr1> [ NOT ] BETWEEN [ ASYMMETRIC | SYMMETRIC ] <expr2> AND <expr3>
```

Description

It checks whether expr1 is within the range between expr2 and expr3.

If ASYMMETRIC or SYMMETRIC is omitted, the default is ASYMMETRIC.
If data types among expr1, expr2, expr3 are different, they are converted.
For more information, refer to **Type Comparison**, **Type Conversion**.

Table 11-42 Equivalence of between conditions

A	B
X BETWEEN ASYMMETRIC Y AND Z	X BETWEEN Y AND Z
X BETWEEN Y AND Z	X >= Y AND X <= Z
X NOT BETWEEN Y AND Z	NOT(X BETWEEN Y AND Z)
X BETWEEN SYMMETRIC Y AND Z	((X BETWEEN Y AND Z) OR (X BETWEEN Z AND Y))
X NOT BETWEEN SYMMETRIC Y AND Z	NOT(X BETWEEN SYMMETRIC Y AND Z)

Example

Table 11-43 Example of between condition

Conditional expression		Result
BETWEEN [ASYMMETRIC]	3 BETWEEN 1 AND 5	TRUE
	NULL BETWEEN 1 AND 5	NULL
	3 BETWEEN NULL AND 5	
	3 BETWEEN 1 AND NULL	
	3 BETWEEN 5 AND 1	FALSE
BETWEEN SYMMETRIC	3 BETWEEN SYMMETRIC 1 AND 5	TRUE
	NULL BETWEEN SYMMETRIC 1 AND 5	NULL
	3 BETWEEN SYMMETRIC NULL AND 5	
	3 BETWEEN SYMMETRIC 1 AND NULL	
	3 BETWEEN SYMMETRIC 5 AND 1	TRUE

IN Condition

Syntax

```

<in_condition> ::=
    <expr>          [NOT] IN ( <expr_list> )
  | <expr>          [NOT] IN ( <subquery> )
  | ( <expr_list> ) [NOT] IN ( <expr_list_list> )
  | ( <expr_list> ) [NOT] IN ( <subquery> )
  | ( <subquery> ) [NOT] IN ( <expr_list> )
  | ( <subquery> ) [NOT] IN ( <expr_list_list> )
  | ( <subquery> ) [NOT] IN ( <subquery> )

<expr_list> ::=
    <expr>
  | <expr>, ... , <expr>
  | ( <expr> )
  | ( <expr> , ... , <expr> )

<expr_list_list> ::=
    <expr_list>
  | <expr_list>, ... , <expr_list>

```

Description

IN condition returns the same result as = ANY.

NOT IN condition returns the same result as !=ALL.

For more information, refer to **Comparison Conditions**.

Example

Table 11-44 Example of IN condition

Conditional expression	Result
1 IN (1, 2, 3, 4, 5)	TRUE
1 IN (1, 2, null, 4, 5)	TRUE
1 IN (2, null, 4, 5)	NULL
1 IN (100, 2, 3, 4, 5)	FALSE
NULL IN (1, 2, 3)	NULL
1 NOT IN (2, 3, 4, 5)	TRUE
1 NOT IN (2, null, 4, 5)	NULL
1 NOT IN (1, 2, null, 4, 5)	FALSE
1 NOT IN (100, 2, 3, 4, 5)	TRUE
NULL NOT IN (1, 2, 3)	NULL

EXISTS Condition

Syntax

```
exists_conditions ::=  
    EXISTS ( subquery )
```

Description

It checks whether the result record of subquery exists.

If the result record of subquery exists, it returns TRUE. Otherwise, it returns FALSE.

Example

```
gSQL> SELECT * FROM DUAL WHERE EXISTS ( SELECT * FROM DUAL );
      DUMMY
      -----
      X
1 row selected.
gSQL> SELECT * FROM DUAL
      WHERE EXISTS ( SELECT * FROM DUAL WHERE DUMMY = 'Y' );
no rows selected.
```

Compatibility

The SQL standard compatibility for condition is as follows.

Table 11-45 SQL standard compatibility for condition

Feature ID	Description	Availability
E061-01	Comparison predicate	O
E061-02	BETWEEN predicate	O
E061-03	IN predicate with list of values	O
E061-04	LIKE predicate	O
E061-05	LIKE predicate: ESCAPE clause	O
E061-06	NULL predicate	O

BINARY

Syntax

BINARY [(length)]

Syntax Rules and Parameters

- length: It is the binary string length.
 - Range: 1 ~ 2000
 - Default value: 1

Description

A fixed-length binary string is stored.

If the binary string length to be stored is shorter than the specified length, 'X'00' is stored in the remaining part.

- Storage size: Bytes of the length value

For More Information

Refer to the followings.

- **BINARY VARYING**
- **BINARY LONG VARYING**

BINARY VARYING

Syntax

BINARY VARYING (length)

Syntax Rules and Parameters

- **length**: It is the maximum length of binary string.
 - Range: 1 ~ 4000

Description

The variable-length binary string is stored.

- Storage size: Bytes of the binary string to be stored
- Alias names: VARBINARY

For More Information

Refer to the followings.

- **BINARY**
- **BINARY LONG VARYING**

BINARY LONG VARYING

Syntax

BINARY LONG VARYING

Description

The value of the long variable binary string is stored.

- Maximum storage size: 100 megabytes
- Storage size: Bytes of the binary string to be stored
- Alias names: LONG BINARY VARYING, LONG VARBINARY

It can not be used as a column of the key, so there are limitations as follows.

- It can not be used as a key column of an index.
- It can not be used as the expression of ORDER BY clause.
- It can not be used as the expression of GROUP BY clause.
- It can not be used as the expression of DISTINCT clause.
- It can not be used as the expression of UNION, INTERSECT, EXCEPT clauses.

For More Information

Refer to the followings.

- **BINARY**
- **BINARY VARYING**

BOOLEAN

Syntax

 BOOLEAN

Description

TRUE or FALSE is stored.

- Storage size: 1 byte.

CHARACTER

Syntax

```
CHARACTER [ (length [ CHARACTERS | OCTETS | CHAR | BYTE ] ) ]
```

Syntax Rules and Parameters

- length: It is the string length.
 - Range: 1 ~ 2000
 - Default value: 1
- [CHARACTERS | OCTETS | CHAR | BYTE]: It is unit of length.
 - CHARACTERS
 - The number of characters
 - CHAR is as same as CHARACTERS.
 - OCTETS
 - The number of bytes
 - BYTE is as same as OCTETS.
 - If omitted, the default is the property value of **CHAR_LENGTH_UNITS** which is set when creating database.

Description

A fixed-length string is stored.

If the length of the string to be stored is shorter than the specified length, white spaces are stored in the remaining part.

- Storage size: Bytes of the length value
- Alias names: CHAR

For More Information

Refer to the followings.

- **CHARACTER VARYING**
- **CHARACTER LONG VARYING**

CHARACTER VARYING

Syntax

CHARACTER VARYING (length [**CHARACTERS** | **OCTETS** | **CHAR** | **BYTE**])

Syntax Rules and Parameters

- **length**: It is the string length.
 - Range: 1 ~ 4000
- [**CHARACTERS** | **OCTETS** | **CHAR** | **BYTE**]: It is unit of length.
 - **CHARACTERS**
 - The number of characters
 - **CHAR** is as same as **CHARACTERS**.
 - **OCTETS**
 - The number of bytes
 - **BYTE** is as same as **OCTETS**.
 - If omitted, the default is the property value of **CHAR_LENGTH_UNITS** which is set when creating database.

Description

The variable-length string is stored.

- Storage size: Bytes of the string to be stored
- Alias names: **VARCHAR**, **VARCHAR2**

For More Information

Refer to the followings.

- **CHARACTER**
- **CHARACTER LONG VARYING**

CHARACTER LONG VARYING

Syntax

CHARACTER LONG VARYING

Description

The value of the long variable-length string is stored.

- Maximum storage size: 100 megabytes
- Storage size: Bytes of the string to be stored
- Alias names: LONG CHARACTER VARYING, LONG CHAR VARYING, LONG VARCHAR

It can not be used as a column of the key, so there are limitations as follows.

- It can not be used as a key column of an index.
- It can not be used as the expression of ORDER BY clause.
- It can not be used as the expression of GROUP BY clause.
- It can not be used as the expression of DISTINCT clause.
- It can not be used as the expression of UNION, INTERSECT, EXCEPT clauses.

For More Information

Refer to the followings.

- CHARACTER
- CHARACTER VARYING

DATE

Syntax

DATE

Description

It is the date type including YEAR, MONTH, DAY, HOUR, MINUTE and SECOND (excluding fractional seconds).

- Value range: Date value between '4714-11-24 BC' and '9999-12-31 AD'
- Storage size: 8 bytes

For More Information

Refer to the followings.

- [Date Literals](#)
- [TIME](#)
- [TIMESTAMP](#)

FLOAT

Syntax

Float [(precision)]

Syntax Rules and Parameters

- precision: It is the binary precision of significant digits.
 - Precision range: 1 ~ 126
 - Default value: 126

Description

The floating point value with a binary precision is stored.

- Exponential range: 1E-130 ~ 1E+125
- Storage size: (number of digits in integer part + 1) / 2 + (number of digits in fractional part + 1) / 2 + 1 (exponent, sign)

It has a binary precision value unlike **NUMBER**, **NUMERIC** types.

- Alias names: REAL = FLOAT(24), DOUBLE = FLOAT(53), DOUBLE PRECISION = FLOAT(53), FLOAT4 = FLOAT(24), FLOAT8 = FLOAT(53).

For More Information

Refer to the followings.

- **NUMBER**
- **NUMERIC**

INTERVAL

Syntax

```

<interval_type> ::=
    INTERVAL YEAR [ ( leading_precision ) ]
  | INTERVAL MONTH [ ( leading_precision ) ]
  | INTERVAL DAY [ ( leading_precision ) ]
  | INTERVAL HOUR [ ( leading_precision ) ]
  | INTERVAL MINUTE [ ( leading_precision ) ]
  | INTERVAL SECOND [ ( leading_precision [ , fractional_seconds_precision ] ) ]
  | INTERVAL YEAR [ ( leading_precision ) ] TO MONTH
  | INTERVAL DAY [ ( leading_precision ) ] TO HOUR
  | INTERVAL DAY [ ( leading_precision ) ] TO MINUTE
  | INTERVAL DAY [ ( leading_precision ) ] TO SECOND [ ( fractional_seconds_precision ) ]
  | INTERVAL HOUR [ ( leading_precision ) ] TO MINUTE
  | INTERVAL HOUR [ ( leading_precision ) ] TO SECOND [ ( fractional_seconds_precision ) ]
  | INTERVAL MINUTE [ ( leading_precision ) ] TO SECOND [ ( fractional_seconds_precision ) ]

```

Syntax Rules and Parameters

- INTERVAL YEAR [(leading_precision)]: A period of YEAR is stored.
 - leading_precision
 - The number of digits in YEAR
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL MONTH [(leading_precision)]: A period of MONTH is stored.
 - leading_precision
 - The number of digits in MONTH
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL YEAR [(leading_precision)] TO MONTH: A period of YEAR and MONTH is stored.
 - leading_precision
 - The number of digits in YEAR
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL DAY [(leading_precision)]: A period of DAY is stored.

- leading_precision
 - The number of digits in DAY
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL HOUR [(leading_precision)]: A period of HOUR is stored.
 - leading_precision
 - The number of digits in HOUR
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL MINUTE [(leading_precision)]: A period of MINUTE is stored.
 - leading_precision
 - The number of digits in MINUTE
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL SECOND [(leading_precision [, fractional_seconds_precision])]: A period of SECOND is stored.
 - leading_precision
 - The number of digits in SECOND
 - Value range: 2 ~ 6
 - Default value: 2
 - fractional_seconds_precision
 - The number of digits in fractional seconds
 - Value range: 0 ~ 6
 - Default value: 6
- INTERVAL DAY [(leading_precision)] TO HOUR: A period of DAY and HOUR is stored.
 - leading_precision
 - The number of digits in DAY
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL DAY [(leading_precision)] TO MINUTE: A period of DAY, HOUR, and MINUTE is stored.
 - leading_precision
 - The number of digits in DAY
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL DAY [(leading_precision)] TO SECOND [(fractional_seconds_precision)]: A period of DAY, HOUR, MINUTE, and SECOND is stored.
 - leading_precision

- The number of digits in DAY
- Value range: 2 ~ 6
- Default value: 2
- fractional_seconds_precision
 - The number of digits in fractional seconds
 - Value range: 0 ~ 6
 - Default value: 6
- INTERVAL HOUR [(leading_precision)] TO MINUTE: A period of HOUR and MINUTE is stored.
 - leading_precision
 - The number of digits in HOUR
 - Value range: 2 ~ 6
 - Default value: 2
- INTERVAL HOUR [(leading_precision)] TO SECOND [(fractional_seconds_precision)]: A period of HOUR, MINUTE and SECOND is stored.
 - leading_precision
 - The number of digits in HOUR
 - Value range: 2 ~ 6
 - Default value: 2
 - fractional_seconds_precision
 - The number of digits in fractional seconds
 - Value range: 0 ~ 6
 - Default value: 6
- INTERVAL MINUTE [(leading_precision)] TO SECOND [(fractional_seconds_precision)]: A period of MINUTE and SECOND is stored.
 - leading_precision
 - The number of digits in MINUTE
 - Value range: 2 ~ 6
 - Default value: 2
 - fractional_seconds_precision
 - The number of digits in fractional seconds
 - Value range: 0 ~ 6
 - Default value: 6

Description

INTERVAL types are classified into YEAR TO MONTH family type and DAY TO SECOND family type depending on the range of value representation as follows.

- YEAR TO MONTH family type: Its storage size is 8 bytes.

- INTERVAL YEAR
- INTERVAL MONTH
- INTERVAL YEAR TO MONTH
- DAY TO SECOND family type: Its storage size is 16 bytes.
 - INTERVAL DAY
 - INTERVAL HOUR
 - INTERVAL MINUTE
 - INTERVAL SECOND
 - INTERVAL DAY TO HOUR
 - INTERVAL DAY TO MINUTE
 - INTERVAL DAY TO SECOND
 - INTERVAL HOUR TO MINUTE
 - INTERVAL HOUR TO SECOND
 - INTERVAL MINUTE TO SECOND

If the number which is bigger than number of the specified digits is in the field to which the `leading_precision` is specified, then an error is returned.

If the number which is bigger than number of the specified digits is in the field to which the `fractional_seconds_precision` is specified, it is rounded off.

Table 11-46 Precisions and value range of the second or later field in `INTERVAL * TO *`

Field	Precision	Value range
MONTH	2	0 ~ 11
HOUR	2	0 ~ 23
MINUTE	2	0 ~ 59
SECOND (interger part)	2	0 ~ 59

For More Information

Refer to **Interval Literals**.

NATIVE_BIGINT

Syntax

 `NATIVE_BIGINT`

Description

Signed 8-byte integer is stored.

It is as same as long long data type of C language (8 bytes integer).

- Value range: -9,223,372,036,854,775,808 ~ 9,223,372,036,854,775,807
- Storage size: 8 bytes

NATIVE_DOUBLE

Syntax

 NATIVE_DOUBLE

Description

Double precision floating-point number (8 bytes) is stored.

It is as same as double data type of C language.

- Exponential range: 1E-307 ~ 1E+308
- Storage size: 8 bytes

NATIVE_INTEGER

Syntax

 NATIVE_INTEGER

Description

Signed 4 byte integer is stored.

It is as same as integer data type of C language (4 bytes).

- Value range: -2,147,483,648 ~ +2,147,483,647
- Storage size: 4 bytes

NATIVE_REAL

Syntax

 NATIVE_REAL

Description

Single precision floating-point number (4 bytes) is stored.

It is as same as float data type of C language.

- Exponential range: 1E-37 ~ 1E+37
- Storage size: 4 bytes

NATIVE_SMALLINT

Syntax

 NATIVE_SMALLINT

Description

Signed 2 byte integer is stored.

It is as same as short data type of C language.

- Value range: -32,768 ~ 32,767
- Storage size: 2 bytes

NUMBER

Syntax

NUMBER [(precision [, scale])]

Syntax Rules and Parameters

- **NUMBER**: A floating point number without a precision and scale is stored.
 - The range of significant digits: 38
 - Exponential range: 1E-130 ~ 1E+125
 - It is as same as **FLOAT** (126).
- **NUMBER(precision)**: The integer with significant digits of precision is stored.
 - Precision range: 1 ~ 38
 - The scale value: 0
 - It has a decimal precision value unlike **FLOAT** type.
 - It is as same as **NUMBER(precision, 0)**, **NUMERIC(precision, 0)**.
- **NUMBER(precision, scale)**: A fixed point number with precision and scale is stored.
 - Precision range: 1 ~ 38
 - Scale range: -84 ~ 127
 - It has a decimal precision value unlike **FLOAT** type.
 - It is as same as **NUMERIC (precision,scale)**.
 - Alias names: **SMALLINT** = **NUMBER(5,0)**, **INTEGER** = **NUMBER(10,0)**, **BIGINT** = **NUMBER(19,0)**, **INT2** = **NUMBER(5,0)**, **INT4** = **NUMBER(10,0)**, **INT8** = **NUMBER(19,0)**

Description

NUMBER type is similar to **NUMERIC** type, but if both the precision and scale are omitted, **NUMBER** type stores the floating point number whose precision and scale are not specified.

- **NUMBER** without precision, scale: Floating-point number
- **NUMERIC** without precision, scale: The fixed point number of **NUMERIC(38, 0)**
- Storage size: (number of digits in integer part + 1) / 2 + (number of digits in fractional part + 1) / 2 + 1(exponent, sign)

For More Information

Refer to the followings.

- `FLOAT`
- `NUMERIC`

NUMERIC

Syntax

NUMERIC [(precision [, scale])]

Syntax Rules and Parameters

- precision: It is the decimal precision of significant digits.
 - precision range: 1 ~ 38
 - Default value: 38
- scale: It is the decimal point range.
 - scale range: -84 ~ 127
 - Default value: 0

Description

A fixed point number with precision and scale is stored.

If the precision and scale are omitted, it means as follows.

- `NUMERIC = NUMERIC(38,0)`
- `NUMERIC(p) = NUMERIC(p,0)`

NUMBER type is similar to NUMERIC type, but if both the precision and scale are omitted, NUMBER type stores the floating-point number whose precision and scale is not specified.

- NUMBER without precision, scale: Floating point number
- NUMERIC without precision, scale: Fixed point number of NUMERIC(38,0)
- Storage size: (number of digits in integer part + 1) / 2 + (number of digits in fractional part + 1) / 2 + 1(exponent, sign)

For More Information

Refer to the followings.

- **FLOAT**
- **NUMBER**

ROWID

Syntax

ROWID

Description

A record identifier (ROWID) is stored.

A record identifier (ROWID) is the identification information of each record in database.

When querying the ROWID pseudo column, each record identifier (ROWID) is obtained. This ROWID pseudo column has the ROWID data type information.

ROWID type consists of the followings in a standalone system.

- OBJECT_ID
- TABLESPACE_ID
- PAGE_ID
- OFFSET within PAGE

ROWID type consists of the followings in a cluster system.

- GRID_BLOCK_SEQUENCE
- GRID_BLOCK_ID
- MEMBER_ID
- SHARD_ID

ROWID is stored in the base 64 value, which can include A ~ Z, a ~ z, 0 ~ 9, +, /.

Each component information of ROWID is obtained using ROWID-related functions.

- Storage size: 16 bytes

For More Information

Refer to the followings.

- ROWID Pseudo Column
- ROWID-related Functions

TIME

Syntax

```
TIME [ ( fractional_seconds_precision ) ] [ WITH TIME ZONE | WITHOUT TIME ZONE ]
```

Syntax Rules and Parameters

- `fractional_seconds_precision`: It is the number of significant digits in fractional seconds.
 - `fractional_seconds_precision` range: 0 ~ 6
 - Default value: 6
- `[WITH TIME ZONE | WITHOUT TIME ZONE]`: It specifies whether to store TIME ZONE value.
 - `WITH TIME ZONE`: The time which includes time zone
 - `WITHOUT TIME ZONE`: The time which does not include time zone
 - Default value: `WITHOUT TIME ZONE`

Description

The time which includes HOUR, MINUTE and SECOND is stored.

- Storage size
 - `TIME WITHOUT TIME ZONE`: 8 bytes
 - `TIME WITH TIME ZONE`: 12 bytes

For More Information

Refer to the followings.

- [Time Literals](#)
- [Time with Time Zone Literals](#)
- [DATE](#)
- [TIMESTAMP](#)

TIMESTAMP

Syntax

```
TIMESTAMP [ ( fractional_seconds_precision ) ] [ WITH TIME ZONE | WITHOUT TIME ZONE ]
```

Syntax Rules and Parameters

- fractional_seconds_precision: It is the number of significant digits in the fractional seconds.
 - fractional_seconds_precision range: 0 ~ 6
 - Default value: 6
- [WITH TIME ZONE | WITHOUT TIME ZONE]: It specifies whether to store TIME ZONE value.
 - WITH TIME ZONE: The time which includes time zone.
 - WITHOUT TIME ZONE: The time which does not include time zone.
 - Default value: WITHOUT TIME ZONE

Description

The time which includes YEAR, MONTH, DATE, HOUR, MINUTE and SECOND is stored.

- Storage size
 - TIMESTAMP WITHOUT TIME ZONE: 8 bytes
 - TIMESTAMP WITH TIME ZONE: 12 bytes

For More Information

Refer to the followings.

- Timestamp Literals
- Timestamp with Time Zone Literals
- DATE
- TIME

11.10 Built-in Function References

* (MULTIPLICATION)

Syntax

expr1 * expr2

Description

It returns the multiplication result of expr1 and expr2.

The multiplication types and result types are as follows.
For more information, refer to **Type Conversion**.

Table 11-47 Numeric * operation

expr1 (expr2)	expr2 (expr1)	Result type
NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_BIGINT
NUMBER	NUMBER	NUMBER
NATIVE DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE_DOUBLE

Table 11-48 INTERVAL * operation

expr1 (expr2)	expr2 (expr1)	Result type
INTERVAL YEAR TO MONTH	Numeric type	INTERVAL YEAR TO MONTH (The result type is the interval type.)
INTERVAL DAY TO SECOND	Numeric type	INTERVAL DAY TO SECOND (The result type is the interval type.)
Refer to INTERVAL type details which is included in INTERVAL type written in the following table.		

Table 11-49 INTERVAL type details which is included in INTERVAL type written in the following table

INTERVAL YEAR TO MONTH	INTERVAL DAY TO SECOND
	<ul style="list-style-type: none">INTERVAL DAYINTERVAL HOUR

INTERVAL YEAR TO MONTH	INTERVAL DAY TO SECOND
<ul style="list-style-type: none">• INTERVAL YEAR• INTERVAL MONTH• INTERVAL YEAR TO MONTH	<ul style="list-style-type: none">• INTERVAL MINUTE• INTERVAL SECOND• INTERVAL DAY TO HOUR• INTERVAL DAY TO MINUTE• INTERVAL DAY TO SECOND• INTERVAL HOUR TO MINUTE• INTERVAL HOUR TO SECOND• INTERVAL MINUTE TO SECOND

Example

```
gSQL> SELECT INTERVAL '1-2' YEAR TO MONTH * 2 AS RESULT FROM DUAL;
RESULT
-----
+000002-04
1 row selected.
gSQL> SELECT INTERVAL '1 01:02:03.400000' DAY TO SECOND * 2 AS RESULT
      FROM DUAL;
RESULT
-----
+000002 02:04:06.800000
1 row selected.
```

+ (ADDITION)

Syntax

expr1 + expr2

Description

It returns the addition result of expr1 and expr2.

The addition types and result types are as follows.
For more information, refer to **Type Conversion**.

Table 11-50 Numeric + operation

expr1 (expr2)	expr2 (expr1)	Result type
NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_BIGINT
NUMBER	NUMBER	NUMBER
NATIVE DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE_DOUBLE

Table 11-51 (DATETIME/INTERVAL) + operation

expr1 (expr2)	expr2 (expr1)	Result type
DATE	NUMERIC	DATE
DATE	INTERVAL YEAR TO MONTH	DATE
DATE	INTERVAL DAY	DATE
DATE	INTERVAL DAY TO SECOND	TIMESTAMP
TIME	NUMERIC	TIME
TIME	INTERVAL YEAR TO MONTH	TIME
TIME	INTERVAL DAY TO SECOND	TIME
TIME WITH TIME ZONE	NUMERIC	TIME WITH TIME ZONE
TIME WITH TIME ZONE	INTERVAL YEAR TO MONTH	TIME WITH TIME ZONE
TIME WITH TIME ZONE	INTERVAL DAY TO SECOND	TIME WITH TIME ZONE
TIMESTAMP	NUMERIC	TIMESTAMP
TIMESTAMP	INTERVAL YEAR TO MONTH	TIMESTAMP
TIMESTAMP	INTERVAL DAY TO SECOND	TIMESTAMP
TIMESTAMP WITH TIME ZONE	NUMERIC	TIMESTAMP WITH TIME ZONE

expr1 (expr2)	expr2 (expr1)	Result type
TIMESTAMP WITH TIME ZONE	INTERVAL YEAR TO MONTH	TIMESTAMP WITH TIME ZONE
TIMESTAMP WITH TIME ZONE	INTERVAL DAY TO SECOND	TIMESTAMP WITH TIME ZONE
INTERVAL YEAR TO MONTH	INTERVAL YEAR TO MONTH	INTERVAL YEAR TO MONTH (The result type includes all the interval range of expr1 and expr2.)
INTERVAL DAY TO SECOND	INTERVAL DAY TO SECOND	INTERVAL DAY TO SECOND (The result type includes all the interval range of expr1 and expr2.)
Refer to INTERVAL type details which is included in INTERVAL type written in the following table.		

Example

```
gSQL> SELECT TO_DATE( '2012-05-05', 'YYYY-MM-DD' ) + 5 AS RESULT FROM DUAL;
```

```
RESULT
```

```
-----
```

```
2012-05-10
```

```
1 row selected.
```

```
gSQL> SELECT
```

```
    TO_DATE( '2012-05-05', 'YYYY-MM-DD' ) + INTERVAL'01-01'YEAR TO MONTH
```

```
    AS RESULT
```

```
    FROM DUAL;
```

```
RESULT
```

```
-----
```

```
2013-06-05
```

```
1 row selected.
```

```
gSQL> SELECT
```

```
    INTERVAL'01-01'YEAR TO MONTH + INTERVAL'02-10'YEAR TO MONTH
```

```
    AS RESULT
```

```
    FROM DUAL;
```

```
RESULT
```

```
-----
```

```
+0000003-11
```

```
1 row selected.
```

+ (POSITIVE)

Syntax

```
+ expr
```

Description

The + sign is displayed in expr.

Example

```
gSQL> SELECT +3 AS RESULT1, +(-3) AS RESULT2 FROM DUAL;  
RESULT1 RESULT2  
-----  
3      -3  
1 row selected.
```

- (NEGATIVE)

Syntax

- expr

Description

The - sign is displayed in expr.

Example

```
gSQL> SELECT -3 AS RESULT1, -(-3) AS RESULT2 FROM DUAL;  
RESULT1 RESULT2  
-----  
      -3         3  
1 row selected.
```

- (SUBTRACTION)

Syntax

expr1 - expr2

Description

It returns the subtraction result of expr1 and expr2.

The subtraction types and result types are as follows.
For more information, refer to **Type Conversion**.

Table 11-52 Numeric - operation

expr1	expr2	Result type
NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_BIGINT
NUMBER	NUMBER	NUMBER

TIME WITH TIME ZONE	INTERVAL YEAR TO MONTH	TIME WITH TIME ZONE
TIME WITH TIME ZONE	INTERVAL DAY TO SECOND	TIME WITH TIME ZONE
TIMESTAMP	TIMESTAMP	INTERVAL DAY TO SECOND
TIMESTAMP	Numeric type	TIMESTAMP

expr1	expr2	Result type
TIMESTAMP	INTERVAL YEAR TO MONTH	TIMESTAMP
TIMESTAMP	INTERVAL DAY TO SECOND	TIMESTAMP
TIMESTAMP WITH TIME ZONE	TIMESTAMP WITH TIME ZONE	INTERVAL DAY TO SECOND
TIMESTAMP WITH TIME ZONE	Numeric type	TIMESTAMP WITH TIME ZONE
TIMESTAMP WITH TIME ZONE	INTERVAL YEAR TO MONTH	TIMESTAMP WITH TIME ZONE
TIMESTAMP WITH TIME ZONE	INTERVAL DAY TO SECOND	TIMESTAMP WITH TIME ZONE
INTERVAL YEAR TO MONTH	INTERVAL YEAR TO MONTH	INTERVAL YEAR TO MONTH (The result type includes all the interval range of expr1 and expr2.)
INTERVAL DAY TO SECOND	INTERVAL DAY TO SECOND	INTERVAL DAY TO SECOND (The result type includes all the interval range of expr1 and expr2.)

Refer to **Table 11-49 INTERVAL type details** which is included in **INTERVAL type** written in the following table.

Example

```

gSQL> SELECT
    TO_DATE( '2012-05-05' ) - TO_DATE( '2012-01-01' ) AS RESULT
  FROM DUAL;
RESULT
-----
      125
1 row selected.
gSQL> SELECT TO_DATE( '2012-05-05' ) - 3 AS RESULT FROM DUAL;
RESULT
-----
2012-05-02
1 row selected.
gSQL> SELECT
    TO_DATE( '2012-05-05' ) - INTERVAL'01-02'YEAR TO MONTH AS RESULT
  FROM DUAL;
RESULT
-----
2011-03-05
1 row selected.
gSQL> SELECT
    INTERVAL'05-11'YEAR TO MONTH - INTERVAL'02-01'YEAR TO MONTH
  AS RESULT
  FROM DUAL;

```

RESULT

+000003-10

1 row selected.

```
gSQL> SELECT INTERVAL '15 23:59:59.999999' DAY TO SECOND
        - INTERVAL '10 23:59:59.999999' DAY TO SECOND AS RESULT
        FROM DUAL;
```

RESULT

+000005 00:00:00.000000

1 row selected.

/ (DIVISION)

Syntax

expr1 / expr2

Description

It returns the division result of expr1 and expr2.

The division types and result types are as follows.
For more information, refer to **Type Conversion**.

Table 11-54 Numeric / operation

expr1	expr2	Result type
NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_DOUBLE
NUMBER	NUMBER	NUMBER
NATIVE_DOUBLE	NATIVE_DOUBLE	NATIVE_DOUBLE

Table 11-55 (DATETIME/INTERVAL) / operation

expr1	expr2	Result type
INTERVAL YEAR TO MONTH	Numeric type	INTERVAL YEAR TO MONTH (The result type is interval type.)
INTERVAL DAY TO SECOND	Numeric type	INTERVAL DAY TO SECOND (The result type is interval type.)
Refer to INTERVAL type details which is included in INTERVAL type written in the following table.		

Example

```
gSQL> SELECT INTERVAL'20-10'YEAR TO MONTH / 2 AS RESULT FROM DUAL;  
RESULT  
-----  
+000010-05  
1 row selected.  
gSQL> SELECT INTERVAL'02 02:04:06.800000'DAY TO SECOND / 2 AS RESULT  
FROM DUAL;
```

RESULT

+000001 01:02:03.400000

1 row selected.

|| (CONCATENATE)

Syntax

str1 || str2

Description

CONCATENATE returns the string concatenating str1 and str2.
If either str1 or str2 is NULL, the string except NULL is returned. If both of str1 and str2 are NULL, NULL is returned.

The argument can be a type which can be converted to either character string type or binary string type.
For more information, refer to **Type Conversion**.

It is an alias of **CONCAT**, **CONCATENATE**.

The result types are as follows.

Table 11-56 The result types of || (CONCATENATE)

Data type	CHAR	VARCHAR	LONG VARCHAR
CHAR	CHAR	VARCHAR	LONG VARCHAR
VARCHAR	VARCHAR	VARCHAR	LONG VARCHAR
LONG VARCHAR	LONG VARCHAR	LONG VARCHAR	LONG VARCHAR
Data type	BINARY	VARBINARY	LONG VARBINARY
BINARY	BINARY	VARBINARY	LONG VARBINARY
VARBINARY	VARBINARY	VARBINARY	LONG VARBINARY
LONG VARBINARY	LONG VARBINARY	LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT 'DATA' || 'BASE' AS RESULT1,  
            'DATA' || NULL  AS RESULT2,  
            NULL || NULL   AS RESULT3  
FROM DUAL;  
RESULT1  RESULT2  RESULT3  
-----  -  
DATABASE DATA    null  
1 row selected.
```

ABS

Syntax

```
ABS( num )
```

Description

ABS returns the absolute value of num.

The num argument can be a numeric type or types which can be converted to number.

Example

```
gSQL> SELECT ABS(-1) AS RESULT1, ABS(1) AS RESULT2 FROM DUAL;  
RESULT1 RESULT2  
-----  
1      1  
1 row selected.
```

ACOS

Syntax

ACOS(num)

Description

ACOS returns the arc cosine value of num.

The num argument should be in the range of -1 to 1.

It returns the radians value in the range of 0 and pi.

Example

```
gSQL> SELECT ACOS( 1 ) FROM DUAL;
```

```
ACOS( 1 )
```

```
-----
```

```
0
```

```
1 row selected.
```

ADDDATE

Syntax

```
ADDDATE( date, INTERVAL expr unit )  
ADDDATE( expr, days )
```

Description

ADDDATE adds the second argument to the first argument, then returns the result.

If any of the input argument value is NULL, the result is also NULL.

The first argument data type can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, and the second argument data type can be INTERVAL or numeric.

The result type is as same as **(DATETIME/INTERVAL) + operation**.

Example

```
gSQL> SELECT ADDDATE( TO_DATE( '2012-12-12', 'YYYY-MM-DD' ), 1 ) AS RESULT  
        FROM DUAL;  
RESULT  
-----  
2012-12-13  
1 row selected.  
gSQL> SELECT ADDDATE( TO_DATE( '2012-12-12', 'YYYY-MM-DD' ),  
                      INTERVAL '01-01' YEAR TO MONTH ) AS RESULT  
        FROM DUAL;  
RESULT  
-----  
2014-01-12  
1 row selected.
```

ADDTIME

Syntax

```
ADDTIME( expr1, expr2 )
```

Description

ADDTIME adds expr2 to expr1, then returns the result.

If expr1 or expr2 is NULL, the result is NULL.

expr1 data type can be TIME, TIME WITH TIME ZONE, TIMESTAMP, TIMESTAMP WITH TIME ZONE TYPE, and expr2 data type can be INTERVAL DAY TO SECOND TYPE.

The result type is as same as **(DATETIME/INTERVAL) + operation**.

Example

```
gSQL> SELECT
      ADDTIME( TO_TIMESTAMP( '2001-05-10 11:22:33',
                           'YYYY-MM-DD HH24:MI:SS' ),
              INTERVAL '0 01:02:03.999999'DAY TO SECOND ) AS RESULT
      FROM DUAL;
RESULT
-----
2001-05-10 12:24:36.999999
1 row selected.
```

ADD_MONTHS

Syntax

```
ADD_MONTHS( date, number )
```

Description

ADD_MONTHS adds as many month as the number to the date, then returns the result.

If any of the input argument is NULL, the result is NULL.

After ADD_MONTHS operation, if the date is bigger than the last day of the month, it is adjusted to the last day of the month.

The data type of date argument can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, and the number argument can be a numeric type.

The result type is always DATE regardless of the input argument date type.

Example

```
gSQL> SELECT
      ADD_MONTHS( TO_DATE( '2001-07-31', 'YYYY-MM-DD' ), 1 ) AS RESULT1,
      ADD_MONTHS( TO_DATE( '2001-07-31', 'YYYY-MM-DD' ), 2 ) AS RESULT2
    FROM DUAL;
RESULT1    RESULT2
-----
2001-08-31 2001-09-30
1 row selected.
```

ASCII

Syntax

ASCII(char)

Description

It returns the database character set code of the first character of char in decimal form.

The data type of char can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING or can be a type which can be converted to a character type, and the return type is NUMBER.

Example

```
gSQL> SELECT ASCII( 'G' ) AS RESULT FROM DUAL;  
RESULT  
-----  
      71  
1 row selected.
```

ASIN

Syntax

ASIN(num)

Description

ASIN returns the arc sin value of num.

The num argument should be in the range of -1 to 1.

It returns the radians value in the range of -pi/2 and pi/2.

Example

```
gSQL> SELECT ASIN( 0 ) FROM DUAL;
```

```
ASIN( 0 )
```

```
-----
```

```
0
```

```
1 row selected.
```

ATAN

Syntax

ATAN(num)

Description

ATAN returns the arc tangent value of num.

The num value range is not limited. It returns the radians value in the range of $-\pi/2$ and $\pi/2$.

Example

```
gSQL> SELECT ATAN( 1 ) FROM DUAL;  
          ATAN( 1 )  
-----  
.785398163397448  
1 row selected.
```

ATAN2

Syntax

```
ATAN2( num1, num2 )
```

Description

ATAN2 returns the arc tangent value of num1 and num2.

The num1 argument value range is not limited. It returns the radians value in the range of -pi and pi.

Example

```
gSQL> SELECT ATAN2( 1, 0 ) FROM DUAL;  
      ATAN2( 1, 0 )  
-----  
1.5707963267949  
1 row selected.
```

AVG

Syntax

```
AVG( [ ALL | DISTINCT ] num )
```

Description

It is an aggregate function, and it obtains average value of exprs.

If ALL is explicitly specified, aggregation is executed for all values.

If DISTINCT is explicitly specified, aggregation is executed for the values which exclude duplicate values.

If ALL or DISTINCT is not explicitly specified, it is processed in the same way as when ALL is specified.

Example

```
gSQL> SELECT AVG(c1) FROM t1;
```

```
AVG(C1)
```

```
-----
```

```
2
```

```
1 row selected.
```

BITAND

Syntax

```
BITAND( num1, num2 )
```

Description

It returns the AND operation result for the bits of num1 and num2.

The input argument data type can be NATIVE_SMALLINT, NATIVE_INTEGER, NATIVE_BIGINT or a data type which can be converted to NATIVE_BIGINT.

When converting to NATIVE_BIGINT type, the decimal point is truncated.

The result type is NATIVE_BIGINT.

Example

```
gSQL> SELECT BITAND( 5, 3 ) AS RESULT FROM DUAL;  
RESULT  
-----  
      1  
1 row selected.
```

BITNOT

Syntax

```
BITNOT( num )
```

Description

It returns the NOT operation result for the num bit.

The input argument data type can be `NATIVE_SMALLINT`, `NATIVE_INTEGER`, `NATIVE_BIGINT` or a data type which can be converted to `NATIVE_BIGINT`.

When converting to `NATIVE_BIGINT` type, the decimal point is truncated.

The result type is as follows.

- If the input argument is `NATIVE_SMALLINT` type, its result type is `NATIVE_SMALLINT` type.
- If the input argument is `NATIVE_INTEGER` type, its result type is `NATIVE_INTEGER` type.
- If the input argument is `NATIVE_BIGINT` type, its result type is `NATIVE_BIGINT` type.

Example

```
gSQL> SELECT BITNOT( 5 ) AS RESULT FROM DUAL;
```

```
RESULT
```

```
-----
```

```
      -6
```

```
1 row selected.
```

BITOR

Syntax

```
BITOR( num1, num2 )
```

Description

It returns the OR operation result for the bits of num1 and num2.

The input argument data type can be NATIVE_SMALLINT, NATIVE_INTEGER, NATIVE_BIGINT types or a data type which can be converted to NATIVE_BIGINT type.

When converting to NATIVE_BIGINT type, the decimal point is truncated.

The result type is NATIVE_BIGINT type.

Example

```
gSQL> SELECT BITOR( 5, 3 ) FROM DUAL;  
BITOR( 5, 3 )  
-----  
              7  
1 row selected.
```

BITXOR

Syntax

```
BITXOR( num1, num2 )
```

Description

It returns the XOR operation result for the bits of num1 and num2.

The input argument data type can be `NATIVE_SMALLINT`, `NATIVE_INTEGER`, `NATIVE_BIGINT` or a data type which can be converted to `NATIVE_BIGINT`.

When converting to `NATIVE_BIGINT` type, the decimal point is truncated.

The result type is `NATIVE_BIGINT`.

Example

```
gSQL> SELECT BITXOR( 5, 3 ) FROM DUAL;  
BITXOR( 5, 3 )  
-----  
6  
1 row selected.
```

BIT_LENGTH

Syntax

```
BIT_LENGTH( str )
```

Description

BIT_LENGTH returns the number of bits for str.

Example

```
gSQL> SELECT BIT_LENGTH( 'LIKE' ) AS RESULT FROM DUAL;  
RESULT  
-----  
32  
1 row selected.
```

BYTE_LENGTH

Syntax

```
BYTE_LENGTH( str )
```

Description

It is an alias of OCTET_LENGTH.

For more information, refer to [OCTET_LENGTH](#), [LENGTHB](#).

Example

- Multi byte character set (e.g. UTF8): 1 byte character

```
gSQL> SELECT BYTE_LENGTH( 'OCTET_LENGTH' ) AS RESULT_1BYTE_CHARACTERS
      FROM DUAL;
RESULT_1BYTE_CHARACTERS
-----
                        12
1 row selected.
```

- Multi byte character set (e.g. UTF8): 2 byte character

```
gSQL> SELECT BYTE_LENGTH( 'αβ' ) AS RESULT_2BYTE_CHARACTERS FROM DUAL;
RESULT_2BYTE_CHARACTERS
-----
                        4
1 row selected.
```

CASE2

Syntax

```
CASE2( condition1, result1
      [, condition2, result2
      , ...
      , conditionN, resultN ]
      [, default ] )
```

Description

CASE2 evaluates the condition in the described order.

If the comparison result is FALSE, it continues evaluating until TRUE comes up.

If the comparison result is TRUE, it returns the corresponding result, and does not evaluate any more.

If all the comparison results are FALSE, it returns the default value. If the default is omitted, it returns NULL.

The result type is the data type of result1 (the first result).

If the data type of result1 (the first result) is a numeric type and a character type then each data type includes the range of result1, ..., resultN.

If result1 (the first result) is CHAR or NULL, then the result type is VARCHAR.

CASE2 can be expressed by using CASE as follows.

- CASE2(condition1, res1, condition2, res2)

```
CASE WHEN condition1 THEN res1
      WHEN condition2 THEN res2
      ELSE NULL
END
```

- CASE2(condition1, res1, condition2, res2, default)

```
CASE WHEN condition1 THEN res1
      WHEN condition2 THEN res2
      ELSE default
END
```

Example

```
gSQL> SELECT I1,  
           CASE2( I1 = 1, 'ONE', I1 = 2, 'TWO' ) AS CASE2_RESULT1,  
           CASE2( I1 = 1, 'ONE', I1 = 2, 'TWO', 'NUMBER' ) AS CASE2_RESULT2  
           FROM T1;  
I1 CASE2_RESULT1 CASE2_RESULT2  
-- -----  
1 ONE          ONE  
2 TWO          TWO  
3 null         NUMBER  
3 rows selected.
```

CBRT

Syntax

```
CBRT( num )
```

Description

It returns the cube root of num.

If the num argument is NULL, the result is also NULL.

Example

```
gSQL> SELECT CBRT( 27 ) FROM DUAL;  
CBRT( 27 )  
-----  
          3  
1 row selected.
```

CEIL

Syntax

```
CEIL( num )  
CEILING( num )
```

Description

CEIL returns the smallest integer which is equal to or bigger than num.

Example

```
gSQL> SELECT CEIL( 3.5 ) AS RESULT1, CEIL( -3.5 ) AS RESULT2 FROM DUAL;  
RESULT1 RESULT2  
-----  
4      -3  
1 row selected.
```

CHAR_LENGTH

Syntax

```
CHAR_LENGTH( str )  
CHARACTER_LENGTH( str )
```

Description

CHAR_LENGTH returns the number of character for str according to the character set.

The str can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or it can be a data type which can be converted to character type. The return type is NATIVE_BIGINT.

If the data type of str is CHARACTER, the trailing blanks are included in the calculation.
If str is NULL, it returns NULL.

It is an alias of **LENGTH**.

Example

Multi byte character set: (e.g. UTF8)

```
gSQL> SELECT CHAR_LENGTH( 'αβ-SUMMER' ) AS RESULT FROM DUAL;  
      RESULT  
-----  
              9  
1 row selected.
```

CHR

Syntax

CHR(num)

Description

It returns a character in the database character set code corresponding to num.

An input argument can be a numeric type and the return type is VARCHAR.

Example

```
gSQL> SELECT CHR(71) FROM DUAL;  
CHR(71)  
-----  
G  
1 row selected.
```

CLOCK_DATE

Syntax

CLOCK_DATE()

Description

Whenever the CLOCK_DATE function is called, the current date (DATE type) value is obtained.

The differences among the functions to obtain the current date are as follows.

- TRANSACTION_DATE(): All date values in the transaction are same.
- STATEMENT_DATE(): All date values in an SQL statement are same.
- CLOCK_DATE(): Whenever the function is called, the current date value is obtained.

Example

Each row can have a different date value.

```
gSQL> SELECT CLOCK_DATE() FROM t1;
CLOCK_DATE()
-----
2013-12-12
2013-12-12
2013-12-13
3 rows selected.
```

CLOCK_LOCALTIME

Syntax

```
CLOCK_LOCALTIME()
```

Description

Whenever the `CLOCK_LOCALTIME` function is called, the current time value without TIME ZONE (TIME WITHOUT TIME ZONE type) is obtained.

The differences among the functions to obtain the current time are as follows.

- `TRANSACTION_LOCALTIME()`: All time values in the transaction are same.
- `STATEMENT_LOCALTIME()`: All time values in an SQL statement are same.
- `CLOCK_LOCALTIME()`: Whenever the function is called, the current time value is obtained.

Example

Each row can have a different time value.

```
gSQL> SELECT CLOCK_LOCALTIME() FROM t1;
CLOCK_LOCALTIME()
-----
14:42:05.470757
14:42:05.470759
14:42:05.470759
3 rows selected.
```

CLOCK_LOCALTIMESTAMP

Syntax

```
CLOCK_LOCALTIMESTAMP()
```

Description

Whenever the `CLOCK_LOCALTIMESTAMP()` function is called, the current `TIMESTAMP` value without `TIME ZONE` (`TIMESTAMP WITHOUT TIME ZONE` type) is obtained.

The differences among the functions to obtain the current `TIMESTAMP` are as follows.

- `TRANSACTION_LOCALTIMESTAMP()`: All `TIMESTAMP` values in the transaction are same.
- `STATEMENT_LOCALTIMESTAMP()`: All `TIMESTAMP` values in an SQL statement are same.
- `CLOCK_LOCALTIMESTAMP()`: Whenever the function is called, the current timestamp value is obtained.

Example

Each row can have a different timestamp value.

```
gSQL> SELECT CLOCK_LOCALTIMESTAMP() FROM t1;
CLOCK_LOCALTIMESTAMP()
-----
2013-12-12 14:46:17.309206
2013-12-12 14:46:17.309209
2013-12-12 14:46:17.309209
```

CLOCK_TIME

Syntax

CLOCK_TIME()

Description

Whenever the `CLOCK_TIME()` function is called, the current time value with TIME ZONE (TIME WITH TIME ZONE type) is obtained.

The differences among the functions to obtain the current time are as follows.

- `TRANSACTION_TIME()`: All time values in the transaction are same.
- `STATEMENT_TIME()`: All time values in an SQL statement are same.
- `CLOCK_TIME()`: Whenever the function is called, the current time value is obtained.

Example

Each row can have a different time value.

```
gSQL> SELECT CLOCK_TIME() FROM t1;
CLOCK_TIME()
-----
14:48:21.052324 +09:00
14:48:21.052326 +09:00
14:48:21.052327 +09:00
3 rows selected.
```

CLOCK_TIMESTAMP

Syntax

```
CLOCK_TIMESTAMP()
```

Description

Whenever `CLOCK_TIMESTAMP()` function is called, the current `TIMESTAMP` value with `TIME ZONE` (`TIMESTAMP WITH TIME ZONE` type) is obtained.

The differences among the functions to obtain the current `TIMESTAMP` are as follows.

- `TRANSACTION_TIMESTAMP()`: All `TIMESTAMP` values in the transaction are same.
- `STATEMENT_TIMESTAMP()`: All `TIMESTAMP` values in an SQL statement are same.
- `CLOCK_TIMESTAMP()`: Whenever the function is called, the current `TIMESTAMP` value is obtained.

Example

Each row can have a different timestamp value.

```
gSQL> SELECT CLOCK_TIMESTAMP() FROM t1;
CLOCK_TIMESTAMP()
-----
2013-12-12 14:49:45.051709 +09:00
2013-12-12 14:49:45.051714 +09:00
2013-12-12 14:49:45.051714 +09:00
3 rows selected.
```

COALESCE

Syntax

```
COALESCE( expr1, ..., exprN )
```

Description

It returns the first non null expr in the expr list.

If all expr in the expr list are null, it returns null.

In the expr list, there should be two or more expr.

If multiple types are in the expr list, the result type is determined by the **Result Type Combination Rule**.

COALESCE can be expressed by using CASE as follows.

- COALESCE(expr1, expr2)

```
CASE WHEN expr1 IS NOT NULL THEN expr1
      ELSE expr2
END
```

- COALESCE(expr1, expr2, ..., exprN)

```
CASE WHEN expr1 IS NOT NULL THEN expr1
      ELSE COALESCE( expr2, ..., exprN )
END
```

Example

```
gSQL> SELECT COALESCE( NULL, 1, 2 ) FROM DUAL;
COALESCE( NULL, 1, 2 )
-----
1
1 row selected.
gSQL> SELECT COALESCE( NULL, NULL, NULL ) FROM DUAL;
COALESCE( NULL, NULL, NULL )
-----
null
1 row selected.
```

CONCAT

Syntax

```
CONCAT( str1, str2, ... )
```

Description

It is an alias of || (CONCATENATE).

It is an argument of CONCAT function and 2 ~ 254 number of CONCATs can be set.

For more information, refer to **|| (CONCATENATE), CONCATENATE**.

Example

```
gSQL> SELECT CONCAT( 'DATA', 'BASE' ) AS RESULT FROM DUAL;  
RESULT  
-----  
DATABASE  
1 row selected.
```

CONCATENATE

Syntax

```
CONCATENATE( str1, str2, ... )
```

Description

It is an alias of `||` (`CONCATENATE`).

It is an argument of `CONCATENATE` function and 2 ~ 254 number of `CONCATENATE`s can be set.

For more information, refer to **CONCAT**, **||** (`CONCATENATE`).

Example

```
gSQL> SELECT CONCATENATE( 'DATA', 'BASE' ) AS RESULT FROM DUAL;  
RESULT  
-----  
DATABASE  
1 row selected.
```

COS

Syntax

```
COS(num)
```

Description

It returns the COSINE value of num.

If the num argument is NULL, the result is also NULL.

Example

```
gSQL> SELECT COS( 0 ) FROM DUAL;  
COS( 0 )  
-----  
          1  
1 row selected.
```

COT

Syntax

COT(num)

Description

It returns the COTANGENT value of num.

If the num argument is NULL, the result is also NULL.

Example

```
gSQL> SELECT COT( 1 ) FROM DUAL;  
          COT( 1 )  
-----  
.642092615934331  
1 row selected.
```

COUNT

Syntax

```
COUNT( [ ALL | DISTINCT ] expr )
```

Description

It is an aggregate function. It returns the number of rows whose expr is not NULL.

If ALL is explicitly specified, aggregation is executed for all values.

If DISTINCT is explicitly specified, aggregation is executed for the values which exclude duplicate values.

If ALL or DISTINCT is not explicitly specified, it is processed in the same way as when ALL is specified.

Example

```
gSQL> SELECT COUNT(c1) FROM t1;
COUNT(C1)
-----
          3
1 row selected.
```

COUNT(*)

Syntax

COUNT(*)

Description

It is an aggregate function, and the number of rows is obtained.

It has nothing to do with whether it is NULL or not because an expression is not explicitly specified.

Example

```
gSQL> SELECT COUNT(*) FROM t1;
COUNT(*)
-----
         4
1 row selected.
```

CURRENT_CATALOG

Syntax

CURRENT_CATALOG [()]

Description

The catalog name (database name) is obtained.

Example

```
gSQL> SELECT CURRENT_CATALOG FROM dual;  
CURRENT_CATALOG  
-----  
TEST_DB  
1 row selected.
```

CURRENT_DATE

Syntax

```
CURRENT_DATE [()]  
STATEMENT_DATE()
```

Description

The current date (DATE type) is obtained.

CURRENT_DATE is an SQL standard function.

The differences among the functions to obtain the current date are as follows.

- TRANSACTION_DATE(): All date values in the transaction are same.
- CURRENT_DATE, STATEMENT_DATE(): All date values in an SQL statement are same.
- CLOCK_DATE(): Whenever the function is called, the current date value is obtained.

Example

```
gSQL> SELECT CURRENT_DATE FROM t1;  
CURRENT_DATE  
-----  
2013-12-12  
2013-12-12  
2013-12-12  
3 rows selected.
```

CURRENT_SCHEMA

Syntax

CURRENT_SCHEMA [()]

Description

User's current SCHEMA is obtained.

Example

```
gSQL> SELECT CURRENT_SCHEMA FROM dual;  
CURRENT_SCHEMA  
-----  
PUBLIC  
1 row selected.
```

CURRENT_TIME

Syntax

```
CURRENT_TIME [( )]
STATEMENT_TIME()
```

Description

The current TIME WITH TIME ZONE type value based on the session time is obtained.

CURRENT_TIME is an SQL standard function.

The differences among the functions to obtain the current time are as follows.

- TRANSACTION_TIME(): All time values in the transaction are same.
- CURRENT_TIME, STATEMENT_TIME(): All time values in an SQL statement are same.
- CLOCK_TIME(): Whenever the function is called, the current time value is obtained.

Example

All rows have the same value.

```
gSQL> SELECT CURRENT_TIME FROM t1;
CURRENT_TIME
-----
16:27:10.116396 +09:00
16:27:10.116396 +09:00
16:27:10.116396 +09:00
3 rows selected.
```

CURRENT_TIMESTAMP

Syntax

```
CURRENT_TIMESTAMP [()]  
STATEMENT_TIMESTAMP()
```

Description

It obtains the TIMESTAMP WITH TIME ZONE type value based on the session time.

CURRENT_TIMESTAMP is an SQL standard function.

The differences among the functions to obtain the current TIMESTAMP are as follows.

- TRANSACTION_TIMESTAMP(): All TIMESTAMP values in the transaction are same.
- CURRENT_TIMESTAMP, STATEMENT_TIMESTAMP(): All TIMESTAMP values in an SQL statement are same.
- CLOCK_TIMESTAMP(): Whenever the function is called, the current timestamp value is obtained.

Example

All rows have the same value.

```
gSQL> SELECT CURRENT_TIMESTAMP FROM t1;  
CURRENT_TIMESTAMP  
-----  
2013-12-12 16:34:55.649632 +09:00  
2013-12-12 16:34:55.649632 +09:00  
2013-12-12 16:34:55.649632 +09:00  
3 rows selected.
```

CURRENT_USER

Syntax

`CURRENT_USER [()]`

Description

It returns the current user.

The user information is managed in three types as follows.

- Logon user: It is a user who performed login, and it is maintained until the connection is closed.
- Session user: It is as same as the first logon user, but it can be changed using the SET SESSION AUTHORIZATION statement.
- Current user: It is generally as same as the session user, but it is temporarily changed internally in system to control access when using the PSM, view.
 - The session user and current user is similar to the difference between the unix system's real user and the effective user.

Example

```
% gsql sys gliese
gSQL> SET SESSION AUTHORIZATION test;
Session set.
gSQL> SELECT
    LOGON_USER() AS result1,
    SESSION_USER() AS result2,
    CURRENT_USER() AS result3
FROM DUAL;
RESULT1 RESULT2 RESULT3
-----
SYS      TEST      TEST
1 row selected.
```

CURRVAL

Syntax

```
seq_name.CURRVAL  
CURRVAL(seq_name)
```

Description

The current value of the sequence object is obtained.

A sequence value should be set with NEXTVAL(seq_name) at least once.

Example

```
gSQL> SELECT seq.CURRVAL FROM dual;  
SEQ.CURRVAL  
-----  
1  
1 row selected.
```

DATEADD

Syntax

```
DATEADD( datepart, number, date )
```

Description

It adds number to the specified datepart of date, and returns the result.

If the number is decimal point, it is not rounded off.

The date data type can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIME, TIME WITH TIME ZONE.

If number or date is NULL, the result is also NULL.

The result type which is as same as the input date argument type is returned.

Table 11-57 Available string format in datepart

datepart	Description
YEAR	Year
QUARTER	Quarter
MONTH	Month
DAYOFYEAR	Day of year
DAY	Day
WEEK	Week
WEEKDAY	Weekday
HOUR	Hour
MINUTE	Minute
SECOND	Second
MILLISECOND	Millisecond
MICROSECOND	Microsecond

Example

```
gSQL> SELECT
      DATEADD( YEAR, 1, TO_DATE( '2013-05-14', 'YYYY-MM-DD' ) ) AS RESULT
FROM DUAL;

RESULT
-----
```

2014-05-14

1 row selected.

gSQL> SELECT

DATEADD(MONTH, 13, TO_DATE('2013-05-14', 'YYYY-MM-DD')) AS RESULT

FROM DUAL;

RESULT

2014-06-14

1 row selected.

gSQL> SELECT

DATEADD(DAY, 397, TO_DATE('2013-05-14', 'YYYY-MM-DD')) AS RESULT

FROM DUAL;

RESULT

2014-06-15

1 row selected.

DATEDIFF

Syntax

DATEDIFF(datepart, startdate, enddate)

Description

It subtracts startdate from enddate, then returns the result to the specified datepart.

If the startdate or enddate is NULL, the result is also NULL.

The data type of startdate and enddate can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIME.

The result type is NUMBER.

Table 11-58 Available string format in datepart

datepart	Description
YEAR	Year
QUARTER	Quarter
MONTH	Month
DAYOFYEAR	Day of year
DAY	Day
HOUR	Hour
MINUTE	Minute
SECOND	Second
MILLISECOND	Millisecond
MICROSECOND	Microsecond

Example

```
gSQL> SELECT
      DATEDIFF( YEAR,
                TO_DATE( '2013-05-14', 'YYYY-MM-DD' ),
                TO_DATE( '2014-06-15', 'YYYY-MM-DD' ) ) AS RESULT
      FROM DUAL;

RESULT
-----
      1
1 row selected.
```

```
gSQL> SELECT
    DATEDIFF( MONTH,
              TO_DATE( '2013-05-14', 'YYYY-MM-DD' ),
              TO_DATE( '2014-06-15', 'YYYY-MM-DD' ) ) AS RESULT
  FROM DUAL;
```

RESULT

13

1 row selected.

```
gSQL> SELECT
    DATEDIFF( DAY,
              TO_DATE( '2013-05-14', 'YYYY-MM-DD' ),
              TO_DATE( '2014-06-15', 'YYYY-MM-DD' ) ) AS RESULT
  FROM DUAL;
```

RESULT

397

1 row selected.

DATE_ADD

Syntax

```
DATE_ADD( date, INTERVAL expr unit )
```

Description

It is the same function as **ADDDATE** (date, INTERVAL expr unit).

Example

```
gSQL> SELECT
      DATE_ADD( TO_DATE( '2012-01-02', 'YYYY-MM-DD' ),
                INTERVAL '2-2' YEAR TO MONTH ) AS RESULT
      FROM DUAL;
RESULT
-----
2014-03-02
1 row selected.
```

DATE_PART

Syntax

```
DATE_PART( field, datetime )
```

Description

The result of DATE_PART is as same as the result of the EXTRACT function. It searches for the specified field from the input datetime type, and returns it.

The field argument should be text literal, and YEAR, MONTH, DAY, HOUR, MINUTE, SECOND, TIMEZONE_HOUR, TIMEZONE_MINUTE can be specified to text literal.

The datetime argument data type can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIME, TIME WITH TIME ZONE, INTERVAL.

If field is not in the range of datetime, an error is returned. For DATE type, field should be YEAR, MONTH, DAY, otherwise an error is returned.

The return type is NUMBER.

For more information, refer to **EXTRACT**.

Example

```
gSQL> SELECT
    DATE_PART( 'DAY', TO_DATE( '2012-01-02', 'YYYY-MM-DD' ) ) AS RESULT
FROM DUAL;
RESULT
-----
      2
1 row selected.
gSQL> SELECT
    DATE_PART( 'YEAR', INTERVAL '9-11' YEAR TO MONTH ) AS RESULT
FROM DUAL;
RESULT
-----
      9
1 row selected.
```

DECODE

Syntax

```
DECODE( expr, comparison_expr1, result1
      [, comparison_expr2, result2
      , ...
      , comparison_exprN, resultN ]
      [, default ] )
```

Description

It evaluates *expr* and *comparison_expr* in the described order in DECODE statement using equal operation.

If the comparison result is FALSE, it continues evaluating until TRUE comes up.

If the comparison result is TRUE, it returns the corresponding result, and does not evaluate any more.

If *expr* and *comparison_expr* are equal, or if both *expr* and *comparison_expr* are NULL(null = null), it is evaluated as TRUE, and returns the corresponding result.

If all of the evaluated results are FALSE, it returns default. If the default is omitted, it returns NULL.

- Comparing *expr* and *comparison_expr*
All *expr*, *comparison_expr1*, ..., *comparison_exprN* are converted to the data type of *comparison_expr1* (the first *comparison_expr*), then they are compared.
If *comparison_expr1* (the first *comparison_expr*) is a character type and a numeric type then it becomes the type including the range of types described in each *expr*, *comparison_expr1*, ..., *comparison_exprN*.
If all types described in *expr*, *comparison_expr1*, ..., *comparison_exprN* are CHAR, then VARCHAR type comparison is performed.
- Result type
The result type becomes the data type of *result1* (the first result).
If the data type of *result1* (the first result) is a character type and a numeric type then it becomes the type including the range of types described in *result1*, ..., *resultN* each.
If *result1* (the first result) is CHAR or NULL, then the result type is VARCHAR.

DECODE can be expressed by using CASE as follows.

- DECODE(*expr*, *comp_expr1*, *res1*, *comp_expr2*, *res2*)

```

CASE WHEN (expr = comp_expr1) OR (expr IS NULL AND comp_expr1 IS NULL ) THEN res1
      WHEN (expr = comp_expr2) OR (expr IS NULL AND comp_expr2 IS NULL ) THEN res2
      ELSE NULL
END

```

- DECODE(expr, comp_expr1, res1, comp_expr2, res2, default)

```

CASE WHEN (expr = comp_expr1) OR (expr IS NULL AND comp_expr1 IS NULL ) THEN res1
      WHEN (expr = comp_expr2) OR (expr IS NULL AND comp_expr2 IS NULL ) THEN res2
      ELSE default
END

```

Example

```

gSQL> SELECT I1,
           DECODE( I1, 1, 'ONE',
                  2, 'TWO',
                  NULL, 'NULL VALUE',
                  'DEFAULT VALUE' ) AS DECODE_RESULT
FROM T1;
I1 DECODE_RESULT
----
1 ONE
2 TWO
null NULL VALUE
3 DEFAULT VALUE
4 rows selected.

```

DEGREES

Syntax

```
DEGREES( radians )
```

Description

It converts a degree radians to a value in degrees, and returns the converted value.

Example

```
gSQL> SELECT DEGREES( PI() ) AS RESULT FROM DUAL;  
RESULT  
-----  
      180  
1 row selected.
```

DIGEST

Syntax

DIGEST(data, type)

Description

It hashes the data to the given type, and returns the result in VARBINARY type.

An implicit conversion may occur when inputting data type based on the following rules.

- Input the BINARY, VARBINARY type data in VARBINARY type.
- Input LONG VARBINARY type data in LONG VARBINARY type.
- Input LONG VARCHAR type data in LONG VARCHAR type.
- Input all other type of data after implicitly converting it to VARCHAR type.

DIGEST function supports the following hash types.

- The result of 'SHA1' is 20 byte varbinary.
- The result of 'SHA224' is 28 byte varbinary.
- The result of 'SHA256' is 32 byte varbinary.
- The result of 'SHA384' is 48 byte varbinary.
- The result of 'SHA512' is 64 byte varbinary.

Use HEX function to view the result in hexadecimal character because the result is returned in VARBINAR Y type. In this case, the length becomes double of the original.

Example

```
gSQL> SELECT HEX( DIGEST( 'my password', 'SHA256' ) ) AS RESULT FROM DUAL;  
RESULT  
-----  
BB14292D91C6D0920A5536BB41F3A50F66351B7B9D94C804DFCE8A96CA1051F2  
1 row selected.
```

DUMP

Syntax

DUMP(expr)

Description

It returns internal representation information of expr.

Internal representation information is displayed as the data type, byte length and data information.

expr can be any data types, and the return type is CHARACTER VARYING.

Example

```
gSQL> SELECT DUMP( 'DUMP' ) AS RESULT FROM DUAL;
```

```
RESULT
```

```
-----
```

```
Type=CHAR Len=4 : Str=68,85,77,80
```

```
1 row selected.
```

EXP

Syntax

EXP(num)

Description

It returns squared value of e (base of natural logarithm)'s num.

Example

```
gSQL> SELECT EXP( 1 ) AS RESULT FROM DUAL;  
          RESULT  
-----  
2.71828182845905  
1 row selected.
```

EXTRACT

Syntax

```
EXTRACT( <field> FROM datetime )
<field> ::=
    YEAR
    | MONTH
    | DAY
    | HOUR
    | MINUTE
    | SECOND
    | TIMEZONE_HOUR
    | TIMEZONE_MINUTE
```

Description

It searches for the specified field from an input datetime type, and returns it.

The datetime argument data type can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIME, TIME WITH TIME ZONE, INTERVAL.

If field is not in the range of datetime, an error is returned.

For DATE type, the field should be YEAR, MONTH, DAY, otherwise an error is returned.

The return type is NUMBER.

Result of EXTRACT is as same as the result of the **DATE_PART** function.

Example

```
gSQL> SELECT
    EXTRACT( SECOND FROM TO_TIMESTAMP( '2012-12-13 01:23:44.5',
                                         'YYYY-MM-DD HH24:MI:SS.FF1' ) )
    AS RESULT
FROM DUAL;
RESULT
-----
    44.5
1 row selected.
gSQL> SELECT
```

```
EXTRACT( YEAR FROM CAST('2-3' AS INTERVAL YEAR TO MONTH) ) AS RESULT  
FROM DUAL;
```

```
RESULT
```

```
-----
```

```
2
```

```
1 row selected.
```

FACTORIAL

Syntax

```
FACTORIAL( num )
```

Description

It multiplies the successive natural numbers from 1 to num in order, and returns the result.

Example

```
gSQL> SELECT FACTORIAL( 5 ) AS RESULT FROM DUAL;  
RESULT  
-----  
      120  
1 row selected.
```

FLOOR

Syntax

```
FLOOR( num )
```

Description

It returns the biggest integer which is equal to or smaller than num.

Example

```
gSQL> SELECT FLOOR(42.8) AS RESULT1, FLOOR(-42.8) AS RESULT2 FROM DUAL;  
RESULT1 RESULT2  
-----  
42      -43  
1 row selected.
```

GREATEST

Syntax

```
GREATEST( expr1 [, expr2, ... exprn ] )
```

Description

It returns the largest value among the received expr argument.

If any expr argument is NULL, the result value is NULL.

The result type becomes the data type of expr1 (the first expr).

If the data type of expr1 (the first expr) is a character type and a numeric type then it becomes the type including the range of expr1, ..., exprN each.

If all of expr1, ..., exprN is described in CHAR type, then all exprs are compared in VARCHAR type and the result type is VARCHAR.

Example

```
gSQL> SELECT GREATEST( 100, 0, 200, 150, 1 ) AS RESULT FROM DUAL;  
RESULT  
-----  
      200  
1 row selected.
```

HEX

Syntax

HEX(str)

Description

It returns a str argument in hexadecimal character.

A str argument data type can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, a type which can be converted to a character type, or a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

The result type is a character type such as CHARACTER VARYING or CHARACTER LONG VARYING.

If str is NULL, then the result value is also NULL.

If an argument of HEX function is a numeric type, then it returns an error.

To convert a decimal number to a hexadecimal number, use TO_CHAR() function by using 'X' number format.

e.g. TO_CHAR(255, 'XX')

For more information, refer to **UNHEX**.

Example

```
gSQL> SELECT HEX( 'abc' ) FROM DUAL;
HEX( 'abc' )
-----
616263
1 row selected.
```

INITCAP

Syntax

```
INITCAP( str )
```

Description

It converts the first letter in each word of string `str` into uppercase, and converts all other letters into lowercase, then it returns the result.

`str` data type can be a character type such as `CHARACTER`, `CHARACTER VARYING`, `CHARACTER LONG VARYING`.

Each word in string is classified by white space or characters which are not alphanumeric.
If `str` is `NULL`, the result is also `NULL`.

The return type is as same as `str` argument datatype.

Example

```
gSQL> SELECT INITCAP( 'hi GLIESE' ) AS RESULT FROM DUAL;  
RESULT  
-----  
Hi Gliese  
1 row selected.
```

INSTR

Syntax

```
INSTR( str, substr [, position [, occurrence ] ] )
```

Description

It search for occurrenceth substr starting from str's position, and returns its location.

The data types of str arguments and substr arguments can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

The position argument and the occurrence argument can be numeric data type.

If position and occurrence are omitted, the default is 1.

The position and occurrence start from 1, and they are calculated in character unit according to character set (not in byte unit).

The position means the first position to search substr in str, it should not be zero, but an integer value.

- If the position is positive: It compares forwards (toward the right) from the beginning of str until it finds the position of substr.
- If the position is negative: It compares backwards (toward the left) from the end of str it finds the position of substr.
- If the position is 0: The result is 0.

The occurrence means the number of repeating the subtr in the str, and it should be a positive integer.

Example

```
gSQL> SELECT INSTR( 'INSTR( STR, SUBSTR )', 'SUB' ) AS RESULT1,
                INSTR( 'INSTR( STR, SUBSTR )', 'SUB', 5 ) AS RESULT2
        FROM DUAL;
RESULT1 RESULT2
-----
      13      13
1 row selected.
gSQL> SELECT INSTR( 'INSTR( STR, SUBSTR )', 'STR', 6, 2 ) AS RESULT1,
                INSTR( 'INSTR( STR, SUBSTR )', 'STR', -6, 2 ) AS RESULT2
```

```
FROM DUAL;  
RESULT1 RESULT2  
-----  
16      3  
1 row selected.
```

LAST_DAY

Syntax

```
LAST_DAY( date )
```

Description

It returns the last day of the month which is included in date.

The date argument data type can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE.

The return type is always DATE regardless of the date argument data type.

Example

```
gSQL> SELECT
      LAST_DAY( TO_DATE( '2012-07-10', 'YYYY-MM-DD' ) ) AS RESULT FROM DUAL;
RESULT
-----
2012-07-31
1 row selected.
```

LAST_IDENTITY_VALUE

Syntax

```
LAST_IDENTITY_VALUE()
```

Description

It is the recent value automatically created for an identity column in the current session, and the result type is `NATIVE_BIGINT`.

If there is not an automatically created value, then it returns null.

This function is similar to `@@IDENTITY` of MS-SQL and `LAST_INSERT_ID()` of MySQL. Be cautious when using it because the last altered table determines the value when performing DML for multiple tables as follows.

```
gSQL> INSERT INTO t1(name) VALUES ( 'leekmo' );
1 row created.
gSQL> SELECT LAST_IDENTITY_VALUE() FROM dual;
LAST_IDENTITY_VALUE()
-----
12
1 row selected.
gSQL> INSERT INTO t2(name) VALUES ( 'leekmo' );
1 row created.
gSQL> SELECT LAST_IDENTITY_VALUE() FROM dual;
LAST_IDENTITY_VALUE()
-----
2
1 row selected.
```

To obtain an identity column value created when performing the INSERT, use **INSERT INTO name RETURNING .. INTO** statement as follows.

```
gSQL> CREATE TABLE t1 ( id INTEGER GENERATED BY DEFAULT AS IDENTITY, name VARCHAR(32) );
Table created.
gSQL> \var v1 integer
gSQL> INSERT INTO t1(name) VALUES ( 'leekmo' ) RETURN id INTO :v1;
V1
--
```

1

1 row created.

Example

The following is an example of using LAST_IDENTITY_VALUE() function.

```
gSQL> CREATE TABLE t1 ( id    INTEGER GENERATED BY DEFAULT AS IDENTITY,
                        name VARCHAR(32) );
```

Table created.

```
gSQL> COMMIT;
```

Commit complete.

- There is not an identity value created in the current session.

```
gSQL> SELECT LAST_IDENTITY_VALUE() FROM dual;
```

```
LAST_IDENTITY_VALUE()
```

```
-----
```

```
                null
```

1 row selected.

- Identity value (1) is automatically created.

```
gSQL> INSERT INTO t1(name) VALUES ( 'leekmo' );
```

1 row created.

- Result: 1

```
gSQL> SELECT LAST_IDENTITY_VALUE() FROM dual;
```

```
LAST_IDENTITY_VALUE()
```

```
-----
```

```
                1
```

1 row selected.

- Identity value (2) is automatically created as a default value.

```
gSQL> UPDATE t1 SET id = DEFAULT;
```

1 row updated.

- Result: 2

```
gSQL> SELECT LAST_IDENTITY_VALUE() FROM dual;
LAST_IDENTITY_VALUE()
-----
                        2
1 row selected.
```

- The user input value does not automatically create an identity value.

```
INSERT INTO t1 VALUES ( 100, 'jhkim' );
1 row updated.
```

- Result: 2

```
SELECT LAST_IDENTITY_VALUE() FROM dual;
LAST_IDENTITY_VALUE()
-----
                        2
1 row selected.
```

LEAST

Syntax

```
LEAST( expr1 [ , expr2, ... exprn ] )
```

Description

It returns the smallest value among received expr arguments.

If any of expr is NULL, the result is NULL.

The result type is determined according to the data type of expr1 (the first expr).

If the data type of expr1 (the first expr) is a character type and a numeric type then it becomes the type including the range of expr1, ..., exprN each.

If all of expr1, ..., exprN is described in CHAR type, then all exprs are compared in VARCHAR type and the result type is VARCHAR.

Example

```
gSQL> SELECT LEAST( 100, 0, 200, 150, 1 ) AS RESULT FROM DUAL;
```

```
RESULT
```

```
-----
```

```
0
```

```
1 row selected.
```

LENGTH

Syntax

```
LENGTH( str )
```

Description

It is an alias of `CHAR_LENGTH`.

Example

Multi byte character set: (e.g.UTF8)

```
gSQL> SELECT LENGTH( 'αβ-SUMMER' ) AS RESULT FROM DUAL;  
RESULT  
-----  
          9  
1 row selected.
```

LENGTHB

Syntax

LENGTHB(str)

Description

It is an alias of **OCTET_LENGTH**.

For more information, refer to **BYTE_LENGTH**.

Example

- Multi byte character set (e.g.UTF8): 1 byte character

```
gSQL> SELECT LENGTHB( 'OCTET_LENGTH' ) AS RESULT_1BYTE_CHARACTERS
      FROM DUAL;
RESULT_1BYTE_CHARACTERS
-----
                        12
1 row selected.
```

- Multi byte character set (e.g.UTF8): 2 byte character

```
gSQL> SELECT LENGTHB( 'αβ' ) AS RESULT_2BYTE_CHARACTERS FROM DUAL;
RESULT_2BYTE_CHARACTERS
-----
                        4
1 row selected.
```

LN

Syntax

```
LN( num )
```

Description

It returns the natural logarithm value of num.
num should be a value which is bigger than 0.

Example

```
gSQL> SELECT LN( 2.71828182845905 ) AS RESULT FROM DUAL;  
RESULT  
-----  
      1  
1 row selected.
```

LOCALTIME

Syntax

```
LOCALTIME [()]  
STATEMENT_LOCALTIME()
```

Description

The current TIME WITHOUT TIME ZONE type value based on the session time is obtained.

LOCALTIME is an SQL standard function.

The differences among the functions to obtain the current time are as follows.

- TRANSACTION_LOCALTIME(): All time values in the transaction are same.
- LOCALTIME, STATEMENT_LOCALTIME(): All time values in an SQL statement are same.
- CLOCK_LOCALTIME(): Whenever the function is called, the current time value is obtained.

Example

All rows have the same value.

```
gSQL> SELECT LOCALTIME FROM t1;  
LOCALTIME  
-----  
16:17:08.592459  
16:17:08.592459  
16:17:08.592459  
3 rows selected.
```

LOCALTIMESTAMP

Syntax

```
LOCALTIMESTAMP [()]  
STATEMENT_LOCALTIMESTAMP()
```

Description

The current TIMESTAMP WITHOUT TIME ZONE type value based on the session time is obtained.

LOCALTIMESTAMP is an SQL standard function.

The differences among the functions to obtain the current TIMESTAMP are as follows.

- TRANSACTION_LOCALTIMESTAMP(): All TIMESTAMP values in the transaction are same.
- LOCALTIMESTAMP, STATEMENT_LOCALTIMESTAMP(): All TIMESTAMP values in an SQL statement are same.
- CLOCK_LOCALTIMESTAMP(): Whenever the function is called, the current timestamp value is obtained.

Example

All rows have the same value.

```
gSQL> SELECT LOCALTIMESTAMP FROM t1;  
LOCALTIMESTAMP  
-----  
2013-12-12 16:21:51.790614  
2013-12-12 16:21:51.790614  
2013-12-12 16:21:51.790614  
3 rows selected.
```

LOCAL_GROUP_ID

Syntax

```
LOCAL_GROUP_ID()
```

Description

It returns a cluster group ID for a server which processes a query from a user.

Note

It is a valid information in a cluster system.

Example

All rows have the same value.

```
gSQL> SELECT LOCAL_GROUP_ID() FROM DUAL;
LOCAL_GROUP_ID()
-----
1
1 row selected.
```

LOCAL_GROUP_NAME

Syntax

```
LOCAL_GROUP_NAME()
```

Description

It returns a cluster group name for a server which processes a query from a user.

Note

It is a valid information in a cluster system.

Example

All rows have the same value.

```
gSQL> SELECT LOCAL_GROUP_NAME() FROM DUAL;  
LOCAL_GROUP_NAME()  
-----  
G1  
1 row selected.
```

LOCAL_MEMBER_ID

Syntax

```
LOCAL_MEMBER_ID()
```

Description

It returns a cluster member ID for a server which processes a query from a user.

Note

It is a valid information in a cluster system.

Example

All rows have the same value.

```
gSQL> SELECT LOCAL_MEMBER_ID() FROM DUAL;  
LOCAL_MEMBER_ID()  
-----  
1  
1 row selected.
```

LOCAL_MEMBER_NAME

Syntax

```
LOCAL_MEMBER_NAME()
```

Description

It returns a cluster member name for a server which processes a query from a user.

Note

It is a valid information in a cluster system.

Example

All rows have the same value.

```
gSQL> SELECT LOCAL_MEMBER_NAME() FROM DUAL;  
LOCAL_MEMBER_NAME()  
-----  
G1N1  
1 row selected.
```

LOG

Syntax

```
LOG( num2 )  
LOG( num1, num2 )
```

Description

It returns the logarithm of num2 in the num1 base.

If num1 is omitted, it returns the logarithm value whose base is 10.

num1 should be a positive number except 1 and 0, and num2 should be a positive number.

Example

```
gSQL> SELECT LOG( 100 ) AS RESULT1, LOG( 4, 16 ) AS RESULT2 FROM DUAL;  
RESULT1 RESULT2  
-----  
2        2  
1 row selected.
```

LOGON_USER

Syntax

```
LOGON_USER()
```

Description

It returns the logged-in user.

The user information is managed in three types as follows.

- Logon user: It is a user who performed login, and it is maintained until the connection is closed.
- Session user: It is as same as the first logon user, but it can be changed using the SET SESSION AUTHORIZATION statement.
- Current user: It is generally as same as the session user, but it is temporarily changed internally in system to control access when using the PSM, view.
 - The session user and current user is similar to the difference between the unix system's real user and the effective user.

Example

```
% gsql test test
gSQL> SELECT LOGON_USER() AS result FROM DUAL;
RESULT
-----
TEST
1 row selected.
```

LOWER

Syntax

```
LOWER( str )
```

Description

It returns lowercases of str.

The str argument data type can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

If str is NULL, the result is also NULL.

The return type is the same datatype as the str argument.

Example

```
gSQL> SELECT LOWER( 'SPRING' ) AS RESULT FROM DUAL;  
RESULT  
-----  
spring  
1 row selected.
```

LPAD

Syntax

LPAD(str, length, [, fill])

Description

It adds character string fill to the left side of str until the string length becomes length, then returns the result.

The str argument data type can be character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, and a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

The length argument is numeric type.

length means the number of characters, and its maximum range is the maximum precision of the result type.

If fill is omitted, a white space is added.

If str is longer than the length, it cuts the str as long as the length, then returns it.

If any of str, length, fill is NULL, the result is also NULL.

If length is 0 or a negative number, the result is NULL.

The following table describes the result types.

Table 11-59 Result type of LPAD

str type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT LPAD( 'aa', 5, 'b' ) AS RESULT FROM DUAL;
RESULT
-----
bbbaa
1 row selected.
```

LTRIM

Syntax

```
LTRIM( trim_source [, trim_character ] )
```

Description

It removes the matching characters by comparing from the left side of trim_character in trim_source until the matching character does not exist. Then it returns the result.

The data type of trim_character and trim_source arguments can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, and a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

If any of trim_character, trim_source is NULL, the result is NULL.

If trim_character is omitted, a single blank space (' ') is specified by default.

The following table describes the result types.

Table 11-60 Result type of LTRIM

trim_source, trim_character type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT LTRIM( '____LTRIM', '_' ) AS RESULT FROM DUAL;  
RESULT  
-----  
LTRIM  
1 row selected.
```

MAX

Syntax

```
MAX( [ ALL | DISTINCT ] expr )
```

Description

It is an aggregate function and the maximum value among rows' exprs is obtained.

If ALL is explicitly specified, aggregation is executed for all values.

If DISTINCT is explicitly specified, aggregation is executed for the values which exclude duplicate values.

If ALL or DISTINCT is not explicitly specified, it is processed in the same way as when ALL is specified.

MAX function returns the same result without being affected by the ALL and DISTINCT.

Example

```
gSQL> SELECT MAX(c1) FROM t1;  
MAX(C1)  
-----  
      3  
1 row selected.
```

MIN

Syntax

```
MIN( [ ALL | DISTINCT ] expr )
```

Description

It is an aggregate function and the minimum value among rows' exprs is obtained.

If ALL is explicitly specified, aggregation is executed for all values.

If DISTINCT is explicitly specified, aggregation is executed for the values which exclude duplicate values.

If ALL or DISTINCT is not explicitly specified, it is processed in the same way as when ALL is specified.

MIN function returns the same result without being affected by the ALL and DISTINCT.

Example

```
gSQL> SELECT MIN(c1) FROM t1;  
MIN(C1)  
-----  
      1  
1 row selected.
```

MOD

Syntax

```
MOD( num1, num2 )
```

Description

It divides num1 by num2, and returns the remainder.

The num1 argument and num2 argument can be a numeric data type.

If num2 is 0, an error is returned.

Example

```
gSQL> SELECT MOD(5, 4) AS RESULT1, MOD(-5, 4) AS RESULT2 FROM DUAL;  
RESULT1 RESULT2  
-----  
1      -1  
1 row selected.
```

MONTHS_BETWEEN

구문

```
MONTHS_BETWEEN( date1, date2 )
```

Description

MONTHS_BETWEEN returns the number of months of which days between date2 and date1 are divided by 31.

If date1 or date2 is NULL, then the result is also NULL.

The date1 argument and date2 argument can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE type.

The result type is NUMBER.

Note

If the same date (e.g. 2014-01-15 and 2014-02-15), or the last day of the month (e.g. 2014-08-31 and 2014-09-30) is included both in date1 and date2, then it returns the integer result regardless of the agreement of timestamp section (if it exists).

Example

```
gSQL> SELECT
      MONTHS_BETWEEN('2018-01-18', '2018-01-17')
    FROM DUAL;
MONTHS_BETWEEN('2018-01-18', '2018-01-17')
-----
                        3.225806451612903E-2
```

1 row selected.

```
gSQL> SELECT
      MONTHS_BETWEEN('2018-02-17', '2018-01-17')
    FROM DUAL;
MONTHS_BETWEEN('2018-02-17', '2018-01-17')
-----
                        1
```

1 row selected.

```
gSQL> SELECT
        MONTHS_BETWEEN('2018-02-28', '2018-01-31')
FROM DUAL;
MONTHS_BETWEEN('2018-02-28', '2018-01-31')
```

```
-----
1
```

```
1 row selected.
```

NEXT_DAY

Syntax

```
NEXT_DAY( date, day )
```

Description

It obtains a date of the day (day of week) which comes first after the given date (an argument).

The second day argument can be a string or a number which indicates the day.

- String: SUNDAY ~ SATURDAY or SUN ~ SAT
- Number: 1 (sunday) ~ 7 (saturday)

The return type is always DATE regardless of the input type of the date.

The hour, minute and second of the result value returns the same hour, minute and second of the input argument date.

Example

```
gSQL> SELECT NEXT_DAY( TO_DATE( '2010-05-01', 'YYYY-MM-DD' ),
                        'SUNDAY' ) AS RESULT1
```

```
FROM DUAL;
```

```
RESULT1
```

```
-----
```

```
2010-05-02
```

```
gSQL> SELECT NEXT_DAY( TO_DATE( '2010-05-01', 'YYYY-MM-DD' ),
                        'SUN' ) AS RESULT1
```

```
FROM DUAL;
```

```
RESULT1
```

```
-----
```

```
2010-05-02
```

```
gSQL> SELECT NEXT_DAY( TO_DATE( '2010-05-01', 'YYYY-MM-DD' ),
                        1 ) AS RESULT1
```

```
FROM DUAL;
```

```
RESULT1
```

```
-----
```

```
2010-05-02
```

```
gSQL> SELECT TO_CHAR( NEXT_DAY( TO_DATE( '2010-05-01', 'YYYY-MM-DD' ),
```

```
        'SUNDAY' ),
      'YYYY-MM-DD HH24:MI:SS' ) AS RESULT2
FROM DUAL;
RESULT2
-----
2010-05-02 00:00:00
```

NEXTVAL

Syntax

```
seq_name.NEXTVAL
NEXTVAL( seq_name )
NEXT VALUE FOR seq_name
```

Description

It obtains the next value of the sequence object.

Example

```
gSQL> CREATE SEQUENCE seq;
Sequence created.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT seq.NEXTVAL FROM dual;
SEQ.NEXTVAL
-----
          1
1 row selected.
gSQL> SELECT NEXTVAL( seq ) FROM dual;
NEXTVAL( SEQ )
-----
          2
1 row selected.
gSQL> SELECT NEXT VALUE FOR seq FROM dual;
NEXT VALUE FOR SEQ
-----
          3
1 row selected.
```

NULLIF

Syntax

```
NULLIF( expr1, expr2 )
```

Description

If expr1 is equal to expr2, it returns NULL. If it is not equal it returns expr1 which is the first argument.

If the data types of expr1 and expr2 are different, the result type is determined by **Result Type Combination Rule**.

NULLIF can be expressed by using CASE as follows.

- NULLIF(expr1, expr2)

```
CASE WHEN expr1 = expr2 THEN NULL
      ELSE expr1
END
```

Example

```
gSQL> SELECT NULLIF( 'SUN', 'SUN' ) AS RESULT1,
              NULLIF( 'SUN', 'MOON' ) AS RESULT2
        FROM DUAL;
RESULT1 RESULT2
-----
null    SUN
1 row selected.
```

NVL

Syntax

```
NVL( expr1, expr2 )
```

Description

If expr1 is not NULL, then it returns expr1. If expr1 is NULL, it returns expr2.

The result type is determined according to the data type of expr1.

If NULL is described in expr1, then the result type is determined according to the data type of expr2.

If the data type of expr1 is a character type and a numeric type then it becomes the type including the range of expr1 and expr2 each.

If the data type of both expr1 and expr2 is CHAR type, then the result type is VARCHAR.

Example

```
gSQL> SELECT I1, NVL( I1, 0 ) FROM T1;
  I1 NVL( I1, 0 )
-----
    1           1
null           0
2 rows selected.
```

NVL2

Syntax

```
NVL2( expr1, expr2, expr3 )
```

Description

If expr1 is not null, then it returns expr2. If expr1 is NULL, it returns expr3.

The result type is determined according to the data type of expr2.

If NULL is described in expr2, then the result type is determined according to the data type of expr3.

If the data type of expr2 is a character type and a numeric type then it becomes the type including the range of expr2 and expr3 each.

If the data type of both expr2 and expr3 is CHAR type, then the result type is VARCHAR.

Example

```
gSQL> SELECT I1, NVL2( I1, I1 * 1000, 0 ) FROM T1;
      I1 NVL2( I1, I1 * 1000, 0 )
-----
      1                1000
null                0
2 rows selected.
```

OCTET_LENGTH

Syntax

```
OCTET_LENGTH( str )
BYTE_LENGTH( str )
LENGTHB( str )
```

Description

It returns the number of bytes in str.

The str argument data type can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or a binary character type such as BINARY, BINARY VARYING, BINARY LONGVARYING.

If the str data type is CHARACTER, the white spaces are included in the calculation.

If str is NULL, the result is also NULL.

It is an alias of **BYTE_LENGTH** and **LENGTHB**.

Example

- Multi byte character set (e.g. UTF8): 1 byte character

```
gSQL> SELECT OCTET_LENGTH( 'OCTET_LENGTH' ) AS RESULT_1BYTE_CHARACTERS
        FROM DUAL;
RESULT_1BYTE_CHARACTERS
-----
                        12
1 row selected.
```

- Multi byte character set (e.g. UTF8): 2 byte character

```
gSQL> SELECT OCTET_LENGTH( 'αβ' ) AS RESULT_2BYTE_CHARACTERS FROM DUAL;
RESULT_2BYTE_CHARACTERS
-----
                        4
1 row selected.
```

OVERLAY

Syntax

OVERLAY(str1 PLACING str2 FROM start_position [FOR string_length])

Description

It overlays the characters in the range between str1's start_position and string_lenght with str2.

The data types of str1 argument and str2 argument can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING

The start_position argument and string_length argument can be numeric data type.

- OVERLAY function has the following result.
 - When FOR is specified.
SUBSTRING(str1 FROM 1 FOR (start_position - 1))
|| str2
|| SUBSTRING(str1 FROM (start_position + string_length)
 - When FOR is omitted.
SUBSTRING(str1 FROM 1 FOR (start_position - 1))
|| str2
|| SUBSTRING(str1 FROM (start_position + CHAR_LENGTH(str2))

For more information, refer to **SUBSTRING**.

The following table describes the result types.

Table 11-61 Result type of OVERLAY

str1, str2 types	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT
      OVERLAY( 'RESULT_OF_XXX_FUNC' PLACING 'OVERLAY' FROM 11 FOR 3 )
      AS RESULT
      FROM DUAL;
RESULT
-----
RESULT_OF_OVERLAY_FUNC
1 row selected.
```

PI

Syntax

PI()

Description

It returns " π " constant.

Example

```
gSQL> SELECT PI() AS RESULT FROM DUAL;  
          RESULT  
-----  
3.141592653589793E+0  
1 row selected.
```

POSITION

Syntax

```
POSITION( str1 IN str2 )
```

Description

It searches for the first str1 within str2, then returns its location.

The data type of str1 argument and str2 argument can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

If str1 can not be found within str2, the return value is 0.

If str1 is found within str2, the position of str1 is returned, and the return value starts from 1.

The returned position value is calculated in character unit (not in byte unit).

If str1 or str2 is NULL, the return value is also NULL.

Example

```
gSQL> SELECT POSITION( 'CHAR' IN 'LONG CHAR 2000' ) AS RESULT FROM DUAL;  
RESULT  
-----  
        6  
1 row selected.
```

POWER

Syntax

```
POWER( num1, num2 )
```

Description

It squares num1 to num2, and returns the result.

The num1 argument and num2 argument can be a numeric data type.

If num1 is a negative number, num2 should be an integer.

If num1 or num2 is NULL, the result is also NULL.

Example

```
gSQL> SELECT POWER( 2, 3 ) AS RESULT FROM DUAL;  
RESULT  
-----  
      8  
1 row selected.
```

RADIANS

Syntax

```
RADIANS( degrees )
```

Description

It returns the radians of degrees.

The degrees argument can be a numeric data type.

Example

```
gSQL> SELECT RADIANS( 180 ) AS RESULT FROM DUAL;  
          RESULT  
-----  
3.14159265358979  
1 row selected.
```

RANDOM

Syntax

```
RANDOM( min, max )
```

Description

It returns a random value in the range above min and below max.
The min argument and max argument can be a numeric data type.

Example

```
gSQL> SELECT RANDOM( 1, 100 ) AS RESULT FROM DUAL;  
          RESULT  
-----  
34.1870528003201  
1 row selected.
```

REPEAT

Syntax

```
REPEAT( str, num )
```

Description

The string repeats `str` as many times as specified in `num`, and returns the result.

The `str` argument can be a character type such as `CHARACTER`, `CHARACTER VARYING`, `CHARACTER LONG VARYING`, or a binary character type such as `BINARY`, `BINARY VARYING`, `BINARY LONG VARYING`.

The `num` argument can be a numeric data type.

If either `str` or `num` is `NULL`, the result is also `NULL`.

If `num` is 0 or a negative number, the result is also `NULL`.

The following table describes the result types.

Table 11-62 Result type of REPEAT

str type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT REPEAT( 'ab', 3 ) AS RESULT FROM DUAL;  
RESULT  
-----  
ababab  
1 row selected.
```

REPLACE

Syntax

REPLACE(str, from, to)

Description

It replaces all *from* strings in *str* string with *to* strings, and returns the result.

The *str* argument, the *from* argument, and the *to* argument can be character data types such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

If *str* is NULL, the result is also NULL.

If *from* is NULL, the *str* is returned without replacement.

If *to* value is omitted or NULL, the *str* value of which *from* is removed is returned.

The following table describes the result types.

Table 11-63 Result type of REPLACE

str type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR

Example

```
gSQL> SELECT REPLACE( 'HI GLIESE', 'HI', 'HELLO' ) AS RESULT FROM DUAL;  
RESULT  
-----  
HELLO GLIESE  
1 row selected.
```

REVERSE

Syntax

```
REVERSE( str )
```

Description

REVERSE returns characters of str in reverse order.

The str argument can be types that are convertible to a character string type or a binary string type. A character string type is performed in a character unit, and a binary string type can be performed in a byte unit.

If str is NULL, then it returns NULL.

The following table describes the arguments and result types.

Table 11-64 Argument and result type of REVERSE

str	Result type
CHAR	CHAR
VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY	BINARY
VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT REVERSE( 'GOLDILOCKS' ) AS RESULT FROM DUAL;
RESULT
-----
SKCOLIDLOG
1 row selected.
gSQL> SELECT REVERSE( '선재소프트 2018' ) AS RESULT FROM DUAL;
RESULT
-----
8102 트프소재선
1 row selected.
```

ROUND(number)

Syntax

```
ROUND( num [, scale ] )
```

Description

It rounds off num based on scale, and returns the result.

The num argument and scale argument can be numeric data types.

If scale is omitted, the scale becomes 0 and is executed as if it is ROUND(num, 0).

If scale is a positive number, it is rounded off based on the number of right digit of the decimal point. If scale is a negative number, it is rounded off based on the number of left digit of the decimal point.

Example

```
gSQL> SELECT ROUND( 152.4282, 2 ) AS RESULT FROM DUAL;  
RESULT  
-----  
152.43  
1 row selected.  
gSQL> SELECT ROUND( 152.4282, -2 ) AS RESULT FROM DUAL;  
RESULT  
-----  
200  
1 row selected.
```

ROUND(date)

Syntax

ROUND(date [, fmt])

Description

It rounds off the date in the specified fmt unit, and returns the result.

The data type of date argument can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE.

The fmt argument can be a character type such as CHARACTER, CHARACTER VARYING.

The result type is always DATE regardless of the date argument data type.

If fmt is omitted, the default is DAY.

The following table describes the available format strings.

Table 11-65 Available format string of fmt

String	Description
CC, SCC	It is represented in four digit year by rounding off from 51 year. (e.g. XX01)
YYYY, YEAR, SYYYY, SYEAR, YYY, YY, Y	It is rounded off from July 1st.
IYYY, IYY, IY, I	It is the year embracing the calendar week defined by ISO 8601 standards, and it is rounded off from July 1st.
Q	It is rounded off from the 16th day in the second month of the quarter.
MONTH, MON, MM, RM	It is rounded off from the 16th day.
WW	A week starts from January 1st of the year, and it is rounded off on wednesday 12 p.m of WEEK.
IW	It is the calendar week defined by ISO 8601 standards (1 ~ 52 weeks or 1 ~ 53 weeks) , and it is rounded off on thursday 12 p.m.
W	A week starts from the 1st day of the month, and it is rounded off on wednesday 12 p.m of WEEK.
DDD, DD, J	It is rounded off at 12 p.m.
DAY, DY, D	It is rounded off on wednesday 12 p.m of WEEK.
HH, HH12, HH24	It is rounded off from 30 minutes.
MI	It is rounded off from 30 seconds.

Example

```

gSQL> SELECT
    ROUND( TO_DATE( '2051-07-16', 'YYYY-MM-DD' ), 'CC' ) AS RESULT
    FROM DUAL;

RESULT
-----
2101-01-01
1 row selected.

gSQL> SELECT
    ROUND( TO_DATE( '2051-07-16', 'YYYY-MM-DD' ), 'YYYY' ) AS RESULT
    FROM DUAL;

RESULT
-----
2052-01-01
1 row selected.

gSQL> SELECT
    ROUND( TO_DATE( '2051-07-16', 'YYYY-MM-DD' ), 'MONTH' ) AS RESULT
    FROM DUAL;

RESULT
-----
2051-08-01
1 row selected.

gSQL> SELECT
    ROUND( TO_TIMESTAMP( '2001-05-05 15:22:33.999999',
                        'YYYY-MM-DD HH24:MI:SS.FF6' ) ) AS RESULT
    FROM DUAL;

RESULT
-----
2001-05-06
1 row selected.

```

ROWID_GRID_BLOCK_ID

Syntax

```
ROWID_GRID_BLOCK_ID( rowid )
```

Description

It returns the GRID block ID.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT C1, ROWID_GRID_BLOCK_ID( ROWID ) FROM T1;
C1 ROWID_GRID_BLOCK_ID( ROWID )
-- -----
1 52
2 52
3 52
3 rows selected.
```

ROWID_GRID_BLOCK_SEQ

Syntax

```
ROWID_GRID_BLOCK_SEQ( rowid )
```

Description

It returns the GRID block sequence.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT C1, ROWID_GRID_BLOCK_SEQ( ROWID ) FROM T1;  
C1 ROWID_GRID_BLOCK_SEQ( ROWID )  
-- -----  
1 747465  
2 747466  
3 747467  
3 rows selected.
```

ROWID_MEMBER_ID

Syntax

```
ROWID_MEMBER_ID( rowid )
```

Description

It returns the member ID.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT C1, ROWID_MEMBER_ID( ROWID ) FROM T1;
C1 ROWID_MEMBER_ID( ROWID )
-- -----
1 1
2 1
3 1
3 rows selected.
```

ROWID_OBJECT_ID

Syntax

```
ROWID_OBJECT_ID( rowid )
```

Description

It returns the object ID.

Note

It is an invalid information in a cluster system.

Example

```
gSQL> SELECT ROWID_OBJECT_ID( t1.ROWID ) FROM t1;  
ROWID_OBJECT_ID( T1.ROWID )  
-----  
22012  
22012  
22012  
22012  
4 rows selected.
```

ROWID_PAGE_ID

Syntax

```
ROWID_PAGE_ID( rowid )
```

Description

It returns the page ID.

Note

It is an invalid information in a cluster system.

Example

```
gSQL> SELECT ROWID_PAGE_ID( t1.ROWID ) FROM t1;
ROWID_PAGE_ID( T1.ROWID )
-----
                8227
                8227
                8227
                8227
4 rows selected.
```

ROWID_ROW_NUMBER

Syntax

```
ROWID_ROW_NUMBER( rowid )
```

Description

It returns the row number.

Note

It is an invalid information in a cluster system.

Example

```
gSQL> SELECT ROWID_ROW_NUMBER( t1.ROWID ) FROM t1;
ROWID_ROW_NUMBER( T1.ROWID )
-----
                                0
                                1
                                2
                                3
4 rows selected.
```

ROWID_SHARD_ID

Syntax

```
ROWID_SHARD_ID( rowid )
```

Description

It returns the shard ID.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT C1, ROWID_SHARD_ID( ROWID ) FROM T1;  
C1 ROWID_SHARD_ID( ROWID )  
-- -----  
1 0  
2 1  
3 2  
3 rows selected.
```

ROWID_TABLESPACE_ID

Syntax

```
ROWID_TABLESPACE_ID( rowid )
```

Description

It returns the tablespace ID.

Note

It is an invalid information in a cluster system.

Example

```
gSQL> SELECT ROWID_TABLESPACE_ID( t1.ROWID ) FROM t1;
ROWID_TABLESPACE_ID( T1.ROWID )
-----
2
2
2
2
4 rows selected.
```

ROWNUM

Syntax

ROWNUM

Description

It sequentially allocates a number starting from 1 to rows which satisfy the WHERE condition.

It allows using ROWNUM in WHERE clause for the compatibility with Oracle.

However, to restrict the number of the query results, it is recommended to use **offset limit clause** (the SQL standard) as follows.

- (Non standard) Describing the number of the results by using ROWNUM

```
gSQL> SELECT * FROM t1 WHERE ROWNUM <= 3;
C1
--
A
B
C
3 rows selected.
```

- (SQL standard) Describing the number of the results by using FETCH statement

```
gSQL> SELECT * FROM t1 FETCH 3;
C1
--
A
B
C
3 rows selected.
```

To restrict the range of the query results, it is recommended to use OFFSET, FETCH statement as follows.

- (Non standard) Describing the range of the number of the results by using ROWNUM

```
gSQL> SELECT c1
        FROM ( SELECT ROWNUM rn, c1
                FROM t1 )
```

```

        WHERE rn BETWEEN 2 AND 3;
C1
--
B
C
2 rows selected.

```

- (SQL standard) Describing the range of the number of the results by using ROWNUM OFFSET, FETCH statement

```

gSQL> SELECT c1 FROM t1 OFFSET 1 FETCH 2;
C1
--
B
C
2 rows selected.

```

It is not recommended to use ROWNUM in WHERE clause for any other uses than the restriction of the number of the results.

The results for the same query may be different according to the execution method as follows when using the ambiguous condition (WHERE c1 < ROWNUM + 3).

- Creating the data

```

CREATE TABLE t1 ( c1 INTEGER );
CREATE INDEX t1_idx ON t1(c1);
INSERT INTO t1 VALUES (1);
INSERT INTO t1 VALUES (2);
INSERT INTO t1 VALUES (3);
INSERT INTO t1 VALUES (4);
INSERT INTO t1 VALUES (5);
COMMIT;

```

- In case of Oracle

```

SQL> SELECT ROWNUM, c1 FROM t1 WHERE c1 < ROWNUM + 3;
  ROWNUM      C1
-----
1         1
2         2
SQL> DROP INDEX t1_idx;

```

- The index has been deleted.

```
SQL> SELECT ROWNUM, c1 FROM t1 WHERE c1 < ROWNUM + 3;
```

ROWNUM	C1
1	1
2	2
3	3
4	4
5	5

- In case of GOLDBLOCKS

```
gSQL> SELECT ROWNUM, c1 FROM t1 WHERE c1 < ROWNUM + 3;
```

```
ROWNUM C1
```

ROWNUM	C1
1	1
2	2
3	3
4	4
5	5

5 rows selected.

```
gSQL> DROP INDEX t1_idx;
```

Index dropped.

```
gSQL> SELECT ROWNUM, c1 FROM t1 WHERE c1 < ROWNUM + 3;
```

```
ROWNUM C1
```

ROWNUM	C1
1	1
2	2
3	3
4	4
5	5

5 rows selected.

Example

```
gSQL> SELECT ROWNUM, c1 FROM t1;
```

```
ROWNUM C1
```

ROWNUM	C1
1	A
2	B

3 C

4 D

5 E

5 rows selected.

RPAD

Syntax

```
RPAD( str, length, [, fill] )
```

Description

It adds fill string to the right side of str until the string's length becomes length, and it returns the result.

The str argument can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

The length argument can be a numeric type.

length means the number of characters, and its maximum range is the maximum PRECISION of the result type.

If fill is omitted, a white space is added.

If str is longer than length, it cuts the str as long as the length, then returns it.

If any of str, length, fill is NULL, the result is also NULL.

If length is 0 or a negative number, the result is NULL.

The following table describes the result types.

Table 11-66 Result type of RPAD

str type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT RPAD( 'aa', 5, 'b' ) AS RESULT FROM DUAL;  
RESULT  
-----  
aabbb  
1 row selected.
```

RTRIM

Syntax

RTRIM(trim_source [, trim_character])

Description

It removes the matching characters by comparing from the right side of trim_character in trim_source until the matching character does not exist. Then it returns the result.

The data type of trim_character and trim_source arguments can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING or a binary data type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

If any of trim_character, trim_source is NULL, the result is NULL.
If trim_character is omitted, a single blank space (' ') is specified by default.

The following table describes the result types.

Table 11-67 Result type of RTRIM

trim_source type, trim_character type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT RTRIM( 'RTRIM_____', ' ' ) AS RESULT FROM DUAL;  
RESULT  
-----  
RTRIM  
1 row selected.
```

SESSION_ID

Syntax

```
SESSION_ID()
```

Description

It obtains the current session ID.

Example

```
gSQL> SELECT SESSION_ID() FROM dual;
SESSION_ID()
-----
          4
1 row selected.
```

SESSION_SERIAL

Syntax

SESSION_SERIAL()

Description

It obtains the serial number of current session.

Example

```
gSQL> SELECT SESSION_SERIAL() FROM dual;
SESSION_SERIAL()
-----
                16
1 row selected.
```

SESSION_USER

Syntax

```
SESSION_USER[()]
```

Description

It returns the session user.

The user information is managed in three types as follows.

- Logon user: It is a user who performed login, and it is maintained until the connection is closed.
- Session user: It is as same as the first logon user, but it can be changed using the SET SESSION AUTHORIZATION statement.
- Current user: It is generally as same as the session user, but it is temporarily changed internally in system to control access when using the PSM, View.
 - The session user and current user is similar to the difference between the unix system's real user and the effective user.

Example

```
% gsql sys gliese
gSQL> SET SESSION AUTHORIZATION test;
Session set.
gSQL> SELECT LOGON_USER() AS result1, SESSION_USER() AS result2 FROM DUAL;
RESULT1 RESULT2
-----
SYS      TEST
1 row selected.
```

SHARD_GROUP_ID

Syntax

```
SHARD_GROUP_ID( table_name, shard_key_value [ , ... ] )
```

Description

It returns the group ID managing the shard which stores `shard_key_value` when the shard strategy is defined in the `table_name`.

The `table_name` (an input argument) should be described by an identifier. If an object corresponding to the `table_name` is not a base table, or if the shard strategy is not defined, then an error occurs.

The `shard_key_value` (an input argument) should be listed in an order of shard key column in the shard strategy defined in the `table_name`. If the number of `shard_key_value` and the number of shard key columns is not same, then an error occurs.

The result type is `NATIVE_BIGINT`.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT T1.C1, SHARD_GROUP_ID( T1, T1.C1 ) FROM T1;
```

```
C1 SHARD_GROUP_ID( T1, T1.C1 )
```

```
-- -----
```

```
A 1
```

```
B 2
```

```
C 3
```

```
3 rows selected.
```

```
gSQL> SELECT SHARD_GROUP_ID( T1, 'B' ) FROM DUAL;
```

```
SHARD_GROUP_ID( T1, 'B' )
```

```
-----
```

```
2
```

```
1 row selected.
```

SHARD_GROUP_NAME

Syntax

```
SHARD_GROUP_NAME( table_name, shard_key_value [ , ... ] )
```

Description

It returns the group NAME managing the shard which stores `shard_key_value` when the shard strategy is defined in the `table_name`.

The `table_name` (an input argument) should be described by an identifier. If an object corresponding to the `table_name` is not a base table, or if the shard strategy is not defined, then an error occurs.

The `shard_key_value` (an input argument) should be listed in an order of shard key column in the shard strategy defined in the `table_name`. If the number of `shard_key_value` and the number of shard key columns is not same, then an error occurs.

The result type is VARCHAR.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT T1.C1, SHARD_GROUP_NAME( T1, T1.C1 ) FROM T1;
C1 SHARD_GROUP_NAME( T1, T1.C1 )
-- -----
A  G1
B  G2
C  G3
3 rows selected.
gSQL> SELECT SHARD_GROUP_NAME( T1, 'B' ) FROM DUAL;
SHARD_GROUP_NAME( T1, 'B' )
-----
G2
1 row selected.
```

SHARD_ID

Syntax

```
SHARD_ID( table_name, shard_key_value [, ... ] )
```

Description

It returns the ID for the shard which stores `shard_key_value` when the shard strategy is defined in the table `table_name`.

The `table_name` (an input argument) should be described by an identifier. If an object corresponding to the `table_name` is not a base table, or if the shard strategy is not defined, then an error occurs.

The `shard_key_value` (an input argument) should be listed in an order of shard key column in the shard strategy defined in the `table_name`. If the number of `shard_key_value` and the number of shard key columns is not same, then an error occurs.

The result type is `NATIVE_BIGINT`.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT T1.C1, SHARD_ID( T1, T1.C1 ) FROM T1;
```

```
C1 SHARD_ID( T1, T1.C1 )
```

```
-- -----
```

```
A                0
```

```
B                1
```

```
C                2
```

```
3 rows selected.
```

```
gSQL> SELECT SHARD_ID( T1, 'B' ) FROM DUAL;
```

```
SHARD_ID( T1, 'B' )
```

```
-----
```

```
1
```

```
1 row selected.
```

SHARD_NAME

Syntax

```
SHARD_NAME( table_name, shard_key_value [ , ... ] )
```

Description

It returns the NAME for the shard which stores `shard_key_value` when the shard strategy is defined in the `table_name`.

The `table_name` (an input argument) should be described by an identifier. If an object corresponding to the `table_name` is not a base table, or if the shard strategy is not defined, then an error occurs.

The `shard_key_value` (an input argument) should be listed in an order of shard key column in the shard strategy defined in the `table_name`. If the number of `shard_key_value` and the number of shard key columns is not same, then an error occurs.

The result type is VARCHAR.

Note

It is a valid information in a cluster system.

Example

```
gSQL> SELECT T1.C1, SHARD_NAME( T1, T1.C1 ) FROM T1;
C1 SHARD_NAME( T1, T1.C1 )
-- -----
A  S1
B  S2
C  S3
3 rows selected.
gSQL> SELECT SHARD_NAME( T1, 'B' ) FROM DUAL;
SHARD_NAME( T1, 'B' )
-----
S2
1 row selected.
```

SHIFT_LEFT

Syntax

```
SHIFT_LEFT( num, cnt )
```

Description

It moves num to the left as many as cnt bits, and returns the movement values.

The data type of input num argument and cnt argument can be NATIVE_SMALLINT, NATIVE_INTEGER, NATIVE_BIGINT, or the type which can be converted to NATIVE_BIGINT.

When converting to NATIVE_BIGINT type, the decimal point is truncated.

cnt is masked with 6 bit, and it is processed to a value in the range within 6 bit.

The result type is NATIVE_BIGINT.

Example

```
gSQL> SELECT SHIFT_LEFT( 7, 3 ) AS RESULT FROM DUAL;  
RESULT  
-----  
      56  
1 row selected.
```

SHIFT_RIGHT

Syntax

```
SHIFT_RIGHT( num, cnt )
```

Description

It moves num to the right as many as cnt bits, and returns the movement values.

The data type of input num argument and cnt argument can be NATIVE_SMALLINT, NATIVE_INTEGER, NATIVE_BIGINT, or the type which can be converted to NATIVE_BIGINT.

When converting to NATIVE_BIGINT type, the decimal point is truncated.

cnt is masked with 6 bit, and it is processed to a value in the range within 6 bit.

The result type is NATIVE_BIGINT.

Example

```
gSQL> SELECT SHIFT_RIGHT( 56, 3 ) AS RESULT FROM DUAL;
RESULT
-----
      7
1 row selected.
```

SIGN

Syntax

SIGN(num)

Description

It returns the sign of num.

The num argument can be a numeric data type.

The return value is as follows.

- If $\text{num} < 0$, -1 is returned.
- If $\text{num} = 0$, 0 is returned.
- If $\text{num} > 0$, 1 is returned.

Example

```
gSQL> SELECT SIGN(-10) AS RESULT1,  
              SIGN(0) AS RESULT2,  
              SIGN(10) AS RESULT3 FROM DUAL;
```

```
RESULT1 RESULT2 RESULT3
```

```
-----
```

```
      -1         0         1
```

```
1 row selected.
```

SIN

Syntax

SIN(num)

Description

It returns the sine value of num.

Example

```
gSQL> SELECT SIN( 0 ) AS RESULT FROM DUAL;  
RESULT  
-----  
      0  
1 row selected.
```

SPLIT_PART

Syntax

SPLIT_PART(string, delimiter, field)

Description

It returns a character string of the field by specifying a character as delimiter within a string.

The data type of string argument and delimiter argument can be a character data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

The field argument can be a numeric data type.

If any of string, delimiter, field is NULL, the result is also NULL.

The value of field should be a numeric value above 1, and if it is 0 or a negative number, an error is returned.

The following table describes the result types.

Table 11-68 Result type of SPLIT_PART

string type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR

Example

```
gSQL> SELECT SPLIT_PART( 'AB;CD;EF;GH', ';', 3 ) AS RESULT FROM DUAL;
RESULT
-----
EF
1 row selected.
```

SQRT

Syntax

```
SQRT( num )
```

Description

It returns the square root of num.

The num argument can be a numeric type, and it should not be a negative number, but above 0.

Example

```
gSQL> SELECT SQRT( 9 ) AS RESULT FROM DUAL;  
RESULT  
-----  
          3  
1 row selected.
```

STATEMENT_DATE

Syntax

```
STATEMENT_DATE()  
CURRENT_DATE [( )]
```

Description

The current date (DATE type) value is obtained.

The differences among the functions to obtain the current date are as follows.

- TRANSACTION_DATE(): All date values in the transaction are same.
- STATEMENT_DATE(): All date values in an SQL statement are same.
- CLOCK_DATE(): Whenever the function is called, the current date value is obtained.

Example

```
gSQL> SELECT STATEMENT_DATE() AS result FROM t1;  
RESULT  
-----  
2013-12-12  
2013-12-12  
2013-12-12  
3 rows selected.
```

STATEMENT_LOCALTIME

Syntax

```
STATEMENT_LOCALTIME()  
LOCALTIME [()]
```

Description

The current TIME WITHOUT TIME ZONE type value based on the session time is obtained.

LOCALTIME is an SQL standard function.

The differences among the functions to obtain the current time are as follows.

- TRANSACTION_LOCALTIME(): All time values in the transaction are same.
- TATEMENT_LOCALTIME(): All time values in an SQL statement are same.
- CLOCK_LOCALTIME(): Whenever the function is called, the current time value is obtained.

Example

All rows have the same time value.

```
gSQL> SELECT STATEMENT_LOCALTIME() AS result FROM t1;  
RESULT  
-----  
16:18:50.775870  
16:18:50.775870  
16:18:50.775870  
3 rows selected.
```

STATEMENT_LOCALTIMESTAMP

Syntax

```
STATEMENT_LOCALTIMESTAMP()  
LOCALTIMESTAMP [()]
```

Description

The current TIMESTAMP WITHOUT TIME ZONE type value based on the session time is obtained.

LOCALTIMESTAMP is an SQL standard function.

The differences among the functions to obtain the current timestamp are as follows.

- TRANSACTION_LOCALTIMESTAMP(): All timestamp values in the transaction are same.
- STATEMENT_LOCALTIMESTAMP(): All timestamp values in an SQL statement are same.
- CLOCK_LOCALTIMESTAMP(): Whenever the function is called, the current timestamp value is obtained.

Example

All rows have the same value.

```
gSQL> SELECT STATEMENT_LOCALTIMESTAMP() FROM t1;  
STATEMENT_LOCALTIMESTAMP()  
-----  
2013-12-12 16:23:39.782187  
2013-12-12 16:23:39.782187  
2013-12-12 16:23:39.782187  
3 rows selected.
```

STATEMENT_TIME

Syntax

```
STATEMENT_TIME()  
CURRENT_TIME [()]
```

Description

The current TIME WITH TIME ZONE type value is obtained.

CURRENT_TIME is an SQL standard function.

The differences among the functions to obtain the current time are as follows.

- TRANSACTION_TIME(): All time values in the transaction are same.
- STATEMENT_TIME(): All time values in an SQL statement are same.
- CLOCK_TIME(): Whenever the function is called, the current time value is obtained.

Example

All rows have the same time value.

```
gSQL> SELECT STATEMENT_TIME() AS result FROM t1;  
RESULT  
-----  
16:28:19.268513 +09:00  
16:28:19.268513 +09:00  
16:28:19.268513 +09:00  
3 rows selected.
```

STATEMENT_TIMESTAMP

Syntax

```
STATEMENT_TIMESTAMP()  
CURRENT_TIMESTAMP [()]
```

Description

The current TIMESTAMP WITH TIME ZONE type value is obtained.

CURRENT_TIMESTAMP is an SQL standard function.

The differences among the functions to obtain the current timestamp are as follows.

- TRANSACTION_TIMESTAMP(): All timestamp values in the transaction are same.
- STATEMENT_TIMESTAMP(): All timestamp values in an SQL statement are same.
- CLOCK_TIMESTAMP(): Whenever the function is called, the current timestamp value is obtained.

Example

All rows have the same value.

```
gSQL> SELECT STATEMENT_TIMESTAMP() AS result FROM t1;  
RESULT  
-----  
2013-12-12 16:36:11.032957 +09:00  
2013-12-12 16:36:11.032957 +09:00  
2013-12-12 16:36:11.032957 +09:00  
3 rows selected.
```

STATEMENT_VIEW_SCN

Syntax

```
STATEMENT_VIEW_SCN()
```

Description

It obtains VIEW SCN of the current STATEMENT.

Example

```
gSQL> SELECT STATEMENT_VIEW_SCN() FROM dual;  
STATEMENT_VIEW_SCN()  
-----  
17697.658.17880  
1 row selected.
```

STATEMENT_VIEW_SCN_DCN

Syntax

```
STATEMENT_VIEW_SCN_DCN()
```

Description

It obtains the Domain Change Number (DCN) value of the current STATEMENT's VIEW SCN.

Example

```
gSQL> SELECT STATEMENT_VIEW_SCN_DCN() FROM dual;  
STATEMENT_VIEW_SCN_DCN()  
-----  
658  
1 row selected.
```

STATEMENT_VIEW_SCN_GCN

Syntax

```
STATEMENT_VIEW_SCN_GCN()
```

Description

It obtains the Global Change Number (GCN) value of the current STATEMENT's VIEW SCN.

Example

```
gSQL> SELECT STATEMENT_VIEW_SCN_GCN() FROM dual;  
STATEMENT_VIEW_SCN_GCN()  
-----  
17697  
1 row selected.
```

STATEMENT_VIEW_SCN_LCN

Syntax

```
STATEMENT_VIEW_SCN_LCN()
```

Description

It obtains the Local Change Number (LCN) value of the current STATEMENT's VIEW SCN.

Example

```
gSQL> SELECT STATEMENT_VIEW_SCN_LCN() FROM dual;
STATEMENT_VIEW_SCN_LCN()
-----
                        17880
1 row selected.
```

STDDEV

Syntax

STDDEV([ALL | DISTINCT] expr)

Description

It is an aggregation function, and it obtains the standard deviation of an expr set.

If ALL is specified, this function is performed for all values. If DISTINCT is specified, this function is performed for the values of which the duplicates were deleted from. If it is not specified, it is processed as if ALL is specified.

If the number of expr sets except for NULL after deleting the duplicates by using DISTINCT is one, then it returns 0 like as **VARIANCE**.

The following table describes the arguments and result types.

Table 11-69 Argument and result type of STDDEV

expr	Result type
NATIVE_INTEGER family <ul style="list-style-type: none"> NATIVE_SMALLINT NATIVE_INTEGER NATIVE_BIGINT 	NATIVE_DOUBLE
NUMBER	NUMBER
NATIVE_DOUBLE family <ul style="list-style-type: none"> NATIVE_REAL NATIVE_DOUBLE 	NATIVE_DOUBLE

GOLDILOCKS gets the standard deviation as follows.

- If the number of expr sets is 1, then it returns 0.
- If the number of expr sets is bigger than 1, It returns the value of **STDDEV_SAMP(expr)**.

Note

The standard deviation is a positive square root of a variance, and it is obtained calculating the square root of the variance. In other words, the STDDEV function is as same as the square root of **VARIANCE** function.

```
STDDEV( [ ALL ] expr )
= SQRT( VARIANCE( [ ALL ] expr ) )

STDDEV( DISTINCT expr )
= SQRT( VARIANCE( DISTINCT expr ) )
```

Example

```
gSQL> SELECT STDDEV(c1) FROM t1;
      STDDEV(C1)
-----
11.4978258814438
1 row selected.
gSQL> SELECT STDDEV(ALL c1) FROM t1;
      STDDEV(ALL C1)
-----
11.4978258814438
1 row selected.
gSQL> SELECT STDDEV(DISTINCT c1) FROM t1;
      STDDEV(DISTINCT C1)
-----
13.2759180473518
1 row selected.
```

STDDEV_POP

Syntax

STDDEV_POP(expr)

Description

It is an aggregation function, and it obtains the population standard deviation of an expr set. If the number of expr sets except for NULL is one, then it returns 0.

The following table describes the arguments and result types.

Table 11-70 Argument and result type of STDDEV_POP

expr	Result type
NATIVE_INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_DOUBLE
NUMBER	NUMBER
NATIVE_DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE_DOUBLE

Note

The population standard deviation is a positive square root of a population variance, and it is obtained by calculating the square root of the population variance. In other words, the STDDEV_POP function is as same as the square root of **VAR_POP** function.

STDDEV_POP(expr)
= SQRT(VAR_POP(expr))

Example

```
gSQL> SELECT STDDEV_POP(c1) FROM t1;  
STDDEV_POP(C1)
```

10.283968105746
1 row selected.

STDDEV_SAMP

Syntax

STDDEV_SAMP(*expr*)

Description

It is an aggregation function, and it obtains the sample standard deviation of an *expr* set. If the number of *expr* sets except for NULL is one, then it returns NULL.

The following table describes the arguments and result types.

Table 11-71 Argument and result type of STDDEV_SAMP

expr	Result type
NATIVE_INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_DOUBLE
NUMBER	NUMBER
NATIVE_DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE_DOUBLE

Note

The sample standard deviation is a positive square root of a sample variance, and it is obtained by calculating the square root of the sample variance. In other words, the STDDEV_SAMP function is as same as the square root of **VAR_SAMP** function.

STDDEV_SAMP(*expr*)
= SQRT(VAR_SAMP(*expr*))

Example

```
gSQL> SELECT STDDEV_SAMP(c1) FROM t1;  
STDDEV_SAMP(C1)
```

11.4978258814438
1 row selected.

SUBSTR

Syntax

```
SUBSTR( str FROM start_position [ FOR string_length ] )
SUBSTR( str, start_position [ , string_length ] )
```

Description

It is an alias of **SUBSTRING**.

Example

- Multi byte character set (e.g. UTF8): 1 byte character

```
gSQL> SELECT
      SUBSTR( 'DATABASE MANAGEMENT SYSTEM', 10, 10 ) AS RESULT
    FROM DUAL;
RESULT
-----
MANAGEMENT
1 row selected.
```

- Multi byte character set (e.g. UTF8): 2 bytes or 3 bytes character

```
gSQL> SELECT SUBSTR( ' “ αβ ≠ AB ” ', 2, 5 ) AS RESULT FROM DUAL;
RESULT
-----
αβ ≠ AB
1 row selected.
```

SUBSTRB

Syntax

```
SUBSTRB( str, start_position [ , string_length ] )
```

Description

It extracts characters which are within string_length range from start_position, and returns the result for string.

This function is as same as **SUBSTRING** function, except that start_position and string_length of the SUBSTR function are calculated in byte units.

Example

- Multi byte character set (e.g. UTF8): 1 byte character

```
gSQL> SELECT
      SUBSTRB( 'DATABASE MANAGEMENT SYSTEM', 10, 10 ) AS RESULT
    FROM DUAL;
RESULT
-----
MANAGEMENT
1 row selected.
```

- Multi byte character set (e.g. UTF8): 2 bytes or 3 bytes character

```
gSQL> SELECT SUBSTRB( ' “ αβ ≠ AB ” ', 4, 11 ) AS RESULT FROM DUAL;
RESULT
-----
αβ ≠ AB
1 row selected.
```

SUBSTRING

Syntax

```
SUBSTRING( str FROM start_position [ FOR string_length ] )
SUBSTRING( str, start_position [ , string_length ] )
```

Description

It extracts characters which are within string_length range from start_position, and returns the result for str.

The str argument data type can be a character data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, or a binary data type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

The start_position argument and string_length argument can be a numeric data type.

If any of str, start_position, string_length is NULL, the result is NULL.

The start_position and string_length start from 1, and they are calculated in character unit according to character set (not in byte unit).

If start_position is 0, the start_position is assigned to 1.

If start_position is a positive number, it searches for the position forwards (towards right) from the beginning of str.

If start_position is a negative number, it searches for the position backwards (towards left) from the end of str.

If string_length is omitted, characters from the start_position to the last character of str, are returned.

If string_length is 0 or a negative number, the result is NULL.

If start_position > (str length), the result is NULL.

If (str length + start_position) < 0, the result is NULL.

It is an alias of **SUBSTR**.

For more information, refer to **SUBSTRB**.

The following table describes the result types.

Table 11-72 Result type of SUBSTRING

str type	Result type
CHAR or VARCHAR	VARCHAR

str type	Result type
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

- Multi byte character set (e.g. UTF8): 1 byte character

```
gSQL> SELECT
      SUBSTRING( 'DATABASE MANAGEMENT SYSTEM' FROM 10 FOR 10 ) AS RESULT
FROM DUAL;
RESULT
-----
MANAGEMENT
1 row selected.
```

- Multi byte character set (e.g. UTF8): 2 bytes or 3 bytes character

```
gSQL> SELECT SUBSTRING( ' “ αβ ≠ AB ” ' FROM 2 FOR 5 ) AS RESULT FROM DUAL;
RESULT
-----
αβ ≠ AB
1 row selected.
```

SUM

Syntax

```
SUM( [ ALL | DISTINCT ] expr )
```

Description

It is an aggregate function and the sum of expr value is obtained.

If ALL is explicitly specified, aggregation is executed for all values.

If DISTINCT is explicitly specified, aggregation is executed for the values which exclude duplicate values.

If ALL or DISTINCT is not explicitly specified, it is processed in the same way as when ALL is specified.

Example

```
gSQL> SELECT SUM(c1) FROM t1;
SUM(C1)
-----
        6
1 row selected.
```

SYSDATE

Syntax

SYSDATE

Description

It obtains the current DATE type value based on the OS time of the database server.

Example

```
gSQL> SELECT SYSDATE FROM t1;  
SYSDATE  
-----  
2013-12-12  
2013-12-12  
2013-12-12  
3 rows selected.
```

SYS_EXTRACT_UTC

Syntax

```
SYS_EXTRACT_UTC( datetime_with_timezone )
```

Description

It returns the UTC (Coordinated Universal Time—formerly Greenwich Mean Time) value.

If the timezone is not specified, it is calculated as session time zone.

The data type of an input argument can be time, time with time zone, timestamp, timestamp with time zone.

The result type is time or timestamp type.

Example

```
gSQL> SELECT
      SYS_EXTRACT_UTC(
        TO_TIMESTAMP_TZ( '2017-05-25 21:13:32.123456 +09:00',
                        'YYYY-MM-DD HH24:MI:SS.FF6 TZH:TZM' )
      ) AS RESULT
    FROM DUAL;

RESULT
-----
2017-05-25 12:13:32.123456
1 row selected.
```

SYSTIME

Syntax

SYSTIME

Description

It obtains the current TIME WITH TIME ZONE type value based on the OS time of the database server.

Example

```
gSQL> SELECT SYSTIME FROM t1;
SYSTIME
-----
16:30:46.954941 +09:00
16:30:46.954941 +09:00
16:30:46.954941 +09:00
3 rows selected.
```

SYSTIMESTAMP

Syntax

SYSTIMESTAMP

Description

It obtains the current TIMESTAMP WITH TIME ZONE type value based on the OS time of the database server.

Example

```
gSQL> SELECT SYSTIMESTAMP FROM t1;
SYSTIMESTAMP
-----
2013-12-12 16:37:34.432241 +09:00
2013-12-12 16:37:34.432241 +09:00
2013-12-12 16:37:34.432241 +09:00
3 rows selected.
```

TAN

Syntax

TAN(num)

Description

It returns the tangent value of num in radians unit.

Example

```
gSQL> SELECT TAN( 1 ) AS RESULT FROM DUAL;  
          RESULT  
-----  
1.5574077246549  
1 row selected.
```

TO_BASE64

Syntax

```
TO_BASE64( str )
```

Description

It converts str by using base64 encoding, and returns the converted character.

str argument can be a character type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING, a type which can be converted to a character type, or a binary character type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

The result type is a character such as CHARACTER VARYING or CHARACTER LONG VARYING.

If str is NULL, the result value is also NULL.

Base64 encoding represents 8 bit binary data in 64 characters consisting of ascii areas.

64 characters consist of A~Z, a~z, 0~9, +, /.

6 bit is represented as a character, and three characters (24 bits) are represented with 4 characters as a unit.

If the encoded characters can not fill 4 characters, then others are filled with '='.

If encoded characters are over 76, then a newline is added and they are divided into multiple lines.

Use FROM_BASE64() function to decode the base64 encoded character.

The newline, carriage return, tab, space are ignored when decoding base64.

For more information, refer to **FROM_BASE64**.

Example

```
gSQL> SELECT TO_BASE64( 'abc' ), TO_BASE64( 'abcd' ) FROM DUAL;
TO_BASE64( 'abc' ) TO_BASE64( 'abcd' )
-----
YWJj                YWJjZA==
1 row selected.
```

TO_CHAR(datetime)

Syntax

```
TO_CHAR( datetime [, fmt ] )
```

Description

It converts datetime to a string in the specified fmt format, and returns the result.

The datetime argument data type can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIME, TIME WITH TIME ZONE, INTERVAL.

The fmt argument data type can be a character data type such as CHARACTER, CHARACTER VARYING.

If fmt is omitted, it follows the default format.

- DATE: Refer to **NLS_DATE_FORMAT**.
- TIMESTAMP: Refer to **NLS_TIMESTAMP_FORMAT**.
- TIMESTAMP WITH TIME ZONE: Refer to **NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT**.
- TIME: Refer to **NLS_TIME_FORMAT**.
- TIME WITH TIME ZONE: Refer to **NLS_TIME_WITH_TIME_ZONE_FORMAT**.

If the data type of the datetime argument is INTERVAL, it is converted to a string then returned regardless of fmt.

For more information about the string which can be specified in fmt, refer to **Datetime Format String**.

The result type is CHARACTER VARYING.

Example

The following is an example of when fmt is omitted, and NLS_DATE_FORMAT = 'YYYY-MM-DD'.

```
gSQL> SELECT
      TO_CHAR( TO_DATE( '2012-03-15', 'YYYY-MM-DD' ) ) AS RESULT
    FROM DUAL;

RESULT
-----
2012-03-15
1 row selected.
```

The following is an example of when fmt is specified.

```
gSQL> SELECT
      TO_CHAR( TO_DATE('2012-03-15','YYYY-MM-DD'), 'DD-MON-YY' ) AS RESULT
    FROM DUAL;
RESULT
-----
15-MAR-12
1 row selected.
```

TO_CHAR(number)

Syntax

```
TO_CHAR( number [ , fmt ] )
```

Description

It converts the number to a string in the specified fmt format, and returns the result.

The number argument can be a numeric data type.

The fmt argument data type can be a character data type such as CHARACTER, CHARACTER VARYING.

If fmt is omitted, all significant digits are converted to the string and returned.

For more information about the string which can be specified in fmt, refer to **Number Format String**.

The result type is CHARACTER VARYING.

Example

```
gSQL> SELECT TO_CHAR( 12500000 ) AS RESULT FROM DUAL;
RESULT
-----
12500000
1 row selected.
gSQL> SELECT TO_CHAR( 12500000, 'S999,999,999' ) AS RESULT FROM DUAL;
RESULT
-----
+12,500,000
1 row selected.
```

TO_DATE

Syntax

```
TO_DATE( str [, fmt ] )
```

Description

It converts the `str` string in the specified `fmt` format to `DATE` type, and returns the result.

The `str` argument and `fmt` argument data type can be a character data type such as `CHARACTER`, `CHARACTER VARYING`, `CHARACTER LONG VARYING`.

If `fmt` is omitted, the default format is `NLS_DATE_FORMAT`, and in this case `str` should be the default format string.

For more information about the string which can be specified in `fmt`, refer to **Datetime Format String**.

For more information, refer to **NLS_DATE_FORMAT**.

The result type is `DATE`.

Example

The following is an example of when `fmt` is omitted, and `NLS_DATE_FORMAT = 'YYYY-MM-DD'`.

```
gSQL> SELECT TO_DATE( '2009-07-29' ) AS RESULT FROM DUAL;
RESULT
-----
2009-07-29
1 row selected.
```

The following is an example of when `fmt` is specified.

```
gSQL> SELECT TO_DATE( '29-JUL-09', 'DD-MON-YY' ) AS RESULT FROM DUAL;
RESULT
-----
2009-07-29
1 row selected.
```

TO_NATIVE_DOUBLE

Syntax

```
TO_NATIVE_DOUBLE( str [, fmt ] )
```

Description

It converts the str string in the specified fmt format to NATIVE_DOUBLE type, and returns the result.

The data type of str argument and fmt argument can be a character data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

If any of str, fmt is NULL, the result is also NULL.

For more information about the string which can be specified in fmt, refer to **Number Format String**.

The result type is NATIVE_DOUBLE.

Example

```
gSQL> SELECT TO_NATIVE_DOUBLE( '123.45' ) AS RESULT1,  
            TO_NATIVE_DOUBLE( '+123.45', 'S999.99' ) AS RESULT2  
      FROM DUAL;  
RESULT1 RESULT2  
-----  
123.45  123.45  
1 row selected.
```

TO_NATIVE_REAL

Syntax

```
TO_NATIVE_REAL( str [, fmt ] )
```

Description

It converts the `str` string in the specified `fmt` format to `NATIVE_REAL` type, and returns the result.

The data type of `str` argument and `fmt` argument can be a character data type such as `CHARACTER`, `CHARACTER VARYING`, `CHARACTER LONG VARYING`.

If any of `str`, `fmt` is `NULL`, the result is also `NULL`.

For more information about the string which can be specified in `fmt`, refer to **Number Format String**.

The result type is `NATIVE_REAL`.

Example

```
gSQL> SELECT TO_NATIVE_REAL( '123.45' ) AS RESULT1,
             TO_NATIVE_REAL( '+123.45', 'S999.99' ) AS RESULT2
       FROM DUAL;
RESULT1 RESULT2
-----
123.45  123.45
```

TO_NUMBER

Syntax

```
TO_NUMBER( str [, fmt] )
```

Description

It converts the str string in the specified fmt format to NUMBER type, and returns the result.

The data type of str argument and fmt argument can be a character data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

If any of str, fmt is NULL, the result is also NULL.

For more information about the string which can be specified in fmt, refer to **Number Format String**.

The result type is NUMBER.

Example

```
gSQL> SELECT TO_NUMBER( '123.45' ) AS RESULT1,  
            TO_NUMBER( '+123.45', 'S999.99' ) AS RESULT2  
      FROM DUAL;  
RESULT1 RESULT2  
-----  
123.45  123.45  
1 row selected.
```

TO_TIME

Syntax

```
TO_TIME( str [, fmt ] )
```

Description

It converts the str string in the specified fmt format to TIME type, and returns the result.

The data type of str argument and fmt argument can be a character data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

If fmt is omitted, the default format is NLS_TIME_FORMAT, and in this case str should be the default format string.

For more information about the string which can be specified in fmt, refer to **Datetime Format String**.

For more information, refer to **NLS_TIME_FORMAT**.

The result type is TIME.

Example

The following is an example of when fmt is omitted, and NLS_TIME_FORMAT = 'HH24:MI:SS.FF6'.

```
gSQL> SELECT TO_TIME( '11:22:33.999999' ) AS RESULT FROM DUAL;
RESULT
-----
11:22:33.999999
1 row selected.
```

The following is an example of when fmt is specified.

```
gSQL> SELECT
      TO_TIME( '112233.999999/P.M.', 'HH12MISS.FF6/P.M.' ) AS RESULT
FROM DUAL;
RESULT
-----
23:22:33.999999
1 row selected.
```

TO_TIME_TZ

Syntax

```
TO_TIME_TZ( str [, fmt ] )
```

Description

It is an alias of `TO_TIME_WITH_TIME_ZONE`.

For more information, refer to `NLS_TIME_WITH_TIME_ZONE_FORMAT`.

Example

The following is an example of when `fmt` is omitted, and `NLS_TIME_WITH_TIME_ZONE_FORMAT` = 'HH24:MI:SS.FF6 TZH:TZM'.

```
gSQL> SELECT TO_TIME_TZ( '11:22:33.999999 +09:00' ) AS RESULT FROM DUAL;
RESULT
-----
11:22:33.999999 +09:00
1 row selected.
```

The following is an example of when `fmt` is specified.

```
gSQL> SELECT TO_TIME_TZ( '11:22:33.999999 +09:00 PM',
                        'HH12:MI:SS.FF6 TZH:TZM PM' ) AS RESULT
FROM DUAL;
RESULT
-----
23:22:33.999999 +09:00
1 row selected.
```

```
AS RESULT
```

```
FROM DUAL;
```

```
RESULT
```

```
-----
```

```
23:22:33.999999 +09:00
```

```
1 row selected.
```

TO_TIMESTAMP

Syntax

```
TO_TIMESTAMP( str [, fmt ] )
```

Description

It converts the `str` string in the specified `fmt` format to `TIMESTAMP` type, and returns the result.

The data type of `str` argument and `fmt` argument can be a character data type such as `CHARACTER`, `CHARACTER VARYING`, `CHARACTER LONG VARYING`.

If `fmt` is omitted, the default format is `NLS_TIMESTAMP_FORMAT`, and in this case `str` should be the default format string.

For more information about the string which can be specified in `fmt`, refer to **Datetime Format String**.

For more information, refer to **NLS_TIMESTAMP_FORMAT**.

The result type is `TIMESTAMP`.

Example

The following is an example of when `fmt` is omitted, and `NLS_TIMESTAMP_FORMAT` = 'YYYY-MM-DD HH24:MI:SS.FF6'.

```
gSQL> SELECT
      TO_TIMESTAMP( '2009-07-29 11:22:33.999999' ) AS RESULT
    FROM DUAL;
RESULT
-----
2009-07-29 11:22:33.999999
1 row selected.
```

The following is an example of when `fmt` is specified.

```
gSQL> SELECT
      TO_TIMESTAMP( '090729 112233999999 PM', 'YMMDD HH12MISSFF6 PM' )
    AS RESULT
    FROM DUAL;
RESULT
-----
```

2009-07-29 23:22:33.999999

1 row selected.

TO_TIMESTAMP_TZ

Syntax

```
TO_TIMESTAMP_TZ( str [, fmt ] )
```

Description

It is an alias of `TO_TIMESTAMP_WITH_TIME_ZONE`.

For more information, refer to `NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT`.

Example

The following is an example of when `fmt` is omitted, and `NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT` = 'YYYY-MM-DD HH24:MI:SS.FF6 TZH:TZM'.

```
gSQL> SELECT
      TO_TIMESTAMP_TZ( '2009-07-29 11:22:33.999999 +09:00' ) AS RESULT
    FROM DUAL;
RESULT
-----
2009-07-29 11:22:33.999999 +09:00
1 row selected.
```

The following is an example of when `fmt` is specified.

```
gSQL> SELECT
      TO_TIMESTAMP_TZ( '29-JUL-09 11:22:33.999999 +09:00',
                      'DD-MON-RR HH12:MI:SS.FF6 TZH:TZM' ) AS RESULT
    FROM DUAL;
RESULT
-----
2009-07-29 11:22:33.999999 +09:00
1 row selected.
```

TO_TIMESTAMP_WITH_TIME_ZONE

Syntax

```
TO_TIMESTAMP_WITH_TIME_ZONE( str [, fmt ] )
TO_TIMESTAMP_TZ( str [, fmt ] )
```

Description

It converts the `str` string in the specified `fmt` format to `TIMESTAMP WITH TIME ZONE` type, and returns the result.

The data type of `str` argument and `fmt` argument can be a character data type such as `CHARACTER`, `CHARACTER VARYING`, `CHARACTER LONG VARYING`.

If `fmt` is omitted, the default format is `NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT`, and in this case `str` should be the default format string.

For more information about the string which can be specified in `fmt`, refer to **Datetime Format String**.

For more information, refer to **NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT**.

It is an alias of `TO_TIMESTAMP_TZ`.

The result type is `TIMESTAMP WITH TIME ZONE`.

Example

The following is an example of when `fmt` is omitted, and `NLS_TIMESTAMP_WITH_TIME_ZONE_FORMAT` = `'YYYY-MM-DD HH24:MI:SS.FF6 TZH:TZM'`.

```
gSQL> SELECT
      TO_TIMESTAMP_WITH_TIME_ZONE( '2009-07-29 11:22:33.999999 +09:00' )
      AS RESULT
      FROM DUAL;

RESULT
-----
2009-07-29 11:22:33.999999 +09:00
1 row selected.
```

The following is an example of when `fmt` is specified.

```
gSQL> SELECT
      TO_TIMESTAMP_WITH_TIME_ZONE( '29-JUL-09 11:22:33.999999 +09:00' ,
                                   'DD-MON-RR HH12:MI:SS.FF6 TZH:TZM' )
      AS RESULT
      FROM DUAL;

RESULT
-----
2009-07-29 11:22:33.999999 +09:00
1 row selected.
```

TRANSACTION_DATE

Syntax

```
TRANSACTION_DATE()
```

Description

It obtains the current date (DATE type) value based on the session time.

The differences among the functions to obtain the current date are as follows.

- TRANSACTION_DATE(): All date values in the transaction are same.
- STATEMENT_DATE(): All date values in an SQL statement are same.
- CLOCK_DATE(): Whenever the function is called, the current date value is obtained.

Example

All date values are always same within a single transaction.

```
gSQL> SELECT TRANSACTION_DATE() FROM dual;
TRANSACTION_DATE()
-----
2013-12-12
1 row selected.
gSQL> SELECT TRANSACTION_DATE() FROM dual;
TRANSACTION_DATE()
-----
2013-12-12
1 row selected.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT TRANSACTION_DATE() FROM dual;
TRANSACTION_DATE()
-----
2013-12-13
1 row selected.
```

TRANSACTION_LOCALTIME

Syntax

TRANSACTION_LOCALTIME()

Description

It obtains the current TIME WITHOUT TIME ZONE type value based on the session time.

The differences among the functions to obtain the current time are as follows.

- TRANSACTION_LOCALTIME(): All time values in the transaction are same.
- STATEMENT_LOCALTIME(): All time values in an SQL statement are same.
- CLOCK_LOCALTIME(): Whenever the function is called, the current time value is obtained.

Example

All time values are always same within a single transaction.

```
gSQL> SELECT TRANSACTION_LOCALTIME() FROM dual;
TRANSACTION_LOCALTIME()
-----
16:43:24.391834
1 row selected.
gSQL> SELECT TRANSACTION_LOCALTIME() FROM dual;
TRANSACTION_LOCALTIME()
-----
16:43:24.391834
1 row selected.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT TRANSACTION_LOCALTIME() FROM dual;
TRANSACTION_LOCALTIME()
-----
16:43:32.651833
1 row selected.
```

TRANSACTION_LOCALTIMESTAMP

Syntax

TRANSACTION_LOCALTIMESTAMP()

Description

It obtains the current TIMESTAMP WITHOUT TIME ZONE type value based on the session time.

The differences among the functions to obtain the current timestamp are as follows.

- TRANSACTION_LOCALTIMESTAMP(): All timestamp values in the transaction are same.
- STATEMENT_LOCALTIMESTAMP(): All timestamp values in an SQL statement are same.
- CLOCK_LOCALTIMESTAMP(): Whenever the function is called, the current timestamp value is obtained.

Example

All timestamp values are always same within a single transaction.

```
gSQL> SELECT TRANSACTION_LOCALTIMESTAMP() FROM dual;
TRANSACTION_LOCALTIMESTAMP()
-----
2013-12-12 16:43:32.651833
1 row selected.
gSQL> SELECT TRANSACTION_LOCALTIMESTAMP() FROM dual;
TRANSACTION_LOCALTIMESTAMP()
-----
2013-12-12 16:43:32.651833
1 row selected.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT TRANSACTION_LOCALTIMESTAMP() FROM dual;
TRANSACTION_LOCALTIMESTAMP()
-----
2013-12-12 16:46:07.831834
1 row selected.
```

TRANSACTION_TIME

Syntax

TRANSACTION_TIME()

Description

It obtains the current TIME WITH TIME ZONE type value based on the session time.

The differences among the functions to obtain the current time are as follows.

- TRANSACTION_TIME(): All time values in the transaction are same.
- STATEMENT_TIME(): All time values in an SQL statement are same.
- CLOCK_TIME(): Whenever the function is called, the current time value is obtained.

Example

All time values are always same within a single transaction.

```
gSQL> SELECT TRANSACTION_TIME() FROM dual;
TRANSACTION_TIME()
-----
16:46:07.831834 +09:00
1 row selected.
gSQL> SELECT TRANSACTION_TIME() FROM dual;
TRANSACTION_TIME()
-----
16:46:07.831834 +09:00
1 row selected.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT TRANSACTION_TIME() FROM dual;
TRANSACTION_TIME()
-----
16:48:00.691827 +09:00
1 row selected.
```

TRANSACTION_TIMESTAMP

Syntax

TRANSACTION_TIMESTAMP()

Description

It obtains the current TIMESTAMP WITH TIME ZONE type value based on the session time.

The differences among the functions to obtain the current timestamp are as follows.

- TRANSACTION_TIMESTAMP(): All timestamp values in the transaction are same.
- STATEMENT_TIMESTAMP(): All timestamp values in an SQL statement are same.
- CLOCK_TIMESTAMP(): Whenever the function is called, the current timestamp value is obtained.

Example

All timestamp values are always same within a single transaction.

```
gSQL> SELECT TRANSACTION_TIMESTAMP() FROM dual;
TRANSACTION_TIMESTAMP()
-----
2013-12-12 16:48:00.691827 +09:00
1 row selected.
gSQL> SELECT TRANSACTION_TIMESTAMP() FROM dual;
TRANSACTION_TIMESTAMP()
-----
2013-12-12 16:48:00.691827 +09:00
1 row selected.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT TRANSACTION_TIMESTAMP() FROM dual;
TRANSACTION_TIMESTAMP()
-----
2013-12-12 16:49:26.291827 +09:00
1 row selected.
```

TRANSLATE

Syntax

```
TRANSLATE( string, from, to )
```

Description

It converts all characters which are same as the characters in *from* to its corresponding characters in *to*. Then it returns the result.

The data type of the string argument, the from argument, and the to argument can be a data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

If any of *string*, *from*, *to* is NULL, the result is also NULL.

Characters in string which are not same as characters in *from*, are not replaced.

Characters in string which are same as characters in *from*, are replaced to its corresponding characters in *to*.

If the number of characters in *from* is bigger than the number of characters in *to*, the characters in *from* which does not correspond to the characters in *to*, are removed, and returned.

If the same characters are repeated multiple times in *from*, they are replaced with the first mapped character.

The following table describes the result types.

Table 11-73 Result type of TRANSLATE

string type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR

Example

```
gSQL> SELECT TRANSLATE( '12345', '15', 'FL' ) AS RESULT FROM DUAL;
RESULT
-----
F234L
1 row selected.
gSQL> SELECT TRANSLATE( 'ABC12345', 'ABC12345', 'XYZ' ) AS RESULT FROM DUAL;
RESULT
```

XYZ

1 row selected.

```
gSQL> SELECT TRANSLATE( 'ABC12345ABC', 'ABCABCABC', 'XYZ^&*xyz' ) AS RESULT
      FROM DUAL;
```

RESULT

XYZ12345XYZ

1 row selected.

TRIM

Syntax

```
TRIM([ [ LEADING | TRAILING | BOTH ] [trim_character] FROM ] trim_source)
```

Description

It removes the matching characters by comparing trim_character in trim_source from the LEADING, TRAILING, BOTH direction until the matching character does not exist. Then it returns the result.

The trim_character argument and trim_source argument can be a character data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING or a binary character data type such as BINARY, BINARY VARYING, BINARY LONG VARYING.

If any of trim_character, trim_source is NULL, the result is NULL.

- [LEADING | TRAILING | BOTH]
 - LEADING: Removes trim_character from the beginning of trim_source.
 - TRAILING: Removes trim_character from the back of trim_source.
 - BOTH: Removes trim_character from the both direction (the beginning, the back) of trim_source.
- trim_character should be a single character.
- If trim_character is omitted, single blank space (' ') is specified by default.
- When FROM is specified
 - [LEADING | TRAILING | BOTH], trim_character or [LEADING | TRAILING | BOTH] trim_character should be specified.
 - e.g. TRIM(LEADING FROM ' abc') , TRIM('x' FROM 'xabc') , TRIM(LEADING 'x' FROM 'xabc')
 - If [LEADING | TRAILING | BOTH] is omitted, BOTH is specified by default.
- When FROM is omitted.
 - It is TRIM(trim_source), it is executed in the same way as TRIM(BOTH ' ' FROM trim_source).

The following table describes the result types.

Table 11-74 Result type of TRIM

trim_character, trim_source type	Result type
CHAR or VARCHAR	VARCHAR
LONG VARCHAR	LONG VARCHAR
BINARY or VARBINARY	VARBINARY
LONG VARBINARY	LONG VARBINARY

Example

```
gSQL> SELECT TRIM( LEADING '_' FROM '___TRIM FUNCTION___' ) AS RESULT  
FROM DUAL;
```

RESULT

TRIM FUNCTION___

1 row selected.

```
gSQL> SELECT TRIM( TRAILING '_' FROM '___TRIM FUNCTION___' ) AS RESULT  
FROM DUAL;
```

RESULT

___TRIM FUNCTION

1 row selected.

```
gSQL> SELECT TRIM( BOTH '_' FROM '___TRIM FUNCTION___' ) AS RESULT  
FROM DUAL;
```

RESULT

TRIM FUNCTION

1 row selected.

TRUNC(number)

Syntax

```
TRUNC( num [ , scale ] )
```

Description

It truncates the num based on scale, then returns the result.

The num argument and scale argument can be a numeric type.

If scale is omitted, the scale becomes 0, and it is executed as same as TRUNC(num, 0).

If scale is a positive number, it is truncated based on the number of right digit of the decimal point.

If scale is a negative number, it is truncated off based on the number of left digit of the decimal point.

Example

```
gSQL> SELECT TRUNC( 142.4282, 2 ) AS RESULT FROM DUAL;  
RESULT  
-----  
142.42  
1 row selected.  
gSQL> SELECT TRUNC( 142.4282, -2 ) AS RESULT FROM DUAL;  
RESULT  
-----  
100  
1 row selected.
```

TRUNC(date)

Syntax

TRUNC(date [, fmt])

Description

It truncates the date in a specified fmt unit, and returns the result.

The date argument data type can be DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE.

The fmt argument data type can be a character data type such as CHARACTER, CHARACTER VARYING.

The result type is always DATE regardless of the input date type.

If fmt is omitted, the default is *DAY*, and the available format string is described in the following table.

Table 11-75 Available format string in fmt

Format string	Description
CC, SCC	Century
YYYY, YEAR, SYYYY, SYEAR, YYY, YY, Y	Year
IYYY, IYY, IY, I	The year embracing the calendar week defined by ISO 8601 standards
Q	Quarter
MONTH, MON, MM, RM	Month
WW	The week whose first week starts from January 1st of the year
IW	The week containing the first thursday of the year designated as the calendar week by ISO 8601 standards (1 ~ 52 weeks or 1 ~ 53 weeks) becomes the first week.
W	The week whose first week starts from the first day of the month
DDD, DD, J	Day
DAY, DY, D	Day of the week
HH, HH12, HH24	Hour
MI	Minute

Example

```
gSQL> SELECT
      TRUNC( TO_DATE( '2051-07-16', 'YYYY-MM-DD' ), 'CC' ) AS RESULT
FROM DUAL;
RESULT
```

```
-----
```

```
2001-01-01
```

```
1 row selected.
```

```
gSQL> SELECT
      TRUNC( TO_DATE( '2051-07-16', 'YYYY-MM-DD' ), 'YYYY' ) AS RESULT
      FROM DUAL;
```

```
RESULT
```

```
-----
```

```
2051-01-01
```

```
1 row selected.
```

```
gSQL> SELECT
      TRUNC( TO_DATE( '2051-07-16', 'YYYY-MM-DD' ), 'MONTH' ) AS RESULT
      FROM DUAL;
```

```
RESULT
```

```
-----
```

```
2051-07-01
```

```
1 row selected.
```

```
gSQL> SELECT
      TRUNC( TO_TIMESTAMP( '2001-05-05 11:22:33.999999',
                          'YYYY-MM-DD HH24:MI:SS.FF6' ) ) AS RESULT
      FROM DUAL;
```

```
RESULT
```

```
-----
```

```
2001-05-05
```

```
1 row selected.
```

UPPER

Syntax

```
UPPER( str )
```

Description

It returns the uppercase characters of str.

The str argument can be a character data type such as CHARACTER, CHARACTER VARYING, CHARACTER LONG VARYING.

If str is NULL, the result is NULL.

The return type is as same as the str argument type.

Example

```
gSQL> SELECT UPPER( 'spring' ) AS RESULT FROM DUAL;  
RESULT  
-----  
SPRING  
1 row selected.
```

UNHEX

Syntax

UNHEX(str)

Description

str argument is a hexadecimal character and this function represents it as each byte and returns it as a binary string.

The input argument can be a character type such as CHARACTER VARYING, CHARACTER LONG VARYING. The result type is a binary character type such as BINARY VARYING or BINARY LONG VARYING.

If str is NULL, then the result value is also NULL.

If str includes a character which does not belong to the hexadecimal range, then it returns an error.

For more information, refer to **HEX**.

Example

```
gSQL> SELECT UNHEX( HEX( 'abc' ) ) FROM DUAL;
UNHEX( HEX( 'abc' ) )
-----
616263
1 row selected.
```

UNHEX_TO_CHARSTR

Syntax

```
UNHEX_TO_CHARSTR( str )
```

Description

str argument is a hexadecimal character and this function represents it as each byte and returns it as a character string.

The input argument can be a character type such as CHARACTER VARYING, CHARACTER LONG VARYING. The result type is a character type such as CHARACTER VARYING, CHARACTER LONG VARYING.

If str is NULL, then the result value is also NULL.

If str includes a character which does not belong to the hexadecimal range, then it returns an error.

When returning it as a character string, it applies the currently applicable character set and returns the result value because the str argument is a hexadecimal character of an unknown data.

If it is not included in the currently applicable character set, then it returns an error.

For more information, refer to **HEX**, **UNHEX**.

Example

```
gSQL> SELECT UNHEX_TO_CHARSTR( '616263' ) FROM DUAL;
UNHEX_TO_CHARSTR( '616263' )
-----
abc
1 row selected.
gSQL> SELECT UNHEX_TO_CHARSTR( HEX( 'abc' ) ) FROM DUAL;
UNHEX_TO_CHARSTR( HEX( 'abc' ) )
-----
abc
1 row selected.
```

USER_ID

Syntax

```
USER_ID ( )
```

Description

It obtains the current user's number ID.

Note

In cluster system, the value may vary depending on the connected server.

It is recommended to use **CURRENT_USER** function obtaining the current username.

Example

```
% gsql test test
gSQL> SELECT USER_ID() FROM dual;
USER_ID()
-----
         6
1 row selected.
```

UUID

Syntax

UUID()

Description

It creates the universal unique identifier, then returns it.

The return type is VARBINARY type, and it internally consists of 16 bytes.

Example

```
gSQL> SELECT HEX( UUID() ) FROM DUAL;  
HEX( UUID() )  
-----  
E6F0A5C2387511E8B95259E479C2FD50  
1 row selected.
```

VAR_POP

Syntax

VAR_POP(*expr*)

Description

It is an aggregation function, and it obtains the population variance of an *expr* set. If the number of *expr* sets except for NULL is one, then it returns 0.

The following table describes the arguments and result types.

Table 11-76 Argument and result type of VAR_POP

expr	Result type
NATIVE_INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_DOUBLE
NUMBER	NUMBER
NATIVE_DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE_DOUBLE

Note

The population variance is a variance of the population (entire) group, and it is the average of the square value of deviation. In other words, it is calculated by extracting the population average (the entire average) from each value of the data, and squaring each value, then adding them together and dividing them by the number of datas in the population group.

This value is used to figure out how far each value is from the average value.

For more information, refer to **STDDEV_POP**.

Example

```
gSQL> SELECT VAR_POP(c1) FROM t1;  
VAR_POP(C1)  
-----  
          105.76  
1 row selected.
```

VAR_SAMP

Syntax

VAR_SAMP(*expr*)

Description

It is an aggregation function, and it obtains the sample variance of an *expr* set. If the number of *expr* sets except for NULL is one, then it returns NULL.

The following table describes the arguments and result types.

Table 11-77 Argument and result type of VAR_SAMP

expr	Result type
NATIVE_INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_DOUBLE
NUMBER	NUMBER
NATIVE_DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE_DOUBLE

Note

Unlike the population variance dealing with the population (entire) group, the sample variance deals with the average and deviation of extracted samples. In other words, it is calculated by extracting the sample average from each value of the data, and squaring each value, then adding them together and dividing them by the number of datas in the population group minus 1. This value is used to figure out the variance of the population group.

For more information, refer to **STDDEV_SAMP**.

Example

```
gSQL> SELECT VAR_SAMP(c1) FROM t1;
```

```
VAR_SAMP(C1)
```

```
-----
```

```
132.2
```

```
1 row selected.
```

VARIANCE

Syntax

VARIANCE([ALL | DISTINCT] expr)

Description

It is an aggregation function, and it obtains the variance of an expr set.

If ALL is specified, this function is performed for all values. If DISTINCT is specified, this function is performed for the values of which the duplicates were deleted from. If it is not specified, it is processed as if ALL is specified.

If the number of expr sets except for NULL after deleting the duplicates by using DISTINCT is one, then it returns 0.

The following table describes the arguments and result types.

Table 11-78 Argument and result type of VARIANCE

expr	Result type
NATIVE_INTEGER family <ul style="list-style-type: none">NATIVE_SMALLINTNATIVE_INTEGERNATIVE_BIGINT	NATIVE_DOUBLE
NUMBER	NUMBER
NATIVE_DOUBLE family <ul style="list-style-type: none">NATIVE_REALNATIVE_DOUBLE	NATIVE_DOUBLE

Note

GOLDILOCKS gets the variance as follows.

- If the number of expr sets is 1, then it returns 0.
- If the number of expr sets is bigger than 1, It returns the value of **STDDEV_SAMP (expr)**.

For more information, refer to **STDDEV**.

Example

```
gSQL> SELECT VARIANCE(c1) FROM t1;
```

```
VARIANCE(C1)
```

```
-----
```

```
132.2
```

```
1 row selected.
```

```
gSQL> SELECT VARIANCE(ALL c1) FROM t1;
```

```
VARIANCE(ALL C1)
```

```
-----
```

```
132.2
```

```
1 row selected.
```

```
gSQL> SELECT VARIANCE(DISTINCT c1) FROM t1;
```

```
VARIANCE(DISTINCT C1)
```

```
-----
```

```
176.25
```

```
1 row selected.
```

VERSION

Syntax

VERSION()

Description

It obtains the product's version string.

Example

```
gSQL> SELECT VERSION() FROM dual;
```

```
VERSION()
```

```
-----
```

```
Release Name.X.X.X revision(XXXXX)
```

```
1 row selected.
```

WIDTH_BUCKET

Syntax

```
WIDTH_BUCKET( num, min, max, cnt )
```

Description

It creates a section of the same width as cnt within a range between specified min and max, and it returns the section location in which the num is located.

The data type of num argument, min argument, max argument and cnt argument can be a numeric data type.

min, max means the range for the section. If the min value is equal to the max value, an error is returned. cnt means the number of sections. The cnt value should be a positive number. If the cnt value is 0 or a negative number, an error is returned.

The section's location is numbered from one.

If any of num, min, max, cnt is NULL, the result is also NULL.

Example

```
gSQL> SELECT WIDTH_BUCKET( 5, 1, 20, 5 ) AS RESULT FROM DUAL;  
RESULT  
-----  
          2  
1 row selected.
```

12.

SQL Languages

Structured Query Languages (SQL) are classified as follows.

- Data Definition Language
- Data Manipulation Language
- Data Query Language
- Control Language

12.1 Data Definition Language

DDL Related Statements

For more information, refer to the followings.

- Non-schema object DDL
 - Database Related Statements
 - Profile Related Statements
 - Audit Policy Related Statement
 - Authorization Related Statements
 - Schema Related Statements
 - Tablespace Related Statements
- SQL schema object DDL
 - Table Related Statements
 - Index Related Statements
 - View Related Statements
 - Sequence Related Statements
 - Synonym Related Statements
- Cluster object DDL
 - Cluster System Related Statements
 - Cluster Group Related Statements
 - Cluster Member Related Statements
 - Cluster Location Related Statements
 - Global Secondary Index Related Statements

Concepts of DDL

Data Definition Language (DDL) is an SQL language which creates, drops and alters SQL objects.

SQL objects of a database are listed in the following table. For more information, refer to the links in the following table.

Table 12-1 SQL objects types

Object type	Object	Description	Refer to
		It is an object which defines a password man	

Object type	Object	Description	Refer to
Non-schema object	Profile	agement policy.	Profile
	Audit policy	It is an object which defines the SQL audit policy.	Audit Policy
	User	It is a user object which consists of a set of privileges.	Authorization
	Schema	It is a logical position including SQL schema objects such as tables.	Schema
	Tablespace	It is a physical storage of objects such as tables, indexes, etc.	Tablespace
	Public synonym	It is a public synonym.	Public Synonym
SQL schema object	Table	It is a physical relation where the data is stored.	Table
	View	It is a logical relation which consists of queries.	View
	Index	It is an index object to improve query performance.	Index
	Sequence	It is an object which generate sequence number.	Sequence
	Synonym	It is an object which declares an alias for an object.	Synonym
	Stored procedure	It is a user defined procedure object.	Stored Procedure
	Stored function	It is a user defined function object.	Stored Function
Cluster object	Cluster group	It is a cluster member set.	Cluster Group
	Cluster member	It is a data server which configures a cluster system.	Cluster Member
	Cluster location	It is a location object of a cluster member.	Cluster Location
	Shard	It is a set of rows which horizontally divides a cluster table.	Cluster Table and Shard
	Global secondary index	It is an index for the row identifier of a cluster.	Global Secondary Index

DDL and Transaction

A transaction of GOLDILOCKS includes not only DML statements such as INSERT, DELETE, UPDATE data, but also DDL statement such as CREATE, DROP, ALTER objects. Many DBMS performs implicit transactions of DDL. On the other hand, GOLDILOCKS includes a DDL statement in the transaction, and it guarantees the atomicity and consistency of transaction.

This feature is useful when a user needs to atomically perform batch DDL such as database migration or tool installation, or to recover a mistake through ROLLBACK when statement such as DROP TABLE or TRUNCATE

NCATE TABLE is executed by user mistake.

If the property of DDL statement is auto-commit, then it automatically commits when executing the statement. On the other hand, if it is not auto-commit, then it can rollback the transaction even after the statement was executed. Whether the DDL is auto-commit or not is queried by using **V\$SQL_COMMAND** view as follows.

```
gSQL>
```

```
SELECT command, auto_commit
FROM V$SQL_COMMAND
WHERE is_ddl = 'YES';
```

COMMAND	AUTO_COMMIT
-----	-----
ALTER AUDIT POLICY	YES
ALTER CLUSTER GROUP .. ADD CLUSTER MEMBER	YES
ALTER CLUSTER GROUP .. OFFLINE CLUSTER MEMBER	YES
ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS	YES
ALTER DATABASE OFFLINE INACTIVE CLUSTER MEMBERS	YES
ALTER DATABASE RESET LOCAL CLUSTER MEMBER	YES

106 rows selected.	

The followings are examples of COMMIT and ROLLBACK when table-related DDL statements are included in the transactions, and examples of its effects on other transactions. The example shows that the transaction including DDL guarantees the transaction atomicity. In addition, it ensures the reading consistency of

the transaction, which is not affected by other transactions before transaction's commitment or when the transaction is rolled back.

Creating Object and Transaction

- Before committing or rolling back a transaction of creating table

When a table is created, and transaction is not committed, the table data can be manipulated on the DDL transaction as follows. However, other transactions are not allowed to enquire the table until the creating table transaction is committed. CREATE TABLE statement, like as INSERT statement, can not be queried by any other transaction until the transaction is committed.

- Transaction A: Table t1 is created but the transaction is not committed.

```
gSQL> CREATE TABLE t1 ( id INTEGER, name VARCHAR(128) );
Table created.
gSQL> INSERT INTO t1 VALUES ( 1, 'leekmo' );
1 row created.
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
```

As above, if table t1 is created on the transaction A and the transaction is not yet committed, the transaction B in another session can not enquire the table t1 and can not create the table named as t1.

- Transaction B: Table t1 can not be enquired until committing the transaction A.

```
gSQL> SELECT * FROM t1;
ERR-42000(16040): table or view does not exist :
SELECT * FROM t1
          *
ERROR at line 1:
```

- Table t1 can not be created until the transaction A is rolled back.

```
gSQL> CREATE TABLE t1 ( emp_no INTEGER );
ERR-HYT00(14026): resource busy or timeout expired
```

- After committing a transaction of creating table

If the transaction A is committed, table t1 can be enquired by the transaction B and CREATE TABLE statement returns a validation error to notify that the table t1 exists as follows.

- Transaction B: After committing the transaction A, the table can be enquired as follows.

```
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
```

- After the transaction A is committed, a validation error is returned.

```
gSQL> CREATE TABLE t1 ( emp_no INTEGER );
ERR-42000(16005): name 'PUBLIC.T1' is already used by an existing object :
CREATE TABLE t1 ( emp_no INTEGER )
          *
ERROR at line 1:
```

- After rolling back a transaction of creating table

If the transaction A is rolled back, creating table t1 is also rolled back, and table t1 can be created by the transaction B.

- Transaction B: The transaction A is rolled back and its state becomes as same as before creating table t1.

```
gSQL> SELECT * FROM t1;
ERR-42000(16040): table or view does not exist :
SELECT * FROM t1
          *
ERROR at line 1:
```

- The transaction A is rolled back and it can create the table t1.

```
gSQL> CREATE TABLE t1 ( emp_no INTEGER );
Table created.
```

Dropping Object and Transaction

- Before committing or rolling back a transaction of dropping table

When a table is dropped, and transaction is not committed, other transactions can enquire the dropped table until the DROP TABLE transaction is committed. DROP TABLE statement, like as DELETE statement, retrieves the state of before deleting the table when other transaction enquires it until the transaction is committed.

The following example describes the state which the transaction A drops the table t1, then it creates new table t1, and the transaction is not committed.

- Transaction A: There is a row having two columns in the table t1 before dropping the table.

```
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
```

- Dropping the existing table t1

```
gSQL> DROP TABLE t1;
Table dropped.
```

- Creating the new table t1

```
gSQL> CREATE TABLE t1 ( addr VARCHAR(128) );
Table created.
```

- Creating a new row in the newly created table t1

```
gSQL> INSERT INTO t1 VALUES ( 'Seoul, Korea' );
1 row created.
gSQL> SELECT * FROM t1;
ADDR
-----
Seoul, Korea
1 row selected.
```

If the transaction B enquires when the transaction A is not committed, the information which is before the transaction A is executed is obtained as follows. DROP TABLE statement, like as DELETE statement, does not affect any other transaction until the transaction is committed.

- Transaction B: The transaction B retrieves the table which is before the execution of the transaction A.

```
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
```

- After committing a transaction of dropping table

If the transaction A is committed, then the transaction B enquires the newly created table t1 as follows.

- Transaction B: After committing the transaction A, the transaction B enquires the newly created table t1.

```
gSQL> SELECT * FROM t1;
ADDR
-----
Seoul, Korea
1 row selected.
```

- After rolling back a transaction of dropping table

If the transaction A is rolled back, the transaction B enquires the table t1 which is before the execution of the transaction A as follows. Namely, if the transaction A is rolled back, the rollback transaction does not affect the data of which the transaction B enquires.

- Transaction B: If the transaction A is rolled back, the transaction B enquires the information which is before the execution of the transaction A.

```
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
```

Altering Object and Transaction

ALTER TABLE statement is used to alter the table structure. ALTER TABLE statement also ensures atomicity and consistency of the transaction like as CREATING TABLE or DROPPING TABLE statements. Before committing a transaction in which a column is added to a table, other transactions retrieve the information of the existing table as follows. Namely, ALTER TABLE statement, like as UPDATE statement, retrieves information which is before DDL transaction in other transaction until the transaction is committed.

- Transaction A: It adds a new UPDATE_TIME column.

```
gSQL> ALTER TABLE t1 ADD COLUMN ( update_time TIMESTAMP DEFAULT CURRENT_TIMESTAMP );
Table altered.
```

- The table t1 including the added column is retrieved.

```
gSQL> select * from t1;
ID NAME      UPDATE_TIME
-- -----
1 leekmo 2014-07-10 12:50:33.540495
1 row selected.
```

If the transaction B is executed before committing the transaction A as follows, then the table t1 which is before adding a column is retrieved.

- Transaction B: The added column UPDATE_TIME is not retrieve, because the transaction A is not committed.

```
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
```

12.2 Data Manipulation Language

DML Related Statements

For more information, refer to the followings.

- INSERT related statements
 - **INSERT INTO**
 - **INSERT INTO name RETURNING**
 - **INSERT INTO name RETURNING .. INTO**
- UPDATE related statements
 - **UPDATE**
 - **UPDATE name RETURNING**
 - **UPDATE name RETURNING .. INTO**
 - **UPDATE name WHERE CURRENT OF cursor_name**
- DELETE related statements
 - **DELETE FROM**
 - **DELETE FROM name RETURNING**
 - **DELETE FROM name RETURNING .. INTO**
 - **DELETE FROM name WHERE CURRENT OF cursor_name**
- SELECT related statements: **SELECT .. INTO**
- Dynamic SQL related statements
 - **EXECUTE IMMEDIATE 'sql_string'**
 - **PREPARE statement_name**
 - **EXECUTE statement_name**

Concepts of DML

Data Manipulation Language (DML) is an SQL language which manipulates and enquires data in existing tables such as INSERT, DELETE, UPDATE.

This chapter describes only DML statements which change data. For more information about queries, refer to **Data Query Language**.

The DDL statements change the SQL object structure, but DML statements manipulate the objects contents. For example, ALTER TABLE statement alters the table structure, but INSERT statement adds one or more rows in the table.

DML statements such as inserting, deleting, updating data in table are classified as follows.

Table 12-2 Data manipulation statements

Category	Statements	Description
INSERT	INSERT .. VALUES	It adds a single row to the table.
	INSERT .. SELECT	It adds the query results to the table.
	INSERT .. RETURN .. INTO	It sets the value of the added row as a variable.
	INSERT .. RETURN	It retrieves the added row as the query result.
DELETE	DELETE .. WHERE	It deletes the row which satisfies the condition.
	DELETE .. WHERE CURRENT OF	It deletes the row which is at the cursor's position.
	DELETE .. RETURN .. INTO	It sets the value of the removed row as a variable.
	DELETE .. RETURN	It retrieves the removed row as the query result.
UPDATE	UPDATE .. WHERE	It updates the row which satisfies the condition.
	UPDATE .. WHERE CURRENT OF	It updates the row which is at the cursor's position.
	UPDATE .. RETURN .. INTO	It sets the value of the updated row as a variable.
	UPDATE .. RETURN	It retrieves the updated row as the query result.

Inserting Data

It adds data in a row unit when adding data to a table. The INSERT statement can add one or more rows to a table. Even when the data in some columns are omitted, all rows are added with completed columns to the table.

The following is an example of a table.

```
CREATE TABLE t1
(
    id    NUMBER(10,0),
    name  VARCHAR(128),
    addr  VARCHAR(1024) DEFAULT 'n/a'
);
```

The most basic way to add a row is as follows.

```
INSERT INTO t1 VALUES ( 1, 'leekmo', 'Seoul, Korea' );
```

The values listed in the VALUES clause are inserted in accordance with the sequence of the listed column when the table is created.

However, the example above can cause an unexpected failure when inserting or deleting columns, so it is recommended to explicitly specify the column name as follows.

```
INSERT INTO t1 (id, name, addr) VALUES ( 1, 'leekmo', 'Seoul, Korea' );
INSERT INTO t1 (name, addr, id) VALUES ( 'leekmo', 'Seoul, Korea', 1 );
```

The two INSERT statements above are listed in different order from the columns, but the added row of the table t1 has the same data.

If the table does not list all the columns, unspecified column is set to the default value to complete the row. The addr column which was not used in the statement stores the default value (n/a) which was specified when creating table as follows.

```
INSERT INTO t1 ( id, name ) VALUES ( 1, 'leekmo' );
INSERT INTO t1 ( id, name ) SELECT id, name FROM emp;
```

Use DEFAULT to explicitly specify the default value for the column as follows.

```
INSERT INTO t1 ( id, name, addr ) VALUES ( 1, 'leekmo', DEFAULT );
```

Use either of the following two statements to set all the columns to the default value.

```
INSERT INTO t1 ( id, name, addr ) VALUES ( DEFAULT, DEFAULT, DEFAULT );
INSERT INTO t1 DEFAULT VALUES;
```

Use a single INSERT statement to add multiple rows. The following is an example of adding three new rows using a single INSERT statement.

```
INSERT INTO t1 (id, name, addr) VALUES
( 1, 'leekmo', 'Seoul, Korea' ),
( 2, 'mkkim', 'Seoul, Korea' ),
( 3, 'xcom', 'Inchon, Korea' );
```

Use the SELECT query results to add multiple rows. The following is an example of adding rows to the table t1 by retrieving employees who joined the company more than three years ago.

```
INSERT INTO t1 ( id, name, addr )
SELECT id, name, addr
FROM emp
WHERE DATEDIFF( YEAR, SYSDATE, join_date ) >= 3;
```

Deleting Data

DELETE statement deletes data from the table in a row unit like when inserting data. Rows can be deleted by using WHERE condition or by using row's ID(ROWID).

The following is an example of deleting rows which satisfy WHERE condition.

```
DELETE FROM t1 WHERE id = 1;
```

The following is an example of deleting the row using ROWID.

```
gSQL> SELECT rowid FROM t1 WHERE id = 1;
                ROWID
-----
AAAAAAAAFNHAACAAAAiAAA
1 row selected.
gSQL> DELETE FROM t1 WHERE ROWID = 'AAAAAAAAFNHAACAAAAiAAA';
1 row deleted.
```

DELETE statement without a WHERE clause deletes the entire row in a table. DELETE statement without a WHERE clause is similar to TRUNCATE TABLE statement in terms of deleting entire row, but it is recommended to use the TRUNCATE TABLE statement.

```
DELETE FROM t1;
TRUNCATE TABLE t1;
```

Updating Data

Update data by using UPDATE statement. One or more rows and columns can be updated. Other columns which is not specified in the UPDATE statement is not affected.

The following is an example of updating a column in rows which satisfy the condition.

```
UPDATE t1 SET page_view = page_view + 1 WHERE id = 1;
```

The followings are examples of updating multiple columns, and the two UPDATE statements mean the same.

```
UPDATE t1 SET page_view = page_view + 1, status = 'F' WHERE id = 1;
UPDATE t1 SET (page_view, status) = (page_view + 1, 'F') WHERE id = 1;
```

Use DEFAULT as follows to set the column value to a default value.

```
UPDATE t1 SET addr = DEFAULT WHERE id = 1;
```

Manipulating Data Using Cursor

Cursor is a session object to execute queries and to manipulate the query result. Use cursor to update or delete the query result set.

The following is an example of declaring updatable cursor, and updating or deleting the row at the position of the current cursor using the updatable cursor.

```
gSQL> DECLARE cur1 CURSOR FOR SELECT id, data FROM t1 FOR UPDATE;
Cursor declared.
gSQL> OPEN cur1;
Cursor is open.
gSQL> \var v_id INTEGER
gSQL> \var v_data VARCHAR(128)
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA
----
1 data_1
1 row fetched.
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA
----
2 data_2
1 row fetched.
gSQL> DELETE FROM t1 WHERE CURRENT OF cur1;
1 row deleted.
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA
----
3 data_3
1 row fetched.
gSQL> UPDATE t1 SET id = id + :v_id WHERE CURRENT OF cur1;
1 row updated.
gSQL> COMMIT;
Commit complete.
gSQL> SELECT * FROM t1 ORDER BY 1;
```

```
ID DATA
-- -----
1 data_1
6 data_3
2 rows selected.
```

The examples above describe the followings.

Use **DECLARE cursor_name** to declare FOR UPDATE cursor, and use **OPEN cursor_name** to open the cursor.

Use **FETCH cursor_name** to move the cursor to the specified position.

Use **DELETE FROM name WHERE CURRENT OF cursor_name** to delete the row in the specified position.

Use **UPDATE name WHERE CURRENT OF cursor_name** to update the row in the specified position.

FOR UPDATE cursor is closed using **CLOSE cursor_name**, or it is closed when committing transaction.

DML Query

When executing DML statements changing the data, use RETURNING clause to retrieve the changed data. The RETURNING clause of DML statements, like as SELECT, can retrieve data, so the execution of the DML statement and the SELECT statement can be replaced with the DML query.

The following is an example of using **INSERT INTO name RETURNING** syntax to insert data and retrieve the result. The join_date value which was input by using SYSDATE function can be retrieved by a single DML query.

```
gSQL> INSERT INTO t1 ( id, join_date ) VALUES ( 1, SYSDATE ) RETURNING id, join_date;
ID JOIN_DATE
-- -----
1 2014-07-18
1 row created.
```

The following is an example of using **DELETE FROM name RETURNING** syntax to delete data and retrieve the result. The result data can be manipulated by using operation in RETURNING clause.

```
gSQL> DELETE FROM t1 RETURNING ( id || ':' || join_date ) AS id_and_join_date;
ID_AND_JOIN_DATE
-----
1: 2014-07-18
1 row deleted.
```

The following is an example of using **UPDATE name RETURNING** syntax to update rows and retrieve the

updated values. The value which is before updating can be retrieved by using OLD clause.

- It updates the row and retrieves the updated value.

```
gSQL> UPDATE t1 SET page_view = page_view + 1 WHERE id = 1 RETURNING page_view;
PAGE_VIEW
-----
      102
1 row updated.
```

- It updates the row and retrieves the value which is before the updating.

```
gSQL> UPDATE t1 SET page_view = page_view + 1 WHERE id = 1 RETURNING OLD page_view;
PAGE_VIEW
-----
      102
1 row updated.
```

RETURNING clause of DML statements, like as SELECT query, can retrieve multiple query results. However, if the DML is executed only for a single row, then the host variable can be obtained by using RETURNING INTO clause. In this case, the number of changed rows should be one or less, like **SELECT .. INTO** clause .

The following is an example of setting the value to the host variable using RETURNING .. INTO clause of each DML statement.

- It declares the host variable.

```
gSQL> \var v_id          INTEGER
gSQL> \var v_page_view BIGINT
gSQL> \var v_date        DATE
```

- After inserting the row, a value is set to the host variable.

```
gSQL> INSERT INTO t1 ( id, join_date ) VALUES ( 1, SYSDATE ) RETURNING join_date INTO :v_date;
V_DATE
-----
2014-07-18 16:57:11.000000
1 row created.
```

- After updating the row, a value is set to the host variable.

```
gSQL> UPDATE t1 SET page_view = page_view + 1 WHERE id = 1 RETURN page_view INTO :v_page_view;
V_PAGE_VIEW
```

```

-----
          101
1 row updated.

```

- After deleting the row, a value is set to the host variable.

```

gSQL> DELETE FROM t1 WHERE id = 1 RETURN id, page_view INTO :v_id, :v_page_view;
V_ID V_PAGE_VIEW
----
1      101
1 row deleted.

```

For more information about DML query, refer to the followings.

- **INSERT INTO name RETURNING**
- **INSERT INTO name RETURNING .. INTO**
- **DELETE FROM name RETURNING**
- **DELETE FROM name RETURNING .. INTO**
- **UPDATE name RETURNING**
- **UPDATE name RETURNING .. INTO**

12.3 Data Query Language

Query Related Statements

For more information, refer to the followings.

- SELECT query related statements
 - **SELECT**
 - **SELECT .. FOR UPDATE**
- DML query related statements
 - **INSERT INTO name RETURNING**
 - **UPDATE name RETURNING**
 - **DELETE FROM name RETURNING**
- Cursor related statements
 - **DECLARE cursor_name**
 - **OPEN cursor_name**
 - **FETCH cursor_name**
 - **CLOSE cursor_name**
 - **DELETE FROM name WHERE CURRENT OF cursor_name**
 - **UPDATE name WHERE CURRENT OF cursor_name**

Concepts of Query

Query means a series of operations to retrieve data for one or more of the table or view. By using the query, a user can get the result data which satisfies the specific condition in the desired form from the stored data.

Query is a SELECT statement which is at the top in the entire SQL statement separated by ';'. Top-level SELECT statement can include another SELECT statement in it. In this case, the subordinate SELECT statement is called as a subquery.

In GOLDBLOCKS, query is divided into SELECT query, DML query, and cursor. SELECT query returns the result by using the SELECT statement. DML query returns the result by using the RETURNING phrase in INSERT, DELETE, UPDATE statements. Cursor temporarily saves the result sets when it is enquired once, and randomly accesses to a row of the saved result set, then brings the result.

A user can get the results at once by using SELECT query and DML query. On the other hand, by using th

e cursor, SELECT statement specified with DECLARE cursor is executed in OPEN cursor, and then it holds the result set until CLOSE cursor is called. Then it repeatedly brings the result by randomly accessing a row of the result set using FETCH cursor.

This chapter describes SELECT query, DML query and cursor.

Basic Query

The basic form of a query is *SELECT <select list> FROM <table expression>*. <select list> which is between SELECT and FROM keywords, specifies one or more columns or expressions to be included in rows which are the result for the table or view described in <table expression>.

```
SELECT n_name
       , INITCAP( n_name )
FROM nation
WHERE n_regionkey = 1;
```

N_NAME	INITCAP(N_NAME)
ARGENTINA	Argentina
BRAZIL	Brazil
CANADA	Canada
PERU	Peru
UNITED STATES	United States

5 rows selected.

One or more tables or views can be described in <table expression>, and same column can be included in two tables or views. In this case, the name of table or view should be specified together when describing that column in <select list>. When describing a table or a column, it is recommended to clearly describe the schema names and table names, etc.

- A wrong example

```
SELECT n_name
FROM nation AS n
       , v_nation AS v
WHERE n.n_nationkey = v.n_nationkey
      AND v.n_regionkey = 1;
```

ERR-42000(16142): column ambiguously defined :

```
SELECT n_name
      *
```

ERROR at line 1:

- A correct example

```
SELECT n.n_name
      FROM nation   AS n
           , v_nation AS v
 WHERE n.n_nationkey = v.n_nationkey
       AND v.n_regionkey = 1;
N_NAME
-----
ARGENTINA
BRAZIL
CANADA
PERU
UNITED STATES
5 rows selected.
```

⟨select list⟩ supports the alias name. It changes output column names in each columns which are separated by comma (,). Alias name can be used only in the ⟨order by clause⟩, and it can not to be used in other phrases.

```
SELECT p_type
      , p_retailprice * 0.9 AS discount_price
 FROM part
 ORDER BY discount_price
 FETCH 5;
      2      3      4      5
P_TYPE                DISCOUNT_PRICE
-----
PROMO BURNISHED COPPER          810.9
ECONOMY BRUSHED NICKEL          810.9
LARGE BRUSHED BRASS             811.8
LARGE BRUSHED NICKEL            811.8
PROMO ANODIZED STEEL            811.8
5 rows selected.
```

In addition to ⟨select list⟩, ⟨hint clause⟩ and ⟨set quantifier⟩ can also be used between SELECT and FROM keywords. ⟨hint clause⟩ allows a user to directly adjust the query execution plan. For more information, refer to **hint clause**. ⟨set quantifier⟩ removes the duplicate data of the row which is returned as the result. For more information, refer to **query specification**.

- An example of using hint

```
SELECT
    /*+ INDEX( part ) */
    p_type
    , p_retailprice
FROM part
WHERE p_partkey = 100;
P_TYPE          P_RETAILPRICE
-----
ECONOMY ANODIZED TIN      1000.1
1 row selected.
```

- An example of using <set quantifier>

```
SELECT DISTINCT
    o_orderpriority
FROM orders;
O_ORDERPRIORITY
-----
5-LOW
2-HIGH
3-MEDIUM
1-URGENT
4-NOT SPECIFIED
5 rows selected.
```

SET Operator

SET operators combine the result set of two or more queries into a single result set. SET operators are UNION, EXCEPT, INTERSECT, and MINUS. MINUS operates as same as EXCEPT. Each SET operator has additional options such as ALL and DISTINCT. If the option is omitted, DISTINCT is used by default.

When using the SET operators to describe two or more queries, generally the queries are processed sequentially from the left. When parentheses are used to explicitly specify the processing order of the queries, then those queries are processed first.

```
SELECT n_name
FROM nation
WHERE n_nationkey < 10
```

```

INTERSECT
( SELECT n_name
  FROM nation
  WHERE n_regionkey = 1
  UNION ALL
  SELECT n_name
  FROM nation
  WHERE n_regionkey = 2 );
N_NAME
-----
BRAZIL
ARGENTINA
INDONESIA
INDIA
CANADA
5 rows selected.

```

Each query of the SET operators should have the same number of the target, and the target at the same positions of each query should have a data type which belongs to the same group.

⟨order by clause⟩ of SET operator sorts the final result set. Each query of SET operators can have its own ⟨order by clause⟩ to sort themselves.

For more information about SET operators, refer to **set operator**.

Join

Join is a query that combines rows from more than one table or view in ⟨from clause⟩. If there is not a join condition, the result is obtained by combining each result row of the left table or view with each result row of the right table or view.

If tables or views have a column name in common when joining two or more tables or views in ⟨from clause⟩, a user should distinguish these columns by using the table or view name in ⟨select list⟩, ⟨where clause⟩. Otherwise, a validation error occurs.

Join queries either contain the join condition or do not contain the join condition. Join condition is for comparing columns from two different tables or views. If the join condition is not specified, each row of a table or view is combined with each row of another table or view, and the combined row is returned. If the join condition is specified, rows from each table or view which satisfies the join condition, are returned in the combined form.

Equi-join is a join whose join condition contains an equality operator(=). Equi-join condition is an importa

nt factor in optimizing the join operation by the optimizer.

Self-join is a join operation which has only the same tables in <from clause>. To describe column in <select list>, the alias name in each table is described and table alias in column is used.

CROSS JOIN

CROSS JOIN is a join operation whose join condition does not exist, and it is also called as Cartesian Product. CROSS JOIN combines each row of one table or view with each row of the other, and the combined row is returned as a result.

```
SELECT a.r_name
      , b.r_name
  FROM region AS a
      , region AS b
  FETCH 5;
```

R_NAME	R_NAME
AFRICA	AFRICA
AFRICA	AMERICA
AFRICA	ASIA
AFRICA	EUROPE
AFRICA	MIDDLE EAST

5 rows selected.

INNER JOIN

INNER JOIN returns the rows which satisfy the join condition for two or more tables or views. INNER JOIN is when *inner join* is explicitly specified in <from clause>. Or, when tables or views are listed with comma (,) in <from clause> and its join condition is specified in <where clause>.

If there are explicit *inner join* in <from clause>, and the join condition in <where clause>, then they are processed as one inner join condition.

- An example of using an INNER JOIN statement

```
SELECT n_name
  FROM region INNER JOIN nation ON r_regionkey = n_regionkey
  WHERE r_name = 'AFRICA';
```

N_NAME
ALGERIA

```

ETHIOPIA
KENYA
MOROCCO
MOZAMBIQUE
5 rows selected.

```

- An example of a list using a comma (,)

```

SELECT n_name
       FROM region
           , nation
       WHERE r_regionkey = n_regionkey
           AND r_name = 'AFRICA';
N_NAME
-----
ALGERIA
ETHIOPIA
KENYA
MOROCCO
MOZAMBIQUE
5 rows selected.

```

OUTER JOIN

OUTER JOIN returns all rows which satisfy the join condition for two or more tables or views. It also returns rows which do not satisfy the join condition for one or both side of table or view depending on the direction of OUTER JOIN.

OUTER JOIN can be classified as LEFT OUTER JOIN , RIGHT OUTER JOIN, FULL OUTER JOIN. All three OUTER JOIN return rows which satisfy the join condition, but they are distinguished by the additional results. LEFT OUTER JOIN returns all rows of the left table which do not satisfy the join condition by filling NULL for all of its right rows. RIGHT OUTER JOIN returns all rows of the right table which do not satisfy the join condition by filling NULL for all of its left rows. FULL OUTER JOIN returns all additional return results of LEFT OUTER JOIN and RIGHT OUTER JOIN.

```

SELECT r_name
       , n_name
       FROM region LEFT OUTER JOIN nation
           ON r_regionkey = n_regionkey AND r_name = 'AFRICA';
R_NAME          N_NAME

MIDDLE EAST	null

9 rows selected.

GOLDILOCKS supports the outer join operator(+) for compatibility with Oracle, and which is not supported in the SQL standard. The outer join operator(+) lists tables by using a comma(,) in <from clause> and it adds a (+) to a node column which is operated as the outer node in the join condition of <where clause>.

When using the outer join operator (+), the sign(+) should be specified on the right side of the column as follows.

```
select * from t1, t2 where t1.i1 = t2.i1(+);
```

The syntax rules of the outer join operator (+) are as follows.

- <Join outer operator> can be used only for <where clause>.
- <Join outer operator> can be used only for <column reference> of <table reference> which is a target of <joined table>.
- <value expression> including <join outer operator>, can not be combined with other conditions which use <OR logical operator>.
- <column reference> including <join outer operator> can not be used as the argument of IN function.
- A <table reference> can not be used as null generated table of many outer joins (constraints on the outer join)
- When executing the outer join of two or more tables, they are listed according to the left outer join sequence, and executes the outer join from the very left of them.
- When executing outer join between two or more tables and multiple tables are combined into a table by the outer join, then the outer join is executed according to the sequence of calculation by an optimizer.

Even when the outer join operator (+) is specified, it is ignored in the following cases.

- <join outer operator> can be used for <value expression> which can be used as the join condition between the two tables, if it can not be used as the join condition, then it is ignored and an error or warning does not occur.
- <join outer operator> which is specified in <column reference> of the outer query is ignored, and an error or warning does not occur.
- If two <table reference> are outer joined using <join outer operator>, then <join outer operator> should

uld be specified in all <column reference> which belong to null generated tables. Otherwise, join of two <table reference> is processed as an inner join, an error or warning does not occur.

Differences between Oracle and GOLDDILOCKS for the outer join operator (+) are as follows.

- Quantified comparison (in, = any, = all = row, etc.)
 - GOLDDILOCKS: It processes the operation as a validation error.
 - Oracle: The and/or operation is applied, and performs the validation check.
- Or sub-clause in an *and* clause
 - GOLDDILOCKS: Validation is applied on the columns of an *or* sub-clause.
 - Oracle: Validation is ignored on the columns of an *or* sub-clause.
- When the condition clause includes a subquery
 - GOLDDILOCKS: The outer join is applied and the condition is processed as a join condition.
 - Oracle: The outer join is applied but the condition is processed as a where filter.

Note

GOLDDILOCKS supports the outer join operator (+) for compatibility with Oracle. It is recommended to specify OUTER JOIN in <from clause>. (Oracle also recommends to specify OUTER JOIN in <from clause>.)

NATURAL JOIN

NATURAL JOIN uses the join condition of an equality operator(=) for columns of same name when joining two or more tables or views. It is as same as INNER JOIN except that NATURAL JOIN has the implicit join condition for columns of the same name.

```
SELECT r_name
FROM region a NATURAL JOIN region b;
R_NAME
-----
AFRICA
AMERICA
ASIA
EUROPE
MIDDLE EAST
5 rows selected.
```

SEMI JOIN

SEMI JOIN returns the corresponding left rows if there exist right rows which satisfy the join condition. Unlike other join operations to return the rows which combine the left and right rows, SEMI JOIN returns only the left rows as the result.

- An example of using the semi join

```
SELECT r_name
FROM region
WHERE r_regionkey IN ( SELECT n_regionkey
                       FROM nation
                       WHERE n_nationkey < 5 );
```

R_NAME
AFRICA
AMERICA
MIDDLE EAST

3 rows selected.

ANTI-SEMI JOIN

ANTI-SEMI JOIN returns the corresponding left rows if there does not exist any right rows which satisfy the join condition. It returns only the left rows as the result like as SEMI JOIN.

- An example of using the anti-semi join

```
SELECT r_name
FROM region
WHERE r_regionkey NOT IN ( SELECT n_regionkey
                          FROM nation
                          WHERE n_nationkey < 5 );
```

R_NAME
ASIA
EUROPE

2 rows selected.

For more information about the join operation, refer to [joined table](#).

Grouping Result Set (group by)

<group by clause> is used in order to group the rows which have the same column into one. <group by clause> lists and delimiters columns by using the comma (,), and GOLDBLOCKS supports the group operation based on it.

```
SELECT
    o_orderpriority
  , MIN( o_totalprice ) AS min_price
  , MAX( o_totalprice ) AS max_price
FROM orders
GROUP BY
    o_orderpriority;
O_ORDERPRIORITY MIN_PRICE MAX_PRICE
-----
5-LOW            857.71 530604.44
2-HIGH           896.8 522720.61
3-MEDIUM        875.52 508668.52
1-URGENT         866.9 544089.09
4-NOT SPECIFIED  884.82 555285.16
5 rows selected.
```

If <group by clause> is specified, only the columns and the aggregate functions described in <group by clause> can be included in <select list>.

If only constants or parentheses instead of columns are specified in <group by clause>, it is assumed to be empty grouping set which includes the imaginary columns of the same value in each row. Then, the grouping in column base is performed. It is same when specifying <having clause> without <group by clause>.

<having clause> can be used to get the specified rows from grouped results by <group by clause>. <having clause> describes the conditions for each group, and it can describe the condition using the aggregate operation.

```
SELECT
    o_orderpriority
  , MIN( o_totalprice ) AS min_price
  , MAX( o_totalprice ) AS max_price
FROM orders
GROUP BY
    o_orderpriority
HAVING
```

```

        MIN( o_totalprice ) < 870;
O_ORDERPRIORITY MIN_PRICE MAX_PRICE
-----
5-LOW           857.71 530604.44
1-URGENT        866.9 544089.09
2 rows selected.

```

For more information about the grouping, refer to **group by clause**.

Sorting Result Set (order by)

⟨Order by clause⟩ sorts the result set based on the specific columns. ⟨order by clause⟩ can sort based on all types of column except the LONG type.

When a positive integer value is in ⟨order by clause⟩, it means the column which is located in the corresponding to an integer value for the targets in the ⟨select list⟩. The range of positive integer value which can be described in ⟨order by clause⟩ is from 1 and to the number of the targets in ⟨select list⟩.

```

SELECT
    o_orderpriority
    , MIN( o_totalprice ) AS min_price
    , MAX( o_totalprice ) AS max_price
FROM orders
GROUP BY
    o_orderpriority
ORDER BY 1;
O_ORDERPRIORITY MIN_PRICE MAX_PRICE
-----
1-URGENT        866.9 544089.09
2-HIGH          896.8 522720.61
3-MEDIUM       875.52 508668.52
4-NOT SPECIFIED 884.82 555285.16
5-LOW           857.71 530604.44
5 rows selected.

```

If the column data type in ⟨order by clause⟩ is numeric, it is sorted by numeric comparison. If the column data type is a character type, it is sorted by character comparison.

Each column in ⟨order by clause⟩ can be described by using the sorting direction option such as ASC, DESC. If it is omitted, it is regarded as ASC.

For more information about sorting, refer to **order by clause**.

Subquery

Subquery supports a multi-level search request. The multi-level search request means that the result of the current query depends on the result of the subquery.

For example, the query to get people who are older than the average age of the people in a specific group is written in multi-step. The first query is to obtain the average age of people in a specific group, then the second query is to retrieve the number of people who are older than the average using the first query.

```
SELECT e_name
  FROM emp
 WHERE e_age > ( SELECT AVG(e_age)
                  FROM emp
                  WHERE e_dept = 'RND' );
```

A subquery can be used in <from clause>, <where clause>. The subquery in <from clause> is "inline view" and the subquery in <where clause> is "nested subquery".

The column name of a table or view in nested subquery can be same as the column name of a table or view in the query including the nested subquery when using the nested subquery. If only the column name exists in <select list> of the nested subquery, then it refers to the column of the table or view in the nested subquery. If the column name in <select list> of the nested subquery does not exist in the nested subquery's table or view, then it refers to the column name of the table or view in the query which includes the nested subquery, if exists.

```
SELECT r_name
  FROM region
 WHERE EXISTS ( SELECT *
                  FROM nation
                  WHERE n_nationkey < 5          /* nation.n_nationkey */
                  AND n_regionkey = r_regionkey ) /* nation.n_regionkey = region.r_regionkey */
;
```

The optimizer unnests the nested subquery of <where clause> in the query which includes the nested subquery. Then it processes it as SEMI JOIN or ANTI-SEMI JOIN operation.

This is an optimization of the nested subquery, and the optimizer determines it by calculating the cost of unnesting if the subquery exists in IN, NOT IN, EXISTS, NOT EXISTS, quantify operator.

If a user wants to forcibly unnest the nested subquery, the user can use <hint clause> of nested subquery.

For more information about unnesting the nested subquery, refer to **hint clause**.

```
SELECT r_name
FROM region
WHERE r_regionkey IN ( SELECT /*+ UNNEST */
                        n_regionkey
                        FROM nation
                        WHERE n_nationkey < 5 );
```

For more information about subquery, refer to **subquery**.

12.4 Control Language

Control Language Related Statements

Transaction control related statements: Refer to the followings.

- COMMIT
- ROLLBACK
- LOCK TABLE
- SAVEPOINT *savepoint_specifier*
- RELEASE SAVEPOINT *savepoint_specifier*

Session control related statements: Refer to the followings.

- ALTER SESSION SET *property_name*
- SET SESSION AUTHORIZATION *user_identifier*
- SET SESSION CHARACTERISTICS AS *transaction_mode*
- SET TIME ZONE
- SET TRANSACTION *transaction_mode*

System control related statements: Refer to the followings.

- ALTER SYSTEM CHECKPOINT
- ALTER SYSTEM {MOUNT | OPEN} DATABASE
- ALTER SYSTEM [KILL | DISCONNECT] SESSION
- ALTER SYSTEM SET *property_name*
- ALTER SYSTEM RESET *property_name*
- ALTER SYSTEM SWITCH LOGFILE

Transaction Control

Transaction control statements are used to manage the changes caused by executing DML or DDL statements in the transactions. Transaction control statements can be committed to keep the changes permanently, or rolled back to undo the changes.

Transaction control statements are classified as follows.

Table 12-3 Transaction control statements

Statement	Description	Refer to
COMMIT	It terminates the transaction normally.	COMMIT
ROLLBACK	It undoes the transaction.	ROLLBACK

Statement	Description	Refer to
SAVEPOINT	It creates the savepoint.	SAVEPOINT savepoint_specifier
RELEASE SAVEPOINT	It removes the savepoint.	RELEASE SAVEPOINT savepoint_specifier
LOCK TABLE	It sets the table-level lock.	LOCK TABLE
SET TRANSACTION	It controls the transaction properties. (Read/write, isolation level)	SET TRANSACTION transaction_mode
SET CONSTRAINTS	It controls the checkpoint of the deferrable constraints.	SET CONSTRAINTS

A transaction is automatically created when the DML statements or DDL statements are executed for the first time. DML statements change the data and DDL statements change the SQL objects. However, the SELECT statements or the control statement do not generate a transaction.

The transaction rollbacks are classified as total rollback and partial rollback. The partial rollback is executed either in an explicit method or an implicit method. The total rollback is executed by ROLLBACK statement, and it undoes any changes performed by DML, DDL within the transaction.

The explicit partial rollback is a method which a user executes ROLLBACK statement using the savepoints as follows.

The following example describes that savepoints sp1, sp2 are declared, and then the partial rollback is explicitly executed.

```

gSQL> CREATE TABLE t1 ( id INTEGER, name VARCHAR(128) );
Table created.
gSQL> COMMIT;
Commit complete.
gSQL> INSERT INTO t1 VALUES ( 1, 'leekmo' );
1 row created.
gSQL> SAVEPOINT sp1;
Savepoint created.
gSQL> INSERT INTO t1 VALUES ( 2, 'mkkim' );
1 row created.
gSQL> SAVEPOINT sp2;
Savepoint created.
gSQL> INSERT INTO t1 VALUES ( 3, 'xcom' );
1 row created.
gSQL> ROLLBACK TO SAVEPOINT sp2;
Rollback complete.
gSQL> SELECT * FROM t1;
ID NAME
-- -----

```

```

1 leekmo
2 mkkim
2 rows selected.
gSQL> ROLLBACK TO SAVEPOINT sp1;
Rollback complete.
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
gSQL> ROLLBACK WORK;
Rollback complete.
gSQL> SELECT * FROM t1;
no rows selected.

```

The implicit partial rollback is undoing only the changes of the corresponding statement when an error occurs while executing the statement.

The following example describes the implicit partial rollback.

If a unique constraint is violated, only the INSERT statement is rolled back and the previous changes of the transaction are retained.

```

gSQL> ALTER TABLE t1 ADD CONSTRAINT t1_uk UNIQUE(id);
Table altered.
gSQL> COMMIT;
Commit complete.
gSQL> INSERT INTO t1 VALUES ( 4, 'egonspace' );
1 row created.
gSQL> INSERT INTO t1 VALUES ( 1, 'jhkim' );
ERR-40002(16057): unique constraint (PUBLIC.T1_UK) violated
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
2 mkkim
3 xcom
4 egonspace
4 rows selected.

```

Session Control

Session is a logical object to manage the user's state information who accesses the database. Session control statement changes the session properties.

Session control statements are classified as follows.

Table 12-4 Session control statements

Statement	Description	Refer to
SET SESSION CHARACTERISTICS	It controls the transaction properties in the session.	SET SESSION CHARACTERISTICS AS TRANSACTION transaction_mode
SET TIME ZONE	It alters the time zone of the session.	SET TIME ZONE
SET SESSION AUTHORIZATION	It alters the user of the session.	SET SESSION AUTHORIZATION user_identifier
ALTER SESSION SET	It alters the session property.	ALTER SESSION SET property_name

SET TRANSACTION statement is the transaction controlling statement and SET SESSION CHARACTERISTICS statement is session controlling statement. Both SET TRANSACTION statement and SET SESSION CHARACTERISTICS statement control the transaction properties.

The difference between SET TRANSACTION statement and SET SESSION CHARACTERISTICS statement is that SET TRANSACTION statement is applied only to a transaction which will be executed next. On the other hand, SET SESSION CHARACTERISTICS statement is applied for all transactions which occur in the session afterwards.

The following is a result of CURRENT_TIMESTAMP statement which obtains the current date and time after changing the time zone by using SET TIME ZONE statement.

```
gSQL> SELECT CURRENT_TIMESTAMP FROM DUAL;
CURRENT_TIMESTAMP
-----
2014-07-21 11:42:49.828276 +09:00
1 row selected.
gSQL> SET TIME ZONE '+00:00';
Session set.
gSQL> SELECT CURRENT_TIMESTAMP FROM DUAL;
CURRENT_TIMESTAMP
-----
2014-07-21 02:43:03.437940 +00:00
1 row selected.
```

System Control

System control statements manage the database system, and they are classified as follows.

Table 12-5 System control statements

Statement	Description	Refer to
ALTER SYSTEM {OPEN MOUNT} DATABASE	It starts up the database.	ALTER SYSTEM {MOUNT OPEN} DATABASE
ALTER SYSTEM CHECKPOINT	It performs the checkpoint.	ALTER SYSTEM CHECKPOINT
ALTER SYSTEM KILL SESSION	It forcibly terminates the specific session.	ALTER SYSTEM [KILL DISCONNECT] SESSION
ALTER SYSTEM SWITCH LOGFILE	It switches the log file.	ALTER SYSTEM SWITCH LOGFILE
ALTER SYSTEM SET	It sets the system properties.	ALTER SYSTEM SET property_name
ALTER SYSTEM RESET	It removes the system properties.	ALTER SYSTEM RESET property_name

The following is an example of enquiring sessions connected to the database, and terminating the specific session.

```
gSQL> SELECT USER_NAME, SESSION_ID, SERIAL_NO, SESSION_STATUS, PROGRAM_NAME FROM V$SESSION
WHERE USER_NAME = 'TEST';
USER_NAME SESSION_ID SERIAL_NO SESSION_STATUS PROGRAM_NAME
-----
TEST          62          49 CONNECTED      gsql
TEST          65         109 CONNECTED      gsqlnet
TEST          66         130 CONNECTED      gsql
3 rows selected.
gSQL> ALTER SYSTEM DISCONNECT SESSION 65, 109;
System altered.
```

12.5 Processing SQL in Cluster

This chapter describes how to process various SQL statements in a cluster environment.

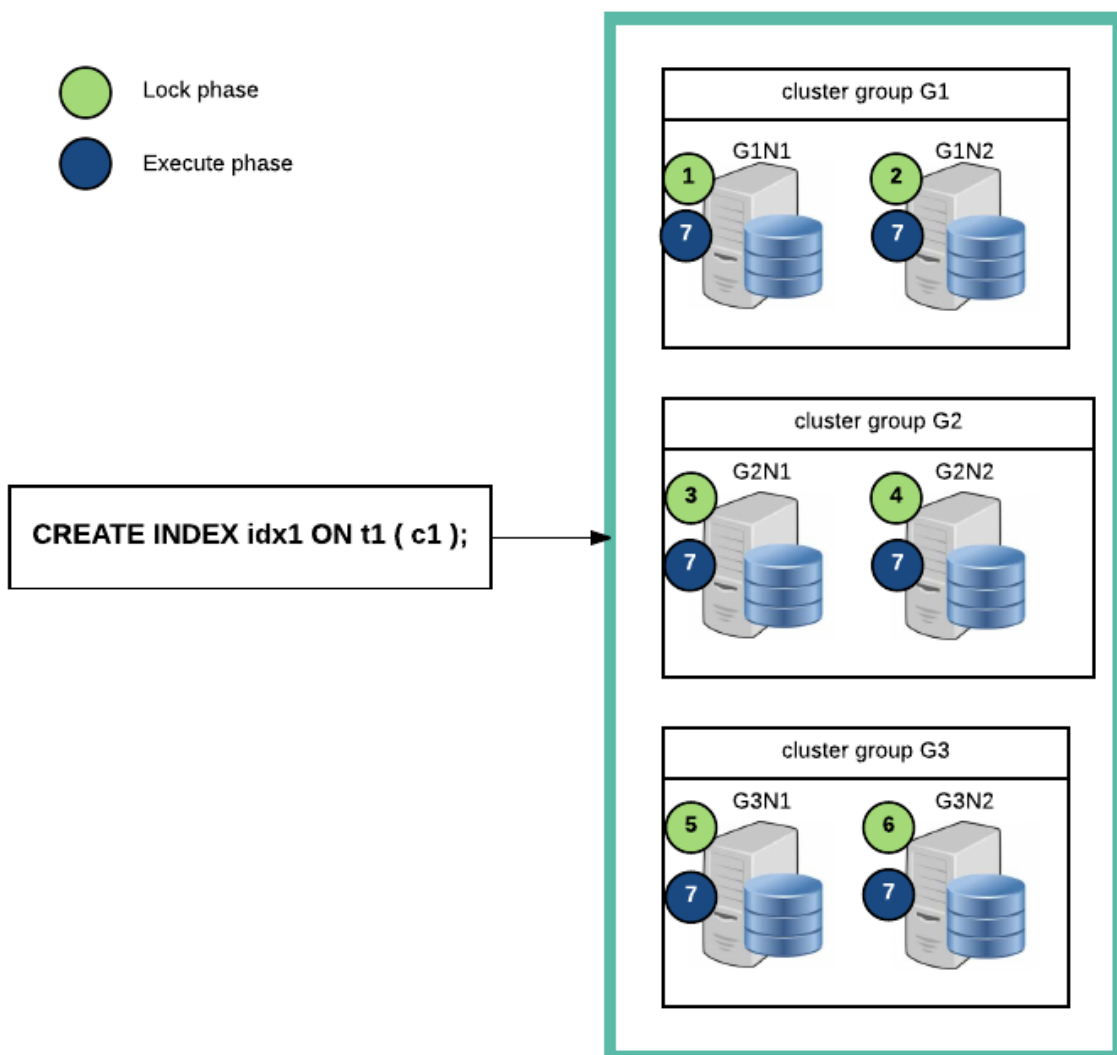

Processing DDL in Cluster

DDL Processing Procedure in Cluster

GOLDILOCKS cluster does not have a separate meta server, and a user can perform DDL in any cluster member configuring the cluster system.

DDL is executed following the procedure below in a cluster environment.

Figure 1 Processing DDL in cluster

DDL is performed through two phases, which are a lock phase and an execution phase. On the lock phase, a lock which is required for performing DDL is acquired and DDL is sequentially performed on every cluster member. On the execute phase, DDL is simultaneously performed for every cluster member.

DDL is completed when DDL is successfully performed on every cluster members. If DDL fails on a specific cluster member, then DDL operations on every cluster members are cancelled. DDL can not be performed if an error occurred in any cluster member. All cluster member synchronize meta information for objects through this process.

Simultaneous DDL Execution

The cluster object DDL which changes the cluster system configuration and the SQL object DDL can not be simultaneously performed. The availability of simultaneously performing the cluster object DDL and the SQL object DDL are as follows.

Table 12-6 Availability of simultaneously performing DDL

DDL	Cluster object DDL	SQL object DDL
Cluster object DDL	X	X
SQL object DDL	X	O

The following DDL can not be simultaneously performed as given above.

- Cluster object DDL and cluster object DDL
 - (X) CREATE CLUSTER GROUP g2 CLUSTER MEMBER g2n1 HOST '192.168.0.21' PORT 10210;
 - (X) ALTER CLUSTER GROUP g1 ADD CLUSTER MEMBER g1n2 HOST '192.168.0.12' PORT 10120;
- Cluster object DDL and SQL object DDL
 - (X) CREATE CLUSTER GROUP g2 CLUSTER MEMBER g2n1 HOST '192.168.0.21' PORT 10210;
 - (X) CREATE TABLE t1 (c1 INTEGER);
- SQL object DDL and SQL object DDL
 - (O) CREATE TABLE t1 (c1 INTEGER);
 - (O) CREATE TABLE t2 (a1 INTEGER);

Processing SELECT in Cluster

Processing Query in Cluster

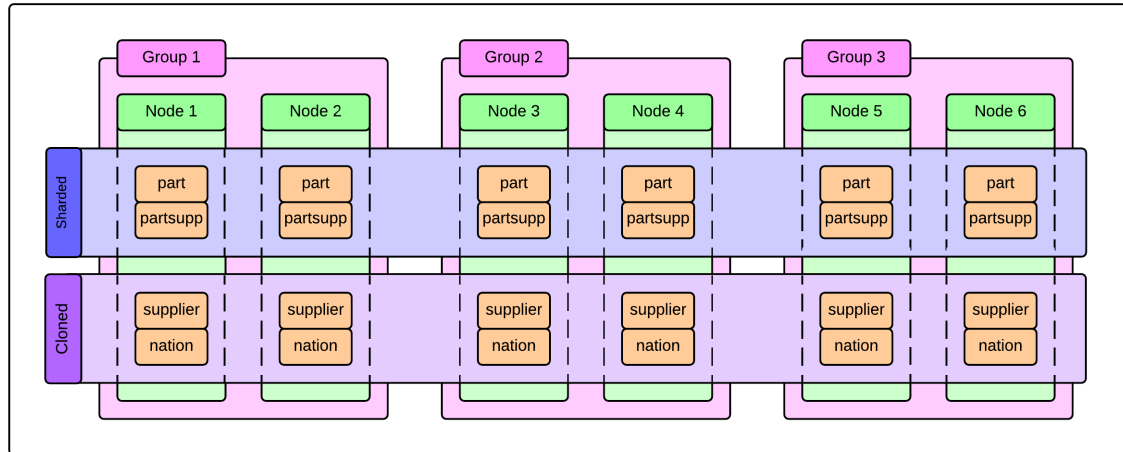

Generally, a query processing of the cluster is similar to that of the stand alone. However, when the data exist on both a local server and a remote server, it is different that the cluster requests the query processing to a remote server and receives the result from it.

There are a sharded table and a cloned table (Refer to **Cluster Table and Shard**) in a cluster environment,

and each table data is stored in a local server and a remote server. The sharded table data is dividedly stored in a group, and its duplicated data is stored in members of the same group. The data is duplicated and stored in every group and member of a cloned table.

The following figure describes a 3 x 2 GOLDILOCKS cluster and tables stored in that cluster.

Figure 2 3 x 2 cluster configuration and tables

The following DDL creates the tables given above.

```
CREATE TABLE part
(
    p_partkey    INTEGER
, p_name       VARCHAR(55)
, p_brand      CHAR(10)
, p_type       VARCHAR(25)
, p_size       INTEGER
, p_retailprice NUMERIC(12,2)
, CONSTRAINT part_pk PRIMARY KEY( p_partkey ) INDEX part_pk_index
)

SHARDING BY HASH(p_partkey)
SHARD COUNT 3;

CREATE TABLE partsupp
(
    ps_partkey    INTEGER
, ps_supkey      INTEGER
, ps_availqty    INTEGER
, ps_supplycost  NUMERIC(12,2)
, CONSTRAINT partsupp_pk PRIMARY KEY( ps_partkey, ps_supkey ) INDEX partsupp_pk_index
)

SHARDING BY HASH(ps_partkey)
SHARD COUNT 3;
```

```

CREATE TABLE supplier
(
    s_suppkey    INTEGER
  , s_name      CHAR(25)
  , s_nationkey  INTEGER
  , s_phone     CHAR(15)
  , CONSTRAINT supplier_pk PRIMARY KEY( s_suppkey ) INDEX supplier_pk_index
) CLONED;
CREATE TABLE nation
(
    n_nationkey  INTEGER
  , n_name      CHAR(25)
) CLONED;

```

In the figure above, the part table and the partsupp table is a sharded table, and their data are dividedly stored per a group. The supplier table is a cloned table and its data is duplicated and stored in every node.

GOLDILOCKS in a cluster environment processes a query depending on the table type and the location of search target data. The query processing in the cluster is divided into a query processing at a single table and a processing at two or more tables.

Query Process in a Single Table

The query processing in a single table is divided into a processing in a sharded table and a processing in a cloned table. A processing in a sharded table is dividedly stored in n groups, so it requests a query to both a local server and a remote server, and collects results to make a result set. GOLDILOCKS uses an access node called as cluster access to request a query to a remote server and receive a result. The cluster access simultaneously requests a query to both a local server and a remote server, and collects results in parallel to make a result set.

The following is an example of processing a query at a part table which is a sharded table.

```

gSQL> \explain plan
SELECT p_name, p_brand, p_type, cluster_group_id
FROM part;
P_NAME P_BRAND    P_TYPE CLUSTER_GROUP_ID
-----
Part#3 Brand#2    STEEL      1
Part#2 Brand#1    NICKEL     2
Part#5 Brand#3    STEEL      2
Part#1 Brand#1    COPPER     3
Part#4 Brand#3    NICKEL     3
5 rows selected.

```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
```

IDX	NODE DESCRIPTION	ROWS
0	SELECT STATEMENT	
1	CLUSTER ACCESS ("PART") [HASH SHARDING]	5
2	TABLE ACCESS ("PART") [HASH SHARDING]	1

```
=====
```

```
1 - SQL : SELECT /*+ FULL("_A1") */
"A1"."P_NAME","A1"."P_BRAND","A1"."P_TYPE","A1".CLUSTER_GROUP_ID FROM
"PUBLIC"."PART"@LOCAL "_A1"
```

```
2 - READ COLUMNS : P_NAME, P_BRAND, P_TYPE
```

```
<<< end print plan
```

GOLDILOCKS specifies **Cluster Domain** for a sharded table, or specifies a shard with an equi condition of a shard key. When using a cluster domain, the search target is only the data in a specified domain. In this case, only the nodes belonging to the specified domain are accessible. If the cluster domain only needs to access a local server by using it, then a cluster access does not occur.

The following is an example of processing a query when allowing to access only to a local server by using the cluster domain.

```
gSQL> \explain plan
```

```
SELECT p_name, p_brand, p_type, cluster_group_id
FROM part@g1;
```

```
P_NAME P_BRAND P_TYPE CLUSTER_GROUP_ID
```

```
-----
Part#3 Brand#2 STEEL 1
```

```
1 row selected.
```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
```

```
====
```

IDX	NODE DESCRIPTION	ROWS
0	SELECT STATEMENT	
1	TABLE ACCESS ("PART"@G1") [HASH SHARDING]	1

```
=====
```

```
=====
====
1 - READ COLUMNS : P_NAME, P_BRAND, P_TYPE
<<< end print plan
```

Using an equi condition of a shard key indicates a specific shard of a table, and the query is transferred only to the domain in which the data of the corresponding shard key is located. When indicating a shard whose equi condition of a shard key is in a local server, differently from when specifying a cluster domain, a cluster access occurs, but it accesses only to a local server at an actual execution.

The following is an example of processing a query by using an equi condition.

```
gSQL> \explain plan
SELECT p_name, p_brand, p_type, cluster_group_id
FROM part
WHERE p_partkey = 3;
P_NAME P_BRAND P_TYPE CLUSTER_GROUP_ID
-----
Part#3 Brand#2 STEEL 1
1 row selected.
>>> start print plan
< Execution Plan >
=====
===
| IDX | NODE DESCRIPTION |

2 - READ INDEX COLUMNS : P_PARTKEY
```

```

      READ TABLE COLUMNS : P_NAME, P_BRAND, P_TYPE
      MIN RANGE : P_PARTKEY = 3
      MAX RANGE : P_PARTKEY = 3
<<< end print plan

```

When processing a query for a cloned table in a cloned table, it is available in most of local servers because every node has a duplicated data unlike a sharded table. However, if a new group or a member is added, there is not any data for a cloned table in that group or that member. Therefore, the data should be retrieved from a remote server, then a cluster access occurs.

The following is an example of processing a query for a supplier, which is a cloned table.

```

gSQL> \explain plan
SELECT s_name, s_nation
FROM supplier;
S_NAME                S_NATION
-----
Supplier#1            FRANCE
Supplier#2            KOREA

<<< end print plan

```

Processing the Join Query

Whether to process a query for two or more tables in a cluster depends on the sharding type of those tables. If the join condition for those tables is an equi-join condition for a shard key, then GOLDILOCK processes that join in a local server and a remote server in parallel by using a join node of a cluster join.

A parallel processing for a join is available when data for a join processing is logically located in the same position. The combinations are a sharded table and a sharded table, a sharded table and a cloned table, a cloned table and a cloned table.

If the sharding strategy of a sharded table and a sharded table is the same, and there is an equi condition for a shard key, then a parallel processing is available. It is because it is an equi-join with a same shard when the shard arrangement is the same.

In the figure above, it is assumed that a shard key of a part table is p_partkey, and a shard key of a partsupp table is ps_partkey, and the following is an example of processing a query with an equi condition for a shard key of two tables.

```
gSQL> \explain plan
SELECT p_name, ps_availqty
  FROM part, partsupp
 WHERE p_partkey = ps_partkey;
P_NAME PS_AVAILQTY
```

```
-----
Part#3      8895
Part#3      4969

3 - READ COLUMNS : PS_PARTKEY, PS_AVAILQTY
4 - INDEX COLUMNS : P_PARTKEY
TABLE COLUMNS : P_NAME
READ COLUMNS : P_PARTKEY, P_NAME
HASH FILTER : P_PARTKEY = {PS_PARTKEY}
5 - READ COLUMNS : P_PARTKEY, P_NAME
<<< end print plan

```

In case when it is a sharded table and a cloned table, a parallel processing without any condition is available if a cloned table is also in the group in which a sharded table is. The following is an example of processing partsupp (a sharded table) and supplier (a cloned table) in parallel.

```

gSQL> \explain plan
SELECT s_name, ps_availqty
FROM supplier, partsupp
WHERE s_suppkey = ps_suppkey;
S_NAME                PS_AVAILQTY

2 |
|    3  |      TABLE ACCESS ("PARTSUPP") [HASH SHARDING] |
2 |
|    4  |      HASH JOIN INSTANT ACCESS |
2 |
|    5  |      TABLE ACCESS ("SUPPLIER") [CLONED] |
5 |
=====

```

```
=====
```

```

1 - SQL : SELECT /*+ KEEP_JOINED_TABLE FULL("_A1") USE_HASH("_A1") FULL("_A2")
USE_HASH("_A2") */ "_A2"."S_NAME", "_A1"."PS_AVAILQTY" FROM "PUBLIC"."PARTSUPP"@LOCAL "_A1"
INNER JOIN "PUBLIC"."SUPPLIER"@LOCAL "_A2" ON "_A2"."S_SUPPKEY" = "_A1"."PS_SUPPKEY"
2 - JOINED COLUMNS : SUPPLIER.S_NAME, PARTSUPP.PS_AVAILQTY
3 - READ COLUMNS : PS_SUPPKEY, PS_AVAILQTY
4 - INDEX COLUMNS : S_SUPPKEY
   TABLE COLUMNS : S_NAME
   READ COLUMNS : S_SUPPKEY, S_NAME
   HASH FILTER : S_SUPPKEY = {PS_SUPPKEY}
5 - READ COLUMNS : S_SUPPKEY, S_NAME

```

```
<<< end print plan
```

In case when it is a cloned table and a cloned table, and if at least one node has both tables in it, then a p

parallel processing is available. If it is in a local server, then the cluster join is not used because accessing a remote server is not required.

The following is an example of processing a query when 2 cloned tables (supplier, nation) are in a local server.

```
gSQL> \explain plan
SELECT s_name, n_name
  FROM supplier, nation
 WHERE s_nationkey = n_nationkey;
S_NAME          N_NAME
-----
Supplier#2      KOREA

```

```

        READ COLUMNS : S_NATIONKEY, S_NAME
        HASH FILTER : S_NATIONKEY = {N_NATIONKEY}
4 - READ COLUMNS : S_NAME, S_NATIONKEY
<<< end print plan

```

Cluster Domain

Cluster domain collects data from limited servers in a cluster environment. For example, to retrieve employees of a specific range in a sharded table configured per a salary interval, enquire it as follows by setting the corresponding cluster group as a cluster domain.

- Configure a sharded table per salary interval

```

gSQL> CREATE TABLE t1( name VARCHAR(128), salary INTEGER )
      SHARDING BY RANGE( salary )
          SHARD s1 VALUES LESS THAN ( 200 )      AT CLUSTER GROUP G1,
          SHARD s2 VALUES LESS THAN ( 400 )      AT CLUSTER GROUP G2,
          SHARD s3 VALUES LESS THAN ( MAXVALUE ) AT CLUSTER GROUP G3;

```

Table created.

```
gSQL> INSERT INTO t1 VALUES ( 'A', 500 );
```

1 row created.

```
gSQL> INSERT INTO t1 VALUES ( 'B', 100 );
```

1 row created.

```
gSQL> INSERT INTO t1 VALUES ( 'C', 300 );
```

1 row created.

- Retrieve employees in a specific salary range

```
gSQL> SELECT name, salary FROM t1@G2;
```

NAME SALARY

C 300

1 row selected.

Cluster domain is defined by targeting each table or view which is described in **from clause**, and by referring to . One of the followings can be selected.

- A cluster member performing a user query
- A cluster member performing a user query for an offline table
- All cluster groups
- A single cluster group
- A single cluster member

When a cluster member is selected as the cluster domain, it accesses to the server and collects the data. If the server does not have a data distribution for the table, then there is not any search result.

"@LOCAL_OFFLINE" cluster domain is supported to retrieve the offline table data on the server accessed by a user. If the table is online, then an error occurs.

When a cluster group is selected as the cluster domain, it accesses to a server which has a data distribution for the table and is able to communicate with, then collects the data. If there is not any accessible server, then there is not any search result.

When all cluster groups are selected as the cluster domain, then it collects the data from each cluster group, and transfers the result to a user.

The cluster domain can not be used to determine the target for the data update. In other words, <cluster domain> can not be applied to the table which is a DML target.

The cluster domain for the table which is a DML target causes a syntax error as follows.

```
gSQL> INSERT INTO T1@LOCAL VALUES ( 1 );
```

```
ERR-42000(16062): syntax error :
```

```
INSERT INTO T1@LOCAL VALUES ( 1 )
```

```
          *
```

```
ERROR at line 1:
```

```
gSQL> UPDATE T1@GLOBAL SET I1 = 1;
```

```
ERR-42000(40000): syntax error:
```

```
UPDATE T1@GLOBAL SET I1 = 1
```

```
.....^      ^
```

```
Error at line 1
```

```
gSQL> DELETE FROM T1@G1;
```

```
ERR-42000(40000): syntax error:
```

```
DELETE FROM T1@G1
```

```
.....^^
```

```
Error at line 1
```

The cluster domain for the table which is an alteration target of SELECT FOR UPDATE causes a syntax error as follows.

- The cluster domain for the target of data collection

```
gSQL> SELECT I1 FROM T1@LOCAL;
```

```
I1
```

```
--
```

```
1
```

```
1 row selected.
```

- The cluster domain for the target of data update

```
gSQL> SELECT I1 FROM T1@LOCAL FOR UPDATE;
ERR-42000(16062): syntax error :
SELECT I1 FROM T1@LOCAL FOR UPDATE
          *
ERROR at line 1:
```

Generated Query

The generated query is generated to refer to or to update the data in another server when processing a query given by a user.

```
SELECT c1 FROM t1;
```

When the query is given by a user as above, then the server to which the query is given generates a generated query to collect the t1 data from all related cluster groups as follows.

```
SELECT c1 FROM t1@LOCAL;
```

The following constructed table is used to describe a generated query.

```
CREATE TABLE t_shard_1( shard_key INTEGER, c1 INTEGER )
    SHARDING BY RANGE( shard_key )
        SHARD s1 VALUES LESS THAN ( 200 )      AT CLUSTER GROUP G1,
        SHARD s2 VALUES LESS THAN ( 400 )      AT CLUSTER GROUP G2,
        SHARD s3 VALUES LESS THAN ( MAXVALUE ) AT CLUSTER GROUP G3;
CREATE TABLE t_shard_2( shard_key INTEGER, c1 INTEGER )
    SHARDING BY RANGE( shard_key )
        SHARD s1 VALUES LESS THAN ( 300 )      AT CLUSTER GROUP G1,
        SHARD s2 VALUES LESS THAN ( MAXVALUE ) AT CLUSTER GROUP G3;
CREATE TABLE t_clone_1( c1 INTEGER ) CLONED AT CLUSTER WIDE;
CREATE TABLE t_clone_2( c1 INTEGER ) CLONED AT CLUSTER GROUP G2, G3;
```

Configuring Generated Query

The generated query reconfigures a query based on the plan node information. The following plan nodes can be configured as a generated query.

- Access node
 - Table access
 - Index access

- Rowid access
- Join node
 - Nested loops join
 - Hash join
 - Merge join (It is not currently supported.)
- Configuring a generated query for an access node

```
gSQL> \EXPLAIN PLAN ONLY
SELECT 1 FROM t_shard_1;
>>> start print plan
< Execution Plan >

HASH FILTER : SHARD_KEY = {C1}
5 - READ COLUMNS : SHARD_KEY, C1
<<< end print plan

```

The generated query is configured based on the most appropriate plan among the available plan nodes by considering the cost.

When joining two tables as above, the generated query can be generated based on an access node for t_shard_1 and t_clone_1. Or, the generated query can be generated based on a join mode for two tables.

In the former case, the generated query based on two access nodes should be performed to process SELECT. In the latter case, the generated query based on a join node should be performed. An optimizer will select the latter execution plan in an environment whose communication cost is more expensive than the record navigation time.

When a user requests the data update such as **Processing DML in Cluster**, then the generated query including the data update feature is generated

The following **Constraints of Generated Query Configuration** determines the range of the contents for configuring the generated query, or determines it is impossible to configure the generated query.

Constraints of Generated Query Configuration

The generated query configuration is constrained in the following cases.

- Grouping
- Ordering
- Offset & limit
- Using Non-deterministic Expression
- Joining Shard Tables Whose Sharding Strategies Are Different Each Other
- Joining Shard Tables without Equi-join Condition for shard_key
- When Unable to Unnest Subquery
- When Including a Subquery with Different Sharding Strategy

Grouping

Note

The grouping information is not configured with a generated query.

- The generated query does not include the grouping information.

```
gSQL> \EXPLAIN PLAN ONLY
SELECT 1 FROM t_shard_1 GROUP BY shard_key;
>>> start print plan
< Execution Plan >

When Including a Subquery with Different Sharding Strategy

Note

It is a similar situation with when joining shard tables whose sharding strategies are different each other, and it can not configure the generated query by using the join in a form of the unnested subquery.

For more information about unnesting a subquery, refer to **Subquery**.

- The generated query for the join can not be configured.
- The generated query related to an access is generated on the cluster access node.

```

gSQL> \EXPLAIN PLAN ONLY
SELECT 1 FROM t_shard_1 WHERE shard_key IN ( SELECT shard_key FROM t_shard_2 );
>>> start print plan

Selecting a Target Server for Performing Generated Query

It analyzes the following information and selects a target to perform the generated query.

- The table replication arrangement policy
- **Cluster Domain**
- The condition to retrieve a sharding key

It analyzes the information above of tables included in the generated query, then selects their common server as a server for performing the generated query.

The following is a summary of the table replication arrangement policy defined to describe **Generated Query**.

```

t_shard_1 (shard table) : at cluster group G1, G2, G3
t_shard_2 (shard table) : at cluster group G1, G3
t_clone_1 (cloned table) : at cluster group G1, G2, G3 (cluster wide)
t_clone_2 (cloned table) : at cluster group G2, G3

```

The following is an example of selecting a target server for performing according to the table replication

arrangement policy.

- The target server for performing: All servers in G1, G3

```
gSQL> SELECT c1 FROM t_shard_2;
```

- The target server for performing: All servers in G1, G2, G3

```
gSQL> SELECT c1 FROM t_clone_1;
```

- The target server for performing: All servers in G1, G3 (The common cluster group)

```
gSQL> SELECT c1 FROM t_shard_2, t_clone_1;
```

The following is an example of selecting the target server for performing according to description of the cluster domain.

- The target server for performing: All servers in G1, G2, G3

```
gSQL> SELECT c1 FROM t_shard_1@GLOBAL;
```

- The target server for performing: The server which received a request from a user

```
gSQL> SELECT c1 FROM t_shard_1@LOCAL;
```

- The target server for performing: All servers in G2

```
gSQL> SELECT c1 FROM t_shard_1@G2;
```

- The target server for performing: G3N1 server

```
gSQL> SELECT c1 FROM t_shard_1@G3N1;
```

- The target server for performing: There is not a target server.

```
gSQL> SELECT c1 FROM t_shard_1@G4;
```

The following is an example of selecting the target server for performing according to the retrieving condition for a sharding key.

- The target server for performing: All servers in G1, G2, G3

```
gSQL> SELECT c1 FROM t_shard_1;
```

- The target server for performing: All servers in G1, G2, G3

```
gSQL> SELECT c1 FROM t_shard_1 WHERE c1 = 1;
```

- The target server for performing: All servers in G3

```
gSQL> SELECT c1 FROM t_shard_1 WHERE shard_key = 500;
```

- The target server for performing: There is not a target server.

```
gSQL> SELECT c1 FROM t_shard_1 WHERE shard_key = 100 AND shard_key = 500;
```

Selecting the target server for performing the generated query on a query processing phase may vary depending on whether the data is updated when performing the generated query.

Selecting Target Server for Generated Query Updating the Data

When performing the generated query to update the data, the performing target cluster group is analyzed by the table replication arrangement policy and the condition for retrieving a sharding key. All servers in the performing target cluster group is selected as targets for performing generated query.

Cluster Domain can not be specified in a user query updating the data.

When performing the generated query to update the data, the performing target is divided into a master server and a slave server. For more information, refer to **Data Update Using Generated Query**.

The following is an example of selecting the performing target server.

- Generated query performing target server: All servers in G2
- t_shard_1: All servers in G2
- The table replication arrangement policy: All servers in G1, G2, G3
- The condition for retrieving a sharding key: All servers in G2
- t_clone_1: All servers in G1, G2, G3
- The table replication arrangement policy: All servers in G1, G2, G3

```
gSQL> \EXPLAIN PLAN ONLY
SELECT * FROM t_shard_1, t_clone_1 WHERE t_shard_1.shard_key = 300 FOR UPDATE;
>>> start print plan
< Execution Plan >
```

```

<<< end print plan

```

Selecting Target Server for Generated Query Retrieving the Data

When performing the generated query to retrieve the data, it retrieves the common servers by using the table replication arrangement policy and the condition for retrieving a sharding key. When multiple servers in a same cluster group become the targets, then the generated query is performed only for a single accessible server per cluster group considering the network condition.

The following is an example of selecting the performing target server.

- Generated query performing target server: A server in G2
- t_shard_1: All servers in G2
- The table replication arrangement policy: All servers in G1, G2, G3
- Cluster domain: All servers in G2
- The condition for retrieving a sharding key: All servers in G2
- t_clone_1: All servers in G1, G2, G3

- The table replication arrangement policy: All servers in G1, G2, G3
- Cluster domain: All servers in G1, G2, G3

```
gSQL> \EXPLAIN PLAN ONLY
```

```
SELECT * FROM t_shard_1@G2, t_clone_1 WHERE t_shard_1.shard_key = 300;
```

```
>>> start print plan
```

```
< Execution Plan >
```

```

Processing DML in Cluster

In GOLDBLOCKS, a user can perform DML for all cluster members configuring a cluster system.

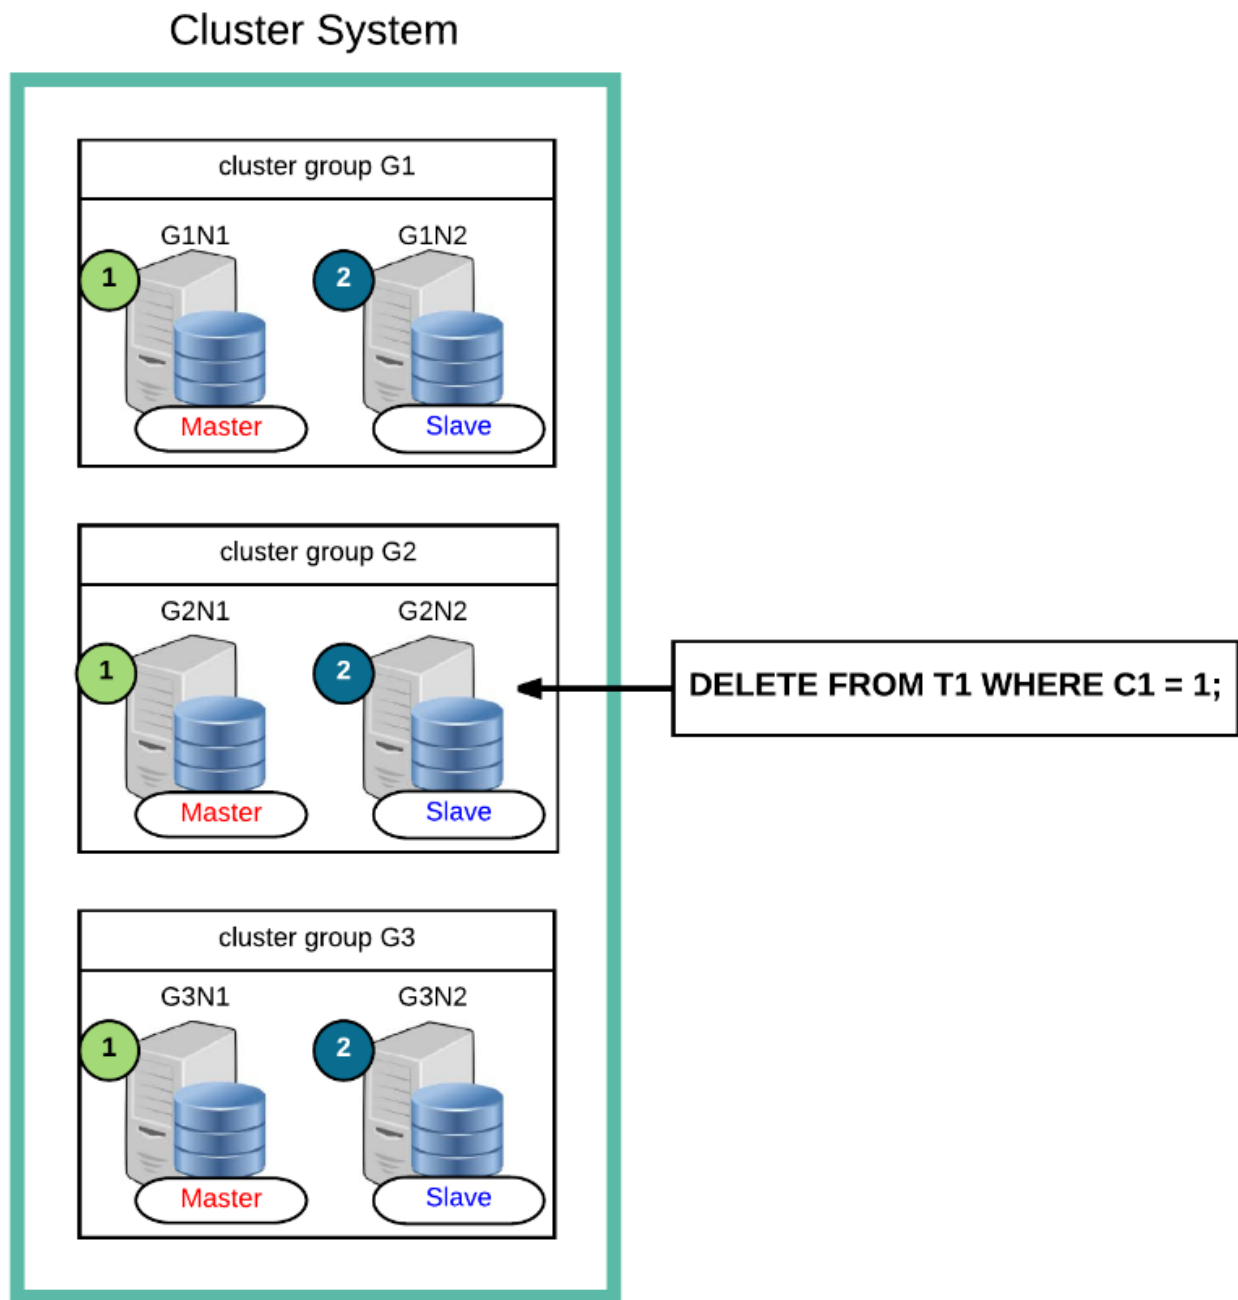

Data update on a cluster environment updates the data of the cluster member containing the same data replication same.

The following constructed table is used to describe the data update.

```
CREATE TABLE t1( shard_key INTEGER, c1 INTEGER )
    SHARDING BY RANGE( shard_key )
        SHARD s1 VALUES LESS THAN ( 200 )      AT CLUSTER GROUP G1,
        SHARD s2 VALUES LESS THAN ( 400 )      AT CLUSTER GROUP G2,
        SHARD s3 VALUES LESS THAN ( MAXVALUE ) AT CLUSTER GROUP G3;
```

DML is performed as the figure below on a cluster environment.

Figure 3 Processing DML in cluster

A master server and a slave server per each group are defined for the DML processing in cluster.

Selecting Master Server in Each Cluster Group

It is a single cluster member with the smallest member_id among accessible cluster members per each cluster group when updating data on a cluster environment.

Selecting Slave Server in Each Cluster Group

They are cluster members remained after excluding master servers from accessible cluster members per each cluster group when updating data on a cluster environment.

For more information about cluster group and cluster member configuration, refer to **DBA_CLUSTER**.

```
gSQL> SELECT * FROM DBA_CLUSTER;
```

GROUP_ID	GROUP_NAME	MEMBER_ID	MEMBER_NAME	MEMBER_HOST	MEMBER_PORT
1	G1	1	G1N1	127.0.0.1	10110
1	G1	2	G1N2	127.0.0.1	10120
2	G2	3	G2N1	127.0.0.1	10210
2	G2	4	G2N2	127.0.0.1	10220
3	G3	5	G3N1	127.0.0.1	10310
3	G3	6	G3N2	127.0.0.1	10320

6 rows selected.

Performing DML

DML is sequentially performed by applying to a master server phase then applying to a slave server phase.

- Applying to a master server
 - It updates the data in the master server in each cluster group.
- Applying to a slave server
 - It updates the data in the slave server in the same way as they were applied in the master server in each cluster group.

In GOLDILOCKS, the following two methods are used to update data while synchronizing the master server and the slave server per each cluster group.

- **Data Update Using Generated Query**
- **Data Update Using Rowid (Rowid Pseudo Column)**

Data Update Using Generated Query

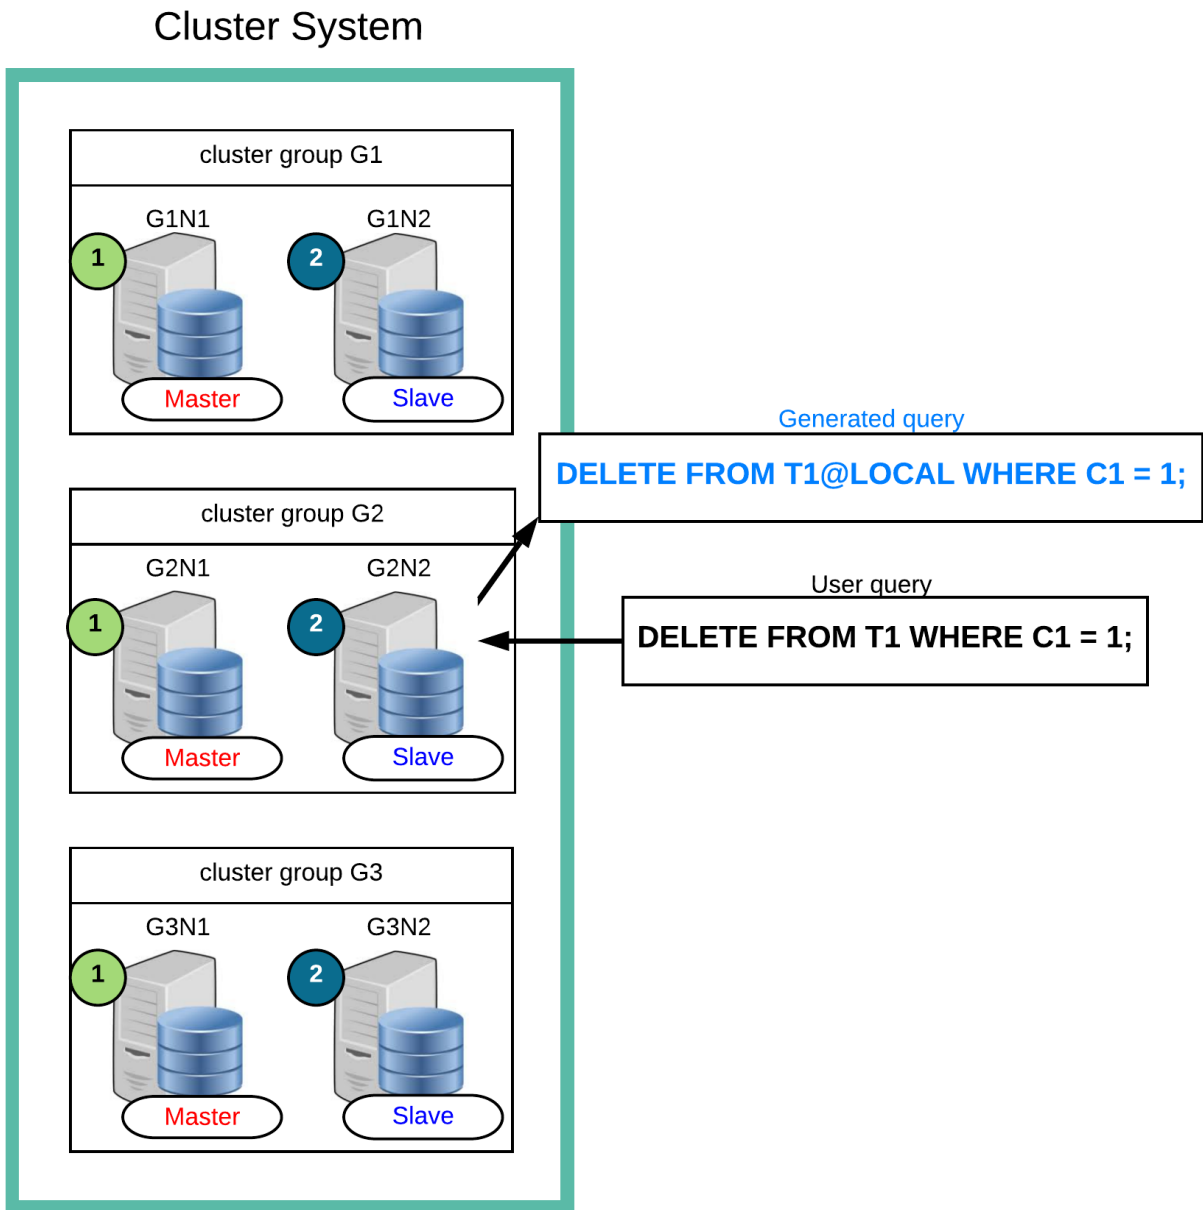

Data update using the generated query is a method to update records of each server by using the generated query. The generated query is internally generated by a server which was given a query from a user. It is supported only when the same result performed by a generated query from each server is guaranteed.

For more information, refer to **Generated Query**.

The generated query for a master server and the generated query for a slave server may be different each other depending on whether the updated record returns the result.

The data update using the generated query is performed as the figure below.

Figure 4 Updating data using generated query (Altering the entire cluster group)

If there is not a condition to select an alteration target cluster group in a conditional clause as given above, then all cluster groups become the data update target by using the generated query.

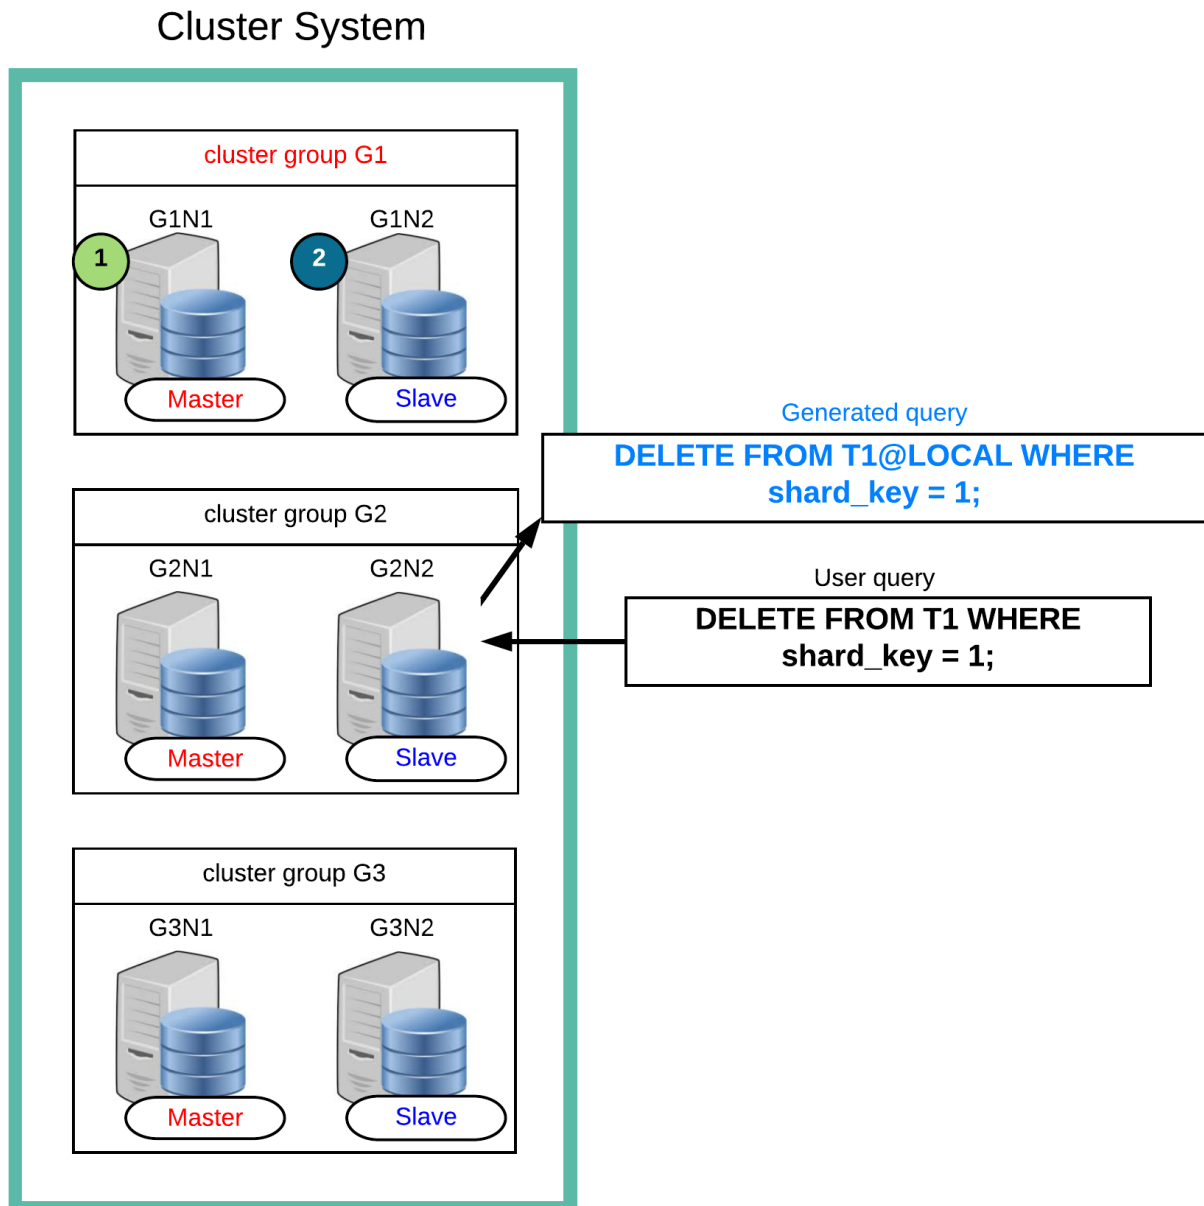

The data update using the generated query is performed as follows.

1. The generated query is performed on each master server

2. The generated query is performed on each slave server

If only a specific cluster group is selected as a data update target by a conditional clause, then it is performed as follows.

Figure 5 Updating data using generated query (Altering a specific cluster group)

If the alteration target is determined by using the search condition (`shard_key = 1`) as given above, it is found that the record whose `shard_key` is 1 is in G1 cluster group by the sharding strategy. Therefore, only the record in G1 cluster group is deleted.

Updating the data in a specific cluster group is applied to a slave after it is applied to a master like as updating the data in the entire cluster group.

Data update using the generated query is supported only in the following cases.

- The generated query which guarantees the same result when performing the generated query on each cluster member of a cluster group can be generated.
 - This means that a deterministic statement or a function configures an unused generated query.
- Both of the data reference target server and the data update target server can be restricted to a same server when configuring the generated query.
 - This means that the server performing the generated query does not need to access another server while processing the query.

The following user queries support the data update using the generated query.

- **SELECT .. FOR UPDATE**
- **SELECT .. INTO .. FOR UPDATE**
- **DELETE FROM**
- **DELETE FROM name RETURNING**
- **DELETE FROM name RETURNING .. INTO**
- **UPDATE**
- **UPDATE name RETURNING**
- **UPDATE name RETURNING .. INTO**

The data update using the generated query is available even when the **14.6 Global Secondary Index** is not configured.

Data Update Using Rowid (Rowid Pseudo Column)

Data update using the rowid information is a method to update the same records stored in different cluster members by using the rowid. This method is used when adding a new record or when **Data Update Using Generated Query** is not available.

The rowid provided on a cluster environment is a logical identification information and it is a standard to determine whether the records are same. The rowid of all same records stored in different cluster members is same. Rowid information is provided when creating a record, or a new rowid information is provided when modifying the value of the sharding key column.

For more information about the rowid, refer to **ROWID Pseudo Column**.

Data update using the rowid information is divided into a rowid information collection phase and a data update phase. When updating two or more records, a rowid information collection phase and a data update phase are repeated per record.

- The rowid information collection phase
 - It collects the rowid information of records to be added or to be updated.
- The data update phase

- It updates records of a cluster group corresponding to the collected rowid.
- It sequentially updates records of a slave server after updating records of a master server.

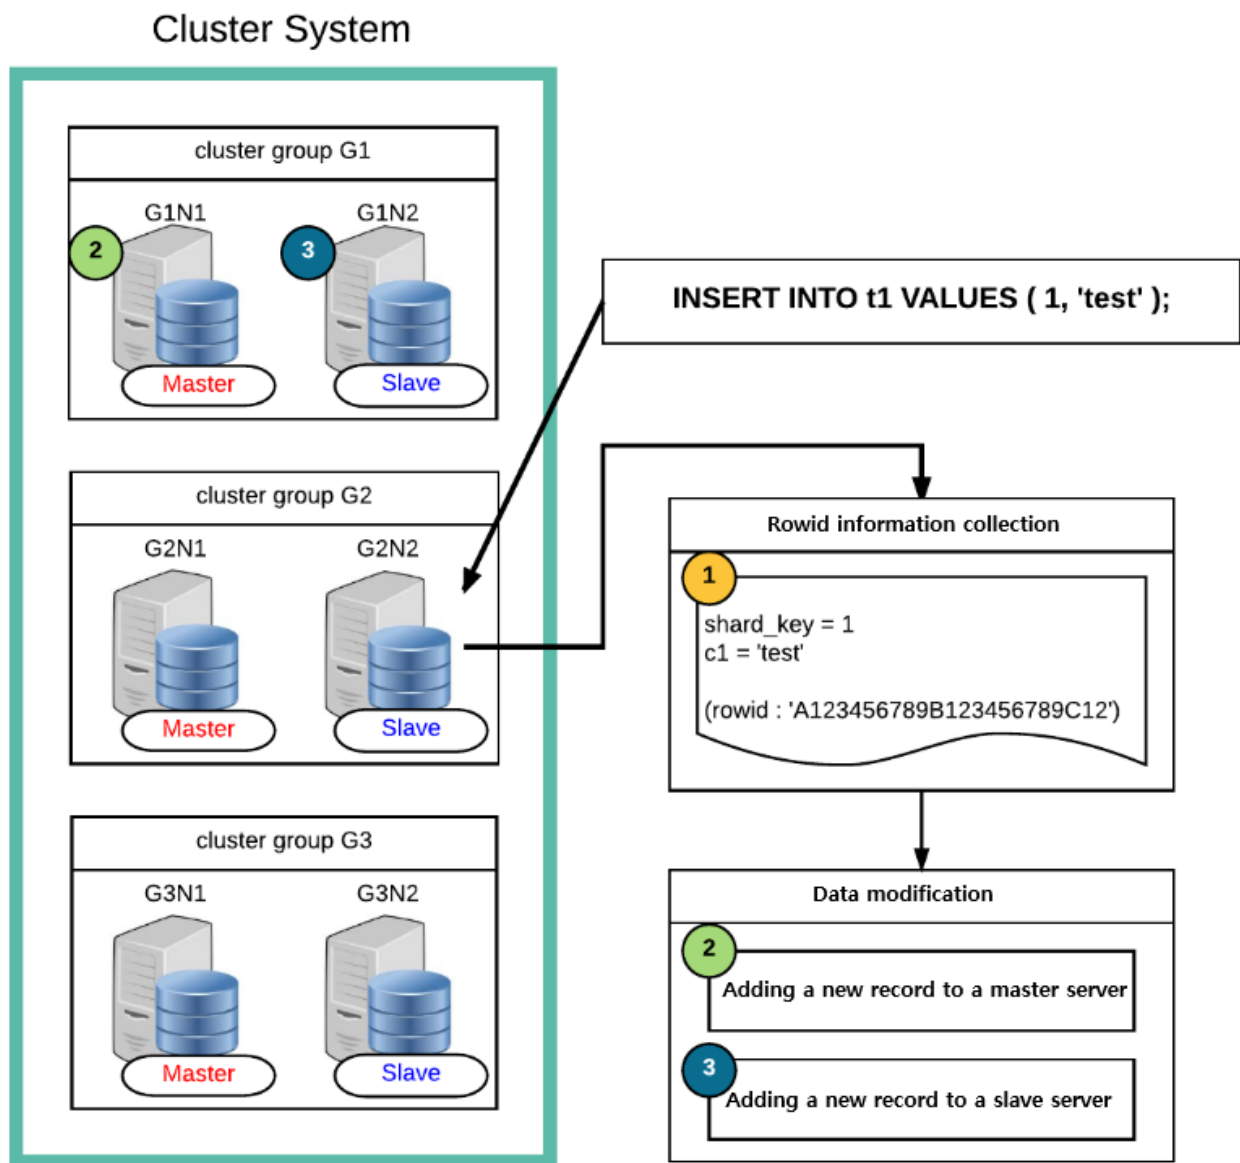

Data update using the rowid information supports the following two methods depending on whether to use the **Global Secondary Index**.

- **Data Update Using Rowid Information without Global Secondary Index**
- **Data Update Using Rowid Information with Global Secondary Index**

Data Update Using Rowid Information without Global Secondary Index

Data update using the rowid information without the global secondary index is supported when the existing record is not updated like as INSERT.

Data update using the rowid information without the global secondary index is performed as follows.

Figure 6 Data update using the rowid information without the global secondary index

When adding a record, a rowid is provided to a new record and each record is stored at an appropriate position in a master server. All records are applied to a slave server after applying to a master server.

If the sharding key column is configured by using the value (shard_key = 1) as given above, it is found that the record whose shard_key is 1 is in G1 cluster group by the sharding strategy. Therefore, the record is added only to the G1 cluster group.

Data update using the rowid information without the global secondary index supports the following query types.

- `INSERT INTO`
- `INSERT INTO name RETURNING`
- `INSERT INTO name RETURNING .. INTO`

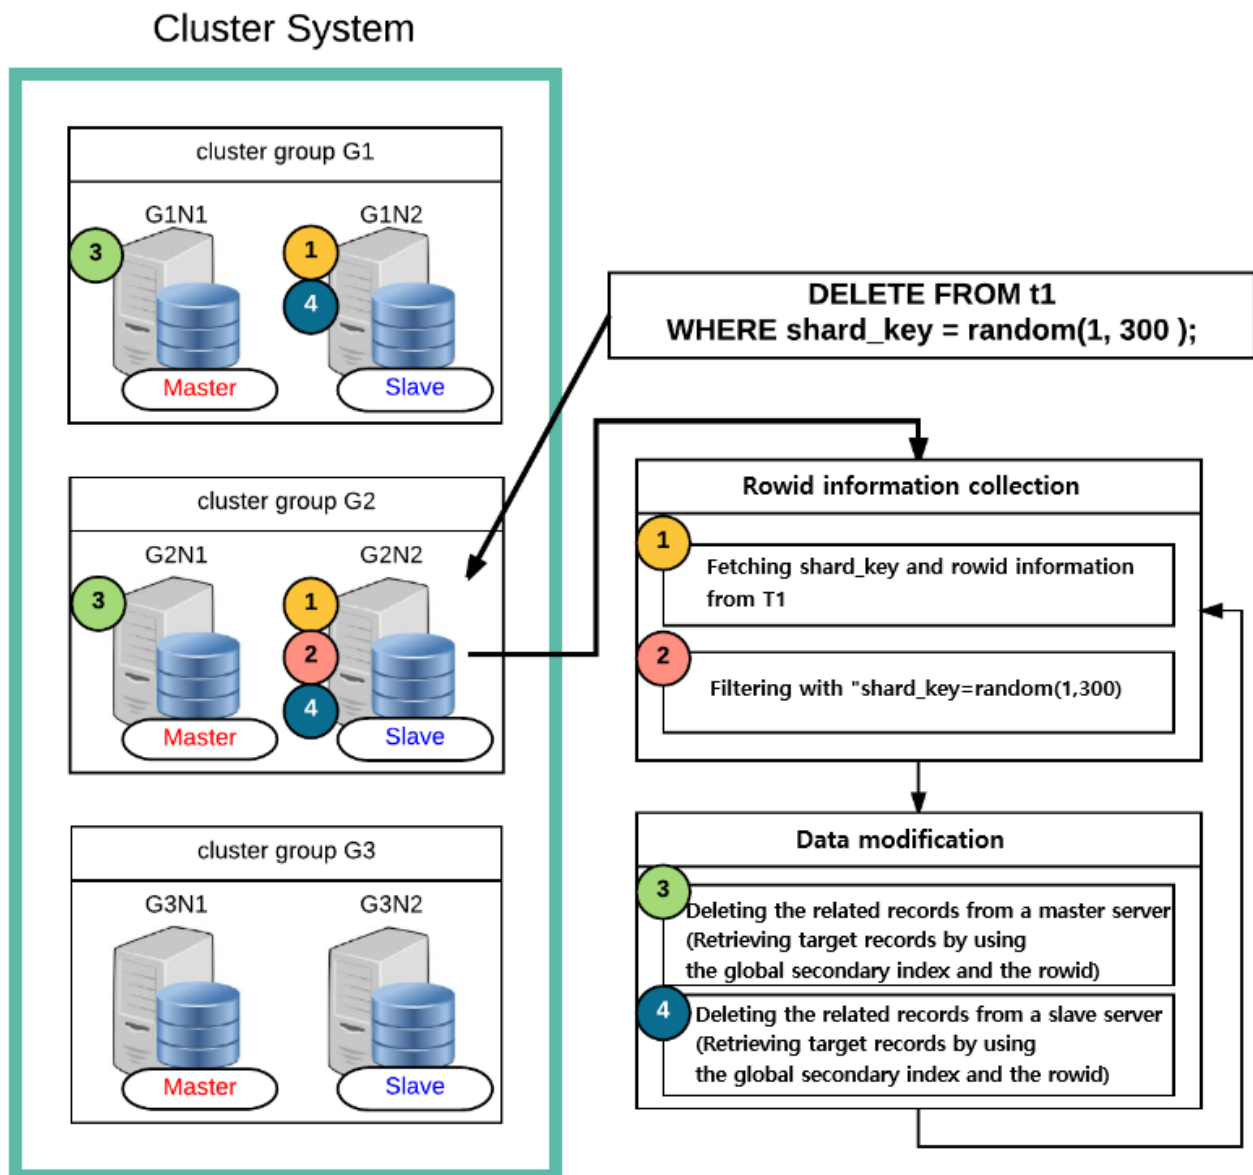

Data Update Using Rowid Information with Global Secondary Index

Data update using the rowid information with the global secondary index is supported when the existing record is updated.

To update the existing records, use the rowid information to guarantee the same update of the same data both in a master server and a slave server.

Data update using the rowid information with the global secondary index is performed as follows.

Figure 7 Data update using the rowid information with the global secondary index

On the rowid information collection phase, the server received the user query collects the information of the target record to be updated. If the conditional clause whose result is updatable whenever it is evaluated, the server received the user query collects the rowid information and the column information being referenced from that conditional clause by using the condition excluding that conditional clause. The target

record to be updated is selected by filtering with a condition excluded before collecting the result.

On the data update phase, data in a master server and a slave server for a cluster group to which the records selected on the rowid information collection phase belong is sequentially updated. The shard_key is in the range from 1 to 300 by a condition ("shard_key = random(1,300)"), and it belongs to G1, G2 cluster group by the sharding strategy as the figure above. Therefore, only the records in G1, G2 cluster groups are deleted.

On the data update phase, the server which collected the rowid information, transfers it to a master server and a slave server, and requests the data modification. The servers received the request retrieve the target record and modify it by using the received rowid information and the existing global secondary index.

The rowid information collection phase and the data update phase are repeated until there is not any record to be updated.

The following cases require the identification among the records to be updated, and they are supported when data update using the generated query is not available.

- When using the non-deterministic expression
- When using the non-deterministic clause
- When unable to configure the generated query for the data update

The followings are query types supporting the data update using the rowid.

- **SELECT .. FOR UPDATE**
- **SELECT .. INTO .. FOR UPDATE**
- **DELETE FROM**
- **DELETE FROM name RETURNING**
- **DELETE FROM name RETURNING .. INTO**
- **DELETE FROM name WHERE CURRENT OF cursor_name**
- **UPDATE**
- **UPDATE name RETURNING**
- **UPDATE name RETURNING .. INTO**
- **UPDATE name WHERE CURRENT OF cursor_name**

When Using Non-deterministic Expression

The expression which can not guarantee the same result whenever performing the query described by using the expression is a non-deterministic expression.

If the generated query described by using the non-deterministic expression updates the data, then it can not guarantee that the query in a master server and the query in a slave server are updated same. Therefore, the data update using the rowid is supported when the non-deterministic expression is described.

- The non-deterministic expressions are as follows.

- Sequence
 - seq_name.currval, seq_name.nextval, next value for seq_name
 - currval(), nextval()
- The built-in function which should be evaluated in expression unit
 - random()
 - clock_date(), clock_time(), clock_timestamp(), clock_localtime(), clock_localtimestamp()
- psm
 - Schema level function

The following is an example of using the non-deterministic expression.

- Using the sequence

```
UPDATE t1 SET c1 = seq.nextval;
```

- The built-in function which should be evaluated in expression unit

```
DELETE FROM t1 WHERE c1 = random( 1, 100 );
```

- Schema level function

```
SELECT * FROM t1 WHERE shard_key = func( c1 );
```

When Using Non-deterministic Clause

The clause which can not guarantee the same result whenever performing the query described by using the clause is a non-deterministic clause.

If the generated query described by using the non-deterministic clause updates the data, then it can not guarantee that the query in a master server and the query in a slave server are updated same. Therefore, the data update using the rowid is supported when the non-deterministic clause is described.

The clause using **<offset limit clause>** is classified as a non-deterministic clause.

The following is an example of using the non-deterministic clause.

- Using the OFFSET clause

```
DELETE FROM t1 OFFSET 1;
```

- Using the LIMIT clause

```
UPDATE t1 SET c1 = c1 + 1 LIMIT 10;
```

When Unable to Configure Generated Query for the Data Update

The data update using the rowid is supported when unable to configure a generated query by using a data update query given by a user. For more information, refer to **Constraints of Generated Query Configuration**.

The following is an example of when unable to configure the generated query.

- Equi-join of tables with different sharding strategies each other

```
SELECT * FROM t1, t2 WHERE t1.shard_id = t2.shard_id FOR UPDATE;
```

- Accessing another cluster group to retrieve the t2 record of a subquery while retrieving the t1 record belonging to a cluster group

```
DELETE FROM t1 WHERE t1.shard_id IN ( SELECT t2.shard_id FROM t2 );
```

13.

SQL Objects

This chapter describes the concepts and features of the following objects which configure the database.

- Authorization: User and privilege
- Schema
- Tablespace
- Table
- Index
- Sequence
- View
- Synonym
- Stored procedure
- Stored function

13.1 Database

Database-related Statements

For more information, refer to the followings.

- Starting up the database: **ALTER SYSTEM {MOUNT | OPEN} DATABASE**
- Backup and recovery
 - **ALTER DATABASE BACKUP**
 - **ALTER DATABASE DELETE BACKUP**
 - **ALTER DATABASE RECOVER**
 - **ALTER DATABASE REGISTER**
 - **ALTER DATABASE RESTORE**
- Creating, dropping, altering log files
 - **ALTER SYSTEM CHECKPOINT**
 - **ALTER SYSTEM SWITCH LOGFILE**
 - **ALTER DATABASE ARCHIVELOG**
 - **ALTER DATABASE ADD LOGFILE**
 - **ALTER DATABASE DROP LOGFILE**
 - **ALTER DATABASE RENAME LOGFILE**
- Comments on objects: **COMMENT ON name IS**
- System statistics information: **ANALYZE SYSTEM**

The information which is related to the database objects can be retrieved through the following views.

Table 13-1 Database object related information

Database Configuration Objects

SQL Objects that Configure the Database

A database consists of multiple SQL objects.

SQL objects in database are classified as SQL schema objects and non-schema objects, depending on whether they are included in the SCHEMA.

Figure 1 SQL objects

SQL schema objects are included in the SCHEMA, and they are as follows.

- **TABLE:** It is an object which stores the physical data, and it consists of columns and rows.
- **VIEW:** It is a logical object which provides a relation name for the query, and it is similar to a table.
- **INDEX:** It is an object to improve the query performance.
- **SEQUENCE:** It is an object to generate numbers.
- **CONSTRAINT:** It is an object to retain the integrity of tables.
- **SYNONYM:** It is an alias of TABLE, VIEW, SEQUENCE, and other synonym.
- **STORED PROCEDURE:** It is a persistent stored module in a procedure form.
- **STORED FUNCTION:** It is a persistent stored module in a function form.

SQL schema object can be used together with a schema name, or it can be used omitting a schema name. If schema name is omitted, the name is interpreted by the user's schema path.

The following is an example of when objects are created by specifying the schema name.

```
gSQL> CREATE TABLE my_schema.lineitem ( id INTEGER );
gSQL> CREATE INDEX my_schema.my_index ON my_schema.lineitem ( id );
```

Non-schema object is not included in the schema, and they are as follows.

- PROFILE: It is a password management policy.
- AUDIT POLICY: It is an audit policy.
- USER: It is a user.
- SCHEMA: It is the logical locations of the SQL schema objects.
- TABLESPACE: It is the physical spaces of the SQL schema objects.
- PUBLIC SYNONYM: It is an alias of TABLE, VIEW, SEQUENCE, and other synonym which does not have schema name

The SQL standard explicitly defines concepts and syntax for the SCHEMA objects. However, the concepts of USER and DATABASE are described only, and their syntaxes are not defined in SQL. The SQL standard does not deal with the TABLESPACE object. Namely, the SQL standard does not explicitly define the non-schema objects.

GOLDILOCKS defines USER, SCHEMA, TABLESPACE as separate descendant of a database. However, other DBMS vendors define the concepts of non-schema objects as follows.

- GOLDILOCKS
 - User and schema are separate objects.
 - User either does not have a schema, or has multiple schemas.
 - The relationship between user and schema is User : Schema = 1 : N.
- Oracle
 - User and schema are defined as similar concepts.
 - The relationship between user and schema is User : Schema = 1 : 1.
- DB2
 - User is not a descendant of DATABASE.
 - The relationship between user and schema is User : Schema = 1 : N.
- Postgres
 - User is not a descendant of DATABASE.
 - The relationship between user and schema is User : Schema = 1 : N.
- MySQL
 - User and schema are defined as similar concepts.
 - User is a descendant of DATABASE(SCHEMA).

Name Space of Objects

An object in the database has an identifiable name.

An SQL schema object has a unique name within a schema.

For example, the same lineitem table objects can be created in different schemas as follows.

```
gSQL> CREATE TABLE my_schema.lineitem ( id INTEGER );
gSQL> CREATE TABLE your_schema.lineitem ( name VARCHAR(128) );
```

SQL schema objects have the following name spaces in a single schema as follows.

- TABLE, VIEW, SEQUENCE, PRIVATE SYNONYM, STORED PROCEDURE, STORED FUNCTION
- INDEX
- CONSTRAINT

Table and view can not be created under the same name, but table and index can be created under the same name, as follows.

- Table and view can not be created under the same name.

```
gSQL> CREATE TABLE my_relation ( id INTEGER );
gSQL> CREATE VIEW my_relation ( name ) AS SELECT name FROM tmp_relation;
```

- Table and index can be created under the same name.

```
gSQL> CREATE TABLE my_object ( id INTEGER );
gSQL> CREATE INDEX my_object ON my_table ( name );
```

A non-schema object has an identifiable name within a database. Non-schema objects have the name spaces as follows.

- PROFILE
- AUDIT POLICY
- USER
- SCHEMA
- TABLESPACE

Namely, USERS can not be created under the same name, but USER and SCHEMA can be created under the same name.

- my_name USER object and my_name SCHEMA object are created.

```
gSQL> CREATE USER my_name IDENTIFIED BY my_name WITH SCHEMA my_name;
```

Built-in Objects

When creating database, GOLDILOCKS automatically creates objects such as user, schema, tablespace which are necessary for system operation.

Built-in User

When creating database, the following accounts are automatically created. The built-in accounts can not be removed except TEST user.

- `_SYSTEM` account
 - It is an account used by the internal system. When creating database, it is the owner of the built-in objects. When user creates an object, it becomes the grantor who grants the privilege to the object owner.
- `SYS` account
 - It is a user to manage the database.
- `TEST` account
 - It is a user for testing, and this object can be removed.
- `ADMIN` account
 - It is a role to manage the database.
- `SYSDBA` account
 - It is a role to start up/shut down the database.
- `PUBLIC` account
 - It is an account for all users. It is used to control the privileges for all users.

Built-in Schema

When creating database, the following schemas are automatically created. All built-in schemas can not be removed.

- `DEFINITION_SCHEMA`
 - It consists of the physical tables which store all objects information of the database.
- `FIXED_TABLE_SCHEMA`
 - It consists of the fixed tables which display the data structure information of system in a table form.
- `DICTIONARY_SCHEMA`
 - It consists of the user perspective views for querying object information of the database.

- INFORMATION_SCHEMA
 - It consists of the views defined in the SQL standard for querying the object information of the database.
- PERFORMANCE_VIEW_SCHEMA
 - It consists of the user perspective views for querying the state of the system.
- PUBLIC
 - It is the schema in which all users can create objects, and it differs from the PUBLIC account, which means all users.

Built-in Tablespace

When creating database, the following tablespaces are created automatically. All the built-in tablespaces can not be removed.

- DICTIONARY_TBS
 - It stores the dictionary tables to manage the SQL objects information.
- MEM_UNDO_TBS
 - It stores undo segments and transactions information.
- MEM_DATA_TBS
 - It is the first created data tablespace.
 - The user created tables are stored in data tablespace.
- MEM_TEMP_TBS
 - It is the first created temporary tablespace.
 - The temporary objects such as sort and hash which are created during query processing are stored in the temporary tablespace.
- MEM_AUX_TBS
 - It is a system auxiliary tablespace and it stores records which is automatically created such as an audit record.

Built-in Profile

When creating database, the "DEFAULT" profile is automatically created. Password parameter information of the "DEFAULT" profile is as follows.

Table 13-2 Configuration of DEFAULT profile

Parameter	Value
FAILED_LOGIN_ATTEMPTS	10
PASSWORD_LOCK_TIME	1
PASSWORD_LIFE_TIME	180
PASSWORD_GRACE_TIME	7
PASSWORD_REUSE_MAX	UNLIMITED

Parameter	Value
PASSWORD_REUSE_TIME	UNLIMITED
PASSWORD_VERIFY_FUNCTION	NULL

The followings are characteristics of the default values of "DEFAULT" profile.

- Account logout
 - An account is locked for one day (PASSWORD_LOCK_TIME) after consecutive 10(FAILED_LOGIN_ATTEMPTS) times of failed login attempts.
- Password expiration
 - After 180 days (PASSWORD_LIFE_TIME) has elapsed, the password expires after seven days of grace period (PASSWORD_GRACE_TIME).
- Password reusable
 - The old password can be reused.
- Password complexity verification
 - The password complexity is not verified.

13.2 Profile

Profile-related Statements

For more information, refer to the followings.

- Creating a profile: **CREATE PROFILE**.
- Dropping a profile: **DROP PROFILE**.
- Altering a profile: **ALTER PROFILE**.
- Assigning a profile to the user: **CREATE USER**, **ALTER USER**
- Clearing a password history: **ALTER DATABASE CLEAR PASSWORD HISTORY**.

Table 13-3 Profile object related information

Schema	View	Description
DICTIONARY_SCHEMA	DBA_PROFILES	All profile information
	DBA_USERS	User profile information

Concepts of Profile

GOLDILOCKS performs user authentication for database security. The password management policy is required because the user authentication password is vulnerable to theft, forgery and misuse.

Profile includes information such as this password management policy. DBA or security managers assign the profile to a user, and apply the password management policy which is appropriate to the corresponding user.

Creating, Altering, Allocating Profile

A profile is created by using CREATE PROFILE statement.

```
CREATE PROFILE profile1 LIMIT
    FAILED_LOGIN_ATTEMPTS    10
    PASSWORD_LOCK_TIME       1
    PASSWORD_LIFE_TIME       180
    PASSWORD_GRACE_TIME      7
    PASSWORD_REUSE_MAX       UNLIMITED
    PASSWORD_REUSE_TIME      UNLIMITED
```

```
PASSWORD_VERIFY_FUNCTION NULL;
```

A profile is allocated by using CREATE USER, ALTER USER statements.

```
CREATE USER u1 IDENTIFIED BY u1 PROFILE profile1;
ALTER USER u2 PROFILE profile1;
```

The profile parameters are updated by using ALTER PROFILE statement.

```
ALTER PROFILE profile1 LIMIT
    PASSWORD_REUSE_MAX          3
    PASSWORD_REUSE_TIME        30;
```

If a profile is not allocated to a user, the user is not restricted on creating and using the password.

If the created profile or a DEFAULT profile is allocated to a user, the user complies with the profile's password policies when creating and using the password.

Setting Password of DEFAULT Profile

When the default profile is assigned to a user, the password is managed as follows.

Table 13-4 DEFAULT profile of password

Parameter	Default setting	Description
FAILED_LOGIN_ATTEMPS	10	The allowed number of consecutive login failure The account is locked after consecutive 10 times login attempt failures.
PASSWORD_LOCK_TIME	1	The account lockout duration If the consecutive login failures exceed the allowable value, the account is locked for one day.
PASSWORD_LIFE_TIME	180	The password life time The password is expired after 180 days.
PASSWORD_GRACE_TIME	7	The duration to change the password when the the password is expired. The password should be changed within seven days after first login since the password is expired. If a user does not change the password within the period, the user can not log in using the password.
PASSWORD_REUSE_MAX	UNLIMITED	The number of times of which passwords are not reusable. PASSWORD_REUSE_MAX should be set together with PASSWORD_REUSE_TIME. If both of the two values are UNLIMITED, the password can always be reused.
PASSWORD_REUSE_TIME	UNLIMITED	The duration which the password can not be reused.

Account Lockout

If the number of consecutive login attempt failures exceeds the number of times specified in `FAILED_LOGIN_ATTEMPTS`, the account is locked during the period specified in `PASSWORD_LOCK_TIME`.

```
CREATE PROFILE profile1 LIMIT
    FAILED_LOGIN_ATTEMPTS    10
    PASSWORD_LOCK_TIME       1;
ALTER USER u1 PROFILE profile1;
```

When a user `u1`'s login attempts consecutively fail more than 10 times, the account is locked for one day. And after one day the account is automatically unlocked.

If the `PASSWORD_LOCK_TIME` value is not specified, it is regarded as the value which is specified in `PASSWORD_LIFE_TIME` of `DEFAULT` profile.

If the `PASSWORD_LOCK_TIME` value is `UNLIMITED` the locked accounts are not automatically released. Therefore, the following statement should be executed to unlock the account.

```
ALTER USER u1 ACCOUNT UNLOCK;
```

If login is successful, the number of failed login attempt is initialized to zero.

A security manager can explicitly lock the user accounts. In this case, the user accounts can not be automatically released so the security manager should unlock the user accounts.

```
ALTER USER u1 ACCOUNT LOCK;
ALTER USER u1 ACCOUNT UNLOCK;
```

Password Lifetime

`PASSWORD_LIFE_TIME` specifies the life time the password. After the life time, the password is expired. A user, DBA or security manager should change the password after a password is expired.

```
CREATE PROFILE profile1 LIMIT
    PASSWORD_LIFE_TIME        180
    PASSWORD_GRACE_TIME       7;
ALTER USER u1 PROFILE profile1;
```

The grace period starts since when the user `u1` has tried to log in for the first time after 180 days.

During seven days of the grace period, the user is reminded to enter a new password whenever accessing the account, until he changes the password.

If seven days of the grace period passed and the password is not changed, the user can not login until entering a new password.

A password can be expired by using CREATE USER or ALTER USER statements.

```
ALTER USER u1 PASSWORD EXPIRE;
```

When the password is expired, the error (ERR-28000(16312) the password has expired) occurs whenever logging in as follows, then a new password should be entered.

```
% gsql u1 u1
ERR-28000(16312): the password has expired
Changing password for u1
New password:
Retype new password:
Connected to GOLDILOCKS Database.
gSQL>
```

Reusing Password

The password can be reused after it is changed as many times as the specified value in PASSWORD_REUSE_MAX. Also, it should be after the specified time in PASSWORD_REUSE_TIME.

```
CREATE PROFILE profile1 LIMIT
    PASSWORD_REUSE_MAX          2
    PASSWORD_REUSE_TIME         1;
ALTER USER u1 PROFILE profile1;
```

The user u1 can reuse the current password after the password has been changed for two times, and 10 days elapsed.

```
ALTER USER u1 IDENTIFIED BY u1 REPLACE u1;
ALTER USER u1 IDENTIFIED BY u1 REPLACE u1
*
ERROR at line 1:
ORA-28007: the password cannot be reused
ALTER USER u1 IDENTIFIED BY u2 REPLACE u1;
User altered.
ALTER USER u1 IDENTIFIED BY u3 REPLACE u2;
User altered.
```

- 10 days elapsed.

```
ALTER USER u1 IDENTIFIED BY u1 REPLACE u3;
```

User altered.

The both conditions should be satisfied to reuse the old password. If only one of the value in PASSWORD_REUSE_MAX and PASSWORD_REUSE_TIME is UNLIMITED, the password can not be reused.

If both of values are UNLIMITED, the password can always be reused.

Table 13-5 Password reuse

PASSWORD_REUSE_MAX	PASSWORD_REUSE_TIME	Password reusability
Integer value	Integer value	If both of the conditions are satisfied, it can be reused.
Integer value	UNLIMITED	It can not be reused.
UNLIMITED	Integer value	It can not be reused.
UNLIMITED	UNLIMITED	It can always be reused.

Password Complexity Verification

Password complexity verification checks if the password is complex enough to protect against breaking in to the system.

GOLDILOCKS supports the method of password complexity verification as follows.

Table 13-6 Password complexity verification

Method	Description
KISA_VERIFY_FUNCTION	<ul style="list-style-type: none"> 8 or more characters 1 or more letters 1 or more numbers 1 or more special characters
ORA12C_VERIFY_FUNCTION	<ul style="list-style-type: none"> 8 or more characters 1 or more letters 1 or more numbers Database name should not be included. Username or the reversed username should not be included. <i>goldilocks</i> should not be included. <i>oracle</i> should not be included. The following simple password can not be used. <ul style="list-style-type: none"> welcome1, database1, account1, user1234, password1, oracle123, computer1, abcdefg1, change_on_intall The new password should be different at least 3 characters from the old password.
	<ul style="list-style-type: none"> 9 or more characters 2 or more uppercases

Method	Description
ORA12C_STRONG_VERIFY_FUNCTION	<ul style="list-style-type: none"> • 2 or more lowercases • 2 or more numbers • 2 or more special characters • The new password should be different at least 4 characters from the old password.
VERIFY_FUNCTION_11G	<ul style="list-style-type: none"> • 8 or more characters • 1 or more letters • 1 or more numbers • Username should not be included. • The new password should be different at least 3 characters from the old password.
VERIFY_FUNCTION	<ul style="list-style-type: none"> • It should not be same as the username. • 4 or more characters • 1 or more letters • 1 or more numbers • 1 or more special characters • The following simple password can not be used. <ul style="list-style-type: none"> ◦ welcome, database, account, user, password, oracle, computer, abcd • The new password should be different at least 3 characters from the old password.

For more information about profile and user setting, refer to **CREATE PROFILE** , **CREATE USER** .

13.3 Audit Policy

Audit Policy-related Statement

For more information, refer to the followings.

- Creating audit policy: **CREATE AUDIT POLICY**
- Dropping audit policy: **DROP AUDIT POLICY**
- Altering audit policy: **ALTER AUDIT POLICY**
- Activating audit policy: **AUDIT POLICY**
- Deactivating audit policy: **NOAUDIT POLICY**
- Dropping audit trail: **ALTER DATABASE CLEAR AUDIT TRAIL**

Table 13-7 Audit policy object information

Schema	View	Description
DICTIONARY_SCHEMA	AUDIT_POLICIES	Information about all audit policies
	AUDIT_POLICY_OPTIONS	Information about audit policy option
	AUDIT_POLICY_ENABLED	Information about activating audit policy

Examples

AUDIT SYSTEM ON DATABASE privilege is required to perform the followings.

Creating Audit Policy

Perform **CREATE AUDIT POLICY** statement to create an audit policy object.

The following is an example of creating an audit_t1_dml object to audit the DML for a u1.t1 table.

```
CREATE AUDIT POLICY audit_t1_dml
  ACTIONS INSERT ON u1.t1
    , DELETE ON u1.t1
    , UPDATE ON u1.t1
;
Audit policy created.
```

Enquire the information about audit policy options by using **AUDIT_POLICY_OPTIONS** view.

```

SELECT policy_name
       , audit_option
       , object_schema
       , object_name
FROM   audit_policy_options
WHERE  policy_name = 'AUDIT_T1_DML'
ORDER BY audit_option
;

```

POLICY_NAME	AUDIT_OPTION	OBJECT_SCHEMA	OBJECT_NAME
AUDIT_T1_DML	DELETE	U1	T1
AUDIT_T1_DML	INSERT	U1	T1
AUDIT_T1_DML	UPDATE	U1	T1

3 rows selected.

Activating Audit Policy

Use **AUDIT POLICY** statement to activate the audit policy.

The following is an example of activating an audit policy to leave an audit record when a user except for u1, sys succeeded to perform DML for u1.t1 table.

```

AUDIT POLICY audit_t1_dml
  EXCEPT u1, sys
  WHENEVER SUCCESSFUL
;

```

The activated audit policy is applied to the newly created session, but it does not affect the existing sessions.

View the information about activated audit policy by using **AUDIT_POLICY_ENABLED**.

```

SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM   audit_policy_enabled
WHERE  policy_name = 'AUDIT_T1_DML'
ORDER BY user_name
;

```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
-------------	-------------	-----------	--------------	--------------

```

-----
AUDIT_T1_DML      EXCEPT          SYS      YES      NO
AUDIT_T1_DML      EXCEPT          U1       YES      NO
2 rows selected.

```

After the audit policy is activated, the corresponding actions create audit records.

The following is an example of when u2 user successfully performs SQL statements.

```

SELECT COUNT(*) FROM u1.t1;
INSERT INTO u1.t1 VALUES ( 1 );
UPDATE u1.t1 SET id = id + 1 WHERE id = 1;
DELETE u1.t1 WHERE id = 2;
COMMIT;

```

In the example above, INSERT, UPDATE, DELETE are target actions of an audit, so it creates audit records, but SELECT and COMMIT are not a target action of an audit, so it does not create audit records.

Viewing Audit Trail

SELECT ON DICTIONARY_SCHEMA.AUDIT_TRAIL privilege for AUDIT_TRAIL view is required to view audit records.

The following is an example of viewing an audit trail created by an audit_t1_dml audit policy.

```

SELECT policy_name
       , logon_username
       , action_name
       , object_schema
       , object_name
       , sql_text
FROM audit_trail
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  LOGON_USERNAME ACTION_NAME OBJECT_SCHEMA OBJECT_NAME SQL_TEXT
-----
-----
AUDIT_T1_DML U2          INSERT      U1          T1          INSERT INTO u1.t1 VALUES ( 1
)
AUDIT_T1_DML U2          UPDATE      U1          T1          UPDATE u1.t1 SET c1 = c1 + 1
WHERE c1 = 1
AUDIT_T1_DML U2          DELETE      U1          T1          DELETE u1.t1 WHERE c1 = 2
3 rows selected.

```

Dropping Audit Trail

When an audit policy is activated, the size of an audit trail keeps increasing. Execute the following statement to drop the audit trail.

```
ALTER DATABASE CLEAR AUDIT TRAIL;
```

Store it in the user table and drop it as follows to store the audit trail.

- Creating a user table

```
CREATE TABLE my_audit_trail  
AS SELECT *  
FROM audit_trail  
WITH NO DATA;
```

- Storing it in a user table, then dropping it.

```
INSERT INTO my_audit_trail SELECT * FROM audit_trail;  
ALTER DATABASE CLEAR AUDIT TRAIL;
```

Create and manage the view as follows to view both the stored audit trail and the current audit_trail.

```
CREATE VIEW unified_audit_trail  
AS  
SELECT * FROM my_audit_trail  
UNION ALL  
SELECT * FROM dictionary_schema.audit_trail  
;
```

Deactivating Audit Policy

Deactivate the audit policy by using the following statement.

```
NOAUDIT POLICY audit_t1_dml;
```

Deactivating audit policy affects the newly created session, but it does not affect the activated information about existing sessions.

Dropping Audit Policy

Execute the following statement to drop the audit policy object.

```
DROP AUDIT POLICY audit_t1_dml;
```

The audit policy object should be deactivated to be dropped, and dropping the object does not affect the existing sessions.

Concepts of Audit Policy

Audit Trail

Viewing Audit Trail

Audit record can be viewed by using `DICTIONARY_SCHEMA.AUDIT_TRAIL` view.

`SELECT` privilege is required to view `AUDIT_TRAIL` view.

```
GRANT SELECT ON DICTIONARY_SCHEMA.AUDIT_TRAIL TO user_name;
```

`AUDIT_TRAIL` view has the following information.

Table 13-8 Column information

Information	Column name	Description
Session information	MEMBER_NAME	Cluster member name
	SESSION_ID	Session identifier
	SESSION_SERIAL	Session serial number
	LOGON_USERNAME	Logon user name of the user whose actions were audited
	CURRENT_USERNAME	Effective user for the statement execution
	SERVER_PROCESS	Server process identifier for the session
Peer client information	CLIENT_PROGRAM_NAME	Client program used for session
	CLIENT_USERNAME	Client operating system user name for the session
	CLIENT_PROCESS	Client process identifier for the session
	CLIENT_HOST	Client host ip address for the session
	CLIENT_PORT	Client port number for the session
	CLIENT_TERMINAL	Client terminal name for the session
	TRANSACTION_ID	Transaction identifier
	SCN	System change number (SCN) string of the query at the time of the event

Information	Column name	Description
SQL information	GCN	Global change number (GCN) of the query at the time of the event
	DCN	Domain change number (DCN) of the query at the time of the event
	LCN	Local change number (LCN) of the query at the time of the event
	STMT_NO	Numeric number for each statement run in a session
	SQL_TEXT	SQL associated with the event
	SQL_BINDS	List of bind variables, if any, associated with SQL_TEXT
	RETURN_CODE	Error code generated by the action, zero if the action succeeded
	ERROR_MESSAGE	Error message generated by the action, null if the action succeeded
Event information	ENTRY_ID	Audit trail entry identifier in the session
	EVENT_TIMESTAMP	Timestamp of the creation of the audit trail entry in local time zone
	POLICY_NAME	Audit policy name that caused the current audit record
	PRIVILEGE_USED	Database privilege used to execute the action
	ACTION_NAME	Action name executed by the user
	OBJECT_TYPE	Object type of object affected by the action
	OBJECT_SCHEMA	Schema name of object affected by the action
	OBJECT_NAME	Object name of object affected by the action

Storing Audit Trail

AUDIT_TRAIL view consists of the following tables.

- AUDIT_TRAIL_SESSION
 - It records a record per a session.
 - Session information
 - Peer client information
- AUDIT_TRAIL_SQL
 - It records a record per SQL.
 - SQL information
- AUDIT_TRAIL_EVENT
 - It records a record per an audit option.
 - Audit event information

Audit records configuring an audit trail is divided into multiple tables then stored.

The schema of the tables is DEFINITION_SCHEMA, and it is stored in MEM_AUX_TBS tablespace.

- DEFINITION_SCHEMA
 - It is a schema storing dictionary tables.
- MEM_AUX_TBS
 - System auxiliary tablespace
 - It is a tablespace to store a record which automatically created by the database.
 - It is managed by a separate tablespace not to affect the service management by an automatically

created record.

Creating Audit Record

If an audit policy is activated, it creates an audit record when the corresponding action occurs. It creates one or more audit records when multiple corresponding actions occur.

- If similar audit options are listed as follows, it creates a single audit record.
 - Defining an audit policy

```
CREATE AUDIT POLICY p1
  PRIVILEGES INSERT ANY TABLE
  ACTIONS INSERT;
AUDIT POLICY p1;
```

- Performing an audit action

```
INSERT INTO other_user.t1 VALUES ( 1 );
```

- If different audit options are listed as follows, it creates two audit records.
 - Defining an audit policy

```
CREATE AUDIT POLICY p1
  ACTIONS SELECT ON u1.t1
    , SELECT ON u1.t2;
AUDIT POLICY p1;
```

- Performing an audit action

```
SELECT COUNT(*) FROM u1.t1 A, u1.t2 B WHERE A.id = B.id;
```

- If multiple audit policies are activated in the identical action as follows, it creates two audit records.
 - Defining an audit policy

```
CREATE AUDIT POLICY p1
  PRIVILEGES INSERT ANY TABLE;
AUDIT POLICY p1;
CREATE AUDIT POLICY p2
  ACTIONS INSERT;
AUDIT POLICY p2;
```

- Performing an audit action

```
INSERT INTO other.t1 VALUES (1);
```

Dropping Audit Trail (purge)

Execute the following statement to drop the audit trail.

```
ALTER DATABASE CLEAR AUDIT TRAIL;
```

Create a user table and store old audit record in it as follows.

```
CREATE TABLE my_audit_trail AS SELECT * FROM audit_trail WITH NO DATA;
```

Then, regularly store it by using INSERT .. SELECT statement before dropping the audit trail.

```
INSERT INTO my_audit_trail SELECT * FROM audit_trail;
ALTER DATABASE CLEAR AUDIT TRAIL;
```

Execute DELETE statement by using EVENT_TIMESTAMP column to store the audit record of the specified period.

```
INSERT INTO my_audit_trail SELECT * FROM audit_trail;
DELETE FROM my_audit_trail WHERE event_timestamp < ADD_MONTHS( sysdate, -3 );
ALTER DATABASE CLEAR AUDIT TRAIL;
```

View the old audit record and the current audit record together by creating a view as follows.

```
CREATE VIEW audit_trail_view
AS SELECT * FROM dictionary_schema.audit_trail
   UNION ALL
   SELECT * FROM my_audit_trail;
SELECT * FROM audit_trail_view;
```

Configuring Audit Policy

Audit policy may include the following options.

- Privilege auditing
 - It audits SQL performance by using the database privilege.
- Object action auditing
 - It audits SQL performance for the specific object.
- System action auditing

- It audits SQL performance for all objects.

Multiple audit options can be managed by creating multiple audit policies, but it is recommended to manage multiple audit options by creating a small number of audit policies.

The activated audit policy information is constructed as a session information at logon time, so the less the number of audit policies, the less the load becomes.

Moreover, if multiple audit policies are activated, then it determines whether to create an audit record for an SQL statement, so a load creating multiple audit records may occur.

Audit policy information constructed in a session at logon time is not affected by dropping, altering, activating or deactivating an audit policy.

Altering an audit policy is applied only to a newly logon session.

Privilege Auditing

Privilege auditing is set to audit when SQL statement is successfully performed by using the database privilege.

It does not create an audit record which is based on the privilege auditing about sys user (the database owner).

The database privilege which can be listed for the privilege auditing can be viewed through **V\$AUDITABLE_DB_PRIVILEGES** view.

```
SELECT privilege_name FROM v$auditbale_db_privileges;
```

```
PRIVILEGE_NAME
```

```
-----
```

```
ADMINISTRATION
```

```
ALTER DATABASE
```

```
ALTER SYSTEM
```

```
ACCESS CONTROL
```

```
CREATE USER
```

```
ALTER USER
```

```
DROP USER
```

```
CREATE TABLESPACE
```

```
ALTER TABLESPACE
```

```
DROP TABLESPACE
```

```
USAGE TABLESPACE
```

```
CREATE SCHEMA
```

```
DROP SCHEMA
```

```
ANALYZE ANY
```

```
CREATE ANY TABLE
```

```
ALTER ANY TABLE
DROP ANY TABLE
SELECT ANY TABLE
INSERT ANY TABLE
DELETE ANY TABLE
UPDATE ANY TABLE
LOCK ANY TABLE
CREATE ANY VIEW
DROP ANY VIEW
CREATE ANY SEQUENCE
ALTER ANY SEQUENCE
DROP ANY SEQUENCE
USAGE ANY SEQUENCE
CREATE ANY INDEX
ALTER ANY INDEX
DROP ANY INDEX
CREATE ANY SYNONYM
DROP ANY SYNONYM
CREATE PUBLIC SYNONYM
DROP PUBLIC SYNONYM
CREATE PROFILE
ALTER PROFILE
DROP PROFILE
CREATE ANY PROCEDURE
ALTER ANY PROCEDURE
DROP ANY PROCEDURE
EXECUTE ANY PROCEDURE
AUDIT SYSTEM
43 rows selected.
```

The following is an example of when a user u1 who has SELECT ANY TABLE privilege activates an audit policy for the privilege auditing.

```
CREATE AUDIT POLICY p1
    PRIVILEGES SELECT ANY TABLE;
AUDIT POLICY p1;
```

Whether the audit record is created when a user u1 performs the following two statements is as follows.

- SELECT * FROM u1.t1
 - It does not use SELECT ANY TABLE privilege because it is an owner of the object.
 - An audit record does not exist.

- `SELECT * FROM other.t1`
 - It succeeds with `SELECT ANY TABLE` privilege even though it does not have `SELECT ON other.t1` privilege.
 - It creates an audit record.

Use `AUDIT_POLICY_OPTIONS` view to view the privilege auditing information as follows.

```
SELECT audit_option
       , audit_option_type
       , object_schema
       , object_name
FROM audit_policy_options
WHERE policy_name = 'P1'
;
```

AUDIT_OPTION	AUDIT_OPTION_TYPE	OBJECT_SCHEMA	OBJECT_NAME
SELECT ANY TABLE	DATABASE PRIVILEGE	null	null

Auditing Object Action

It audits SQL which is performed for a specific object.

Actions to be audited per each object type are as follows.

Table 13-9 Audit action per object type

Object type	Actions
Table	ALTER, COMMENT, DELETE, GRANT, INDEX, INSERT, LOCK, RENAME, SELECT, UPDATE
View	ALTER, COMMENT, GRANT, SELECT
Sequence	ALTER, COMMENT, GRANT, SELECT
Stored function/ procedure	ALTER, COMMENT, EXECUTE, GRANT

Create the audit policy as follows to audit DML for table `u1.t1`.

```
CREATE AUDIT POLICY audit_t1_dml
  ACTIONS INSERT ON u1.t1
        , DELETE ON u1.t1
        , UPDATE ON u1.t1
;
```

Execute `AUDIT_POLICY_OPTIONS` view as follows to view the information about object action auditing.

```

SELECT audit_option
       , audit_option_type
       , object_schema
       , object_name
FROM audit_policy_options
WHERE policy_name = 'AUDIT_T1_DML'
ORDER BY audit_option
;

```

AUDIT_OPTION	AUDIT_OPTION_TYPE	OBJECT_SCHEMA	OBJECT_NAME
DELETE	OBJECT ACTION	U1	T1
INSERT	OBJECT ACTION	U1	T1
UPDATE	OBJECT ACTION	U1	T1

3 rows selected.

ALL option such as ALL ON schema.object means all audit actions which can be defined for the corresponding object.

The following is an example of using ALL option together with other options.

```

CREATE AUDIT POLICY p1
      ACTIONS ALL ON u1.seq1
      , ALTER ON u1.seq1
;

```

Audit policy created.

```

SELECT audit_option
       , audit_option_type
       , object_schema
       , object_name
FROM audit_policy_options
WHERE policy_name = 'P1'
ORDER BY audit_option
;

```

AUDIT_OPTION	AUDIT_OPTION_TYPE	OBJECT_SCHEMA	OBJECT_NAME
ALL	OBJECT ACTION	U1	SEQ1
ALTER	OBJECT ACTION	U1	SEQ1

2 rows selected.

When dropping ALL option as follows, not every audit options are dropped, but only ALL option is dropped.

```

ALTER AUDIT POLICY p1
    DROP ACTIONS ALL ON u1.seq1;
Audit Policy altered.
SELECT audit_option
       , audit_option_type
       , object_schema
       , object_name
  FROM audit_policy_options
 WHERE policy_name = 'P1'
 ORDER BY audit_option;
AUDIT_OPTION AUDIT_OPTION_TYPE OBJECT_SCHEMA OBJECT_NAME
-----
ALTER          OBJECT ACTION      U1          SEQ1
1 row selected.

```

Auditing success or failure of EXECUTE a stored function or a stored procedure is determined based only on whether it is executable at the time of the execution.

- WHENEVER NOT SUCCESSFUL creates an audit record when it can not performs a stored function/ procedure.
- WHENEVER SUCCESSFUL creates an audit record even when an error occurs while performing an SQL statement in a stored function/ procedure.
- If an auditing the failure of an SQL statement in a stored function/ procedure, then that SQL statement should be included in an auditing target.

The following is an example of executing SELECT statement including a stored function.

```

SELECT others.func1( t1.c1 )
  FROM t1;

```

It corresponds to WHENEVER NOT SUCCESSFUL when it fails to call others.func1() due to an error such as a lack of privilege. It corresponds to WHENEVER SUCCESSFUL even though an error occurs while executing an SQL statement in a stored function when it succeeds to call others.func1().

Auditing System Action

It audits an SQL statement regardless of a specific object.

A valid system action enquires V\$AUDITABLE_SYSTEM_ACTIONS.

```

SELECT action_name FROM v$auditable_system_actions;
ACTION_NAME
-----
ALL

```

DDL

170 rows selected.
```

The following is an example of creating an audit policy including a system action, and enquiring an audit option.

```
CREATE AUDIT POLICY p1
    ACTIONS SELECT
        , DROP TABLE
        , DROP USER
;
Audit Policy created.
SELECT audit_option
    , audit_option_type
    , object_schema
    , object_name
FROM audit_policy_options
WHERE policy_name = 'P1'
ORDER BY audit_option
;
AUDIT_OPTION AUDIT_OPTION_TYPE OBJECT_SCHEMA OBJECT_NAME
-----
DROP TABLE    SYSTEM ACTION    null      null
DROP USER      SYSTEM ACTION    null      null
SELECT         SYSTEM ACTION    null      null
3 rows selected.
```

Useful Audit Policy

The following is an example of defining a useful audit policy.

- Auditing a logon failure

```
CREATE AUDIT POLICY AUDIT_LOGON_FAILURES
    ACTIONS LOGON
;
```

```
AUDIT POLICY AUDIT_LOGON_FAILURES
    WHENEVER NOT SUCCESSFUL
;
```

- Auditing a Data Definition Language (DDL) performance

```
CREATE AUDIT POLICY AUDIT_DDL
    ACTIONS DDL
;
AUDIT POLICY AUDIT_DDL
    WHENEVER SUCCESSFUL
;
```

- Auditing a parameter alteration

```
CREATE AUDIT POLICY AUDIT_DATABASE_PARAMETER
    ACTIONS ALTER DATABASE
        , ALTER SYSTEM
;
AUDIT POLICY AUDIT_DATABASE_PARAMETER
    WHENEVER SUCCESSFUL
;
```

- Auditing an account alteration

```
CREATE AUDIT POLICY AUDIT_ACCOUNT_MGMT
    ACTIONS CREATE USER
        , DROP USER
        , ALTER USER
        , CHANGE PASSWORD
        , GRANT
        , REVOKE
;
AUDIT POLICY AUDIT_ACCOUNT_MGMT
;
```

- Auditing the recommendations of Center for Internet Security (CIS)

```
CREATE AUDIT POLICY AUDIT_CIS_RECOMMENDATIONS
    PRIVILEGES ALTER SYSTEM
        , ALTER DATABASE
    ACTIONS CREATE USER
```

```

        , DROP USER
        , ALTER USER
        , CHANGE PASSWORD
        , GRANT
        , REVOKE
        , CREATE PROFILE
        , ALTER PROFILE
        , DROP PROFILE
        , CREATE SYNONYM
        , DROP SYNONYM
        , CREATE PROCEDURE
        , DROP PROCEDURE
        , ALTER PROCEDURE
;
AUDIT POLICY AUDIT_CIS_RECOMMENDATIONS
    WHENEVER SUCCESSFUL
;

```

Operating Audit Policy

Activating Audit Policy

An audit policy object does not start auditing until it is activated.

An audit policy object should be activated by using AUDIT POLICY statement as follows to perform auditing.

```

CREATE AUDIT POLICY audit_t1_dml
    ACTIONS INSERT ON u1.t1
        , DELETE ON u1.t1
        , UPDATE ON u1.t1
;
Audit policy created.
AUDIT POLICY audit_t1_dml;
Audit succeeded.

```

When activating an audit policy, it audits new sessions only, but it does not affect the existing sessions.

When activating an audit policy by using AUDIT POLICY statement, it can specify a user which will audit using BY clause or EXCEPT clause, or it may audit success/ failure of an audit action by using WHENEVER clause.

- BY | EXCEPT
 - BY user_list: It specifies a user to audit.
 - EXCEPT user_list: It audits all users except for specified users.
 - When it is omitted, it audits all users.
- WHENEVER
 - WHENEVER SUCCESSFUL: It creates an audit record when an audit action succeeds.
 - WHENEVER NOT SUCCESSFUL: It creates an audit record when an audit action fails.
 - When it is omitted, it creates an audit record regardless of a success/ failure of an audit action.

The information about activated audit policy can be viewed by executing AUDIT_POLICY_ENABLED view.

```
SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM   audit_policy_enabled
WHERE  policy_name = 'AUDIT_T1_DML'
;
```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
-----	-----	-----	-----	-----
AUDIT_T1_DML	BY	ALL USERS	YES	YES

If the auditing target user is omitted as the example above, it outputs ALL USERS meaning all users.

Note the followings when using BY clause and EXCEPT clause.

- BY clause and EXCEPT clause can not be used together for the same audit policy.

```
AUDIT POLICY audit_t1_dml BY u1;
Audit succeeded.
AUDIT POLICY audit_t1_dml EXCEPT u2;
ERR-42000(16475): audit policy already applied with the BY clause
```

- If multiple AUDIT POLICY BY clauses are used in the same audit policy, it is activated for the user sets. In other words, the following examples have the same meaning.
 - Example 1

```
AUDIT POLICY audit_t1_dml BY u1;
Audit succeeded.
AUDIT POLICY audit_t1_dml BY u2;
Audit succeeded.
```

```

SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM   audit_policy_enabled
WHERE  policy_name = 'AUDIT_T1_DML'
;

```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
AUDIT_T1_DML	BY	U1	YES	YES
AUDIT_T1_DML	BY	U2	YES	YES

2 rows selected.

- Example 2

```

AUDIT POLICY audit_t1_dml BY u1, u2;
Audit succeeded.
SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM   audit_policy_enabled
WHERE  policy_name = 'AUDIT_T1_DML'
;

```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
AUDIT_T1_DML	BY	U1	YES	YES
AUDIT_T1_DML	BY	U2	YES	YES

2 rows selected.

- If multiple AUDIT POLICY EXCEPT clauses are used in the same audit policy, only the last AUDIT POLICY statement is valid. In other words, the following examples have different meanings.

- Example 1

```

AUDIT POLICY audit_t1_dml EXCEPT u1;
Audit succeeded.
AUDIT POLICY audit_t1_dml EXCEPT u2;
Audit succeeded.
SELECT policy_name

```

```

, enabled_opt
, user_name
, when_success
, when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;

```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
AUDIT_T1_DML	EXCEPT	U2	YES	YES

1 row selected.

- Example 2

```

AUDIT POLICY audit_t1_dml EXCEPT u1, u2;
Audit succeeded.
SELECT policy_name
, enabled_opt
, user_name
, when_success
, when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;

```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
AUDIT_T1_DML	EXCEPT	U1	YES	YES
AUDIT_T1_DML	EXCEPT	U2	YES	YES

2 rows selected.

- WHENEVER clause which is used together with BY clause is accumulated. In other words, the following examples have the same meaning.

- Example 1

```

AUDIT POLICY audit_t1_dml BY u1 WHENEVER SUCCESSFUL;
Audit succeeded.
SELECT policy_name
, enabled_opt
, user_name
, when_success
, when_failure

```

```

FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
AUDIT_T1_DML BY          U1          YES          NO
1 row selected.
AUDIT POLICY audit_t1_dml BY u1 WHENEVER NOT SUCCESSFUL;
Audit succeeded.
SELECT policy_name
      , enabled_opt
      , user_name
      , when_success
      , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
AUDIT_T1_DML BY          U1          YES          YES
1 row selected.

```

◦ Example 2

```

AUDIT POLICY audit_t1_dml BY u1;
Audit succeeded.
SELECT policy_name
      , enabled_opt
      , user_name
      , when_success
      , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
AUDIT_T1_DML BY          U1          YES          YES
1 row selected.

```

- If WHENEVER clause is used together with EXCEPT clause, then only the last part of it is valid. In other words, the following examples have different meanings.

◦ Example 1

```
AUDIT POLICY audit_t1_dml EXCEPT u1 WHENEVER SUCCESSFUL;
Audit succeeded.
AUDIT POLICY audit_t1_dml EXCEPT u1 WHENEVER NOT SUCCESSFUL;
Audit succeeded.
SELECT policy_name
      , enabled_opt
      , user_name
      , when_success
      , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
AUDIT_T1_DML EXCEPT      U1          NO          YES
1 row selected.
```

◦ Example 2

```
AUDIT POLICY audit_t1_dml EXCEPT u1;
Audit succeeded.
SELECT policy_name
      , enabled_opt
      , user_name
      , when_success
      , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
AUDIT_T1_DML EXCEPT      U1          YES          YES
1 row selected.
```

Deactivating Audit Policy

NOAUDIT POLICY statement should be executed to deactivate an audit policy.
NOAUDIT POLICY statement is applied only to a new session, and it does not affect to the existing session.

If all information is set to be deactivated by using the query below, then an audit policy is completely deactivated.

```
SELECT policy_name
      , enabled_opt
      , user_name
      , when_success
      , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
no rows selected.
```

NOAUDIT POLICY statement deletes each activated information which is created according to the specified AUDIT POLICY method.

The following is an example of deactivating only the auditing for u1 user of audit_t1_dml.

```
SELECT policy_name
      , enabled_opt
      , user_name
      , when_success
      , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  ENABLED_OPT  USER_NAME  WHEN_SUCCESS  WHEN_FAILURE
-----
AUDIT_T1_DML BY          U1          YES           YES
AUDIT_T1_DML BY          SYS         YES           YES
2 rows selected.
NOAUDIT POLICY audit_t1_dml BY u1;
Noaudit succeeded.
SELECT policy_name
      , enabled_opt
      , user_name
      , when_success
      , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'AUDIT_T1_DML'
;
POLICY_NAME  ENABLED_OPT  USER_NAME  WHEN_SUCCESS  WHEN_FAILURE
```

```
-----  
AUDIT_T1_DML BY          SYS          YES          YES  
1 row selected.
```

If AUDIT POLICY name BY clause is used it should be deactivated by using NOAUDIT POLICY name BY statement. If AUDIT POLICY name EXCEPT clause is used it should be deactivated by using NOAUDIT POLICY name statement without BY clause.

NOAUDIT POLICY statement should be used according to the usage as follows to deactivate each option of AUDIT POLICY statement.

Table 13-10 Activating/ deactivating audit policy

Type	AUDIT POLICY statement	NOAUDIT POLICY statement
All users	AUDIT POLICY p1	NOAUDIT POLICY p1
Using BY	AUDIT POLICY p1 BY u1	NOAUDIT POLICY p1 BY u1
Using EXCEPT	AUDIT POLICY p1 EXCEPT u1	NOAUDIT POLICY p1

If all users are activated as follows, NOAUDIT POLICY BY clause does not affect anything.

```
AUDIT POLICY audit_t1_dml;  
Audit succeeded.  
SELECT policy_name  
       , enabled_opt  
       , user_name  
       , when_success  
       , when_failure  
FROM audit_policy_enabled  
WHERE policy_name = 'AUDIT_T1_DML'  
;  
POLICY_NAME  ENABLED_OPT  USER_NAME  WHEN_SUCCESS  WHEN_FAILURE  
-----  
AUDIT_T1_DML BY          ALL USERS YES          YES  
1 row selected.  
NOAUDIT POLICY audit_t1_dml BY u1;  
Noaudit succeeded.  
SELECT policy_name  
       , enabled_opt  
       , user_name  
       , when_success  
       , when_failure  
FROM audit_policy_enabled  
WHERE policy_name = 'AUDIT_T1_DML'
```

```

;
POLICY_NAME  ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
AUDIT_T1_DML BY          ALL USERS YES          YES
1 row selected.

```

If one or more users are separately activated, NOAUDIT POLICY statement should be used according to the AUDIT POLICY configuration.

- When it is activated by using BY clause
 - The following is an example of activating by using BY clause.

```

AUDIT POLICY p1 WHENEVER NOT SUCCESSFUL;
AUDIT POLICY p1 BY u1;
AUDIT POLICY p1 BY u2;

```

- The information about activating is viewed as follows.

```

SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM   audit_policy_enabled
WHERE  policy_name = 'P1';
POLICY_NAME  ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
P1           BY          ALL USERS NO          YES
P1           BY          U1          YES         YES
P1           BY          U2          YES         YES
3 rows selected.

```

- The following is the information about activating when NOAUDIT statement is performed.

```

NOAUDIT POLICY p1;
Noaudit succeeded.
SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure

```

```

FROM audit_policy_enabled
WHERE policy_name = 'P1';
POLICY_NAME ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
P1          BY          U1          YES          YES
P1          BY          U2          YES          YES
2 rows selected.

```

In the example above, the auditing for ALL USERS is deactivated, but the auditing for user u1 and u2 are still activated.

If NOAUDIT POLICY statement is used again by using BY option as follows, then it completely deactivate the audit policy p1.

```

NOAUDIT POLICY p1 BY u1, u2;
Noaudit succeeded.
SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'P1';
no rows selected.

```

- When it is activated by using EXCEPT
 - The following is an example of activating by using the audit policy.

```

AUDIT POLICY p1 EXCEPT u1, sys;

```

- The information about activating is viewed as follows.

```

SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'P1';
POLICY_NAME ENABLED_OPT USER_NAME WHEN_SUCCESS WHEN_FAILURE
-----
P1          EXCEPT  U1          YES          YES

```

P1	EXCEPT	SYS	YES	YES
----	--------	-----	-----	-----

2 rows selected.

- Unlike AUDIT POLICY statement, NOAUDIT POLICY statement does not have an EXCEPT option, and it executes the statement without an option as follows.

```
NOAUDIT POLICY p1;
Noaudit succeeded.
SELECT policy_name
       , enabled_opt
       , user_name
       , when_success
       , when_failure
FROM   audit_policy_enabled
WHERE  policy_name = 'P1';
no rows selected.
```

In other words, if an audit policy is activated by using an EXCEPT option, then a separate user can not be re activated by using NOAUDIT POLICY statement.

13.4 Authorization

Authorization-related Statements

For more information, refer to the followings.

- Creating a user: **CREATE USER**
- Dropping a user: **DROP USER**
- Altering a user: **ALTER USER**
- Granting privileges: **GRANT privileges TO**
- Revoking privileges: **REVOKE privileges FROM**

Information related to a user object and the authorization can be retrieved through the following views.

Table 13-11 Authorization objects related information

Schema	View	Description
	ALL_COL_PRIVS	Privileges for the user-accessible column
	ALL_COL_PRIVS_MADE	Privileges for the column whose user is the grantor
	ALL_COL_PRIVS_RECD	Privileges for the column whose user is the grantee
	ALL_DB_PRIVS	DB privileges which is related to a user
	ALL_DB_PRIVS_MADE	Privileges for the DB whose user is the grantor
	ALL_DB_PRIVS_RECD	Privileges for the DB whose user is the grantee
	ALL_PROC_PRIVS	Stored procedure/function privileges which is related to a user
	ALL_PROC_PRIVS_MADE	Privileges for the stored procedure/function whose user is the grantor
	ALL_PROC_PRIVS_RECD	Privileges for the stored procedure/function whose user is the grantee
	ALL_SCHEMA_PRIVS	Privileges for the user-accessible schema
	ALL_SCHEMA_PRIVS_MADE	Privileges for the schema whose user is the grantor
	ALL_SCHEMA_PRIVS_RECD	Privileges for the schema whose user is the grantee
	ALL_SEQ_PRIVS	Privileges for the user-accessible sequence
	ALL_SEQ_PRIVS_MADE	Privileges for the sequence whose user is the grantor
	ALL_SEQ_PRIVS_RECD	Privileges for the sequence whose user is the grantee
	ALL_TAB_PRIVS	Privileges for the user-accessible table
	ALL_TAB_PRIVS_MADE	Privileges for the table whose user is the grantor
	ALL_TAB_PRIVS_RECD	Privileges for the table whose user is the grantee
	ALL_TBS_PRIVS	Privileges for the user-accessible tablespace

Schema	View	Description
DICTIONARY_SCHEMA	ALL_TBS_PRIVS_MADE	Privileges for the tablespace whose user is the grantor
	ALL_TBS_PRIVS_RECD	Privileges for the tablespace whose user is the grantee
	ALL_USERS	Information about the user-accessible user
	USER_COL_PRIVS	Privilege information about the user owned column
	USER_COL_PRIVS_MADE	Information of granting privileges about the user owned column
	USER_COL_PRIVS_RECD	Information of acquiring privilege about the user owned column
	USER_PROC_PRIVS	Privilege information about the user owned stored procedure/function
	USER_PROC_PRIVS_MADE	Information of granting privileges about the user owned stored procedure/function
	USER_PROC_PRIVS_RECD	Information of acquiring privilege about the user owned stored procedure/function
	USER_SCHEMA_PRIVS	Privilege information about the user owned schema
	USER_SCHEMA_PRIVS_MADE	Information of granting privileges about the user owned schema
	USER_SCHEMA_PRIVS_RECD	Information of acquiring privilege about the user owned schema
	USER_SEQ_PRIVS	Privilege information about the user owned sequence
	USER_SEQ_PRIVS_MADE	Information of granting privileges about the user owned sequence
	USER_SEQ_PRIVS_RECD	Information of acquiring privilege about the user owned sequence
	USER_TAB_PRIVS	Privileges information about the user owned table
	USER_TAB_PRIVS_MADE	Information of granting privileges about the user owned table
	USER_TAB_PRIVS_RECD	Information of acquiring privilege about the user owned table
	USER_USERS	Information about the current user
INFORMATION_SCHEMA	COLUMN_PRIVILEGES	Privilege information of user-accessible column
	ROUTINE_PRIVILEGES	Privilege information of user-accessible stored procedure/function
	TABLE_PRIVILEGES	Privilege information of user-accessible table
	USAGE_PRIVILEGES	Privilege information of user-accessible sequence

Concepts of User

A user object consists of the user's execution privilege set. The user should have the appropriate privilege to execute the SQL statements for the corresponding object.

For example, the user which is created by using **CREATE USER** statement is an object without any privileges. The user can not access the database nor does it execute any SQL statement. For access, the user should have **CREATE SESSION ON DATABASE** privilege which allows creating sessions in database object. The appropriate privilege should be granted after executing **CREATE USER** statement as follows.

```
CREATE USER u1 IDENTIFIED BY u1_password;  
GRANT CREATE SESSION ON DATABASE TO u1;  
COMMIT;
```

For more information about granting privilege after creating user object, refer to **Examples in CREATE USER and GRANT privileges TO**.

Creating Objects and Privileges

Creating SQL Schema Object

When creating an SQL schema object such as a table, the user should have the privileges for the superordinate non-schema object to which the table belongs in order to execute **CREATE TABLE** statements.

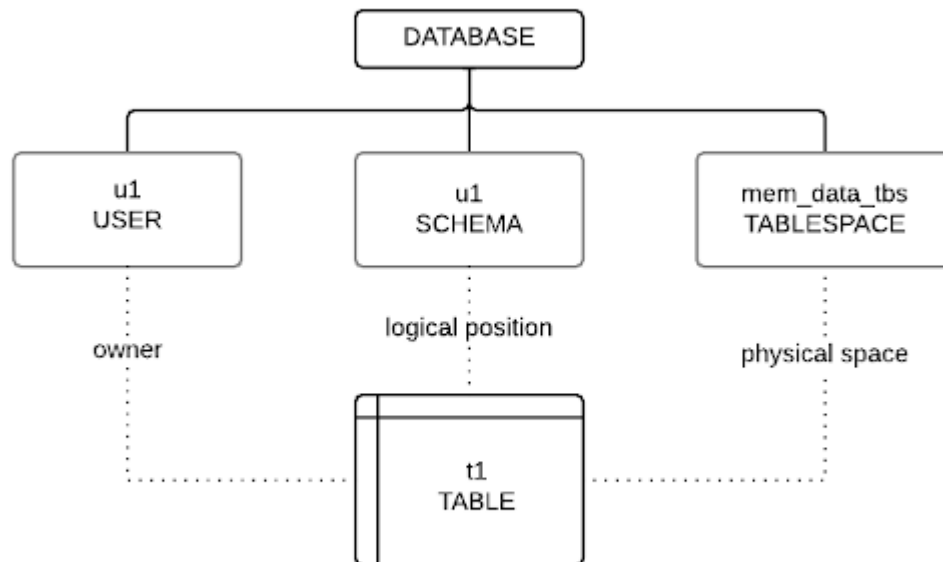

The following is an example of **CREATE TABLE** statements.

```
CREATE TABLE t1 ( id BIGINT, name VARCHAR(128) );
```

When it is interpreted as follows,

```
CREATE TABLE u1.t1 ( id BIGINT, name VARCHAR(128) ) TABLESPACE mem_data_tbs;
```

In the figure below, the owner of the table **t1** is the account **u1** who is the owner of the schema **u1**. The schema **u1** is the logical location which includes the table, and the table space **mem_data_tbs** is the physical storage which stores the table.

Figure 2 CREATE TABLE and non-schema objects

In this case, the user u1 who performed the statement needs the following privileges for the schema and tablespace to which the table t1 will belong.

One of the following privileges is required to create the table which will be stored on its logical location (schema u1).

- Privilege to create the table on the schema u1
 - CREATE TABLE ON SCHEMA ON u1
- Privilege to create any table on the database
 - CREATE ANY TABLE ON DATABASE
 - A table can be created when having privileges for the database which is superordinate object of the schema u1 even without the schema privilege.

One of the following privileges is required to create a table in tablespace mem_data_tbs which is the physical storage space of tables.

- Privilege to create an object on the tablespace mem_data_tbs
 - CREATE OBJECT ON TABLESPACE mem_data_tbs
- Privilege to use all tablespaces in the database
 - USAGE TABLESPACE ON DATABASE
 - A table can be created when having privileges for the database which is the superordinate object of mem_data_tbs tablespace even without the tablespace privilege.

The owner of the table object is determined as follows.

- The owner of the schema to which the table belongs
- If the owner of the schema to which the table belongs is PUBLIC, then it is the user who executed the statement.

The owner of the table object has the following privileges to change the table structure and manipulate data in the table.

- SELECT ON TABLE
 - The privilege to execute SELECT statement on the table
- INSERT ON TABLE
 - The privilege to execute INSERT statement on the table
- UPDATE ON TABLE
 - The privilege to execute UPDATE statement on the table
- DELETE ON TABLE
 - The privilege to execute DELETE statement on the table
- LOCK ON TABLE
 - The privilege to execute LOCK statement on the table
- INDEX ON TABLE
 - The privilege to execute CREATE/DROP/ALTER INDEX statement on the table
- ALTER ON TABLE
 - The privilege to execute ALTER TABLE statement on the table

The grantor of the given privilege is the `_SYSTEM` account which is used internally, and the grantee is the table owner. Therefore, any user including SYS account is not allowed to remove or change the owner privilege using **REVOKE privileges FROM**. The table owner's privileges are also removed when the table is removed.

Creating Non-schema Object

Like as creating the SQL schema object such as a table, the appropriate privileges for the database (a superordinate object) are required to create the non-schema objects such as user, schema, tablespace.

A user who executes the following statements should have the following privileges for the database object (a superordinate object) per each statement.

- CREATE USER statement
 - CREATE USER ON DATABASE
 - The privilege to execute CREATE USER statement on the database
- CREATE TABLESPACE statement
 - CREATE TABLESPACE ON DATABASE
 - The privilege to execute CREATE TABLESPACE statement on the database

- CREATE SCHEMA statement
 - CREATE SCHEMA ON DATABASE
 - The privilege to execute CREATE SCHEMA statement on the database
- CREATE PUBLIC SYNONYM statement
 - The privilege to execute CREATE PUBLIC SYNONYM statement on the database

Unlike creating the SQL schema object, the user who performed CREATE statement is not the owner of non-schema object. Each object has the following characteristics.

- User object
 - There is not an owner.
 - DROP USER ON DATABASE privilege is required to drop a user object.
- Tablespace object
 - There is not an owner.
 - DROP TABLESPACE ON DATABASE privilege is required to drop a tablespace object.
- Schema object
 - It is an owner which is specified in the CREATE SCHEMA statement.
 - The schema object owner can drop it.
- Public synonym object
 - There is not an owner.
 - DROP PUBLIC SYNONYM ON DATABASE privilege is required to drop a public synonym object.

Privileges

Granting Privileges

To INSERT, DELETE, UPDATE, or SELECT data when the user is not the owner of SQL schema object such as table, then the user should be granted the appropriate privileges by using **GRANT privileges TO** statement.

For example, a user who is not the owner of the table requires one of the following privileges to execute SELECT statement. As the figure below, the user can query the u1.t1 table if the user has SELECT privileges on the superordinate object u1 schema or the database even when the user does not have SELECT privilege on table t1.

- The test user executes the following.

```
SELECT id, name FROM u1.t1 WHERE id < 100;
```

Figure 3 Privilege to execute SELECT statement

- SELECT ON TABLE u1.t1
 - SELECT privilege for the table u1.t1
- SELECT ON SCHEMA u1
 - SELECT privilege for the schema u1 which is the superordinate object
 - SELECT privilege for all tables of the schema u1
- SELECT ANY TABLE ON DATABASE
 - SELECT privilege for the database which is the second superordinate object
 - SELECT privilege for all tables of the database

The user who executed the GRANT statement should be one of the followings to grant the SELECT ON TABLE u1.t1 privileges to another user.

- Owner of the object u1.t1
 - The object owner has the privilege of SELECT ON TABLE u1.t1 WITH GRANT OPTION granted by the _SYSTEM account.
- User with SELECT ON TABLE u1.t1 WITH GRANT OPTION
 - WITH GRANT OPTION enables the grantee to grant the granted privileges to another user.
- User with the privilege of ACCESS CONTROL ON DATABASE
 - The user can control all privileges on all objects.

The following is an example that the object owner grants privileges to another user.

- The owner of the table u1.t1 executes GRANT statement.

```
GRANT SELECT ON TABLE u1.t1 TO test;
```

For more information about the privilege types, refer to **GRANT privileges TO**.

For more information about privileges executing each SQL statements, refer to the *Invocation and Access Rule* of each statement in **SQL References**.

Revoking Privileges

The granted privileges are revoked from a user by using **REVOKE privileges FROM**. The privileges of the object's owner can not be revoked until the object is removed.

For example, a user who can execute REVOKE statement to revoke the SELECT privilege from the test user is as follows. The user can not revoke privileges which were not granted by the user even when the user is the owner of the table.

```
REVOKE SELECT ON TABLE u1.t1 FROM test;
```

- User who grants privileges
 - The user grants the privilege of SELECT ON TABLE u1.t1 to the test1 user.
- User who has the privilege of ACCESS CONTROL ON DATABASE
 - The user can control all privileges on all objects.

When the test user is granted the same privileges from multiple users as follows, the test user can execute SELECT statement until all the privileges are revoked.

- The object owner u1 grants the privilege to the test user.

```
GRANT SELECT ON TABLE u1.t1 TO test;
```

- The object owner u1 grants the privilege of WITH GRANT OPTION to the user u2.

```
GRANT SELECT ON TABLE u1.t1 TO u2 WITH GRANT OPTION;
```

- The user u2 executes it.
- The u2 user with the privilege of WITH GRANT OPTION grants the privilege to the test user.

```
GRANT SELECT ON TABLE u1.t1 TO test;
```

In the example above, the test user has two SELECT ON TABLE u1.t1 privileges which were granted by user u1 and user u2. The privilege information consists of {grantor, grantee, object privileges}.

PUBLIC Account

PUBLIC account is a special account which means every user.

For example, if the SELECT privilege is granted to PUBLIC account as follows, every user can execute SELECT statements on the table, u1.t1.

```
GRANT SELECT ON TABLE u1.t1 TO PUBLIC;
```

Even a user without SELECT privilege can execute SELECT statements on the table u1.t1 using the SELECT privilege on PUBLIC account.

When a privilege is granted to PUBLIC account, it is granted not to the existing users but to PUBLIC account itself. Even the newly created user can also execute SELECT statements.

Likewise, the user can execute SELECT statements if the user has the SELECT privilege on the table u1.t1 because revoking a privilege from PUBLIC account does not mean revoking the privilege from every user.

- The privilege is granted to the test user.

```
GRANT SELECT ON TABLE u1.t1 TO test;
```

- The privilege is granted to PUBLIC account.

```
GRANT SELECT ON TABLE u1.t1 TO PUBLIC;
```

- The privilege is revoked from PUBLIC account, and the test user still has the privilege on SELECT ON TABLE u1.t1.

```
REVOKE SELECT ON TABLE u1.t1 FROM PUBLIC;
```

Column Privilege

By granting privileges only on specific columns of a table, it is possible to control the execution of DML or SELECT statements of other user.

The following is an example table.

```
CREATE TABLE u1.t1
(
    id      BIGINT,
    name    VARCHAR(128),
    addr    VARCHAR(1024),
    salary  NUMBER(20,0)
);
```

If SELECT privilege on the table u1.t1 excluding the salary column information is granted to another user, **GRANT privileges TO** statement is executed by listing the columns to be grantees of the privilege as follows.

ws. The test user who is the grantees of the privilege can not query the salary column.

- The privilege on SELECT columns is granted to the test user.

```
GRANT SELECT( id, name, addr ) ON TABLE u1.t1 TO test;
```

If the privilege on a table is granted as follows, the privilege on every column in the table is automatically granted. If both table privilege and column privilege are granted, the privilege information for a column is duplicated and the information is not dually managed.

- SELECT privilege is granted to the test user.

```
GRANT SELECT ON TABLE u1.t1 TO test;
```

- Privileges on every column in the table u1.t1 are automatically granted.

```
GRANT SELECT(id) ON TABLE u1.t1 TO test;
GRANT SELECT(name) ON TABLE u1.t1 TO test;
GRANT SELECT(addr) ON TABLE u1.t1 TO test;
GRANT SELECT(salary) ON TABLE u1.t1 TO test;
```

The privilege on a column is revoked by using **REVOKE privileges FROM** as follows.

- The privilege on SELECT columns is revoked from the test user.

```
REVOKE SELECT( id, name, addr ) ON TABLE u1.t1 FROM test;
```

If the privilege on a table is revoked as follows, the privilege on every column in the table is automatically revoked. Even if the column privileges and table privileges are separately granted, the columns privileges are revoked when the table privileges are revoked.

- SELECT privilege is revoked from the test user.
- Privileges on every column in the table u1.t1 are revoked.

```
REVOKE SELECT ON TABLE u1.t1 FROM test;
```

When revoking only the column privilege and the table privilege still exists as follows, then the following statements can be executed by using the table privilege. Therefore, to grant the privilege only on a specific column, the table privilege should be revoked, and then each column privilege should be granted.

- SELECT table privilege is granted to the test user.

```
GRANT SELECT ON TABLE u1.t1 TO test;
```

- The SELECT(salary) column privilege is revoked from the test user.
- The test user can query the salary column in the table u1.t1 because the test user has the SELECT privilege on the table.

```
REVOKE SELECT(salary) ON TABLE u1.t1 FROM test;
```

For more information about the privileges on a table and columns, refer to **GRANT privileges TO** .

13.5 Schema

Schema-related Statements

For more information about creating and dropping a schema, refer to the followings.

- Creating a schema: **CREATE SCHEMA**.
- Dropping a schema: **DROP SCHEMA**.

Information which is related to a schema object can be retrieved through the following views.

Table 13-12 Schema object-related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_SCHEMAS	User accessible schema information
	ALL_SCHEMA_PATH	User accessible schema path
	USER_SCHEMAS	User owned schema information
	USER_SCHEMA_PATH	User's schema path information
INFORMATION_SCHEMA	SCHEMATA	User accessible schema information

Concepts of Schema

The database consists of one or more schemas. The schema consists of objects such as tables, indexes, views, and sequences, which processes data. SQL schema object is an object which belongs to the schema.

Schema is similar to the directory in OS. The relationship between schema and tables is similar to the relationship between the directories and files in OS.

Schema is the logical position of the SQL schema object and it is criteria of distinguishing the name. Every SQL schema object should have a unique name and the naming space in the schema is as follows.

- Table, view, sequence, private synonym, stored procedure, stored function
- Index
- Constraint

The same name tables can be defined in the different schema. The different tables with same name are accessible and executed by specifying together with the schema name.

```
gSQL> SELECT u1.t1.id, u1.t1.name, u2.t1.addr
        FROM u1.t1, u2.t1
        WHERE u1.t1.id = u2.t1.id;
```

The name of SQL schema object is specified together with the schema name or without it. If the schema name is omitted, it is determined by the user's schema path. For more information about the schema path, refer to **Schema Path** clause.

- When the schema name is specified

```
gSQL> SELECT u1.t1.id, u1.t1.name FROM u1.t1;
```

- When the schema name is omitted

```
gSQL> SELECT t1.id, t1.name FROM t1;
```

User and Schema

In GOLDDILOCKS, relationship between the user and the schema is 1:N. A user does not own a schema, or the user can have multiple schemas.

The SQL standard does not explicitly define the relationship of the non-schema objects such as user, schema, database. Each DBMS defines the relationship of the non-schema objects in different ways, and they are as follows.

- Oracle
 - The relationship between the user and the schema is 1:1.
- DB2
 - The relationship between the user and the schema is 1:N.
- Postgres
 - The relationship between the user and the schema is 1:N.
- MySQL
 - The relationship between the database and the schema is 1:1.
 - User is a subordinate object of the schema (database).

When establishing the database, GOLDDILOCKS configures various relationships between the users and schemas in accordance with the characteristics of the client system as follows.

Figure 4 Relationship between user and schema

To configure the database in which each user has its own schema as shown in the figure (a), create the users and schemas as follows.

- Create a user and the schema u1 together so that the user owns the schema.

```
gSQL> CREATE USER u1 IDENTIFIED BY u1_password WITH SCHEMA;
```

- WITH SCHEMA statement is optional and a schema whose name is as same as the user is created.

```
gSQL> CREATE USER u2 IDENTIFIED BY u2_password;
```

```
gSQL> CREATE USER u3 IDENTIFIED BY u3_password;
```

To configure the database in which a single user has multiple schemas as shown in the figure (b), create the users and schemas as follows.

- Create the user u1 only without creating a schema.

```
gSQL> CREATE USER u1 IDENTIFIED BY u1_password WITHOUT SCHEMA;
```

- Create multiple schemas and specify the owner of each schema as a user u1.

```
gSQL> CREATE SCHEMA s1 AUTHORIZATION u1;
```

```
gSQL> CREATE SCHEMA s2 AUTHORIZATION u1;
```

```
gSQL> CREATE SCHEMA s3 AUTHORIZATION u1;
```

To configure the database in which multiple users share a single schema without creating a schema as shown in the figure (c), create users as follows.

All users share **PUBLIC Schema** in the following examples.

- Create users only without creating a schema.

```
gSQL> CREATE USER u1 IDENTIFIED BY u1_password WITHOUT SCHEMA;
gSQL> CREATE USER u2 IDENTIFIED BY u2_password WITHOUT SCHEMA;
gSQL> CREATE USER u3 IDENTIFIED BY u3_password WITHOUT SCHEMA;
```

For more information about creating user and schema, refer to **CREATE USER**, **CREATE SCHEMA**.

Schema Path

Schema path is a path to find the schema name when the SQL schema object name such as a table is used without the schema name. Schema path is similar to the PATH environment variable of Unix system. It is similar in searching for a command in the PATH in the specified order when executing commands on Unix system.

When a user has multiple schemas, then creates or queries the table without a schema name as follows, the schema path determines in which schema the table will be created.

- A table t1 is created in the schema s1.

```
gSQL> CREATE TABLE s1.t1 ( id INTEGER );
```

- A table t1 is created in the schema s2.

```
gSQL> CREATE TABLE s2.t1 ( name VARCHAR(128) );
```

- In which schema the table t1 will be created?

```
gSQL> CREATE TABLE t1 ( address VARCHAR(1024) );
```

- Which schema's table t1 is retrieved?

```
gSQL> SELECT * FROM t1;
```

The figure below illustrates an example of a schema path for user u1. The schema path of user u1 is designated in an order of {s1, s2, s3}. Schema s1 has a table t1, schema s2 has a table t2, and the schema s3 has tables t1 and t3.

Figure 5 Example of schema path

In the SELECT statement without the schema name, the schema name is construed by the schema path as follows.

- It is construed as table s1.t1 by the schema path.

```
gSQL> SELECT * FROM t1;
gSQL> SELECT * FROM s1.t1;
```

- It is construed as table s2.t2 by the schema path.

```
gSQL> SELECT * FROM t2;
gSQL> SELECT * FROM s2.t2;
```

- It is construed as table s3.t3 by the schema path.

```
gSQL> SELECT * FROM t3;
gSQL> SELECT * FROM s3.t3;
```

When omitting the schema name to retrieve the table s3.t1 as the example above, the table s3.t1 is determined by schema path, so the schema name should be specified as follows.

- It retrieves the table s1.t1 by the schema path.

```
gSQL> SELECT * FROM t1;
```

- The schema s3 should be specified to retrieve the table s3.t1.

```
gSQL> SELECT * FROM s3.t1;
```

The following CREATE TABLE statement in which the schema name is omitted creates a table in the first schema s1 of the schema path.

- An error occurs because the identical table s1.t1 exists.

```
gSQL> CREATE TABLE t1 ( id INTEGER );
gSQL> CREATE TABLE s1.t1 ( id INTEGER );
```

- The table s2.t2 exists, but the table s1.t2 is created in different schemas.

```
gSQL> CREATE TABLE t2 ( name VARCHAR(128) );
gSQL> CREATE TABLE s1.t2 ( name VARCHAR(128) );
```

- The table s3.t3 exists, but the table s1.t3 is created in different schemas.

```
gSQL> CREATE TABLE t3 ( name VARCHAR(128) );
gSQL> CREATE TABLE s1.t3 ( name VARCHAR(128) );
```

If the current user omits the schema name when creating an object, the schema name to be used can be retrieved by using **CURRENT_SCHEMA** which is the SQL standard function.

```
gSQL> SELECT current_schema FROM dual;
CURRENT_SCHEMA
-----
S1
1 row selected.
```

The schema path information of the current user can be retrieved by using ALL SCHEMA PATH view in DICTIONARY_SCHEMA schema.

```
gSQL> SELECT * FROM all_schema_path;
AUTH_NAME  SCHEMA_NAME          SEARCH_ORDER
-----
U1         S1                    1
U1         S2                    2
U1         S3                    3
U1         PUBLIC                4
PUBLIC     DICTIONARY_SCHEMA     5
PUBLIC     INFORMATION_SCHEMA    6
PUBLIC     DEFINITION_SCHEMA     7
```

```
PUBLIC      PERFORMANCE_VIEW_SCHEMA      8
PUBLIC      FIXED_TABLE_SCHEMA           9
9 rows selected.
```

In the example above, the schema path of the user u1 is in an order of {s1, s2, s3, public}, and the schema path of PUBLIC account is in an order of {DICTIONARY_SCHEMA, INFORMATION_SCHEMA, DEFINITION_SCHEMA, PERFORMANCE_VIEW_SCHEMA, FIXED_TABLE_SCHEMA}.

If omitting the schema name and retrieving a table t1, then it searches for the schema path for the current user u1. If the schema path does not exist in it, then it searches for the schema path of PUBLIC account.

Schema path of a specific user can be altered by using **ALTER USER** statement as follows. The schema path of PUBLIC account can be altered by using ALTER USER PUBLIC SCHEMA PATH statement.

CURRENT PATH clause is used to additionally alter other schemas together with the user's current schema.

- The schema path of user u1 is altered.

```
gSQL> ALTER USER u1 SCHEMA PATH ( s3, s2, s1 );
User altered.
```

- The schema path of PUBLIC account is altered.

```
gSQL> ALTER USER PUBLIC SCHEMA PATH ( s1, s2, s3 );
User altered.
```

- The schema path which includes the current schema path is altered by using CURRENT PATH.

```
gSQL> ALTER USER u1 SCHEMA PATH ( s4, CURRENT PATH );
User altered.
```

The schema path is automatically determined when a user is created by using **CREATE USER** statement. And if the user schema is created by using **CREATE SCHEMA** statement later, then it is not automatically included in the user's schema path, so, if necessary, it should be included in the schema path by using **ALTER USER** statement. For more information, refer to each statement.

PUBLIC Schema

PUBLIC schema is a shared schema in which any user can create objects. As shown in the example below, if the user who does not have the schema creates the table whose schema name is not specified, then the table's schema is PUBLIC.

- A user u1 who does not have the schema is created.

```
gSQL> CREATE USER u1 IDENTIFIED BY u1_password WITHOUT SCHEMA;
gSQL> GRANT CREATE SESSION TO u1;
gSQL> GRANT CREATE OBJECT ON TABLESPACE mem_data_tbs TO u1;
```

- The user u1 creates a table.

```
% gsql u1 u1_password
gSQL> CREATE TABLE t1 ( id INTEGER );
```

- The statements above have the same meaning as the following.

```
gSQL> CREATE TABLE public.t1 ( id INTEGER );
```

In the example above, the table t1's schema which is created by user u1, is PUBLIC. PUBLIC schema is a built-in schema which is automatically created when creating the database.

It is granted the privilege of the same meaning as the following statement so that any user can create an object in the schema.

```
gSQL> GRANT CREATE TABLE, CREATE VIEW, CREATE INDEX, CREATE SEQUENCE, ADD CONSTRAINT
      ON SCHEMA PUBLIC
      TO PUBLIC;
```

PUBLIC schema, shared schema, is different from PUBLIC account which means all users. In the statement above, the privilege of creating objects in the PUBLIC schema (ON SCHEMA PUBLIC) is granted to PUBLIC account (TO PUBLIC) which means all users.

Any user can create or manage tables, but an appropriate privilege is required for retrieving the table created in PUBLIC schema by another user.

The followings are examples of GRANT statements using PUBLIC account and PUBLIC schema.

- SELECT privilege on table u1.t1 is granted to PUBLIC account.
- Any user can retrieve the table u1.t1.

```
gSQL> GRANT SELECT ON TABLE u1.t1 TO PUBLIC;
```

- SELECT privilege on all tables in PUBLIC schema is granted to user u1.
- The user u1 can retrieve all tables in PUBLIC schema.

```
gSQL> GRANT SELECT TABLE ON SCHEMA PUBLIC TO u1;
```

Examples of Using User and Schema

For example, if a single administrator and multiple developers use a single schema, the schema can be controlled by using the following SQL statement.

The following examples describe how to create a `mgr_usr` user who manages `our_schema` schema, and a number of users such as `app_user1`, `app_user2`, `app_user3` who develops applications using `our_schema`.

A `mgr_user` user and a `our_schema` schema are created as follows.

- `mgr_user` and `our_schema` are created.
- `mgr_user` owns `our_schema`.

```
gSQL> CREATE USER mgr_user IDENTIFIED BY mgr_user WITH SCHEMA our_schema;  
User created.
```

- An appropriate privilege is granted to `mgr_user`.

```
gSQL> GRANT ALL PRIVILEGES ON DATABASE TO mgr_user;  
Grant succeeded.  
gSQL> COMMIT;  
Commit complete.
```

Multiple `app_user` users are created as follows.

The `app_user` users are allowed to execute only `SELECT` and `DML` statements on `our_schema`.

- Multiple `app_user` users who do not own the schema are created as follows.

```
gSQL> CREATE USER app_user1 IDENTIFIED BY app_user1 WITHOUT SCHEMA;  
User created.  
gSQL> CREATE USER app_user2 IDENTIFIED BY app_user2 WITHOUT SCHEMA;  
User created.  
gSQL> CREATE USER app_user3 IDENTIFIED BY app_user3 WITHOUT SCHEMA;  
User created.  
gSQL> COMMIT;  
Commit complete.
```

- The access privileges are granted to multiple `app_user` users.

```
gSQL> GRANT CREATE SESSION ON DATABASE TO app_user1, app_user2, app_user3;  
Grant succeeded.  
gSQL> COMMIT;
```

Commit complete.

- Only read/write privileges on our_schema are granted to multiple app_user users.

```
gSQL> GRANT SELECT TABLE, INSERT TABLE, UPDATE TABLE, DELETE TABLE ON SCHEMA our_schema TO
app_user1, app_user2, app_user3;
Grant succeeded.
gSQL> COMMIT;
Commit complete.
```

- SCHEMA_PATH of multiple app_user users is specified as our_schema.

```
gSQL> ALTER USER app_user1 SCHEMA PATH ( our_schema );
User altered.
gSQL> ALTER USER app_user2 SCHEMA PATH ( our_schema );
User altered.
gSQL> ALTER USER app_user3 SCHEMA PATH ( our_schema );
User altered.
gSQL> COMMIT;
Commit complete.
```

Through the operations above, mgr_user has DDL privileges of creating/ dropping/ altering an object in our_schema, but multiple app_user can only read/write operations on the tables in our_schema.

mgr_user can perform management tasks such as creating a table as follows.

```
gSQL> \connect mgr_user mgr_user
gSQL> CREATE TABLE t1 ( c1 INTEGER );
Table created.
gSQL> INSERT INTO t1 VALUES ( 1 );
1 row created.
gSQL> INSERT INTO t1 VALUES (2), (3);
2 rows created.
gSQL> COMMIT;
Commit complete.
```

Multiple app_user can read/write operation for the table in our_schema without specifying the schema name, but they are not allowed to create or drop an object as follows.

```
gSQL> \connect app_user1 app_user1
gSQL> SELECT * FROM t1;
C1
--
```

1

2

3

3 rows selected.

```
gSQL> INSERT INTO t1 VALUES (4);
```

1 row created.

```
gSQL> COMMIT;
```

Commit complete.

```
gSQL> DROP TABLE t1;
```

ERR-42000(16208): insufficient privileges

13.6 Tablespace

Tablespace-related Statements

For more information, refer to the followings.

- Creating tablespace
 - **CREATE TABLESPACE**
 - **CREATE MEMORY DATA TABLESPACE**
 - **CREATE MEMORY TEMPORARY TABLESPACE**
- Dropping tablespace: **DROP TABLESPACE**
- Altering tablespace
 - **ALTER TABLESPACE**
 - **ALTER TABLESPACE name RENAME TO**
 - **ALTER TABLESPACE name BACKUP**
 - **ALTER TABLESPACE name [ONLINE|OFFLINE]**
- Adding, dropping, altering the datafile which configures the tablespace
 - **ALTER TABLESPACE name ADD [DATAFILE|MEMORY]**
 - **ALTER TABLESPACE name DROP [DATAFILE|MEMORY]**
 - **ALTER TABLESPACE name RENAME DATAFILE**

Information which is related to a tablespace object can be retrieved through the following views.

Table 13-13 Tablespace object related information

Schema	View	Description
DICTIONARY_SCHEMA	USER_TABLESPACES	Information of user accessible tablespaces

Concepts of Tablespace

A tablespace is a logical concept and it consists of one or more physical shared memory. It is a space to store data, such as tables, indexes.

Physical objects such as tables, indexes which are stored in a tablespace can be spanned multiple shared memories as shown below.

A tablespace can be extended by adding the shared memory.

Figure 6 Concept of tablespace

Tablespaces are classified into three types depending on the stored data type as follows.

- **DATA TABLESPACE**
 - It is tablespace to store and manage permanent data such as tables, logging indexes.
- **TEMPORARY TABLESPACE**
 - It is tablespace to store and manage volatile data such as the indexes without logging, the hash which is generated during query execution and the sort.
- **UNDO TABLESPACE**
 - It is tablespace to store and manage the data change information for rollback the transaction.

Tables, indexes (LOGGING) stored in DATA tablespace create redo logs to permanently manage data. However, indexes without logging stored in TEMPORARY tablespace do not create redo logs. The index without logging does not log the changes. When restarting the system, it is rebuilt based on the table data, and the index facility is retained.

A tablespace is a physical storage in which SQL schema objects are stored. A particular tablespace can be specified when creating a table and index. A table, the index which is related to the table, and the indexes which is created for the constraint condition of the table can be stored in different tablespaces. For more information about specifying the tablespace when creating an object, refer to the followings.

- CREATE TABLE
- CREATE INDEX
- ALTER TABLE name ADD CONSTRAINT

If a tablespace is not specified when creating an object such as a table or index, the default tablespace is used.

For more information about the user's default tablespace, refer to the followings.

- CREATE USER
- ALTER USER

For more information about tablespace, refer to **Managing Tablespace**.

13.7 Table

Table-related Statements

Statements for creating, dropping, altering a table are as follows.

- Creating table
 - **CREATE TABLE**
 - **CREATE TABLE AS SELECT**
 - **CREATE GLOBAL TEMPORARY TABLE**
- Dropping table
 - **DROP TABLE**
 - **TRUNCATE TABLE**
- Altering table
 - **ALTER TABLE**
 - **ALTER TABLE name RENAME TO**
 - **ALTER TABLE name STORAGE**
- Adding, dropping, alerting a column of the table
 - **ALTER TABLE name ADD COLUMN**

	TABLES	Information about user accessible tables
	TABLE_CONSTRAINTS	Information about user accessible constraints

Concepts of Table

Table is an underlying object which configures the database. In the SQL standard, the table is called as a base table, and the view is called as a viewed table.

The table consists of columns and rows. The table consists of multiple rows, the number and order of columns in each row is same.

The table consists of one or more columns, and each column has a name but a row does not have a name. The order of the row is not always as same as the order in which data is added.

The value is the data in intersection of a column and a row. Column is the set of value which have the same data type.

Each column of a table has a unique name to be distinguished from other columns in the table. It has a data type which corresponds to the characteristics of the value. For more information about data type, refer to **Data Type** section.

The constraints can be added to the table for data integrity. For more information about constraint, refer to **CREATE TABLE, ALTER TABLE name ADD CONSTRAINT**.

The table index can be created to improve performance of queries. For more information about index, refer to **Index** section.

The following is an example of creating a lineitem table using **CREATE TABLE** statement.

```
CREATE TABLE lineitem
(
    l_orderkey      INTEGER      NOT NULL
  , l_partkey      INTEGER      NOT NULL
  , l_suppkey      INTEGER      NOT NULL
  , l_linenumber   INTEGER      NOT NULL
  , l_quantity     NUMERIC(12,2)
  , l_extendedprice NUMERIC(12,2)
  , l_discount     NUMERIC(12,2)
  , l_tax          NUMERIC(12,2)
  , l_returnflag   CHAR(1)      NOT NULL  DEFAULT 'F'
  , l_linestatus   CHAR(1)
  , l_shipdate     DATE
  , l_commitdate   DATE
  , l_receiptdate  DATE
  , PRIMARY KEY (l_orderkey, l_linenumber) INDEX lineitem_pk_idx TABLESPACE mem_temp_tbs
) TABLESPACE mem_data_tbs;
```

In the example above, multiple columns and constraints are defined in the lineitem table. When using constraints to define columns, NOT NULL constraints are defined for the columns l_orderkey, l_partkey, l_suppkey, l_linenumber.

PRIMARY KEY constraint is defined by combining columns of l_orderkey, l_linenumber.

In-line constraint is described together with the column definitions. Out-line constraint is described separately from the column definitions.

Using DEFAULT clause in the column l_returnflag, the value 'F' is declared as a default value for the column. The index which is created when creating PRIMARY KEY constraints is named separately as lineitem_pk_idx. The tablespace in which the index will be stored is named as mem_temp_tbs. The table is physically stored in the tablespace mem_data_tbs.

The following is an example of adding a constraint to a table using **ALTER TABLE name ADD CONSTRAINT** statement.

```
ALTER TABLE lineitem
  ADD CONSTRAINT lineitem_unique_all_key
  UNIQUE( l_orderkey ASC, l_partkey DESC, l_suppkey DESC, l_linenum ASC);
```

In the example above, UNIQUE constraint is added to the lineitem table, and the column sort order ASC/DESC is specified for the automatically created index of constraints.

The following is an example of adding columns to the table using **ALTER TABLE name ADD COLUMN** statement.

```
ALTER TABLE lineitem ADD COLUMN
(
  l_shipinstruct CHAR(25)
, l_shipmode     CHAR(10)
, l_comment      VARCHAR(44)
);
```

In the example above, multiple columns are added to a table. The in-line constraints or default values can be specified when adding columns.

The following is an example of creating an index in the table using **CREATE INDEX** statement.

```
CREATE INDEX lineitem_idx_shipdate ON lineitem( l_shipdate ASC NULLS LAST );
```

The example above describes the index which is created for the column l_shipdate which is often used as the query conditions. The column sort order is ascending (ASC), and if NULL value exists, it is specified to be located at the end.

For more information about DML statements of inserting/deleting/updating data to a table, refer to **Data Manipulation Language** clause.

For more information about SELECT statements of querying data in a table, refer to **Data Query Language** clause, **SELECT** statement.

Global Temporary Table

Global temporary table is a kind of temporary table and the table definition is shared by all users, but the data is separated per session.

The table definition is created when executing CREATE GLOBAL TEMPORARY TABLE, but the physical se

gment is created in a state which is dependent on a session when executing INSERT to that table for the first time. The segments which are allocated to all global temporary tables created in the session are released when the session is terminated. An option defined at the time of creating a global temporary table determines whether to truncate the data left after committing or rolling back.

It supports all DDL and DML provided by a table except for cluster-related statements. A DDL statement returns an error to the global temporary table which is used by the current session. However, TRUNCATE TABLE statement for a global temporary table is applied only to the current session, so it does not return an error even when it is used by another session.

A global temporary table can be defined only in a temporary tablespace, so it does not record a redo log for restart recovery. However, it records the undo log for MVCC and rollback, and the space on which the undo log is recorded can be selected to system undo tablespace or system temp tablespace by using **TEMP_UNDO_ENABLED**.

If TEMP_UNDO_ENABLED is 1, it records undo logs in a temp undo relation of the session separately from the undo relation of the transaction. If the transaction performs only DML for a global temporary table, then it does not record the transaction record nor the commit log, so it improves the DML performance.

When releasing the segment used in the session, it is returned to the corresponding tablespace, and it is allocated again from the tablespace when allocating again. The process allocating and returning segments in a tablespace costs a lot to keep concurrency with other sessions and to allocate and release segments. Therefore, the segment which was released after used in a session can be reused without returning it by using **TEMP_SEGMENT_CACHE_SIZE**.

In other words, if TEMP_SEGMENT_CACHE_SIZE is set to 0 (default value), then it immediately returns the segment which is released after used to the tablespace. If TEMP_SEGMENT_CACHE_SIZE is set to the value bigger than 1 (maximum 4294967295), then it reuses as many segments as set in a session when returning the segment.

When a global temporary table is not used in a session any more, then cleanup segments in a segment cache at once by using **ALTER SESSION CLEANUP GLOBAL TEMPORARY SEGMENT POOL**.

The following is an example of creating a global temporary table by using **CREATE GLOBAL TEMPORARY TABLE**.

```
CREATE GLOBAL TEMPORARY TABLE SESSION_TABLE1(
    COL1 CHAR(10)
    ,COL2 VARCHAR2(20)
    ,COL3 NUMBER(10)
) ON COMMIT DELETE ROWS;
```

The information about the created global temporary table can be viewed in DICTIONARY tables or views in the same way as viewing the information of an ordinary table.

Table in Cluster

For more information about a table in the cluster environment, refer to **Cluster Table and Shard**.

13.8 Index

Index-related Statements

Statements for creating, dropping, altering an index are as follows.

- Creating an index: **CREATE INDEX**.
- Dropping an index: **DROP INDEX**.
- Updating an index: **ALTER INDEX**.

Information which is related to an index object can be retrieved through the following views.

Table 13-15 Index object related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_INDEXES	Information about user accessible indexes
	ALL_IND_COLUMNS	Column information about user accessible index
	USER_INDEXES	Information about user owned indexes
	USER_IND_COLUMNS	Column information about user owned index

Concepts of Index

Index is a table related object, and it is used to improve data access performance when retrieving the table. Each index consists of key values using the data in one or more columns of the table. It is an object which is separate from a table.

Database automatically builds the key data of the index when creating the index, and the index key data is automatically managed when adding/deleting/ updating the table data.

The following is an example of a query.

```
SELECT data FROM t1 WHERE id = 12345;
```

If an index does not exist, the results which satisfy the condition are found by checking all rows in the table. If the table consists of multiple rows while the number of results to satisfy the condition is relatively small, the query above has a very inefficient response time.

When creating an index in id column by using the **CREATE INDEX** statement as follows, the optimizer evaluates the costs between the full scan and index scan of a table, and selects the index scan to improve query performance.

```
CREATE INDEX t1_idx_id ON t1(id);
```

When creating an index, two or more columns can be used as an index key, and the index which consists of two or more keys is called as a composite index. The composite index is sorted by the first key, or sorted by the second key if the first key value is same. It is sorted as many as the number of the keys in this way.

When creating indexes, the column sort order can be specified in ascending (ASC) or descending (DESC). The sort order of NULL value can be specified as NULLS FIRST or NULLS LAST. Refer to the following example.

```
gSQL> CREATE TABLE t1 ( value INTEGER );
Table created.
gSQL> INSERT INTO t1 VALUES (1), (NULL), (3), (2), (NULL);
5 rows created.
gSQL> CREATE INDEX idx1 ON t1 ( value ASC NULLS LAST );
Index created.
gSQL> CREATE INDEX idx2 ON t1 ( value DESC NULLS FIRST );
Index created.
gSQL> SELECT /*+ INDEX(t1, idx1) */ * FROM t1;
VALUE
-----
      1
      2
      3
    null
    null
5 rows selected.
gSQL> SELECT /*+ INDEX(t1, idx2) */ * FROM t1;
VALUE
-----
    null
    null
      3
      2
      1
5 rows selected.
```

In the example above, the index idx1 is specified in the ascending order (ASC), which is NULLS LAST, and the index idx2 is specified in the descending order (DESC), which is NULLS FIRST.

It uses the different index hints when retrieving the table with the same query, so all rows are retrieved by using each index. Results using the index idx1 is sorted in ascending order, and NULL value is located at t

he end. However, the results using the index idx2 is sorted in descending order and NULL value is located in the first.

Concepts of UNIQUE

Index can be created as UNIQUE index or non-unique index. If the key values is not UNIQUE when creating UNIQUE index, then an error occurs.

NULL value is allowed as a key value in UNIQUE index and UNIQUE constraint.

If NULL value is included, the truth table for UNIQUE is as follows. In other words, if the key is one, then it can have multiple null values.

Table 13-16 Truth table for UNIQUE in two values

Value1	Value2	UNIQUE
1	1	false
1	2	true
1	null	true
null	null	true

The UNIQUE index or UNIQUE constraint consisting of two or more keys can have null as the whole value or partial value. If NULL is included in the composite key, the truth table for UNIQUE is as follows.

Table 13-17 Truth table for UNIQUE in composite key

Row1	Row2	UNIQUE
(1, 1)	(1, 1)	false
(1, 1)	(1, 2)	true
(1, null)	(1, null)	false
(1, null)	(2, null)	true
(null, null)	(null, null)	true

Note that the definition of the UNIQUE has been changed in the SQL standard as follows.

Note

- UNIQUE definition until SQL1999

If there are no two rows in T such that the value of each column in one row is non-null and **is equal to** the value of the corresponding column in the other row according to Subclause 8.2, “<comparison predicate>”, then the result of the <unique predicate> is true; otherwise, the result of the <unique predicate> is false.

- UNIQUE definition after SQL2003

If there are no two rows in T such that the value of each column in one row is non-null and is **not distinct from** the value of the corresponding column in the other row, then the result of the $\langle \text{unique predicate} \rangle$ is True; otherwise, the result of the $\langle \text{unique predicate} \rangle$ is False.

GOLDILOCKS follows the SQL2011 standard which is the standard after SQL2003, and the SQL standard UNIQUE is defined by whether or not UNIQUE of composite key exists as shown in the following table.

Table 13-18 Truth table for UNIQUE of the SQL standard composite key

Row1	Row2	Until SQL1999	After SQL2003
(1, 1)	(1, 1)	false	false
(1, 1)	(1, 2)	true	true
(1, null)	(1, null)	true	false
(1, null)	(2, null)	true	true
(null, null)	(null, null)	true	true

Each DBMS vendor follows the SQL standard for UNIQUE definition as follows.

- DBMS which follows the UNIQUE definition after SQL2003: Oracle, SQL server
- DBMS which follows the UNIQUE definition until SQL1999: Postgres, MySQL

13.9 View

View-related Statements

Statements for creating, dropping, altering a view are as follows.

- Creating a view: Refer to **CREATE VIEW**.
- Dropping a view: Refer to **DROP VIEW**.
- Altering a view: Refer to **ALTER VIEW**.

Information which is related to a view object can be retrieved through the following views.

Table 13-19 View object related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_VIEWS	Information about user accessible views
	ALL_DEPENDENCIES	Information about objects related to user accessible views
	USER_VIEWS	Information about user owned views
	USER_DEPENDENCIES	Information about objects related to user owned views
INFORMATION_SCHEMA	VIEWS	Information about user accessible views
	VIEW_TABLE_USAGE	Information about the table used when creating a view
	VIEW_ROUTINE_USAGE	Information about the stored function used when creating a view

Concepts of View

While a table is a physical relation of storing data, a view is a logical relation consisting of queries. In the SQL standard, it is called as the viewed table. Queries about view can be used as same as the table.

A view has the following advantages.

- Data access can be restricted to allow querying only part of the information in the table.
- The complex and frequent queries can be written in a single view to decrease query's complexity.
- Data can be presented in a perspective different from the table perspective by changing the column names or data of the view.
- Creating applications of views is not affected by the changes in table structures.

The view which is created by a **CREATE VIEW** statement is replaced with in-line view when executing queries as follows.

- Creating a view

```
CREATE VIEW v1 ( v_id, v_sum )
AS
SELECT l_partkey, SUM( l_quantity )
FROM lineitem
GROUP BY l_partkey;
```

- Querying the view

```
SELECT v_id, v_sum
FROM v1
WHERE v_sum > 1000;
```

- Translating the view

```
SELECT v_id, v_sum
FROM ( SELECT l_partkey, SUM( l_quantity )
      FROM lineitem
      GROUP BY l_partkey
    ) v1 ( v_id, v_sum )
WHERE v_sum > 1000;
```

In the following example, the asterisk (*) is used in SELECT statement when creating a view v1, and the asterisk means all columns.

In this case, as follows, all the columns including the added column can be retrieved by executing query of view v1 even after a new column addr is added to the table t1 of which the view is approaching.

```
gSQL> CREATE TABLE t1 ( id INTEGER, name VARCHAR(128) );
Table created.
gSQL> INSERT INTO t1 VALUES ( 1, 'leekmo' );
1 row created.
```

- Creating a view by using an asterisk (*)

```
gSQL> CREATE VIEW v1 AS SELECT * FROM t1;
View created.
```

- Querying the view

```
gSQL> SELECT * FROM v1;
ID NAME
```

```
-- -----  
1 leekmo  
1 row selected.
```

- Adding a column to the table which is referenced by the view

```
gSQL> ALTER TABLE t1 ADD COLUMN addr VARCHAR(1024) DEFAULT 'N/A';  
Table altered.
```

- Querying the view after adding the column

```
gSQL> SELECT * FROM v1;  
ID NAME  ADDR  
-- -----  
1 leekmo N/A  
1 row selected.
```

However, creating a view using the asterisk (*) is not recommended because it can cause changes in the application when changing the table structure.

13.10 Sequence

Sequence-related Statements

Statements for creating, dropping, altering, using a sequence are as follows.

- Creating a sequence: Refer to **CREATE SEQUENCE**.
- Dropping a sequence: Refer to **DROP SEQUENCE**.
- Altering a sequence: Refer to **ALTER SEQUENCE**.
- Using a sequence: Refer to **NEXTVAL**, **CURRVAL**.

Information which is related to a sequence object can be retrieved through the following views.

Table 13-20 Sequence object related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_SEQUENCES	Information about user accessible sequences
	USER_SEQUENCES	Information about user owned sequences
INFORMATION_SCHEMA	SEQUENCES	Information about user accessible sequences

Concepts of Sequence

Sequence is an object which automatically creates a sequential number, and it is called as sequence generator in the SQL standard. Sequence is a useful object to automatically manage the unique key or primary key. A sequence can be spanned multiple tables.

The following is an example of using a single sequence object to automatically generate the id column value, and using it across multiple tables.

```
gSQL> CREATE SEQUENCE seq;
Sequence created.
gSQL> INSERT INTO t1 (id, name) VALUES ( seq.NEXTVAL, 'leekmo' );
1 row created.
gSQL> INSERT INTO t2 (id, addr) VALUES ( seq.CURRVAL, 'Seoul, Korea' );
1 row created.
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
1 row selected.
```

```
gSQL> SELECT * FROM t2;
ID ADDR
-- -----
1 Seoul, Korea
1 row selected.
```

In the example above, the next number of the id column in table t1 is automatically created by using the seq.NEXTVAL function. The same value is used for id column in table t2 by using the seq.CURRVAL function.

When creating the sequence, the starting value, incremental value, minimum value, maximum value, cycle or no cycle and cached value of the automatically generated number can be specified.

For more information, refer to **CREATE SEQUENCE** statement.

An identity column is similar to a sequence, and it automatically generates numbers in a table. It can be used as follows.

```
gSQL> CREATE TABLE t1 ( id INTEGER GENERATED ALWAYS AS IDENTITY, name VARCHAR(128) );
Table created.
gSQL> INSERT INTO t1 (name) VALUES ( 'leekmo' );
1 row created.
gSQL> INSERT INTO t1 (name) VALUES ( 'mkkim' );
1 row created.
gSQL> INSERT INTO t1 (name) VALUES ( 'xcom73' );
1 row created.
gSQL> SELECT * FROM t1;
ID NAME
-- -----
1 leekmo
2 mkkim
3 xcom73
3 rows selected.
```

In the example above, the id column is created as an identity column when creating table t1. The identity column automatically generated id column values, and the values are inserted when executing INSERT statement.

For more information, refer to **<identity column specification>** clause of **CREATE TABLE** statement.

The sequence and the identity column are functionally similar because they create the sequential numbers. However, they are different in the following aspects.

- Sequence is an SQL schema object but identity column is a column of the table.
- Sequence can be spanned multiple tables but identity column can be used only in one table.

After creating a sequence, the sequence values can be used by using **NEXTVAL** or **CURRVAL** function. The sequence value is created independently from the transaction, and it is not affected by COMMIT or ROLLBACK of the transaction.

```
gSQL> INSERT INTO t1(id) VALUES( seq.NEXTVAL );
1 row created.
gSQL> SELECT id FROM t1;
ID
--
1
1 row selected.
gSQL> ROLLBACK;
Rollback complete.
gSQL> INSERT INTO t1(id) VALUES( seq.NEXTVAL );
1 row created.
gSQL> SELECT id FROM t1;
ID
--
2
1 row selected.
```

In the example above, seq.NEXTVAL function generates a value of 1 in the first INSERT statement. Then, the seq.NEXTVAL value 2 is generated after the transaction ROLLBACK by increasing the value since the next value, independently from the transaction.

The sequence value can be used only in the following statements.

- The select list value of the top-level SELECT statement
 - SELECT seq.NEXTVAL FROM dual;
- The select list value of INSERT .. SELECT statement
 - INSERT INTO t1(id) SELECT seq.NEXTVAL FROM dual;
- Input value of INSERT .. VALUES statement
 - INSERT INTO t1(id) VALUES (seq.NEXTVAL);
- SET value of UPDATE statement
 - UPDATE t1 SET id = seq.NEXTVAL;

The sequence value can be used only in the location as specified above. It can not be used in subquery, aggregation function argument, or clauses such as WHERE, DISTINCT, GROUP BY, HAVING, ORDER BY.

Cluster Sequence

When using GOLDLOCKS by configuring the cluster system, the global sequence object is internally used. The global sequence object sets the pool of sequence values to be commonly used over all cluster system, and allocates it as much as the cache size when each member node calls NEXTVAL. In other words, if values of 20 sequences are allocated to a specific node, then the value allocated to other nodes starts from the next value. A member node loads sequence values allocated by the global sequence object in its local cache, then returns them as a result of NEXTVAL call until all of them are run out.

The global sequence object has the following features and constraints comparing to the sequence for the standalone database.

- The sign can not be modified by using the INCREMENT BY option in the ALTER SEQUENCE statement. (The size can be modified.)
- When using the CYCLE option, a duplicated value can be returned to member nodes due to the size of the entire sequence pool. Therefore, if the CYCLE option is required, then the sequence pool should be set big enough considering INCREMENT BY, CACHE SIZE, and the number of cluster member nodes.
- Even when there is not an error, the sequence values returned by a specific member node may not be sequential. However, a sequential sequence value is obtained when only a single member node calls NEXTVAL.
- If it is NOCACHE, then the CACHE SIZE is 1, so the additional sequence values are not loaded on a local cache. In this case, the global sequence object allocates a single sequence whenever calling NEXTVAL, then it increases the networking cost and may cause the poor performance.
- It is generally operated as AUTO COMMIT when creating, altering and deleting the sequence.
- When modifying the size of CACHE and INCREMENT by using the ALTER statement, then all sequence values loaded on local caches of all nodes are reset. In other words, the new sequence set should be allocated again by the global sequence object when calling NEXTVAL later.

13.11 Synonym

Synonym-related Statements

Statements for creating and dropping a synonym are as follows.

- Creating a synonym: Refer to **CREATE SYNONYM**.
- Dropping a synonym: Refer to **DROP SYNONYM**.

Information which is related to a synonym object can be retrieved through the following views.

Table 13-21 Synonym object related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_SYNONYMS	All synonym information
	USER_SYNONYMS	Information about user owned synonym

Concepts of Synonym

Synonym is an alias for the following objects.

- Table
- View
- Sequence
- Stored procedure
- Stored function
- Other synonyms

Synonyms can be used as aliases in SELECT, INSERT, UPDATE, DELETE, LOCK TABLE, GRANT, REVOKE, COMMENT statements.

Using synonym is very convenient. It is because only the synonym should be redefined without modifying the application even when the schema of underlying objects is changed.

The database security can be improved by hiding the object's real name and its owner. Moreover, the database usability is enhanced by changing the long object name to a short name.

Synonyms are classified as private synonym and public synonym. Private synonym is a schema object and public synonym is a non-schema object.

The following examples of creating and using the private synonym and the public synonym indicated by t

he table below describe the concepts of them.

```
gSQL> \CONNECT u1 u1
gSQL> CREATE TABLE u1.t1 (col1 INTEGER );
gSQL> INSERT INTO u1.t1 VALUES(1);
gSQL> COMMIT;
```

Private Synonym

Private synonym is a schema object. If a synonym is created without the schema name, the default schema name of the user performing the statement is used.

```
gSQL> \CONNECT u2 u2
gSQL> CREATE SYNONYM u2.syn1 FOR u1.t1;
Synonym created.
gSQL> SELECT * FROM u2.syn1;
ERR-42000(16254): lacks privilege (SELECT ON TABLE "U1"."T1")
```

Synonym is only an alias. Therefore, if a user does not have the appropriate privileges on the underlying object u1.t1, then the user can not use it even when the user created the synonym.

```
gSQL> \CONNECT u1 u1
gSQL> GRANT SELECT ON TABLE u2.syn1 TO u2;
gSQL> \CONNECT u2 u2
gSQL> SELECT * FROM u2.syn1;
COL1
----
    1
1 row selected.
gSQL> SELECT * FROM u1.t1;
COL1
----
    1
1 row selected.
gSQL> DROP SYNONYM u2.syn1;
Synonym dropped.
```

In the example above, the SELECT privilege of u2.syn1 is granted to u2. This is as same as the SELECT privilege of u1.t1 is granted to u2. Therefore, be cautious when granting privileges to synonyms.

Public Synonym

Public synonym is a non schema object. It is not allowed to specify the schema name when it is created or dropped.

```
gSQL> \CONNECT u2 u2
gSQL> CREATE PUBLIC SYNONYM pubSyn1 FOR u1.t1;
Synonym created.
gSQL> SELECT * FROM pubSyn1;
ERR-42000(16254): lacks privilege (SELECT ON TABLE "U1"."T1")
```

Public synonym does not have an owner, and it is accessible for all users. However, a user without an appropriate privilege on the underlying objects can not access the underlying objects.

```
gSQL> \CONNECT u1 u1
gSQL> GRANT SELECT ON TABLE pubSyn1 TO u2;
gSQL> \CONNECT u2 u2
gSQL> SELECT * FROM pubSyn1;
COL1
----
    1
1 row selected.
gSQL> SELECT * FROM u1.t1;
COL1
----
    1
1 row selected.
gSQL> DROP SYNONYM pubSyn1;
Synonym dropped.
```

13.12 Stored Procedure

Stored Procedure-related Statements

Statements for creating, dropping and altering a stored procedure are as follows.

- Creating a stored procedure: Refer to **CREATE PROCEDURE**.
- Dropping a stored procedure: Refer to **DROP PROCEDURE**.
- Altering a stored procedure: Refer to **ALTER PROCEDURE**.

Information which is related to a stored procedure can be retrieved through the following views.

Table 13-22 Stored procedure object related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_ARGUMENTS	Argument information of user accessible procedure and function
	ALL_DEPENDENCIES	Information of an object related to user accessible procedure and function
	ALL_PROCEDURES	Object information of user accessible procedure and function
	ALL_SOURCE	Source text information of user accessible procedure and function
	USER_ARGUMENTS	Argument information of user owned procedure and function
	USER_DEPENDENCIES	Information of an object related to user owned procedure and function
	USER_PROCEDURES	Object information of user owned procedure and function
	USER_SOURCE	Source text information of user accessible procedure and function
INFORMATION_SCHEMA	PARAMETERS	Argument information of user accessible procedure and function
	ROUTINES	Object information of user accessible procedure and function
	ROUTINE_ROUTINE_USAGE	Information of procedure and function which is referenced by user accessible procedure and function
	ROUTINE_SEQUENCE_USAGE	Information of sequence which is referenced by user accessible procedure and function
	ROUTINE_TABLE_USAGE	Information of table and view which is referenced by user accessible procedure and function

Concepts of Stored Procedure

A stored procedure is a kind of a persistent stored module in procedure form and it is defined and managed in schema unit like as other schema-level database objects. The return value is not defined because it is in procedure form. It is used by directly calling it in CALL statement, another stored procedure, or stored

function.

For more information about a stored procedure, refer to **Schema-level Procedure**.

A store procedure is used as follows.

```
CREATE OR REPLACE PROCEDURE PROC1( A1 INTEGER, A2 INTEGER )
IS
  V1 INTEGER;
BEGIN
  SELECT COUNT(*)
    INTO V1
    FROM T1
    WHERE T1.I1 >= A1 AND T1.I1 <= A2;
  DBMS_OUTPUT.PUT_LINE( 'V1 = ' || V1 );
END;
/
BEGIN
  PROC1( 2, 4 ); -- call schema-level procedure
END;
/
V1 = 3
Anonymous PL block executed.
```

13.13 Stored Function

Stored Function-related Statements

Statements for creating, dropping and altering a stored function are as follows.

- Creating a stored function: Refer to **CREATE FUNCTION**.
- Dropping a stored function: Refer to **DROP FUNCTION**.
- Altering a stored function: Refer to **ALTER FUNCTION**.

Information which is related to a stored function can be retrieved through the following views.

Table 13-23 Stored function object related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_ARGUMENTS	Argument information of user accessible procedure and function
	ALL_DEPENDENCIES	Information of an object related to user accessible procedure and function
	ALL_PROCEDURES	Object information of user accessible procedure and function
	ALL_SOURCE	Source text information of user accessible procedure and function
	USER_ARGUMENTS	Argument information of user owned procedure and function
	USER_DEPENDENCIES	Information of an object related to user owned procedure and function
	USER_PROCEDURES	Object information of user owned procedure and function
	USER_SOURCE	Source text information of user accessible procedure and function
INFORMATION_SCHEMA	PARAMETERS	Argument information of user accessible procedure and function
	ROUTINES	Object information of user accessible procedure and function
	ROUTINE_ROUTINE_USAGE	Information of procedure and function which is referenced by user accessible procedure and function
	ROUTINE_SEQUENCE_USAGE	Information of sequence which is referenced by user accessible procedure and function
	ROUTINE_TABLE_USAGE	Information of table and view which is referenced by user accessible procedure and function

Concepts of Stored Function

A stored function is a kind of a persistent stored module in function form and it is defined and managed in schema unit like as other schema-level database objects. The return value should be defined because it is in function form. It is used by directly calling it in CALL statement, another stored procedure, or stored f

unction. Or, it is use by calling it in a general SQL internal expression.

For more information about a stored function, refer to **schema-level function**.

A store function is used as follows.

```
gSQL> CREATE OR REPLACE FUNCTION FUNC1( A1 INTEGER, A2 INTEGER )
RETURN INTEGER
IS
    V1 INTEGER;
BEGIN
    SELECT COUNT(*)
        INTO V1
        FROM T1
        WHERE T1.I1 >= A1 AND T1.I1 <= A2;
    RETURN V1;
END;
/
Function created.
gSQL> SELECT FUNC1( 2, 4 ) FROM DUAL;
FUNC1( 2, 4 )
-----
                3
1 row selected.
```

14.

Cluster Objects

14.1 Cluster System

Cluster System Related Statements

For more information, refer to the followings.

- Expanding a cluster system
 - **CREATE CLUSTER GROUP**
 - **ALTER CLUSTER GROUP name ADD MEMBER**
- Controlling an inactive cluster member
 - **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS**
 - **ALTER SYSTEM JOIN DATABASE**
- Rebalancing data
 - **ALTER DATABASE REBALANCE**
 - **ALTER TABLE name REBALANCE**

Information which is related to a cluster system can be retrieved through the following views.

Table 14-1 Cluster system related information

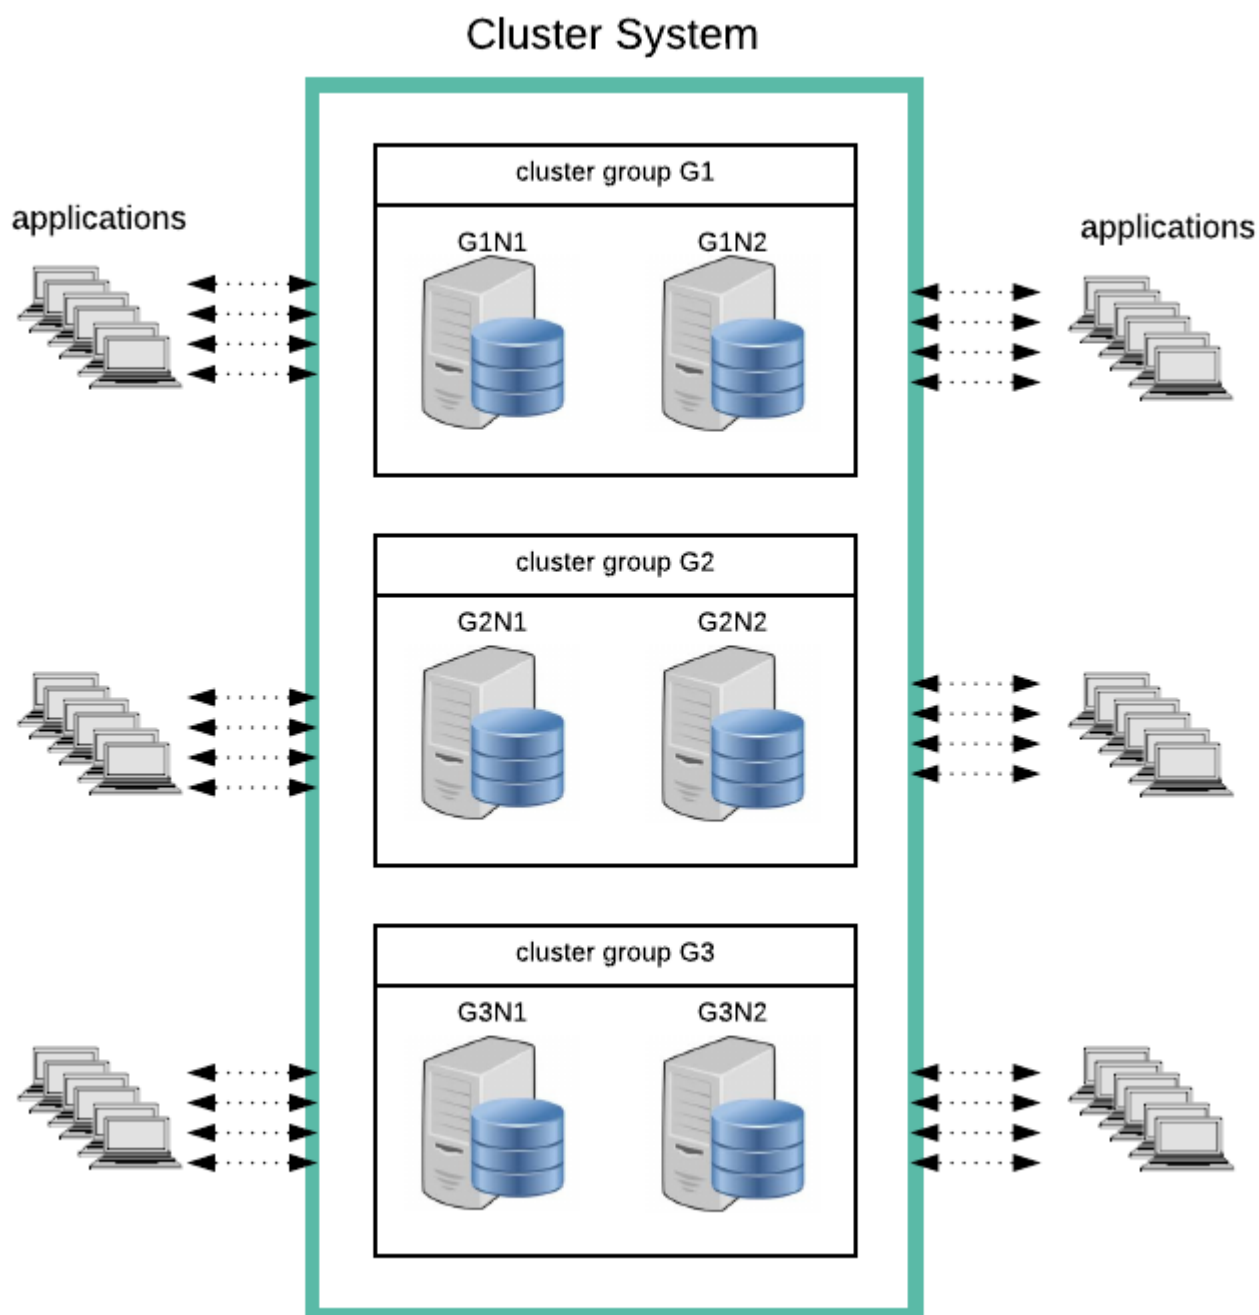

Schema	View	Description
DICTIONARY_SCHEMA	DBA_CLUSTER	Object information of a cluster group and a cluster member which configure a cluster
	DBA_CLUSTER_COMMENTS	Comment information of a cluster group and a cluster member
PERFORMANCE_VIEW_SCHEMA	V\$CLUSTER_MEMBER	Status information of a cluster member

Concepts of Cluster System

GOLDILOCKS cluster system manages data of a single database by sharding or duplicating the data into several servers. Applications can be run on every server configuring a cluster system, and run in the same way as using a single database system regardless of a system configuration or a connected server.

GOLDILOCKS cluster system consists of one or more cluster groups, and a cluster group consists of one or more cluster members. It does not require a separate application server or a meta server, but applications are connected to a cluster member corresponding to a data server, and run.

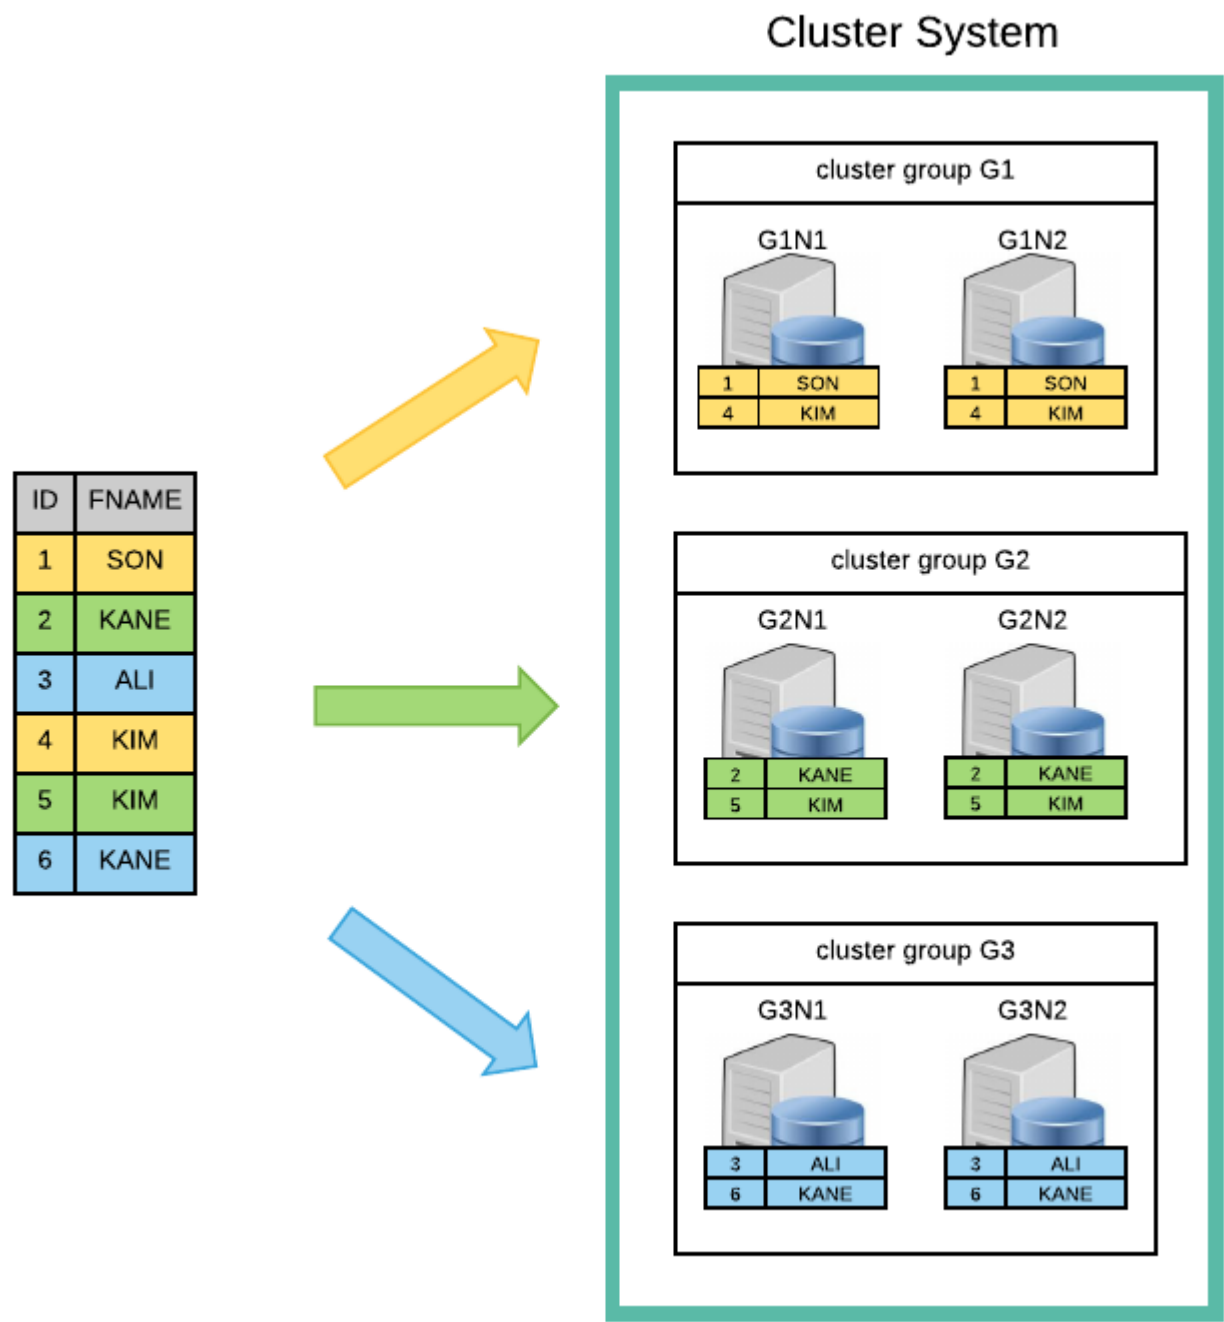

Figure 1 3 x 2 cluster system

The figure above is a 3x2 cluster system which consists of two cluster members consisting of three cluster groups and a single cluster group. In the figure above, the cluster system consists of cluster groups (G1, G2, G3), and the cluster group G1 consists of cluster members (G1N1, G1N2), the cluster group G2 consists of cluster members (G2N1 and G2N2), and the cluster group G3 consists of cluster members (G3N1, G3N2). Applications can access any of those six cluster members and it is run as same as using a single database.

The table data is sharded and placed in each cluster group, and cluster members in a cluster group maintain the replications same. The figure below describes the concepts of the table data placement in a 3x2 cluster.

Figure 2 Concepts of sharding and duplicating by the cluster

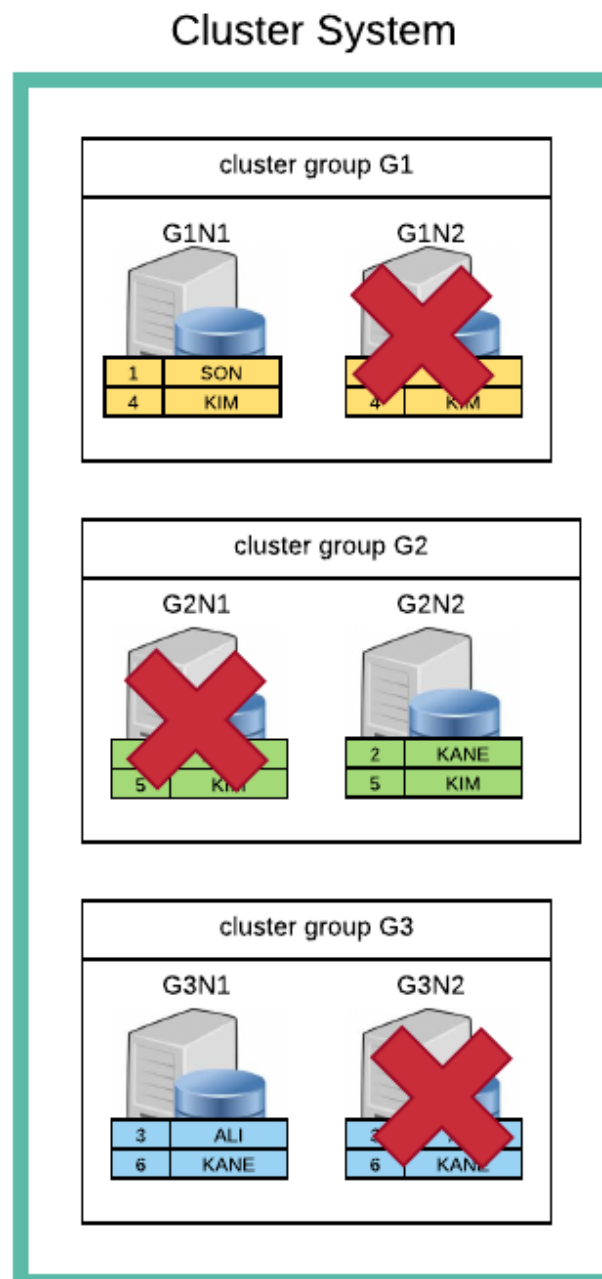

The table data is sharded and placed in each cluster group according to the sharding strategy defined by a user. (According to the ID column in the figure above) The placed data in a cluster group maintains the replication of a cluster member in a cluster group.

Availability of Cluster System

Cluster continues to provide service even when a specific server is broken or the network is cut. Cluster members configuring each cluster group maintain the same data replications, so the service does not stop even when a single cluster member is broken. In other words, unless the data is lost due to the malfunction of all cluster members in a cluster group, the service continues to be provided.

The cluster continues to provide service even when three devices are broken in the 3x2 cluster as follows.

Figure 3 Cluster availability

If additional errors occur in G1N1, G2N2, G3N1 in the situation above, then the data loss occurs and the

service can not be provided any more. Therefore, a user should make the broken device to participate in a cluster system, or add a new cluster member before an additional error occurs.

- **ALTER SYSTEM JOIN DATABASE** statement is used to make the broken cluster member to participate in a cluster system again.
- **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS** statement is used to drop the broken cluster member from the cluster system.
- **ALTER CLUSTER GROUP name ADD MEMBER** statement is used to add a cluster member to a cluster group for the high availability.
- **ALTER DATABASE REBALANCE** statement and **ALTER TABLE name REBALANCE** statement are used to rebalance data to a newly added cluster member.

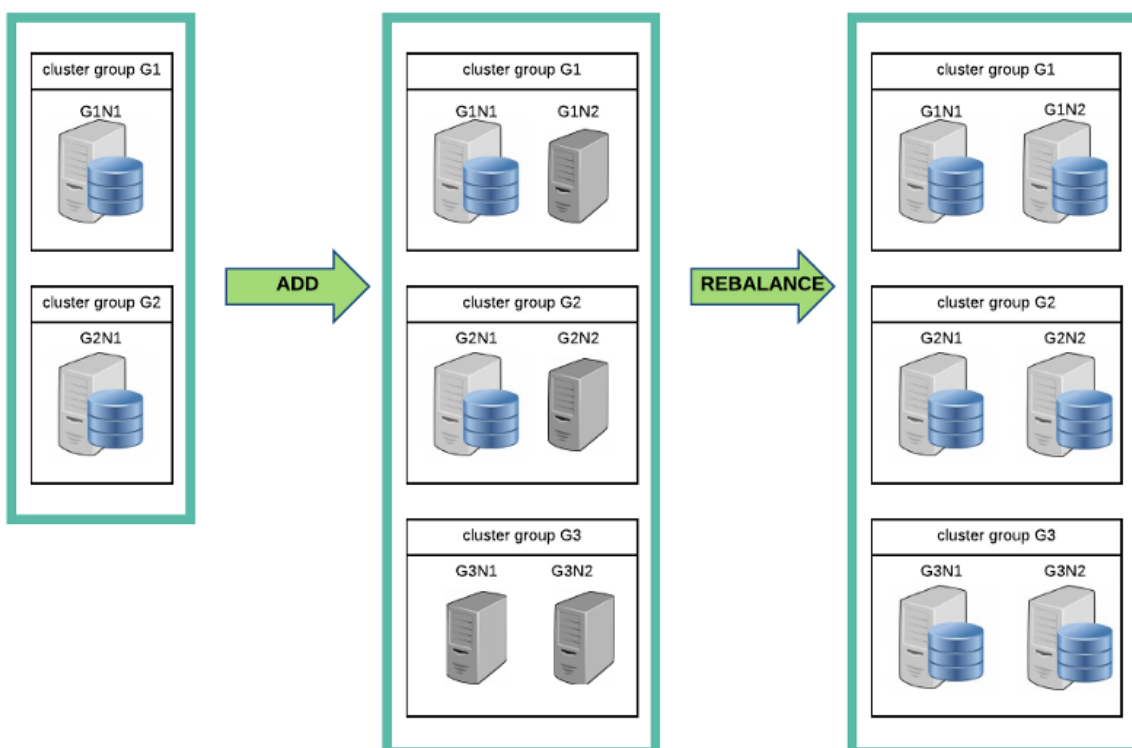

Expanding Cluster System

The cluster can be expanded by adding a new server without stopping the service.

Cluster is expanded by adding a cluster member or a cluster group and by rebalancing the data to a created server.

The following is an example of expanding a 2x1 cluster to a 3x2 cluster.

Figure 4 Expanding cluster system

Add a cluster group and a cluster member by using the following statements to expand a cluster.

- **ALTER CLUSTER GROUP name ADD MEMBER**
- **CREATE CLUSTER GROUP**

To add a new cluster member to the cluster system, tablespaces in the cluster member and those in the cluster system should be same. In other words, tablespaces as same as all tablespaces in the cluster system should be created in the cluster member.

The following is an example of adding a cluster group and a cluster member of the 3x2 cluster to the 2x1 cluster. Add the member G1N2 to the group G1, and add the member G2N2 to the group G2. Then, create the group G3 including the members (G3N1, G3N2).

- Add the member G1N2 to the group G1.

```
gSQL>
ALTER CLUSTER GROUP G1
    ADD CLUSTER MEMBER G1N2 HOST '192.168.0.12' PORT 10120;
Cluster Group altered.
```

- Add the member G2N2 to the group G2.

```
gSQL>
ALTER CLUSTER GROUP G2
    ADD CLUSTER MEMBER G2N2 HOST '192.168.0.22' PORT 10220;
Cluster Group altered.
```

- Create the group G3.

```
gSQL>
CREATE CLUSTER GROUP G3
    CLUSTER MEMBER G3N1 HOST '192.168.0.31' PORT 10310,
    CLUSTER MEMBER G3N2 HOST '192.168.0.32' PORT 10320;
Cluster Group created.
```

The cluster group and the cluster member which are newly added to the cluster system can provide the service by synchronizing the dictionary information of the SQL object. However, the data is not yet placed in the added cluster member, so the availability can not be increased nor can the load balancing be expected. Therefore, the data should be rebalanced to the created cluster member for the high availability and the load balancing.

Use the following statements sequentially to rebalance the data.

- **ALTER DATABASE REBALANCE**

- **ALTER TABLE name REBALANCE**

The following is an example of rebalancing data to all tables in the database.

```
gSQL> ALTER DATABASE REBALANCE;  
Database altered.
```

14.2 Cluster Group

Cluster Group Related Statements

For more information about creating, dropping, and altering a cluster group, refer to the followings.

- Creating a cluster group: **CREATE CLUSTER GROUP**
- Dropping a cluster group: **DROP CLUSTER GROUP**
- Altering a cluster group: **ALTER CLUSTER GROUP name ADD MEMBER**

Information which is related to a cluster group can be retrieved through the following views.

Table 14-2 Cluster group related information

Schema	View	Description
DICTIONARY_SCHEMA	DBA_CLUSTER	Object information of a cluster group and a cluster member which configure the cluster
	DBA_CLUSTER_COMMENTS	Comment information of a cluster group and a cluster member

Concepts of Cluster Group

At least one cluster group should be created to run the cluster system.

Creating Cluster Group

The first created cluster group should include itself as a cluster member. For more information about creating a cluster group, refer to **CREATE CLUSTER GROUP**.

A cluster member is a physical concept meaning the data server, but a cluster group is a logical concept consisting of one or more cluster members.

The availability and load balancing of the cluster system depend on the configuration of the cluster group. The more cluster members the cluster group includes the higher the availability. The more the number of the cluster groups the bigger the throughput of the cluster system because the data is distributed.

All cluster members in a cluster group maintain the same data replications, so it can continuously provide the service unless an error occurs in all cluster members configuring a cluster group. It is recommended to configure the cluster group with two or more cluster members to maintain the availability of the cluster.

r system.

The table data is sharded according to the sharding strategy, and it is stored and managed in each different cluster group according to the shard placement strategy. An appropriate table sharding strategy and the placement strategy according to the service feature determines the entire system performance. Each transaction and query is processed focusing on a cluster group in which the data is stored, so the performance is improved if the referenced data exist in the same cluster group.

Dropping Cluster Group

The cluster group participating in a cluster system and providing a service can be dropped for various reasons. For more information about dropping the cluster group, refer to **DROP CLUSTER GROUP**.

To drop the cluster group, all shards in a sharded table which is created in that cluster group should be transferred to another cluster group. It should be transferred separately according to cluster-wide, group-specific table.

14.3 Cluster Member

Cluster Member Related Statements

For more information, refer to the followings.

- Adding a cluster member: **ALTER CLUSTER GROUP name ADD MEMBER**
- Dropping a cluster member: **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS**
- Controlling a cluster member
 - **ALTER SYSTEM JOIN DATABASE**
 - **ALTER CLUSTER GROUP name OFFLINE MEMBER**
 - **ALTER DATABASE RESET LOCAL CLUSTER MEMBER**

Information which is related to a cluster member can be retrieved through the following views.

Table 14-3 Cluster member related information

Schema	View	Description
DICTIONARY_SCHEMA	DBA_CLUSTER	Object information of a cluster group and a cluster member which configure a cluster
	DBA_CLUSTER_COMMENTS	Comment information of a cluster group and a cluster member
PERFORMANCE_VIEW_SCHEMA	V\$CLUSTER_MEMBER	Status information of a cluster member

Concepts of Cluster Member

The cluster member is a server configuring a cluster system, and it maintains the replications as same as those of cluster member in a cluster group.

The cluster member is a data server storing a part of the cluster database data, and it is also an application server processing the connection and request of an application. Moreover, it is a meta server duplicating and managing the meta information. In other words, GOLDILOCKS cluster does not require any data server, application server, or meta server.

Cluster members which belong to the same cluster group have the same data replications. Therefore, an error in a specific cluster member does not cause an error in the entire system. It is recommended to include two or more cluster members in each cluster group for the high availability of the system. A single cluster group can be configured with maximum 32 cluster members.

Perform **ALTER CLUSTER GROUP name ADD MEMBER** statement to add a new cluster member to a cluster group.

The added cluster member maintains the meta information of the SQL object as same as that in the cluster system, so it can process the connection and request of the application. However, the data is not placed, so adding a cluster member does not guarantee the high availability of the cluster group.

Perform the following statements to place the data after adding a cluster member.

- For rebalancing the entire data: Refer to **ALTER DATABASE REBALANCE**.
- For rebalancing only a part of the table: Refer to **ALTER TABLE name REBALANCE**.

When an error occurs on a cluster member, service is continuously provided but DDL can not be performed. For a normal service operation, an appropriate action should be taken for the cluster member with an error.

To make the cluster member with an error to participate in the cluster system again, then perform **ALTER SYSTEM JOIN DATABASE** statement after connecting to the cluster member and driving up to the LOCAL OPEN phase.

Even when a part of cluster members are not driven or the cluster system is driven while the network is disconnected, perform **ALTER SYSTEM JOIN DATABASE** statement after driving up the cluster member to the LOCAL OPEN phase.

If the cluster member device with an error can not be restored, then drop that cluster member by performing **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS** statement in the cluster system.

The cluster member dropped from the cluster system still includes the previous information, and it can not participate in the cluster system again. Perform **ALTER DATABASE RESET LOCAL CLUSTER MEMBER** statement to reset the cluster member to when it is before participating in the cluster system.

The statement above is different from newly creating the database of the cluster member because it maintains the tablespace information. Therefore, it can shorten the time to create the tablespace when adding a new cluster member to the cluster system.

14.4 Cluster Location

Cluster Location Related Statements

For more information about creating, dropping, and altering a cluster location, refer to the followings.

- Creating a cluster location: **CREATE CLUSTER LOCATION**
- Dropping a cluster location: **DROP CLUSTER LOCATION**
- Altering a cluster location: **ALTER CLUSTER LOCATION**

Information which is related to a cluster location can be retrieved through the following views.

Table 14-4 Cluster location related information

Schema	View	Description
PERFORMANCE_VIEW_SCHEMA	V\$CLUSTER_LOCATION	Information of cluster location

Concepts of Cluster Location

Cluster location is a connection information to connect the internal cluster networks of each cluster member registered on the cluster system. Each cluster members use the cluster-exclusive tcp network to transfer and receive various protocols such as the transaction processing and the exchanging the management information. In this case, the member name, host ip address, and port are used for the connection and they are called as a cluster location by the lump.

A unique cluster location information should be specified for each member, and if the information is duplicate, then the cluster network connection fails and the cluster system does not operate normally.

Cluster location information is automatically added or deleted when adding or dropping a cluster member, so a user rarely need to directly and solely add or delete the location information. However, DDL statement related to the cluster location can be used in the following case.

- When the cluster location information is lost due to the deleted location control file: **CREATE CLUSTER LOCATION**
- When the previously registered connection information of the cluster member is altered, which means that the hardware or the connected ip and port is altered: **ALTER CLUSTER LOCATION**

14.5 Cluster Table and Shard

Shard Related Statements

For more information about definition and rebalance of the shard, refer to the followings.

- Definition of a shard: <table sharding strategy> clause of **CREATE TABLE**.
- Rebalancing a shard: **ALTER TABLE name REBALANCE**

Information which is related to a shard in a cluster table can be retrieved through the following views.

Table 14-5 Shard in a cluster table related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_CLUSTER_TABLES	Information of user accessible cluster table
	ALL_SHARD_KEY_COLUMNS	Shard key column information of user accessible cluster table
	ALL_TAB_PLACE	Placement information of user accessible cluster table
	ALL_TAB_SHARDS	Shard information of user accessible cluster table
	USER_CLUSTER_TABLES	Information of user owned cluster table
	USER_SHARD_KEY_COLUMNS	Shard key column information of user owned cluster table
	USER_TAB_PLACE	Placement information of user owned cluster table
	USER_TAB_SHARDS	Shard information of user owned cluster table

Cluster Table Type

A table which is created by a user in a cluster environment is one of the followings.

- Cloned table: Equally duplicating the table data and managing it
- Sharded table: Horizontally sharding the table data and managing it

A cloned table is appropriate for a table such as a product list or a provider list whose data is relatively small and is not often altered, because a cloned table duplicates all table data and manages it. When inserting, deleting, updating data to the cloned table, they are applied same to all cluster members to which the cloned table is placed.

A sharded table is appropriate for a table such as a transaction history or a call history whose data is big so required to be sharded. They are classified according to three sharding strategies as follows.

- Hash sharded table
 - It divides the table data into several shards based on the hash value of a sharding key, then places them in the cluster system.
- Range sharded table
 - It divides the table data into several shards based on the range value of a sharding key, then places them in the cluster system.
- List sharded table
 - It divides the table data into several shards based on the list value of a sharding key, then places them in the cluster system.

A sharded table horizontally divides rows and manages them in shard unit, the sharding strategy is defined by using the SHARDING BY clause in **CREATE TABLE** statement. The row set classified by the sharding strategy is called as shard.

Each shard is placed in a cluster group according to the placement strategy defined by a user. A shard can automatically be placed by using AT CLUSTER WIDE of **CREATE TABLE**, or a cluster group to place a shard can be specified by using AT CLUSTER GROUP clause. When a shard is automatically placed by using AT CLUSTER WIDE, **ALTER TABLE name REBALANCE** is performed after creating the cluster group by using **CREATE CLUSTER GROUP**. However, when specifying a cluster group to allocate a shard using AT CLUSTER GROUP, the shard is not placed in the newly created cluster group.

The following is an example of creating a table according to the cluster table type and placing the data in the 3x2 cluster environment.

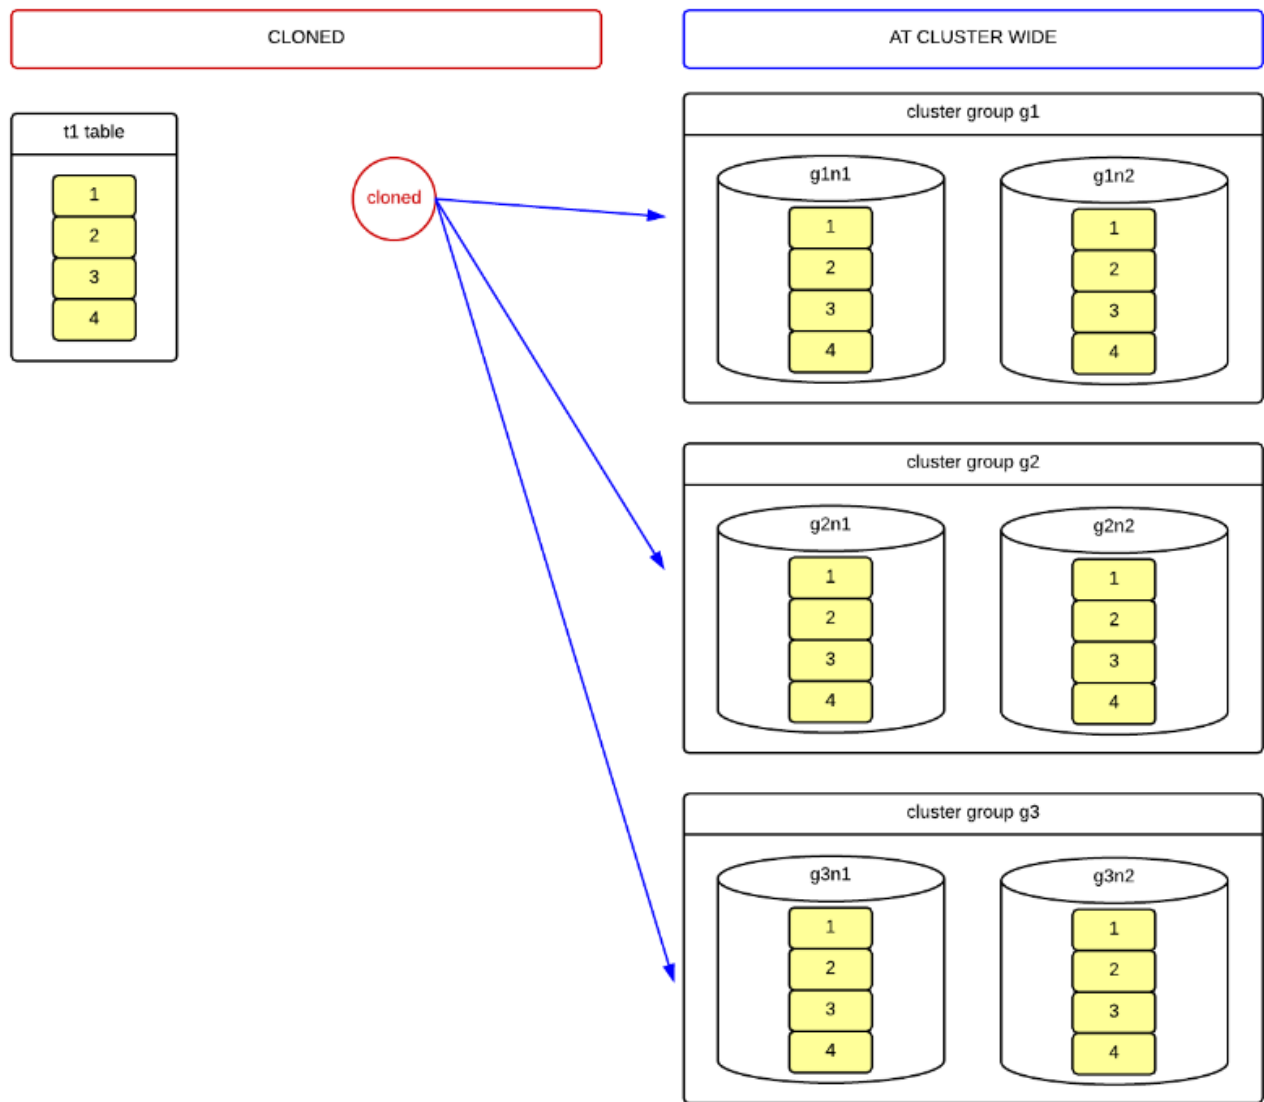

Cloned Table

A cloned table equally duplicates the table data and manages it.

The following is an example of creating a cluster-wide cloned table. All table data is equally duplicated and placed in 3x2 cluster members.

```
CREATE TABLE t1 ( id INTEGER )
  CLONED
  AT CLUSTER WIDE
;
```

Figure 5 Cluster-wide cloned table

The following is an example of creating a group-specific cloned table. All table data is equally duplicated and managed, but the duplicated table data exists only in cluster members of group g1 and g2 which are specified by a user, but it does not exist in a group g3.

```
CREATE TABLE t1 ( id INTEGER )
  CLONED
  AT CLUSTER GROUP g1, g2
;
```

Figure 6 Group-specific cloned table

Hash-sharded table

A hash-sharded table divides the table data into several shards based on the hash value of a sharding key, then places them in the cluster system.

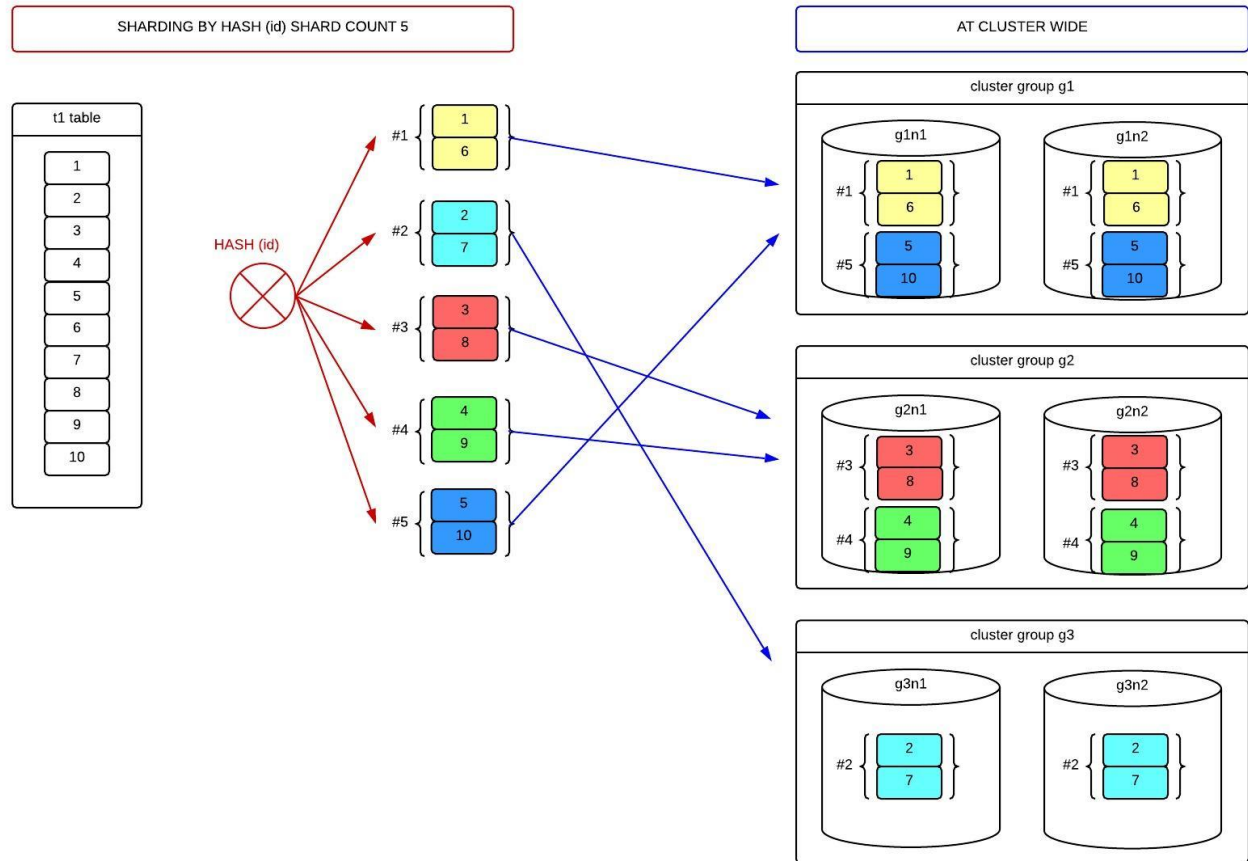

The following is an example of creating the cluster-wide hash-sharded table. When adding data to a table, the hash value is created based on the ID column value, and the shard to place row is selected among five shards by using the hash value. Each shard is automatically placed. All rows with the same ID column value are included in the same shard, and placed in the same cluster group.

```
CREATE TABLE t1 ( id INTEGER )
  SHARDING BY HASH(id)
  SHARD COUNT 5
```

AT CLUSTER WIDE

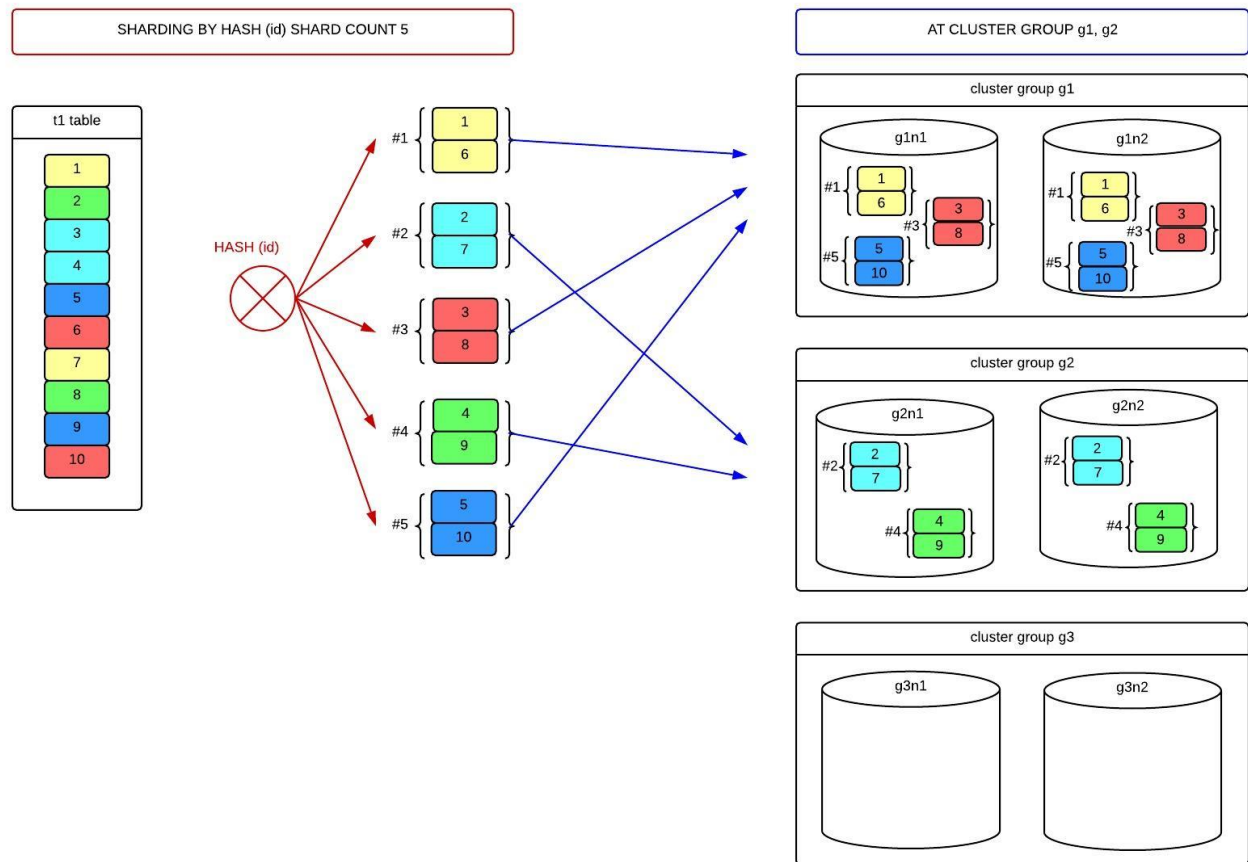

;

Figure 7 Cluster-wide hash-sharded table

The following is an example of creating the group-specific hash-sharded table. The hash value of an ID column determines the shard, but each shard is placed only in the cluster group g1 and g2 which are specified by a user.

```
CREATE TABLE t1 ( id INTEGER )
  SHARDING BY HASH(id)
  SHARD COUNT 5
  AT CLUSTER GROUP g1, g2
;
```

Figure 8 Group-specific hash-sharded table

Range-sharded Table

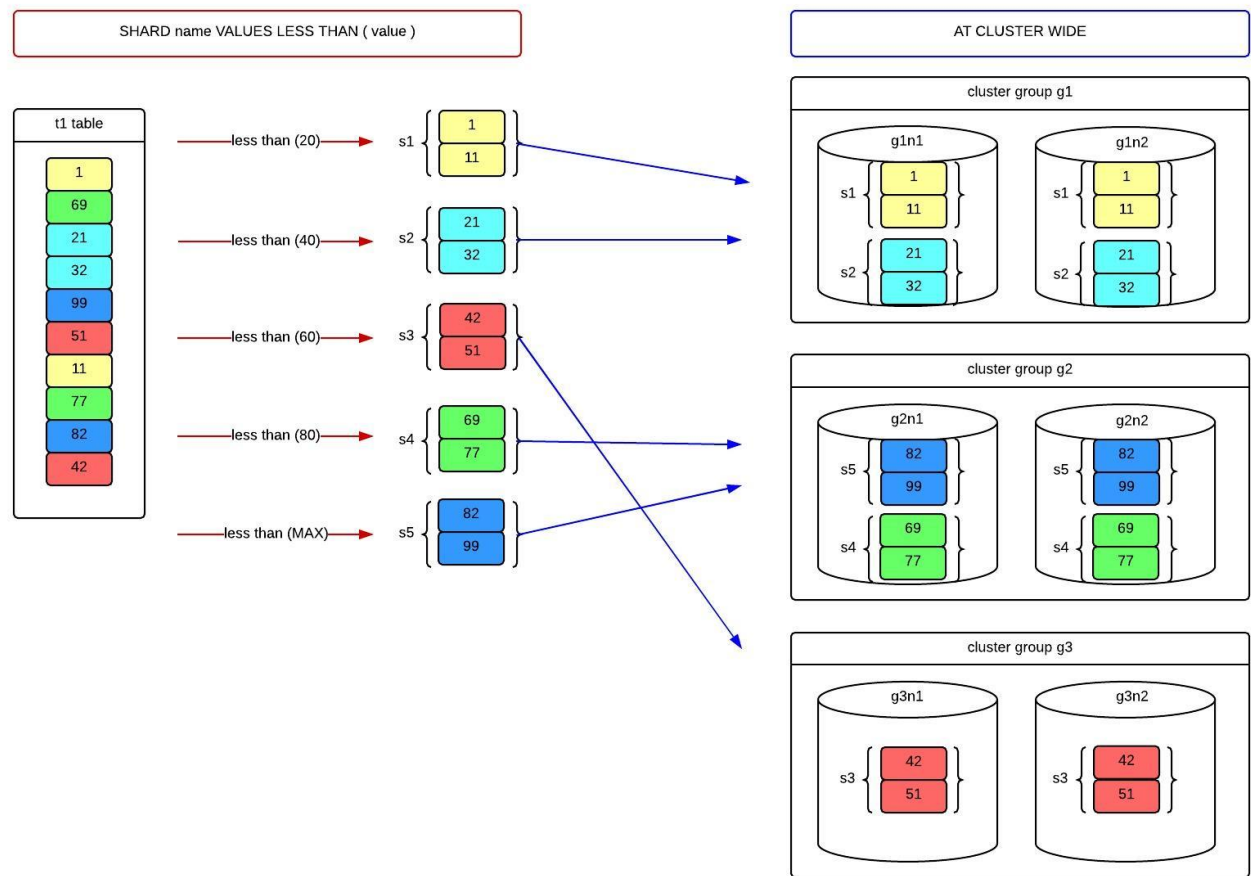

A range-sharded table divides the table data into several shards based on the range value of a sharding key, then places them in the cluster system.

The following is an example of creating the cluster-wide range-sharded table. When adding data to a table, the shard to place row is selected among five shards based on the range value of the ID column. Each shard is automatically placed. All rows of the ID column within the same range are included in the same shard, and placed in the same cluster group.

```
CREATE TABLE t1 ( id INTEGER )
  SHARDING BY RANGE(id)
  AT CLUSTER WIDE
    SHARD s1 VALUES LESS THAN ( 20 ),
    SHARD s2 VALUES LESS THAN ( 40 ),
    SHARD s3 VALUES LESS THAN ( 60 ),
    SHARD s4 VALUES LESS THAN ( 80 ),
    SHARD s5 VALUES LESS THAN ( MAXVALUE )
```

;

Figure 9 Cluster-wide range-sharded table

The following is an example of creating the group-specific range-sharded table. The range value of the ID column defines the shard, but each shard is placed in a cluster group specified by a user.

```
CREATE TABLE t1 ( id INTEGER )
SHARDING BY RANGE(id)
    SHARD s1 VALUES LESS THAN ( 20 )      AT CLUSTER GROUP g1,
    SHARD s2 VALUES LESS THAN ( 40 )      AT CLUSTER GROUP g2,
    SHARD s3 VALUES LESS THAN ( 60 )      AT CLUSTER GROUP g1,
    SHARD s4 VALUES LESS THAN ( 80 )      AT CLUSTER GROUP g2,
    SHARD s5 VALUES LESS THAN ( MAXVALUE ) AT CLUSTER GROUP g3
;
```

Figure 10 Group-specific range-sharded table

List-sharded Table

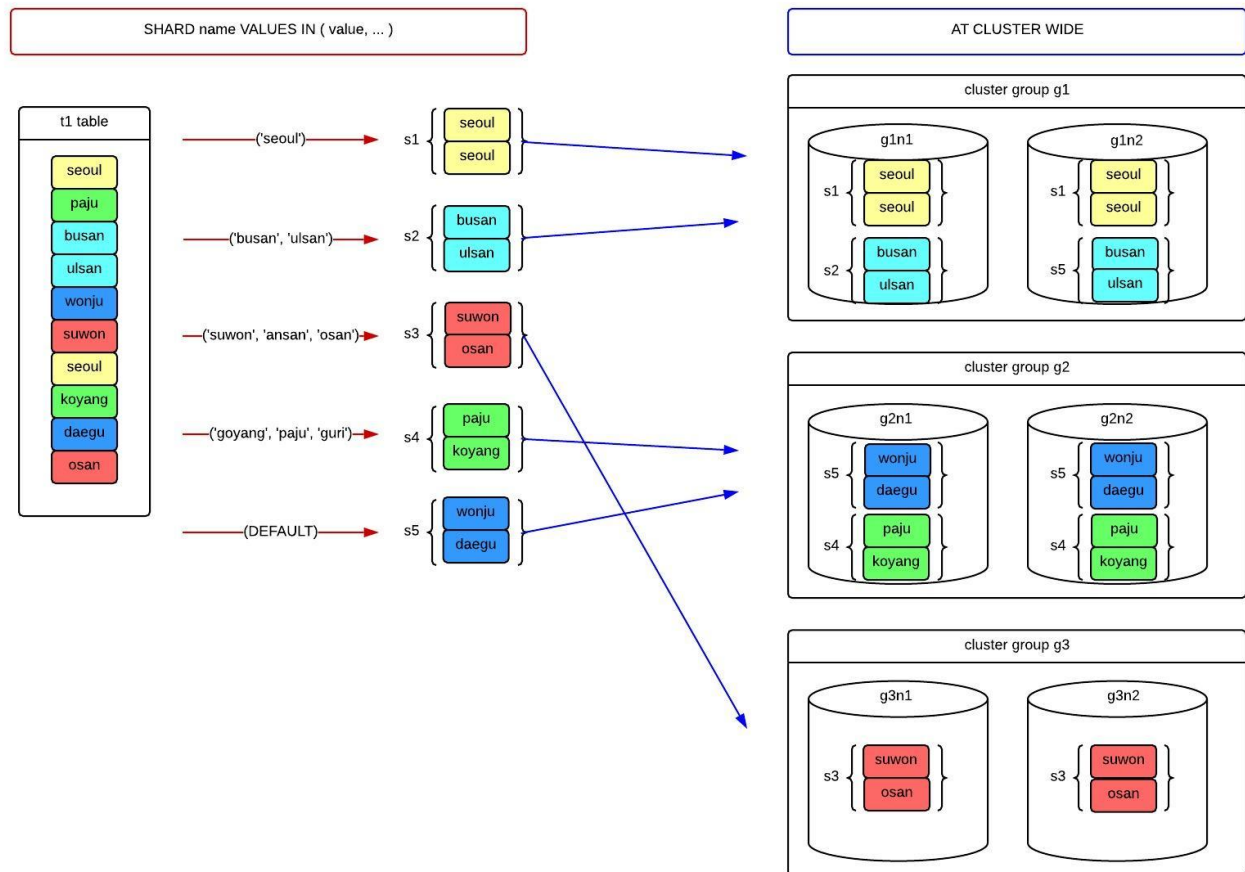

A list-sharded table divides the table data into several shards based on the list value of a sharding key, then places them in the cluster system.

The following is an example of creating the cluster-wide list-sharded table. When adding data to a table, rows are placed in a shard with the list value as same as the CITY column value. Each shard is automatically placed.

```
CREATE TABLE t1 ( city VARCHAR(128) )
  SHARDING BY LIST (city)
    AT CLUSTER WIDE
    SHARD s1 VALUES IN ( 'seoul' ),
    SHARD s2 VALUES IN ( 'busan', 'ulsan' ),
    SHARD s3 VALUES IN ( 'suwon', 'ansan', 'osan' ),
    SHARD s4 VALUES IN ( 'goyang', 'paju', 'guri' ),
    SHARD s5 VALUES IN ( DEFAULT )
```

;

Figure 11 Cluster-wide list-sharded table

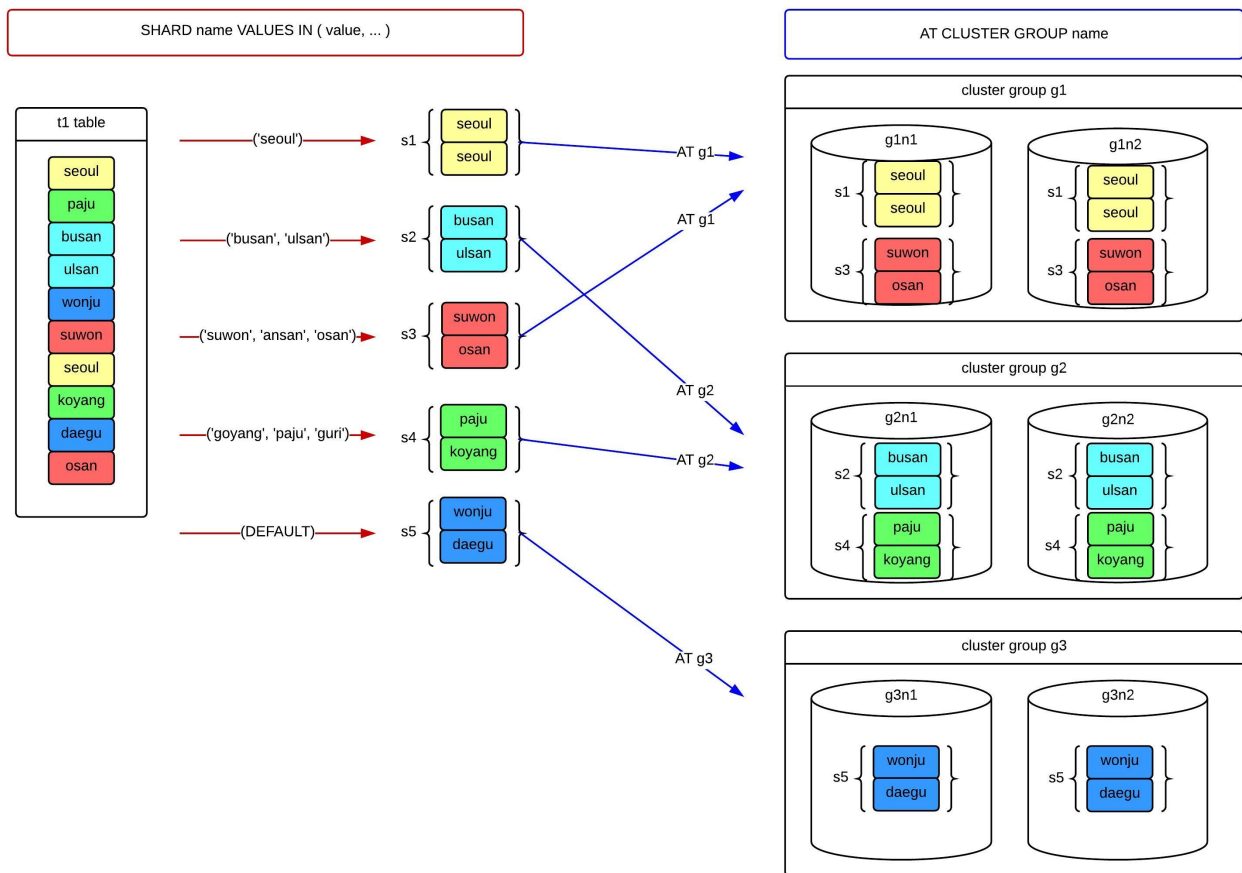

The following is an example of creating the group-specific list-sharded table. The shard is selected by the list value of the CITY column, but each shard is placed in the cluster group specified by a user.

```
CREATE TABLE t1 ( city VARCHAR(128) )
SHARDING BY LIST (city)
  SHARD s1 VALUES IN ( 'seoul' ) AT CLUSTER GROUP g1,
  SHARD s2 VALUES IN ( 'busan', 'ulsan' ) AT CLUSTER GROUP g2,
  SHARD s3 VALUES IN ( 'suwon', 'ansan', 'osan' ) AT CLUSTER GROUP g1,
  SHARD s4 VALUES IN ( 'goyang', 'paju', 'guri' ) AT CLUSTER GROUP g2,
  SHARD s5 VALUES IN ( DEFAULT ) AT CLUSTER GROUP g3
```

;

Figure 12 Group-specific list-sharded table

Rebalancing Cluster Table

Rebalance the data of the cluster table by using **ALTER TABLE name REBALANCE** statement.

Data of the cluster table is rebalanced in the following unit.

- Cloned table: The entire table
- Sharded table: shard unit

If the table is specified as **AT CLUSTER WIDE**, the shard is automatically rebalanced to the created cluster group, but if the cluster group to place the shard is specified by **AT CLUSTER GROUP**, the shard is not rebalanced to the created cluster group.

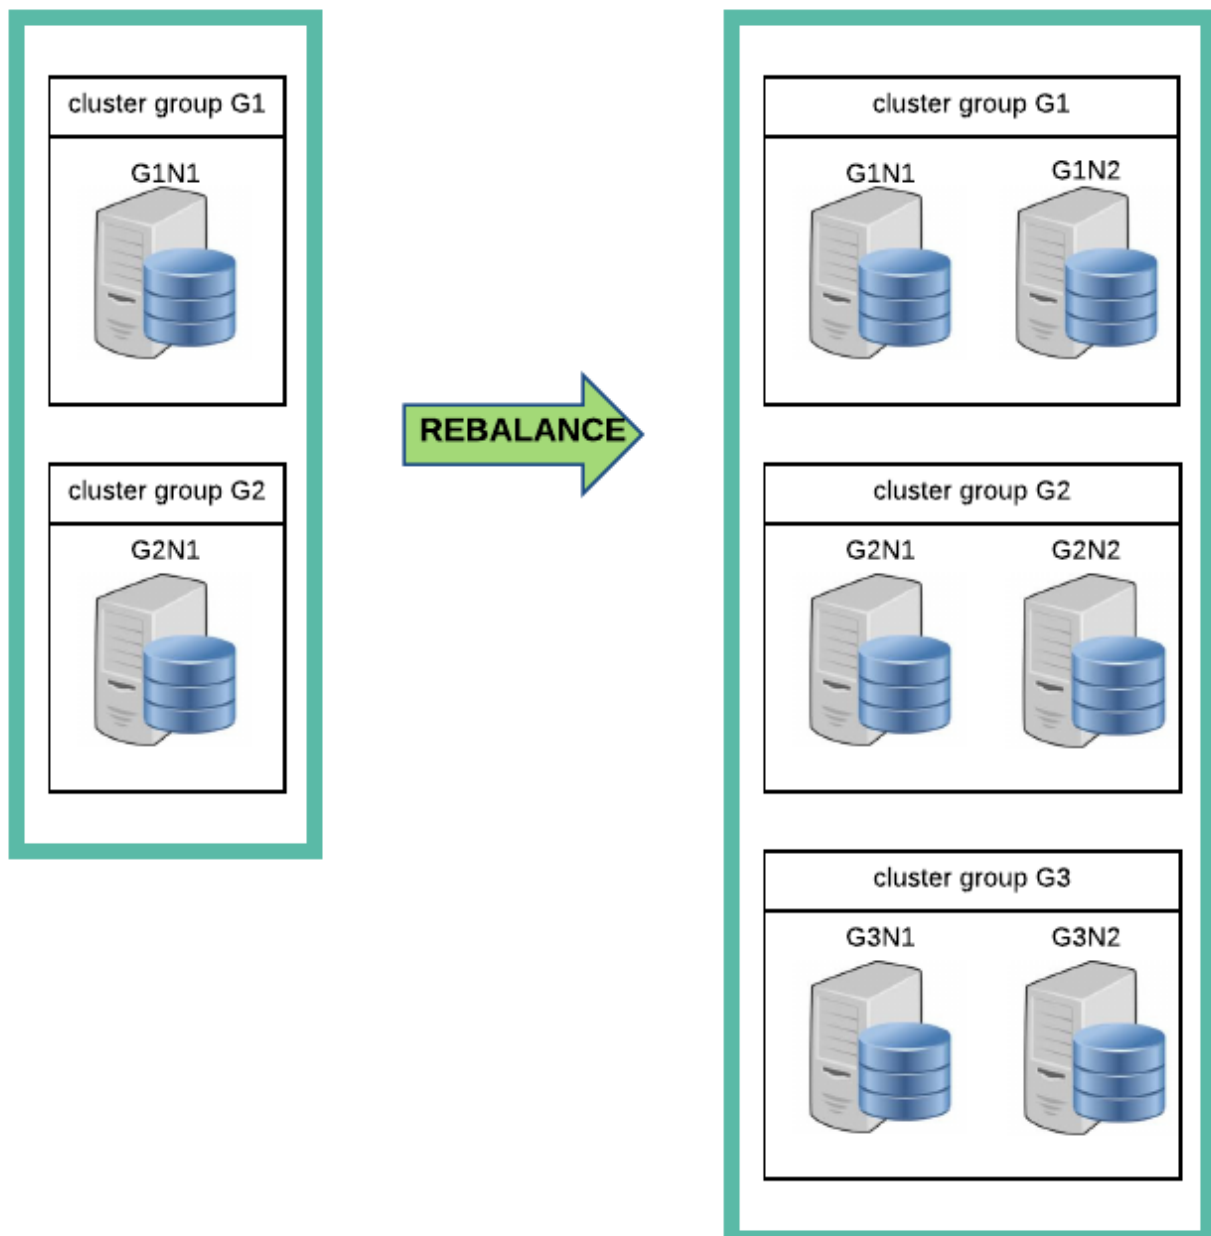

- When automatically rebalancing by using **AT CLUSTER WIDE**, then the data can be rebalanced to a new cluster group and a new cluster member.

```

CREATE TABLE region
(
    r_regionkey    INTEGER
  , r_name        CHAR(25)
  , r_comment     VARCHAR(152)
)
CLONED
AT CLUSTER WIDE;

```

Figure 13 Rebalancing the region table defined by AT CLUSTER WIDE

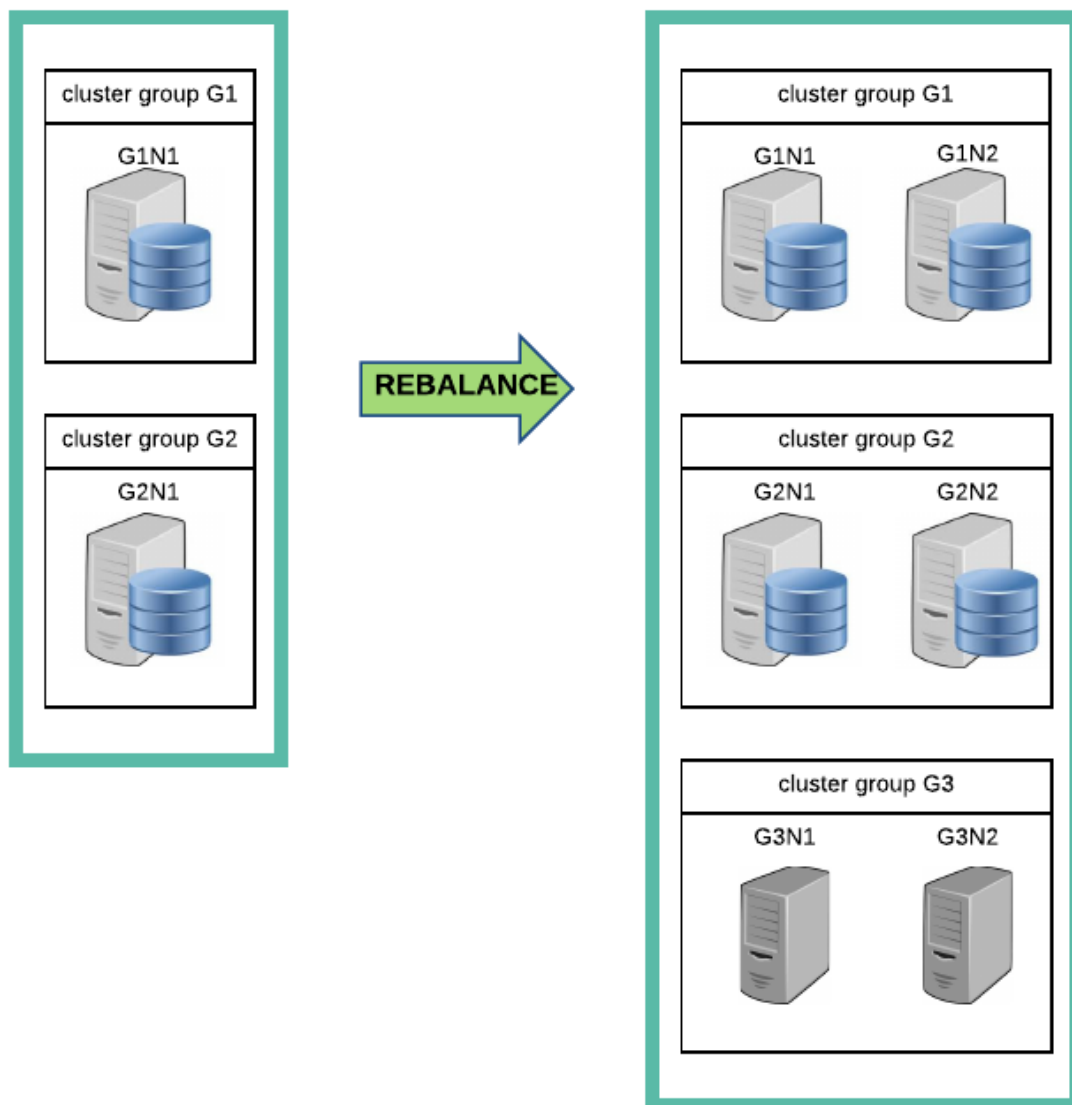

- When specifying the location to place the shard by using AT CLUSTER GROUP

- The data is not rebalanced on the new cluster group.
- The data can be rebalanced on the new cluster member which is added to the specified cluster group.

```
CREATE TABLE nation
(
    n_nationkey  INTEGER
  , n_name      CHAR(25)
  , n_regionkey INTEGER
  , n_comment   VARCHAR(152)
)
CLONED
AT CLUSTER GROUP g1, g2;
```

Figure 14 Rebalancing the nation table defined by AT CLUSTER GROUP

Information about the table placement can be retrieved through the following views.

- **USER_TAB_PLACE**
- **ALL_TAB_PLACE**

```
gSQL>
SELECT group_name, member_name
  FROM user_tab_place
 WHERE table_name = 'REGION';
GROUP_NAME MEMBER_NAME
-----
G1          G1N1
G1          G1N2
G2          G2N1
G2          G2N2
G3          G3N1
G3          G3N2
6 rows selected.
```

The sharded table is rebalanced in shard unit, and rebalancing shards due to the increase of groups is as follows.

```
CREATE TABLE orders
(
  o_orderkey    INTEGER
, o_custkey    INTEGER
, o_orderstatus CHAR(1)
, o_totalprice  NUMERIC(12,2)
, o_orderdate   DATE
, o_orderpriority CHAR(15)
, o_clerk       CHAR(15)
, o_shippriority INTEGER
, o_comment     VARCHAR(79)
)
SHARDING BY HASH( o_orderkey )
SHARD COUNT 24
AT CLUSTER WIDE
;
```

Figure 15 Rebalancing shards due to the increase of groups

In the example above, the data of orders table is divided into 24 shards and placed. All shards are placed in a single group of 1x cluster which has only one group. 12 shards are placed in each group of 2x cluster which has two groups.

When expanding 2x cluster to 3x cluster, shards are transferred from an old group to the new group, but the number of shards in each group is same (8). When expanding 3x cluster to 4x cluster, then each G1, G2, G3 rebalances two shards to the newly created group G4.

In other words, the shard rebalancing minimizes the movement when shards are transferred from an old

group to the new group, then data is equally rebalanced maintaining the same number of shards in each group.

Information about the shard placement of the sharded table can be retrieved through the following view s.

- **USER_TAB_SHARDS**
- **ALL_TAB_SHARDS**

```
gSQL>
SELECT shard_name, group_name
   FROM user_tab_shards
  WHERE table_name = 'ORDERS';
SHARD_NAME    GROUP_NAME
-----
SHARD_000000  G1
SHARD_000001  G1
SHARD_000002  G1
SHARD_000003  G1
SHARD_000004  G1
SHARD_000005  G1
SHARD_000006  G1
SHARD_000007  G1
SHARD_000008  G3
SHARD_000009  G3
SHARD_000010  G3
SHARD_000011  G3
SHARD_000012  G2
SHARD_000013  G2
SHARD_000014  G2
SHARD_000015  G2
SHARD_000016  G2
SHARD_000017  G2
SHARD_000018  G2
SHARD_000019  G2
SHARD_000020  G3
SHARD_000021  G3
SHARD_000022  G3
SHARD_000023  G3
24 rows selected.
```

When tables which have the same <sharding strategy> are completely rebalanced as follows, then the sha

rd placement result is same. Rows with the same shard key are guaranteed to be placed in the same shard and the same group even when the tables are different.

- Table t1
 - It is created in the 2x cluster.
 - CREATE TABLE t1 (c1 INTEGER) SHARDING BY (c1);
 - It is rebalanced in the 4x cluster.
 - ALTER TABLE t1 REBALANCE:
- Table t2
 - It is created in the 3x cluster.
 - CREATE TABLE t2 (a1 INTEGER) SHARDING BY (a1);
 - It is rebalanced in the 4x cluster.
 - ALTER TABLE t2 REBALANCE:
- Table t3
 - It is created in the 4x cluster.
 - CREATE TABLE t3 (i1 INTEGER) SHARDING BY (i1);

In other words, the following query can access only to a single cluster member and process it.

```
SELECT COUNT(*)  
FROM t1, t2, t3  
WHERE t1.c1 = t2.a1  
      AND t2.a1 = t3.i1  
      AND t1.c1 = 1;
```

14.6 Global Secondary Index

Global Secondary Index Related Statements

For more information about creating, dropping, and altering a global secondary index, refer to the followings.

- Creating a global secondary index: **ALTER TABLE name ADD GLOBAL SECONDARY INDEX**
- Dropping a global secondary index: **ALTER TABLE name DROP GLOBAL SECONDARY INDEX**
- Altering a global secondary index: **ALTER TABLE name ALTER GLOBAL SECONDARY INDEX**

Information related to a global secondary index can be retrieved through the following views.

Table 14-6 Global secondary index related information

Schema	View	Description
DICTIONARY_SCHEMA	ALL_CLUSTER_TABLES	Existence of a global secondary index in user accessible table
	ALL_GLOBAL_SECONDARY_INDEXES	Object information of user accessible global secondary index
	ALL_GSI_PLACE	Placement information of user accessible global secondary index
	USER_CLUSTER_TABLES	Existence of a global secondary index in user owned table
	USER_GLOBAL_SECONDARY_INDEXES	Object information of user owned global secondary index
	USER_GSI_PLACE	Placement information of user owned global secondary index

Concepts of Global Secondary Index

A global secondary index is a B-Tree index which configures the GRID (global row identifier) value as a key in each cluster member of the cluster environment.

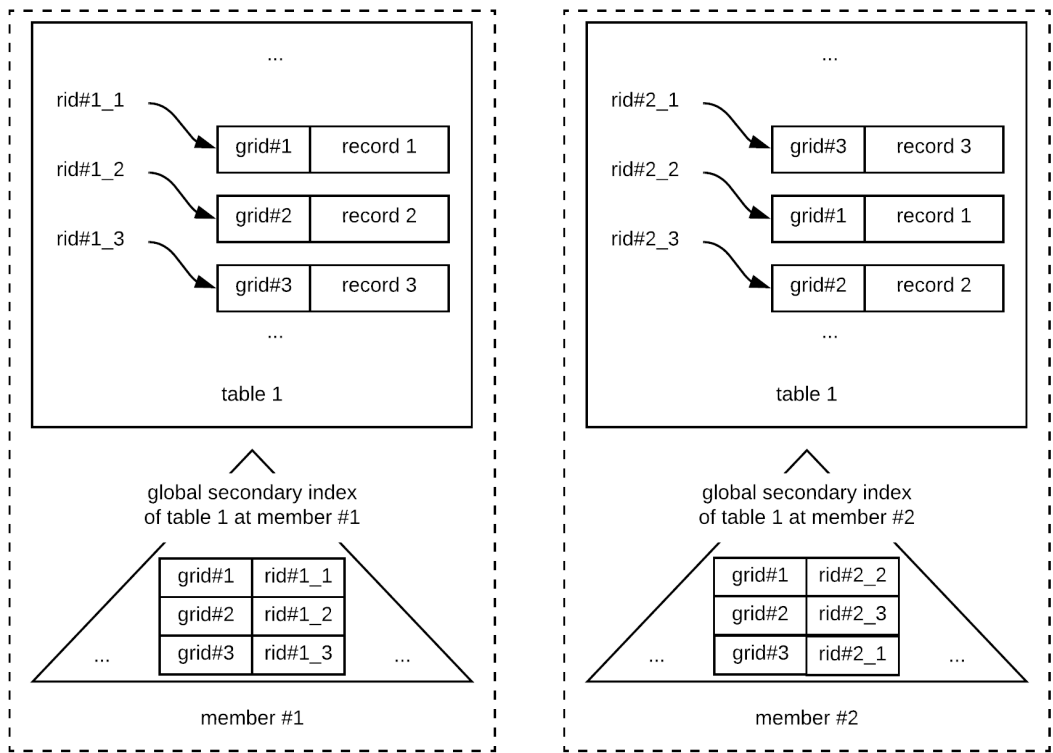

Tables in the cluster environment are duplicated to all members in a group and the same records are applied and retrieved when performing DML or select. GRID is a unique value identifying the same records in cluster members, and it is allocated when the record is inserted for the first time, and it is spread over all members in a group, then stored together with the record.

The GRID value of the record is not altered even when the record is update, and it is not altered even when

en the shard key is altered and transferred to another shard.

When creating a table in a cluster environment, a global secondary index may or may not be created, and it can be separately created or deleted after the table is created. A table may not have a global secondary index, or it may have maximum one global secondary index.

Figure 16 Structure of a global secondary index

A global secondary index is required to perform a non-deterministic query for a table. If the table does not have a global secondary index, then the non-deterministic query fails as follows.

```
gSQL> DELETE FROM T1 LIMIT 1;  
ERR-42000(16423): does not support non-deterministic DML in the cluster system : global  
secondary index expected
```

Refer to the dictionary such as ALL_GSI_PLACE, DBA_GSI_PLACE, and USER_GSI_PLACE to check if a table has a global secondary index.

15.

SQL Tuning

15.1 Overview

SQL tuning describes a comprehensive overview on how to improve the query performance in the SQL statements. GOLDILOCKS provides hint, plan Cache, SQL execution plan output for SQL tuning.

SQL tuning aims to minimize query response time and to improve query throughput, so it describes how to find and solve the problem.

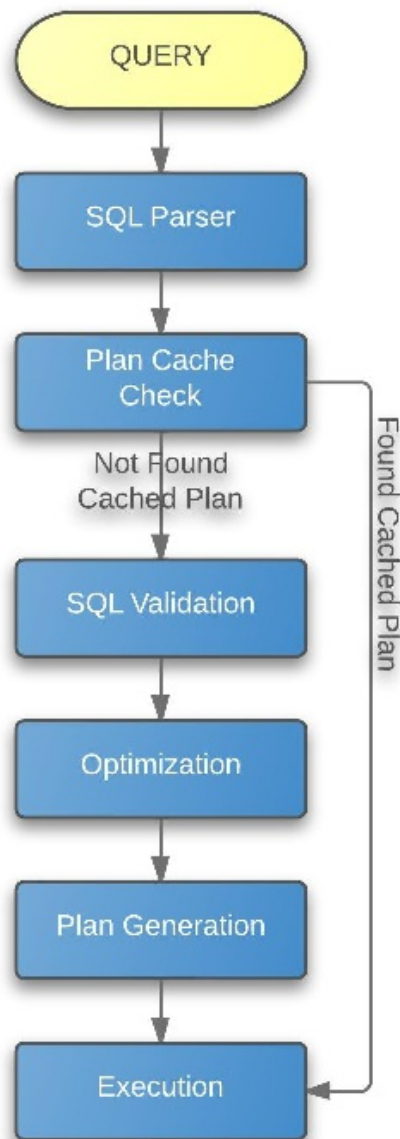

The knowledge about database, database structure, SQL syntax and optimizer is required to understand SQL tuning. This chapter is described under the assumption that the reader knows all prerequisite knowledge.

15.2 SQL Processing

The overall SQL processing of GOLDILOCKS has phases such as SQL parser, plan cache check, SQL validation, optimization, plan generation, execution as follows.

If an execution plan for the same query is stored in plan cache, then the plan cache check executes the plan.

Figure 1 SQL processing phases

SQL Parser

SQL parser is the first phase of SQL processing, and it checks grammatical correctness of SQL statement input by a user. If the SQL statement is not grammatically correct, it is regarded as an error.

The following is an example of the grammatically incorrect SQL statement.

```
gSQL> SELECT * FORM t1;
ERR-42000(40000): syntax error
SELECT * FORM t1
.....^ ^
Error at line 1
```

In SQL parser phase, the necessary information for parsing is collected and stored. The parsing result derives the parsed SQL structure. The parsed SQL structure and other information are stored and managed in each session area.

Plan Cache Check

After the SQL parser phase is completed, it checks if the same query as the submitted query is stored in the plan cache, and this is the plan cache check phase.

In the plan cache check phase, it searches for a plan which is matched with **Plan cache parameters** from the plan cache of the parsed query statement.

In case when the plan is stored in the plan cache, the plan checks the validity of the objects such as tables and columns to which the plan accesses. If all objects are valid the process moves on to the execution phase using the plan. If any object is invalid the process moves on to SQL validation phase.

All plans which are generated by different sessions are shared in plan cache, and plans stored by other sessions can be referenced.

By using the plan stored in the plan cache at plan cache check phase, the process from SQL validation phase to plan generation phase can be omitted, so the performance is improved.

SQL Validation

The syntactic correctness of a query is checked in the SQL validation phase. In this phase, it checks syntactic errors such as whether the tables and columns of the submitted query statement exist, or whether the columns can be referenced.

The following is an example of the syntactically incorrect SQL statement.

```
gSQL> SELECT * FROM t1;
ERR-42000(16040): table or view does not exist :
SELECT * FROM t1
          *
ERROR at line 1:
```

Optimization

In the optimization phase, various execution plan for the SQL statement is set up, and the best plan is selected. In the optimization phase, the cost of the optimization methods such as an access method for a table, a join order, a join method is calculated. Then, it creates various plans and selects the best plan among them.

For more information, refer to [Query Optimizer](#).

Plan Generation

In the plan generation phase, the execution plan which is selected in optimization phase is generated in executable form for execution phase. The execution plan consists of a combination of nodes in multiple phases, and the nodes of each phase returns a result set to the superordinate node. The final phase nodes send the final result of the SQL statement to the user.

The execution plan consists of the nodes in a tree form, and it includes the following information.

- An access method for each table
- An order of the referencing tables
- A join method of the table join operation
- Information about the data filter
- Information about data grouping and aggregation
- Information about data sorting

The following is an example of the SQL execution plan generated in the plan generation phase.

```
gSQL>
\EXPLAIN PLAN
SELECT t1.i1, t1.i2, t2.i1, t2.i2
FROM t1, t2
WHERE t1.i1 = t2.i1
```

```

AND t1.i2 = 1
ORDER BY t1.i1;
no rows selected.
>>> start print plan
< Execution Plan >
=====
|  IDX  |  NODE DESCRIPTION                                |  ROWS  |
=====
|   0   |  SELECT STATEMENT                                |         |
|   1   |    SORT INSTANT ACCESS                           |        0 |
|   2   |      HASH JOIN (INNER JOIN)                       |        0 |
|   3   |        TABLE ACCESS ("T2")                      |        0 |
|   4   |          HASH JOIN INSTANT ACCESS                 |        0 |
|   5   |            TABLE ACCESS ("T1")                  |        0 |
=====
1 - SORT KEY : "T1.I1 ASC NULLS LAST"
    RECORD COLUMNS : I2, I1, I2
    READ COLUMNS : I1, I2, I1, I2
2 - JOINED COLUMNS : T1.I1, T1.I2, T2.I1, T2.I2
3 - READ COLUMNS : I1, I2
4 - INDEX COLUMNS : I1
    TABLE COLUMNS : I2
    READ COLUMNS : I1, I2
    HASH FILTER : I1 = {I1}
5 - READ COLUMNS : I1, I2
    PHYSICAL FILTER : I2 = 1
<<< end print plan

```

Plan Cache Registration

When using the plan cache, the plan generated in **Plan Generation** phase is registered in plan cache. The plans in a cache are distinguished by whether it matches with the **Plan cache parameters** value.

Table 15-1 Plan cache parameters

Parameter	Description
Query text	Case sensitive query text
User information	User id
Cursor property	The cursor property of the query which requires fetch

Parameter	Description
Bind parameter	The number of bind parameters, and the IN/OUT property of each bind parameter
Enable atomic	Whether to use atomic insertion
Enable hint error	Whether validation error occurs for the hint

The followings are examples of queries which have different query text values.

```
"select i1 from t1"
"Select i1 from t1"
"select i1 from t1"
"SELECT I1 FROM T1"
```

Note

If the schema objects (tables, indexes, views, sequences) referenced by the plan are not committed, the plan is not registered.

Execution

In execution phase, the execution plan which is generated in plan generation phase or selected in plan cache check phase is executed, and the result is returned. The execution plan in tree structure is executed from the left and the lowest node to the superordinate node.

```
gSQL>
\EXPLAIN PLAN
SELECT t1.i1, t1.i2, t2.c1, t2.c2
  FROM t1, t2
 WHERE t1.i1 = t2.c1
    AND t1.i2 = 1
 ORDER BY t1.i1;
no rows selected.
>>> start print plan
< Execution Plan >
```

```
=====
|  IDX  |  NODE DESCRIPTION                                |  ROWS  |
-----|-----|-----|
|    0  |  SELECT STATEMENT                                |         |
|    1  |  SORT INSTANT ACCESS                             |    0    |
```

```

| 2 |      HASH JOIN (INNER JOIN)      |      0 |
| 3 |      TABLE ACCESS ("T2")        |      0 |
| 4 |      HASH JOIN INSTANT ACCESS     |      0 |
| 5 |      TABLE ACCESS ("T1")        |      0 |
=====
1 - SORT KEY : "T1.I1 ASC NULLS LAST"
    RECORD COLUMNS : I2, C1, C2
    READ COLUMNS : I1, I2, C1, C2
2 - JOINED COLUMNS : T1.I1, T1.I2, T2.C1, T2.C2
3 - READ COLUMNS : C1, C2
4 - INDEX COLUMNS : I1
    TABLE COLUMNS : I2
    READ COLUMNS : I1, I2
    HASH FILTER : I1 = {C1}
5 - READ COLUMNS : I1, I2
    PHYSICAL FILTER : I2 = 1
<<< end print plan

```

The execution process using the plan generation example above is as follows.

1. The result is returned from IDX3 by using table access for the table T2. The result rows include the columns C1, C2.
2. The result is returned from IDX5 by using table access for the table T1. "I2 = 1" is processed by using physical filter, and the result is returned. The result rows include the columns I1, I2.
3. Hash join instant access for the result returned from IDX5 is created in IDX4, and "I1 = {I1}" is performed as hash filter. The rows of the result include the columns I1, I2.
4. Hash join is performed in IDX2 by using hash filter in IDX4 for the result of IDX3, and the result rows include the columns I1, I2 of the table T1, and the columns C1, C2 of the table T2.
5. Sort instant access for the result of IDX2 is generated in IDX1, and it is sorted by using the column I1 of the table T1. The result includes the columns I1, I2 of the table T1, and the columns I1, I2 of the table T2.
6. The result of IDX1 is finally returned to the user from IDX 0.

For more information about the SQL execution plan, refer to **SQL Execution Plan**.

15.3 Query Optimizer

Overview

An query optimizer determines the most effective execution plan for the SQL statement. In order to do so, the query optimizer generates various types of candidate plans for the SQL statement and calculates the cost for each plan. Then, it selects the final execution plan with the lowest cost among the candidate plans.

The process to find an effective plan by calculating the cost is cost-based optimization. During the process, the query optimizer uses information such as the number of rows which are returned by nodes, the access paths, and the join methods.

The query optimizer produces the candidate plans for the SQL statement returned from parsing and validation phases by calculating the cost based on query transformations and statistics. Then it selects the most efficient (the lowest cost) plan among the candidate plans, then produces the final execution plan.

The query transformations push the conditional clause to a view, or they convert the subQuery to the join form.

There are a heuristic query transformation and a cost-based query transformation.

The heuristic query transformation performs transformation only when transforming the queries is more efficient than the original query.

When transformation is not always efficient, the cost-based query transformation determines the cost effective form by comparing the original query with the transformed query.

Generally, the cost is calculated by using the selectivity and the cardinality. The selectivity is the rows ratio of the result to be returned to the result set after applying conditions. The cardinality is the number of the rows returned to the result from each node.

The query optimizer calculates the cost based on the selectivity and the cardinality. It also uses the access paths method (table access, index access), the join method (nested loops join, hash join), and the join ordering method.

The final execution plan selected by the query optimizer can be retrieved through the explain plan statement. For more information about the translating the execution plan output through the explain plan statement, refer to **SQL Execution Plan**.

Query Transformations

To perform the SQL statement more efficiently, the query transformations transform an SQL statement by pushing the filter or by unnesting the subQuery. For these query transformations, GOLDILOCKS supports the following methods.

- Simple view merging
- Filter push down
- SubQuery unnesting
- Single table min/max aggregation conversion
- Rewrite target on exists

Simple View Merging

It merges a simple view to the superordinate query block.

Merging the simple view enables applying more number of cases when determining a join ordering, a join operation and an access path, so it can generate more optimized plan.

The following is an example of a query.

```
gSQL> \explain plan
      select *
      from   ( select t1.col1 col1, t2.col1 col2
                from   t1, t2
                where  t1.col1 = t2.col1 )v1, t3
      where  v1.col1 = t3.col1;
```

It is assumed that the table t1, t2 are big and the table t3 is small.

If the simple view is not merged, the query above performs t3 after performing the join in the view. In this case, the intermediate result is big and it is not filtered enough.

< Execution Plan >

IDX	NODE DESCRIPTION	ROWS
0	SELECT STATEMENT	
1	NESTED LOOP JOIN (INNER JOIN)	1
2	VIEW (INLINE_VIEW AS V1)	5
3	NESTED LOOP JOIN (INNER JOIN)	5
4	INDEX ACCESS ("T2", "T2_COL1")	(5)

```

| 5 | INDEX ACCESS ("T1", "T1_COL1") | ( 5) | 5 |
| 6 | INDEX ACCESS ("T3", "T3_COL3") | ( 1) | 1 |
=====

```

However, if the simple view is merged, then t2 is performed after performing t1 and t3. In this case, the intermediate result is filtered enough so it improves the performance.

< Execution Plan >

```

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | | |
| 1 | NESTED LOOP JOIN (INNER JOIN) | 1 |
| 2 | NESTED LOOP JOIN (INNER JOIN) | 1 |
| 3 | TABLE ACCESS ("T3") | 1 |
| 4 | INDEX ACCESS ("T1", "T1_COL1") | ( 1) | 1 |
| 5 | INDEX ACCESS ("T2", "T2_COL1") | ( 1) | 1 |
=====

```

The view conditions to merge the simple view are as follows.

- A set operator should not exist within the view.
- DISTINCT should not exist within the view.
- GROUP BY, HAVING, aggregate function should not exist within the view.
- The full outer join should not exist within the view.
- The natural join should not exist within the view.
- The SELECT list within the view should not include a subquery.
- LIMIT, OFFSET statement should not exist within the view.
- The view should not participate in the full outer join.
- When the view is participating in the right side of the left outer join, then only one table should exist in the *from* clause within the view.
- The view should not exist on the right side of the semi join.

Filter Push Down

The filter push down feature pushes the pushable filters among the filters of WHERE clause to the subQuery (view) of FROM clause. The filter push down feature pushes the filter to subQuery (view), and the pushed filter is used for index access in the subQuery (view). Or the pushed filter is used as the first executed filter. It improves the query processing performance.

The following is an example of a query.

```

SELECT l_linenum, l_quantity
FROM ( SELECT *
        FROM lineitem
        WHERE l_shipdate >= date '1996-01-01'
          AND l_shipdate <= date '1996-12-31' )
WHERE l_shipmode = 'AIR';

```

In the example above, the filter `l_shipmode = 'AIR'` which exists in the top-level node (WHERE clause) is pushed to the subQuery in FROM clause. It is as same as the example below.

```

SELECT l_linenum, l_quantity
FROM ( SELECT *
        FROM lineitem
        WHERE l_shipdate >= date '1996-01-01'
          AND l_shipdate <= date '1996-12-31'
          AND l_shipmode = 'AIR' );

```

The transformed query as above improves the performance by using index access when an index exists for `l_shipmode` in the `lineitem` table.

SubQuery Unnesting

The subQuery unnesting feature releases the subQuery in a conditional clause into join form. The subQuery unnesting feature transforms operators (IN, NOT IN, EXISTS, NOT EXISTS) and a quantify operator of ANY and ALL into the semi join operation or anti-semi join operation. The transformed query efficiently processes the join, and it improves the query processing performance.

The following is an example of a query.

```

SELECT ps_availqty
FROM partsupp
WHERE ps_partkey IN ( SELECT p_partkey
                      FROM part
                      WHERE p_type = 'STEEL' );

```

In the example above, IN operator can be transformed into semi join of `ps_partkey = p_partkey` condition. This transformed query can be retrieved by outputting the execution plan as follows.

```

gSQL>
\EXPLAIN PLAN
SELECT ps_availqty
FROM partsupp

```

```
WHERE ps_partkey IN ( SELECT p_partkey
                      FROM part
                      WHERE p_type = 'STEEL' );
```

```
PS_AVAILQTY
```

```
-----
      8895
      4969
      4651
      4093
```

```
4 rows selected.
```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
|  IDX  |  NODE DESCRIPTION                                     |      ROWS |
|-----|-----|
|    0  |  SELECT STATEMENT                                     |           |
|    1  |    NESTED LOOP JOIN (INVERTED LEFT SEMI)             |          4 |
|    2  |      SORT INSTANT ACCESS (UNIQUE)                    |          2 |
|    3  |        TABLE ACCESS ("PART")                       |          2 |
|    4  |          INDEX ACCESS ("PARTSUPP, PARTSUPP_PK_INDEX") |          4 |
|-----|-----|
1  -  JOINED COLUMNS : PARTSUPP.PS_AVAILQTY
2  -  SORT KEY : "PART.P_PARTKEY ASC NULLS LAST"
      READ COLUMNS : P_PARTKEY
3  -  READ COLUMNS : P_PARTKEY, P_TYPE
      PHYSICAL FILTER : P_TYPE = 'STEEL'
4  -  READ INDEX COLUMNS : PS_PARTKEY
      READ TABLE COLUMNS : PS_AVAILQTY
      MIN RANGE : PS_PARTKEY = {P_PARTKEY}
      MAX RANGE : PS_PARTKEY = {P_PARTKEY}
```

```
<<< end print plan
```

In the execution plan output above, the IN operation is transformed into the inverted left semi join by using the nested loop join.

Single Table Min/Max Aggregation Conversion

When a query has a min (or max) aggregate function in a select list, and has a single table in from clause, then an optimizer returns the result by using the index whose first key column is an argument column of the aggregation.

In order to do so, the following conditions should be satisfied.

- It should be a query for a single table. Only one of the MIN or MAX should exist on the target.
- OFFSET/LIMIT clause should not be in a query.
- A single column in a table should be the only aggregation argument.
- The index whose first key is the target column for aggregation should exist.
- The user should not provide a hint such as table access or rowid access.

The single table min/max aggregation conversion improves the query processing performance by reading a single data of the beginning or end of the Index instead of reading all the rows.

The following is an example of a query.

```
SELECT p_name, p_brand, p_type
FROM part
WHERE p_size = ( SELECT MAX( p_size )
                  FROM part );
```

The query above returns p_name, p_brand, p_type of the largest p_size value from part table. The query has MAX aggregation in the SubQuery of the conditional clause.

The query above can be transformed to the query of returning only the last p_size data among data sorted in an ascending order by using the index access for p_size.

This transformed query can be retrieved by outputting the execution plan as follows.

```
gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand, p_type
FROM part
WHERE p_size = ( SELECT MAX( p_size )
                  FROM part );
P_NAME P_BRAND P_TYPE
-----
Part#3 Brand#2 STEEL
1 row selected.
>>> start print plan
< Execution Plan >
=====
|  IDX  |  NODE DESCRIPTION                                |  ROWS  |
-----
|    0  |  SELECT STATEMENT                                |         |
|    1  |  TABLE ACCESS ("PART")                          |         1 |
|    2  |  SUB QUERY LIST                                  |         1 |
|    3  |  INDEX ACCESS ("PART", PART_SIZE)                 |         1 |
```

```
=====
1  -  READ COLUMNS : P_NAME, P_BRAND, P_TYPE, P_SIZE
      PHYSICAL FILTER : P_SIZE = P_SIZE
2  -  READ COLUMNS : P_SIZE
3  -  READ INDEX COLUMNS : P_SIZE
      MAX RANGE : P_SIZE IS NOT NULL
<<< end print plan
```

In the execution plan output above, the max range value is retrieved by using index access for subQuery in the conditional clause.

Rewrite Target on Exists

The rewrite target on exists feature transforms the target clause into the constant value in a subQuery which is located in exists or not exists operation. Exists or not exists operation determines whether the subQuery result row exists or not.

The result is same even when transforming target clause into the constant value because the number of targets or the result of the target expression does not affect the results of the operator.

The rewrite target on exists feature improves query processing performance by reducing an unnecessary expression processing in the target clause.

The following is an example of a query.

```
SELECT p_name, p_brand, p_type
FROM part
WHERE EXISTS( SELECT /*+ NO_QUERY_TRANSFORMATION */
               l_quantity, l_extendedprice * (1 - l_discount)
             FROM lineitem
             WHERE l_partkey = p_partkey
               AND l_quantity > 30 );
```

The query above returns the result rows of part table for the p_partkey when a row whose l_quantity is bigger than 30 exists among rows whose l_partkey and p_partkey are same in lineitem table.

Exists operator in conditional clause has two targets, which are l_quantity and l_extendedprice * (1 - l_discount). They can be transformed to a constant value (TRUE), and the transformed query can be retrieved by outputting the execution plan as follows.

However, **NO_QUERY_TRANSFORMATION** hint prevents query transformation.

```
gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand, p_type
```

```

FROM part
WHERE EXISTS( SELECT /*+ NO_QUERY_TRANSFORMATION */
                l_quantity, l_extendedprice * (1 - l_discount)
              FROM lineitem
              WHERE l_partkey = p_partkey
                AND l_quantity > 30 );

```

```
P_NAME P_BRAND  P_TYPE

```
    PHYSICAL FILTER : L_PARTKEY = {P_PARTKEY} AND L_QUANTITY > 30
```

```
<<< end print plan
```

In the execution plan output above, target for subQuery in exists is transformed into TRUE.

Access Paths

An access path is a method to access a single table. Access paths are classified into table access, index access, rowid access, index concat.

A query optimizer calculates the cost of each access method, then selects the access method with the lowest cost as the execution plan.

Table Access

A table access is a method which scans a stored table when retrieving a table instead of using index or rowid. In general, a query optimizer selects table access method only when other methods can not be used or the user specifies table access hint because table access cost more than any other access method.

The table access is used in the following cases.

- Index does not exist.
- The function exists on the column side at the filter for the column in an index. (e.g. $i1 + 1 = 10$)
- Table access cost is small because the condition for the index's first column does not exist. (e.g. $i2 = 3$ condition is given to an index whose index keys are $i1$ and $i2$)
- The table is small so table access is less expensive than index access.
- A user specifies the table access hint (e.g. `FULL(t1)` hint)
- Though the condition for the index exists, but table access is needed. Therefore, the table access cost turns out to be low when calculating the cost.

The following is an example of using the table access when an index with filter column does not exist.

```
gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand, p_type
  FROM part
 WHERE p_size > 20;
P_NAME P_BRAND  P_TYPE
-----
Part#3 Brand#2   STEEL
1 row selected.
>>> start print plan
< Execution Plan >

=====

1 - READ COLUMNS : P_PARTKEY, P_NAME, P_BRAND, P_TYPE
   PHYSICAL FILTER : P_PARTKEY > 1
<<< end print plan

```

Index Access

An index access performs table scan using an index. In general, when an index is usable in the filter, the index access is more efficient than others. When the index access is available, a query optimizer calculates the cost, and selects the index access with the lowest cost. When a user specifies the index access hint, then a query optimizer calculates the cost of the user defined indexes, and selects the index access with the lowest cost.

However, the index access is not selected in the following cases.

- The index exists in a filter, but it costs more than another access method, such as the table access when calculating the cost.
- The user specifies another access hint except for an index access, and it can be used. (e.g. FULL(t1) hint)
- There is a condition to select another access method. (Refer to the case when using the **Table Access**.)

The following is an example of using the index access selected by a query optimizer.

```
gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand, p_type
  FROM part
 WHERE p_partkey = 1;
P_NAME P_BRAND  P_TYPE
-----
Part#1 Brand#1  COPPER
1 row selected.
>>> start print plan
< Execution Plan >

=====

<<< end print plan

```

Rowid Access

Rowid access directly accesses the page by using the rowid when retrieving the table. To use the rowid access, the filter for the rowid should exist. A query optimizer selects the rowid access prior to other accesses when the condition for the rowid access exists.

The following is an example of using the rowid access.

```

gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand, p_type
  FROM part
 WHERE ROWID = 'AAAAAAAAADiACAAACCjAAA';
P_NAME P_BRAND  P_TYPE

=====

1 - READ COLUMNS : P_NAME, P_BRAND, P_TYPE
    ROWID ACCESS EXPR : ROWID = 'AAAAAAAAADiACAAACCjAAA'
<<< end print plan

```

Index Concat

If an *or* statement exists in a filter and the index access can be executed on each filter divided by the *or* operator, then the index concat returns the result by combining the results of each index access.

The index concat is a concat node which has multiple index access on the subordinate nodes. If the *or* statement exists in a filter, a query optimizer calculates the cost of the index concat and selects the index concat when it has lower cost than other accesses.

The index concat cost is calculated as follows.

1. The filters are created which are newly adjusted based on *or*.
2. The most appropriate index is selected among indexes which are applicable to filters classified based on *or*.
3. The concat cost is calculated to remove the duplicate when collecting the results of the selected indexes.
4. The cost of the previously selected concat is added, then the final index concat cost is determined.

The index concat node is executed as follows.

1. The first node among the subordinate nodes of the index concat node is executed.
2. Among the execution results, the data for removing the duplicates are stored in concat node. The result is transferred to the superordinate node.
3. From the second node, the duplicates are checked in the concat node, and the data for removing the duplicates in the non-duplicate rows are stored in the concat node. Then, the result is transferred to the superordinate node.

The following is an example of using the index concat.

```
gSQL>
\EXPLAIN PLAN
SELECT /*+ INDEX_COMBINE(part, part_size) */
      p_name, p_brand, p_type
FROM part
WHERE p_size = 1
      OR p_size = 21;

<<< end print plan

```

Join

Join combines result rows from two tables (or views) into a single result row. Join condition specifies the condition for combining rows from two tables (or views). Join without join condition returns the results which each rows of one table is combined with all rows of the other table.

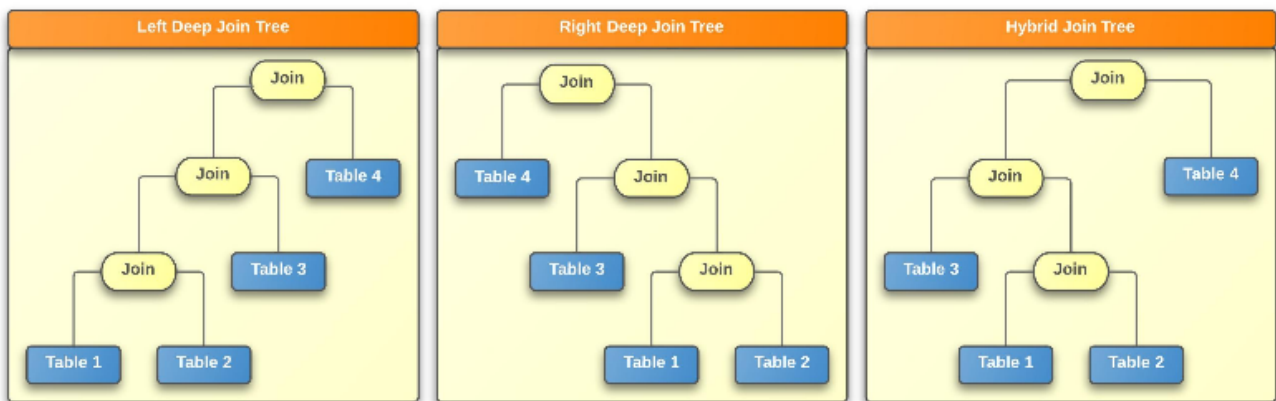

The join process is generally expressed in a tree form. The left table in the join tree is an outer node and the right table is an inner node. In general, join is executed by reading a row of the outer node then combining it with the inner node rows which satisfy the join condition.

If there are three or more tables (or views) in FROM clause, two tables are joined first, and then the result is joined with the third table.

In this case, if join node exists only on the outer node, it is called as left deep join tree. If join node exists only on the inner node, it is called as right deep join tree. If join node exists on both outer and inner node, it is called as hybrid join tree.

The figure below describes the join tree type.

Figure 2 Join tree type

In the figure above, all three types of join tree are performed in an order of table 1, table 2, table 3, table 4. If all data in each table is same and all the join conditions are same as well, then the three types of join tree return the same result. The order of the result rows can be different from each other.

A query optimizer considers the following four items when calculating the join cost.

- The access paths cost to each table which participates in join
- The cost according to join type (inner, outer etc.)
- The cost of available join methods
- The cost according to the order of the two tables which participates in join

The cost differs according to the 4 items above, and a query optimizer selects the plan with lowest cost among them.

Join Type

Cross Join

A cross join does not have a join condition. Therefore, all inner node rows are combined to each outer node row, then they are returned as the join result row.

The following is an example of the cross join.

```
gSQL>
\EXPLAIN PLAN
SELECT s_name, c_name FROM supplier, customer;
S_NAME          C_NAME
-----
Supplier#1      Customer#1
Supplier#1      Customer#2
Supplier#1      Customer#3
```

```

Supplier#1      Customer#4
Supplier#1      Customer#5
Supplier#2      Customer#1
Supplier#2      Customer#2
Supplier#2      Customer#3
Supplier#2      Customer#4
Supplier#2      Customer#5
Supplier#3      Customer#1
Supplier#3      Customer#2
Supplier#3      Customer#3
Supplier#3      Customer#4
Supplier#3      Customer#5
Supplier#4      Customer#1
Supplier#4      Customer#2
Supplier#4      Customer#3
Supplier#4      Customer#4
Supplier#4      Customer#5
S_NAME         C_NAME
-----

```

```

Supplier#5      Customer#1
Supplier#5      Customer#2
Supplier#5      Customer#3
Supplier#5      Customer#4
Supplier#5      Customer#5

```

25 rows selected.

>>> start print plan

< Execution Plan >

```

=====
|  IDX  |  NODE DESCRIPTION                                |  ROWS  |

|    3  |      TABLE ACCESS ("CUSTOMER")                   |     5  |
=====

```

1 - JOINED COLUMNS : SUPPLIER.S_NAME, CUSTOMER.C_NAME

2 - READ COLUMNS : S_NAME

3 - READ COLUMNS : C_NAME

<<< end print plan

Inner Join

An inner join has a join condition. Therefore, only the inner node rows which satisfy the join condition are combined to each row of outer node, then they are returned to the join result row.

A join condition consists of operators between columns of two tables (or views). If the operator of the Join condition is =(equal), then it is called equi-join. Otherwise it is called non-equi-join.

The following is an example of an equi-join in the inner join.

```
gSQL>
\EXPLAIN PLAN

Outer Join

Outer join have a join condition. If any inner join row satisfies the join condition, outer node rows are combined with inner node rows which satisfies the join condition, then return the results. If there is not any inner join row to satisfy the join condition, outer node rows are combined rows which have NULL data only, and return the results.

Outer join is differentiated from other joins by having direction such as left, right and full.

Outer node of left outer join is the left table of a join, and outer node of right outer join is the right table of a join.

Full outer join is the union of left outer join and right outer join. It combines rows which satisfy the join condition, the left and right node rows which do not satisfy the condition and the rows which have NULL data only. Then it returns the result.

The right outer join result is equivalent to the left outer join result when executing it after exchanging the tables' position which are located at each end. Namely, "A LEFT OUTER JOIN B" and "B RIGHT OUTER JOIN A" are equivalent in an aspect of the result. Therefore, query optimizer generates the plan by replacing all the right outer join with left outer join.

The following is an example of the left outer join.

```
gSQL>
```

```
\EXPLAIN PLAN
```

```
SELECT p_name, p_brand, ps_availqty
FROM part LEFT OUTER JOIN partsupp
    ON p_partkey = ps_partkey
    AND ps_availqty > 5000;

Semi Join

A semi join returns only the outer node rows which satisfy the join condition, so it should have a join condition. The semi join returns only the outer node rows whose inner node rows satisfy the join condition.

The semi join can not be explicitly specified in the SQL statement, but query optimizer transforms the operators (IN, EXIST) and ANY type quantify operators (= ANY) to the semi join.

A nested loops join and a hash join support the semi join in the inverted form.

An inverted semi join in the nested loops join has an index for the join condition of the outer node. Therefore, it reads inner node rows in the way of ensuring its uniqueness, and returns the result which satisfy the join condition from the outer node.

This method is used when there are many rows in the outer node, there is a join condition index, and there are small number of rows in the inner node. The uniqueness of inner node rows should be ensured, so the sort instance is used for it. The inverted semi join using the nested loops join has better performance than the semi join using the general nested loops join. For example, it reduces the cost of generating the hash instance. It is because the inverted semi join using the nested loops join performs the index access to the outer node with many rows by using a small number of inner node rows, and returns the join result.

The inverted semi join using the hash join generates outer node as a hash instance, and reads inner node rows. Then it returns the unreturned rows among the rows which satisfy the join condition from the hash instance.

This method is used when there are small number of rows in the outer node, and there many rows in the inner node.

The inverted semi join using the hash join makes a small number of outer node rows into the hash instance,

and returns the result by reading many inner node rows and scanning the hash instant. Therefore, it improves the performance than the semi join which generates the hash instant in the inner node by using the hash join. For example, it reduces the cost of generating the hash instance.

The following is an example of the semi join.

```
gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand
  FROM part
 WHERE p_partkey IN ( SELECT ps_partkey
                      FROM partsupp
                      WHERE ps_availqty > 5000 );

```

Anti-semi Join

An anti-semi join returns only the outer node rows whose inner node rows do not satisfy the join condition. Therefore, the anti-semi join should have a join condition.

The anti-semi join can not be explicitly specified in the SQL statement, but query optimizer transforms the operators (NOT IN, NOT EXISTS) and ALL type quantify operators (= ALL) to anti-semi join.

The anti-semi join separately processes NULL data, unlike semi-join, if NULL data exists. It is because the comparison operation of NULL data returns UNKNOWN instead of TRUE/FALSE.

A query optimizer performs the anti-semi join if the anti-semi join condition guarantees the absence of NULL. If not, it performs the null-aware anti-semi join.

The following is an example of the anti-semi join which guarantees the absence of NULL data in the join condition.

```
gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand
  FROM part
 WHERE p_partkey NOT IN ( SELECT ps_partkey
                        FROM partsupp
                        WHERE ps_availqty > 5000 );

Join Method

Join methods are join operation methods for two tables (or views). They are classified into a nested loops join, a sort merge join, and a hash join.

A query optimizer calculates cost for these three join methods, then selects the join method of the lowest cost.

Nested Loops Join

A nested loops join is the basic join and it does not generate a separate instance in the outer node or the inner node when performing the join. A query optimizer performs the nested loops join in the following cases.

- The join condition does not exist.
- The equi-join condition does not exist in join condition.
- An effective access method such as index exists in inner node.
- USE_NL hint is specified.

The nested loops join usually has a good performance when the inner node uses an index access by the join condition. A query optimizer selects the nested loops join when it is considered as best by calculating the cost.

The nested loops join can be extended by using instances. The extended nested loops join generates a sort instance in the inner node for a similar effects like as index access in join condition.

It is used when the cost of generating the sort instance is added but the cost of searching the inner node rows satisfying the join condition is decreased, so the entire join cost is decreased.

The following is an example of the nested loops join.

```
gSQL>
\EXPLAIN PLAN
SELECT /*+ USE_NL(part, partsupp) */
      p_name, p_brand, p_type
FROM part, partsupp
WHERE p_partkey = ps_partkey
      AND ps_availqty > 5000;

```

Sort Merge Join

A sort merge join sorts the outer node rows and the inner node rows by column satisfying the join condition, then sequentially compares them, and returns the result of join. If there is an index in the outer node and in the inner node for the column which satisfies the join condition, and it is available, then that index is used. Otherwise, it sorts the rows by using the sort instant.

The sort merge join has the better performance than the nested loops join. It is because the sort merge join sequentially reads the sorted data in the outer node and the inner node, and compares the join condition. On the other hand, the nested loops join searches for rows which satisfy the join condition from all inner node rows for each outer node row.

However, if the cost of generating the sort instant in the outer node and the inner node, and sorting rows are big, then the performance is degraded. Therefore, a query optimizer calculates the cost, and selects the sort merge join when its cost is low.

When performing the sort merge join, at least one equi-join should be included in the join condition, and rows are sorted by columns of equi-join conditions.

If there is an index which includes all equi-join conditioned columns, it is used only when the order (ascending, descending) of each column in index key is usable in sort merge join.

For example, if the column I1, I2 is used for sort merge join, and I1 is sorted in ascending order and I2 is sorted in descending order in an index, then the index can not be used.

The following is an example of the sort merge join.

```

gSQL>
\EXPLAIN PLAN
SELECT /*+ USE_MERGE(part, partsupp) */
      p_name, p_brand, p_type

```

```

4 - READ COLUMNS : PS_PARTKEY, PS_AVAILQTY
    PHYSICAL FILTER : PS_AVAILQTY > 5000

```

```

<<< end print plan

```

Hash Join

A hash join performs join by generating the hash instance in the inner node. It has a good performance because hash instance is generated only in the inner node and a join condition is compared by using the hash.

When performing hash join, at least one equi-join should be included in a join condition, and it costs for generating the hash instance whose hash key is columns in the equi-join condition.

However, the hash join has a better performance than other join methods, when the index for the join condition does not exist in the inner node. It is because the hash key can quickly read each outer node row when performing the join condition.

The following is an example of the hash join.

```
gSQL>
\EXPLAIN PLAN
SELECT /*+ USE_HASH(part, partsupp) */
      p_name, p_brand, p_type
FROM part, partsupp
WHERE p_partkey = ps_partkey
      AND ps_availqty > 5000;

<<< end print plan
```

Join Concat

The join condition for the join concat has an *or* statement, and the join conditions which are separated by an *or* statement is processed as a separate join, then they are combined into one result. The join concat selects the best plan for each join condition which is separated by the *or* condition, and removes the dupl

icates, then returns the result.

The join concat is similar to the index concat except that the join concat has a join node as a subordinate node.

The following is an example the index concat.

```
gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand, p_type
  FROM part, partsupp
 WHERE ( p_partkey = ps_partkey AND ps_availqty > 5000 )

## Cluster

A cluster collects data in a local server and a remote server, then combines them into a result set. The clusters are classified into a cluster access and a cluster join. The cluster access collects data of a single table, and the cluster join collects the data of joining two or more tables.

### Cluster Access

The cluster access retrieves the table data in a local server and a remote server in a cluster environment. The cluster access collects a single table data and one of accesses corresponding to the **Access Paths** above can be in its subordinate.

The cluster access is required only when the data should be retrieved from the remote server. Therefore, the cluster access does not occur in a stand alone, nor does it occur when the data should be retrieved only from the local server in a cluster environment.

The following is an example of using the cluster access.

```

gSQL>
\EXPLAIN PLAN
SELECT p_name, p_brand, p_type
 FROM part
 WHERE p_size > 20;
P_NAME P_BRAND P_TYPE

Part#3 Brand#2 STEEL
1 row selected.

 BIND PARAMS : {0} IN
2 - READ COLUMNS : P_NAME, P_BRAND, P_TYPE, P_SIZE
 PHYSICAL FILTER : P_SIZE > 20
<<< end print plan

```

## Cluster Join

The cluster join retrieves the join result data in a local server and a remote server in a cluster environment. The cluster join collects the result data of joining two or more tables and one of methods corresponding to the **Join Method** above can be in its subordinate.

The cluster join is required only when the data should be retrieved from the remote server. Therefore, the cluster join does not occur in a stand alone, nor does it occur when the data should be retrieved only from the local server in a cluster environment.

The following is an example of using the cluster join.

```

gSQL>

```

## Statistics Information

A query optimizer uses statistics information to calculate the cost. Statistics information used by the query optimizer includes the information about table statistics, column statistics, and index statistics.

- Table statistics
  - The number of rows.
- Column statistics
  - The number of non-identical values
  - The number of the NULL values
  - The average length of a value
  - The minimum value
  - The maximum value
- Index statistics
  - The number of non-identical keys

**ANALYZE TABLE** statement is performed to construct the statistics. The constructed statistics is stored in the database and that statistics is used until the new statistics is constructed.

In case when a statistics is not constructed in a table, then use it after constructing the statistics by using the catalog information and page information at the time of query execution.

## Adjusting Optimizer

Generally, a query optimizer selects the most efficient plan by using the given statistics information. However, a better plan than the selected plan may exist. If a query optimizer does not select the best plan, the user can adjust the plan to be selected.

Currently in GOLDILOCKS, a query optimizer provides a hint. If the hint is described and applicable, then the hint which is described by a user is preferentially applied regardless of the calculated cost. Therefore, when a better plan exists, the user can change the plan by using the hint.

For more information about hint, refer to **hint clause**.

## 15.4 SQL Execution Plan

### Overview

SQL execution constructs the plan which is selected as the best among many candidate plans by a query optimizer into a form to be executed. SQL execution plan is separated by execution node unit and each node has an filter to be executed.

The top nodes of an SQL execution plan are classified as INSERT, DELETE, UPDATE and SELECT statements. Each node consists in a tree form which starts from the top node, and it is actually performed from the left bottom node.

The SQL execution plan tree includes the following information.

- The order of the tables referenced by the statement
- Access paths to each table
- Join method of node which processes the join
- Information of the sorting, grouping, aggregation, filter, etc

The identical SQL statements have SQL execution plans in same form, but they can have SQL execution plans in other form in the following cases.

- The tables in different schemas have the same name and the queries are performed for the different schemas.
- After the previous query execution, the schema change occurs such as adding/deleting index.
- After the previous query execution, the statistical information changed by adding/deleting the data, and query optimizer selects and performs the other plan which is better using the change.

### Output

### Syntax

```

<explain plan> ::=
 \explain plan [on | only] <sql statement>
<sql statement> ::=
 <query expression>
 | <select for update statement>
 | <select statement: single row>
 | <insert statement>

```

```
| <update statement: searched>
| <delete statement: searched>
```

## Invocation and Access Rules

To execute <explain plan>, the access privilege on <sql statement> is required.

## Syntax Rules and Parameters

### <explain plan>

- \explain plan on
  - <sql statement> is executed and the query result is output together.
- \explain plan only
  - <sql statement> is not executed.
- \explain plan
  - It is as same as \explain plan on.

### <sql statement>

<sql statement> is a target query to output the execution plan.

## Description

It outputs the execution plan of SELECT and DML statements specified in <sql statement>.

## Examples

When used together with ON as follows, it performs SQL statement and outputs the query result together with the execution plan.

```
gSQL> \explain plan on SELECT id, name FROM t1 ORDER BY 1;
```

```
ID NAME
```

```
-- -----
```

```
1 leekmo
```

```
2 jhkim
```

```
3 bsyu
```

```
3 rows selected.
```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
```

```

<<< end print plan

```

When ON or ONLY is omitted as follows, it performs SQL statement and outputs the query result together with the execution plan.

```

gSQL> \explain plan on SELECT id, name FROM t1 ORDER BY 1;
ID NAME
-- -----
1 leekmo
2 jhkim
3 bsyou
3 rows selected.
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
-----|-----|-----|
| 0 | SELECT STATEMENT | |
| 1 | SORT INSTANT ACCESS | 3 |
| 2 | TABLE ACCESS ("T1") | 3 |
=====
 1 - SORT KEY : "T1.ID ASC NULLS LAST"
 RECORD COLUMNS : NAME
 READ COLUMNS : ID, NAME
 2 - READ COLUMNS : ID, NAME
<<< end print plan

```

When used together with ONLY as follows, it does not perform SQL statement but outputs the execution plan without the query result.

```
gSQL> \explain plan only SELECT id, name FROM t1 ORDER BY 1;
```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
```

| IDX | NODE DESCRIPTION    | ROWS |
|-----|---------------------|------|
| 0   | SELECT STATEMENT    |      |
| 1   | SORT INSTANT ACCESS | 0    |
| 2   | TABLE ACCESS ("T1") | 0    |

```
=====
```

```
1 - SORT KEY : "T1.ID ASC NULLS LAST"
```

```
 RECORD COLUMNS : NAME
```

```
 READ COLUMNS : ID, NAME
```

```
2 - READ COLUMNS : ID, NAME
```

```
<<< end print plan
```

## Reading

### Configuring SQL Execution Plan

An SQL execution plan is determined by a query optimizer, and it consists of nodes for actual query processing. The SQL execution plan is output by using EXPLAIN PLAN as follows.

```
gSQL> \explain plan SELECT id, name FROM t1;
```

```
ID NAME
```

```
-- -----
```

```
1 leekmo
```

```
2 jhkim
```

```
3 bsyou
```

```
3 rows selected.
```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
```

| IDX | NODE DESCRIPTION    | ROWS |
|-----|---------------------|------|
| 0   | SELECT STATEMENT    |      |
| 1   | TABLE ACCESS ("T1") | 3    |

```
=====
```

```
1 - READ COLUMNS : ID, NAME
```

```
<<< end print plan
```

In the example above, \explain plan is specified before the SQL statement to output the SQL execution plan. As a result, the execution plan is output between `>>> start print plan` and `<<< end print plan`, which is between the start and end of the execution result.

The output of SQL execution plans are classified as execution plan node table and node information. Execution plan node outputs the node name and the number of performed rows in a table form. Node Information outputs the detailed information of each execution plan node.

## Execution Plan Node Table

An execution plan node table in **Configuring SQL Execution Plan** which is about the query to retrieve id and name of the table t1 is as follows.

```
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | TABLE ACCESS ("T1") | 3 |
=====
```

In the example above, the execution plan node table consists of columns of IDX, NODE DESCRIPTION, ROWS. Each node has a unique id number starting from zero. The tree form structure of each node is distinguished by a white space before the node name. In the example above, SELECT STATEMENT has TABLE ACCESS as a subordinate node.

Information for each column in execution plan node table is as follows.

- IDX
  - The identifier assigned to each plan node
- NODE DESCRIPTION
  - plan node name
  - Additional information in parentheses distinguishes the plan node.
  - Plan node indicated by the indentation means the subordinate plan node.
    - Starting from the subordinate plan node, and the result is transferred to the superordinate plan node.
- ROWS
  - The number of the result records by performing plan node.

The execution plan node table above is interpreted as follows.

- The execution plan node table above obtained 3 results by performing *TABLE ACCESS* for the table T1, and it is transferred by inputting *SELECT STATEMENT*.

## Node Information

Node information in **Configuring SQL Execution Plan** which is about the query to retrieve id and name of the table t1 is as follows.

```
1 - READ COLUMNS : ID, NAME
```

The node information is output when there are information to be output. The IDX of execution plan node table is output in front of the node to distinguish nodes. The classified name and information is output at the end of the node.

Each information is output within a single line per information when it is needed to output various kinds of information.

The node information above is interpreted as follows.

- ID and NAME are the targets of read column when performing *TABLE ACCESS* for the table T1.

## Classification of Execution Plan Node

The execution plan nodes are classified as <statement node>, <access node>, <join node>, <instant node>, <aggregation node>, <SET operator node>, <subQuery node>, <filter node>, <cluster node> and <other node>.

Each node is described in the following table.

**Table 15-2** Classification of the execution plan node

| Node           | Refer to                                           |
|----------------|----------------------------------------------------|
| Statement node | DELETE STATEMENT                                   |
|                | INSERT STATEMENT                                   |
|                | SELECT STATEMENT                                   |
|                | UPDATE STATEMENT                                   |
| Access node    | INDEX ACCESS (table_name [ AS alias ], index_name) |
|                | TABLE ACCESS (table_name [ AS alias ])             |
|                | USER ROWID ACCESS (table_name [ AS alias ])        |
| Join node      | HASH JOIN (join_method)                            |
|                | NESTED LOOP JOIN (join_method)                     |
|                | SORT MERGE JOIN (join_method) : EQUAL              |
| Instant node   | GROUP HASH INSTANT ACCESS                          |
|                | HASH JOIN INSTANT ACCESS                           |
|                | HASH JOIN INSTANT ACCESS (UNIQUE)                  |
|                | SORT INSTANT ACCESS                                |
|                | SORT INSTANT ACCESS (UNIQUE)                       |
|                | SORT JOIN INSTANT ACCESS                           |

| Node              | Refer to                                        |
|-------------------|-------------------------------------------------|
|                   | SORT JOIN INSTANT ACCESS (UNIQUE)               |
| Aggregation node  | HASH AGGREGATION                                |
| SET operator node | EXCEPT ALL                                      |
|                   | EXCEPT DISTINCT                                 |
|                   | INTERSECT ALL                                   |
|                   | INTERSECT DISTINCT                              |
|                   | UNION ALL                                       |
|                   | UNION DISTINCT                                  |
| SubQuery node     | SUB QUERY FUNCTION                              |
|                   | SUB QUERY FUNCTION (MATERIALIZED)               |
|                   | SUB QUERY LIST                                  |
| Filter node       | FILTER                                          |
| Cluster node      | CLUSTER ACCESS (table_name) [sharding_strategy] |
|                   | CLUSTER JOIN                                    |
| Other node        | CONCAT                                          |
|                   | DELETE (table_name)                             |
|                   | INSERT (table_name)                             |
|                   | UPDATE (table_name)                             |
|                   | VIEW                                            |
|                   | VIEW (view_name)                                |
|                   | GROUP                                           |

## Classification of Node Information

Node information is classified as <Column Information>, <Filter Information> and <Aggregation Information>.

Each node information is described in the following table.

**Table 15-3** Classification of node information

| Node information   | Name                                | Description                                                               |
|--------------------|-------------------------------------|---------------------------------------------------------------------------|
| Column information | READ COLUMNS<br>COLUMNS             | The column list which will be transferred from current node to the result |
|                    | INDEX COLUMNS<br>READ INDEX COLUMNS | The column list which the index will refer to                             |
|                    | TABLE COLUMNS<br>READ TABLE COLUMNS | The column list which the table will refer to                             |

| Node information        | Name                      | Description                                                                                |
|-------------------------|---------------------------|--------------------------------------------------------------------------------------------|
|                         | JOINED COLUMNS            | The column list which will be transferred to the join result                               |
|                         | SORT KEY                  | The column list to be used as sort key in sort instance                                    |
|                         | RECORD COLUMNS            | The column list excluding sort keys in sort instance                                       |
|                         | GROUPING COLUMNS          | The column list to be used as grouping key                                                 |
| Filter information      | PHYSICAL FILTER           | AND-filter of comparison operation which does not need type casting                        |
|                         | LOGICAL FILTER            | AND-filter which excludes physical filter                                                  |
|                         | JOIN FILTER               | Filter about join condition                                                                |
|                         | WHERE FILTER              | Filter to apply to rows consisting of join operation                                       |
|                         | HASH FILTER               | Filter which is processed by using hash key                                                |
|                         | PHYSICAL TABLE FILTER     | AND-filter about comparison operation which does not need type casting among table filters |
|                         | LOGICAL TABLE FILTER      | AND-filter which excludes physical filter among table filters                              |
|                         | MIN RANGE                 | Min key range of index                                                                     |
|                         | MAX RANGE                 | Max key range of index                                                                     |
|                         | PHYSICAL KEY FILTER       | AND-filter about comparison operation which does not need type casting among index filters |
|                         | LOGICAL KEY FILTER        | AND-filter which excludes physical filter among index filters                              |
|                         | MERGE FILTER              | Filter which is used for merge join in sort merge join                                     |
|                         | SUBQUERY FILTER           | SubQuery AND filter to process a subQuery                                                  |
|                         | FUNCTION                  | Function expression to process a subQuery                                                  |
|                         | ROWID ACCESS EXPRESSION   | Filter related to a rowid                                                                  |
|                         | NODE FILTER               | Filter evaluating only once at the first execution                                         |
|                         | FILTER                    | Filter evaluating every rowid                                                              |
| Aggregation information | AGGREGATIONS              | General aggregation list                                                                   |
|                         | NESTED AGGREGATIONS       | Nested aggregation list                                                                    |
| Other information       | NODE EXPR                 | Expression executing only once at the first execution                                      |
|                         | SQL                       | SQL query statement to be transferred to a remote server                                   |
|                         | BIND PARAMS               | Bind parameter used in the SQL query statement above                                       |
|                         | REFERENCE SHARD KEY VALUE | Value of '=' filter for a column which is specified as a shard key in a table              |

## Execution Plan Node References

### CLUSTER ACCESS (table\_name) [sharding\_strategy]

- It collects results of the access node in a local server and a remote server in a cluster environment.
- It is created only when the data should be retrieved from the remote server.
- Node Information
  - SQL: The SQL query statement to be transferred to a remote server
  - BIND PARAMS: A bind parameter used in the SQL query statement above
  - REFERENCE SHARD KEY VALUE: Value of '=' filter for a column which is specified as a shard key in a table

The following is an example.

```
gSQL> \explain plan only
 SELECT l_orderkey
 FROM lineitem
 WHERE l_orderkey = 1
 AND l_linenumber = 2;
>>> start print plan
< Execution Plan >

_A1"."L_ORDERKEY", "_A1"."L_LINENUMBER" FROM "PUBLIC"."LINEITEM"@LOCAL "_A1" WHERE
_A1"."L_ORDERKEY" = ? AND "_A1"."L_LINENUMBER" = ?
 BIND PARAMS : {0} IN {1} IN
 REFERENCE SHARD KEY VALUE : (1, 2)
2 - READ INDEX COLUMNS : L_ORDERKEY, L_LINENUMBER
 MIN RANGE : L_ORDERKEY = 1 AND L_LINENUMBER = 2
```

```
MAX RANGE : L_ORDERKEY = 1 AND L_LINENUMBER = 2
```

```
<<< end print plan
```

## CLUSTER JOIN

- It collects results of the join node in a local server and a remote server in a cluster environment.
- It is created only when the data should be retrieved from the remote server.
- Node Information
  - SQL: The SQL query statement to be transferred to a remote server
  - BIND PARAMS: A bind parameter used in the SQL query statement above
  - REFERENCE SHARD KEY VALUE: Value of '=' filter for a column which is specified as a shard key in a table

The following is an example.

```
gSQL> \explain plan only
 SELECT c_name, o_totalprice
 FROM orders, customer
 WHERE o_custkey = c_custkey
 AND o_orderkey = 1;
 2 3 4 5
```

```
>>> start print plan
```

```
< Execution Plan >
```

```
 MIN RANGE : C_CUSTKEY = {O_CUSTKEY}
```

```
 MAX RANGE : C_CUSTKEY = {O_CUSTKEY}
```

```
<<< end print plan
```

## CONCAT

- It concatenate the results for the subordinate nodes.
- It is generated when OR operation exists in the WHERE clause for index access or join.

The following is an example.

```
gSQL> \explain plan only
```

```
 SELECT s_suppkey FROM supplier WHERE s_suppkey = 1 or s_suppkey = 2;
```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
IDX	NODE DESCRIPTION	ROWS
0	SELECT STATEMENT	
1	CONCAT	0
2	INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX")	0
3	INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX")	0
=====
```

```
2 - READ INDEX COLUMNS : S_SUPPKEY
```

```
 MIN RANGE : S_SUPPKEY = 1
```

```
 MAX RANGE : S_SUPPKEY = 1
```

```
3 - READ INDEX COLUMNS : S_SUPPKEY
```

```
 MIN RANGE : S_SUPPKEY = 2
```

```
 MAX RANGE : S_SUPPKEY = 2
```

```
<<< end print plan
```

## DELETE STATEMENT

- It performs the DELETE statement.
- It has the subordinate node, **DELETE (table\_name)**

The following is an example.

```
gSQL> \explain plan only DELETE FROM supplier;
>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
0	DELETE STATEMENT	
1	DELETE ("SUPPLIER")	0
2	INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX")	0
=====

 2 - READ INDEX COLUMNS : S_SUPPKEY
<<< end print plan
```

## DELETE (table\_name)

It performs the DELETE statement on the specified table.

The following is an example.

```
gSQL> \explain plan only DELETE FROM supplier;
>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
0	DELETE STATEMENT	
1	DELETE ("SUPPLIER")	0
2	INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX")	0
=====

 2 - READ INDEX COLUMNS : S_SUPPKEY
<<< end print plan
```

## EXCEPT ALL

It performs the EXCEPT ALL operation for the subordinate nodes in an order of IDX.

The following is an example.

```
gSQL> \explain plan only
 SELECT s_suppkey FROM supplier
 EXCEPT ALL
 SELECT /*+ FULL(lineitem) */ l_suppkey FROM lineitem
 EXCEPT ALL
 SELECT ps_suppkey FROM partsupp;
>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
0	SELECT STATEMENT	
1	EXCEPT-ALL	0
2	INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX")	0
3	TABLE ACCESS ("LINEITEM")	0
4	INDEX ACCESS ("PARTSUPP, PARTSUPP_PK_INDEX")	0
=====

 2 - READ INDEX COLUMNS : S_SUPPKEY
 3 - READ COLUMNS : L_SUPPKEY
 4 - READ INDEX COLUMNS : PS_SUPPKEY
<<< end print plan
```

## EXCEPT DISTINCT

It performs EXCEPT DISTINCT operation for the subordinate nodes in an order of IDX.

The following is an example.

```
gSQL> \explain plan only
 SELECT s_suppkey FROM supplier
 EXCEPT DISTINCT
 SELECT /*+ FULL(lineitem) */ l_suppkey FROM lineitem
 EXCEPT DISTINCT
 SELECT ps_suppkey FROM partsupp;
>>> start print plan
< Execution Plan >
```

```

IDX	NODE DESCRIPTION	ROWS
0	SELECT STATEMENT	
1	EXCEPT-DISTINCT	0
2	INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX")	0
3	TABLE ACCESS ("LINEITEM")	0
4	INDEX ACCESS ("PARTSUPP, PARTSUPP_PK_INDEX")	0
=====|=====|=====|
2 - READ INDEX COLUMNS : S_SUPPKEY
3 - READ COLUMNS : L_SUPPKEY
4 - READ INDEX COLUMNS : PS_SUPPKEY
<<< end print plan

```

## FILTER

- It processes a filter for the subordinate sub-query result, a node expression, or a node filter.
- Node Information
  - READ COLUMNS: A column list to be read from a filter
  - NODE EXPR: An expression executing only once at the first execution
  - NODE FILTER: A filter evaluating only once at the first execution
  - FILTER: A filter evaluating every row
  - SUBQUERY FILTER: sub-query AND-filter

The following is an example.

```
gSQL> \explain plan only
 SELECT l_orderkey
 FROM lineitem
 WHERE 1 = 1
 AND l_linenumber = 1 + random(1,1)
 AND l_quantity * l_discount >= 10 + random(1,1)
 AND l_orderkey in
 (SELECT /*+ NO_QUERY_TRANSFORMATION */ o_orderkey
 FROM orders);
```

```
>>> start print plan
```

< Execution Plan >

| idx | node description | rows |
|-----|------------------|------|
| 0   | SELECT STATEMENT |      |
| 1   | <b>FILTER</b>    | 0    |

|   |                                            |   |
|---|--------------------------------------------|---|
| 2 | TABLE ACCESS ("LINEITEM")                  | 0 |
| 3 | SUB QUERY LIST                             | 0 |
| 4 | SUB QUERY FUNCTION (MATERIALIZED)          | 0 |
| 5 | INDEX ACCESS ("ORDERS", "ORDERS_PK_INDEX") | 0 |

```
=====
1 - READ COLUMNS : LINEITEM.L_ORDERKEY
 NODE EXPR : 1 + RANDOM(1,1)
 NODE FILTER : 1 = 1
 FILTER : (LINEITEM.L_QUANTITY * LINEITEM.L_DISCOUNT) >= (10 + RANDOM(1,1))
 SUBQUERY FILTER : (LINEITEM.L_ORDERKEY) IN (ORDERS.O_ORDERKEY)
2 - READ COLUMNS : L_ORDERKEY, L_LINENUMBER
 PHYSICAL FILTER : L_LINENUMBER = ?
4 - FUNCTION : (L_ORDERKEY) IN (O_ORDERKEY)
5 - READ INDEX COLUMNS : O_ORDERKEY
```

```
<<< end print plan
```

## GROUP

- It performs a grouping operation which does not require materialization.
- It is generated when GROUP BY clause or DISTINCT clause is in SELECT statement.
  - However, it is supported only when the uniqueness or sort order is ensured for the grouping key.
  - For other cases, the grouping is supported through GROUP HASH INSTANT ACCESS.
- Node information
  - AGGREGATIONS
    - An unnested aggregation list which is to be processed during grouping
    - Executing the grouping
  - GROUPING COLUMNS: A column list consisting of a grouping key
  - RECORD COLUMNS: A column list which is not a grouping key but is added for reference
  - READ COLUMNS: A column list to be read as the grouping results
  - LOGICAL FILTER: The entire AND-filter

The following is an example.

```
gSQL> \explain plan only SELECT /*+ INDEX(lineitem) */ max(sum(l_quantity))
 FROM lineitem
 GROUP BY l_orderkey
 HAVING sum(l_quantity) > 10 and mod(sum(l_quantity), 10) = 1;2 3 4
>>> start print plan
< Execution Plan >
```

```
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
```

```

0	SELECT STATEMENT		
1	HASH AGGREGATION		0
2	GROUP		0
3	INDEX ACCESS("LINEITEM, LINEITEM_PK_INDEX")		0
=====
1 - AGGREGATIONS : MAX(SUM(L_QUANTITY))
2 - AGGREGATIONS : SUM(L_QUANTITY)
 GROUPING COLUMNS : L_ORDERKEY
 RECORD COLUMNS : SUM(L_QUANTITY)
 READ COLUMNS : SUM(L_QUANTITY)
 LOGICAL FILTER : MOD(SUM(L_QUANTITY),10) = 1 AND SUM(L_QUANTITY) > 10
3 - READ INDEX COLUMNS : L_ORDERKEY
 READ TABLE COLUMNS : L_QUANTITY
<<< end print plan

```

## GROUP HASH INSTANT ACCESS

- It performs grouping operation.
- It is generated when GROUP BY clause or DISTINCT clause is in SELECT statement.
- Node information
  - AGGREGATIONS: An unnested aggregation list which is to be processed during grouping
  - NESTED AGGREGATIONS
    - A nested aggregation list which is to be processed during grouping
    - Executing the grouping
  - GROUPING COLUMNS: A column list of instance consisting of a grouping key
  - RECORD COLUMNS: A column list of instance which is not a grouping key but is added for reference
  - READ COLUMNS: A column list to be read from an instant
  - PHYSICAL FILTER: An AND-filter for comparison operation which does not require the type casting
  - LOGICAL FILTER: An AND-filter which excludes PHYSICAL FILTER from the entire FILTER

The following is an example.

```

gSQL> \explain plan only SELECT /*+ FULL(lineitem) */ max(sum(l_quantity))
 FROM lineitem
 GROUP BY l_orderkey
 HAVING sum(l_quantity) > 10 and mod(sum(l_quantity), 10) = 1;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | | ROWS |

```

```

0	SELECT STATEMENT	
1	GROUP HASH INSTANT ACCESS	0
2	TABLE ACCESS ("LINEITEM")	0
=====
1 - AGGREGATIONS : SUM(L_QUANTITY)
 NESTED AGGREGATIONS : MAX(SUM(L_QUANTITY))
 GROUPING COLUMNS : L_ORDERKEY
 RECORD COLUMNS : SUM(L_QUANTITY)
 READ COLUMNS : SUM(L_QUANTITY)
 PHYSICAL FILTER : SUM(L_QUANTITY) > 10
 LOGICAL FILTER : MOD(SUM(L_QUANTITY),10) = 1
2 - READ COLUMNS : L_ORDERKEY, L_QUANTITY
<<< end print plan

```

## HASH AGGREGATION

- It performs the aggregation for the result of the subordinate node.
- If aggregation can not be processed in the subordinate node, a separated HASH AGGREGATION node is generated.
- Node information
  - AGGREGATIONS: An unnested aggregation list which is to be processed in a node

The following is an example.

```

gSQL> \explain plan only SELECT sum(l_quantity) FROM orders, lineitem;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | | ROWS |
=====
| 0 | SELECT STATEMENT | | |
| 1 | HASH AGGREGATION | 0 | |
| 2 | NESTED LOOP JOIN (INNER JOIN) | 0 | |
| 3 | TABLE ACCESS ("LINEITEM") | 0 | |
| 4 | INDEX ACCESS ("ORDERS, ORDERS_PK_INDEX") | 0 | |
=====
1 - AGGREGATIONS : SUM(L_QUANTITY)
2 - JOINED COLUMNS : LINEITEM.L_QUANTITY
3 - READ COLUMNS : L_QUANTITY
4 - READ INDEX COLUMNS : NOTHING
<<< end print plan

```

## HASH JOIN (join\_method)

- It performs a hash join for the two subordinate nodes.
- Inner node of a subordinate node consists of hash instants.
- IDX of the outer node is smaller than IDX of the inner node. (The outer node is displayed on top.)
- join\_method
  - INNER JOIN
  - LEFT OUTER JOIN
  - FULL OUTER JOIN
  - LEFT SEMI JOIN
  - LEFT SEMI JOIN NA
  - INVERTED LEFT SEMI JOIN
  - LEFT ANTI SEMI JOIN
- Node information
  - JOINED COLUMNS: A column list which is to be a join result
  - JOIN FILTER: A filter which is to be applied as a join condition
  - WHERE FILTER: A filter which is to be applied after join operation

The following is an example.

```
gSQL> \explain plan only
 SELECT l_quantity
 FROM orders FULL OUTER JOIN lineitem
 ON o_orderkey = l_orderkey and o_orderdate <> l_shipdate
 WHERE o_orderkey > 1;
>>> start print plan
< Execution Plan >
```

| IDX | NODE DESCRIPTION                   | ROWS |
|-----|------------------------------------|------|
| 0   | SELECT STATEMENT                   |      |
| 1   | <b>HASH JOIN (FULL OUTER JOIN)</b> | 0    |
| 2   | TABLE ACCESS ("ORDERS")            | 0    |
| 3   | HASH JOIN INSTANT ACCESS           | 0    |
| 4   | TABLE ACCESS ("LINEITEM")          | 0    |

```

1 - JOINED COLUMNS : ORDERS.O_ORDERKEY, LINEITEM.L_QUANTITY
 JOIN FILTER : {O_ORDERDATE} <> {L_SHIPDATE}
 WHERE FILTER : ORDERS.O_ORDERKEY > 1
2 - READ COLUMNS : O_ORDERKEY, O_ORDERDATE
3 - INDEX COLUMNS : L_ORDERKEY
 TABLE COLUMNS : L_SHIPDATE, L_QUANTITY
```

```

 READ COLUMNS : L_ORDERKEY, L_SHIPDATE, L_QUANTITY
 HASH FILTER : {O_ORDERKEY} = L_ORDERKEY
4 - READ COLUMNS : L_ORDERKEY, L_QUANTITY, L_SHIPDATE
<<< end print plan

```

## HASH JOIN INSTANT ACCESS

- It is the inner node of the hash join.
- It configures the hash instance for the result of the subordinate node based on the column expression which is used as a hash join condition(equi-join).
- Node information
  - INDEX COLUMNS: A column list of the hash instant which is to be a hash column
  - TABLE COLUMNS: A column list of the hash instant which excludes hash columns
  - READ COLUMNS: A column list which is to be read from the hash instant
  - HASH FILTER: An equi-join condition for the hash join
  - PHYSICAL TABLE FILTER: An AND-filter for the comparison operation which does not require the type casting and does not include INDEX COLUMNS
  - LOGICAL TABLE FILTER: An AND-filter which excludes PHYSICAL TABLE FILTER from the entire TABLE FILTER

The following is an example.

```

gSQL> \explain plan only
 SELECT /*+ USE_HASH(orders, lineitem)
 ORDERING(orders, lineitem) */ l_quantity
 FROM orders INNER JOIN lineitem
 ON o_orderkey = l_orderkey and l_suppkey > o_orderkey
 and l_quantity * 20 > o_totalprice;

```

```
>>> start print plan
```

```
< Execution Plan >
```

```

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
0	SELECT STATEMENT	
1	HASH JOIN (INNER JOIN)	0
2	TABLE ACCESS ("ORDERS")	0
3	HASH JOIN INSTANT ACCESS	0
4	TABLE ACCESS ("LINEITEM")	0
=====

1 - JOINED COLUMNS : LINEITEM.L_QUANTITY
2 - READ COLUMNS : O_ORDERKEY, O_TOTALPRICE
3 - INDEX COLUMNS : L_ORDERKEY

```

```

TABLE COLUMNS : L_SUPPKEY, L_QUANTITY
READ COLUMNS : L_ORDERKEY, L_SUPPKEY, L_QUANTITY
HASH FILTER : {O_ORDERKEY} = L_ORDERKEY
PHYSICAL TABLE FILTER : L_SUPPKEY > {O_ORDERKEY}
LOGICAL TABLE FILTER : (L_QUANTITY * 20) > {O_TOTALPRICE}
4 - READ COLUMNS : L_ORDERKEY, L_SUPPKEY, L_QUANTITY
<<< end print plan

```

## HASH JOIN INSTANT ACCESS (UNIQUE)

- It configures the hash instance for the result of the subordinate node based on the column expression which is used as hash join condition(equi-join).
  - However, it configures the hash instance by excluding the duplicates based on the entire hash column list.
- It is generated when the hash join method is semi join or anti semi join.
- Node information
  - INDEX COLUMNS: A column list of the hash instant which is to be a hash column
  - TABLE COLUMNS: A column list of the hash instance which excludes the hash column
  - READ COLUMNS: A column list which is to be read from hash instant
  - HASH FILTER: An equi-join condition for the hash join
  - PHYSICAL TABLE FILTER: An AND-filter for the comparison operation which does not require the type casting and includes columns which is not INDEX COLUMNS.
  - LOGICAL TABLE FILTER: An AND-filter which excludes PHYSICAL TABLE FILTER from the entire TABLE FILTER

The following is an example.

```

gSQL> \explain plan only
 SELECT o_custkey
 FROM orders
 WHERE o_orderkey in
 (SELECT l_orderkey
 FROM lineitem);

```

```
>>> start print plan
```

```
< Execution Plan >
```

| ===== |     |  |                                   |  |      |
|-------|-----|--|-----------------------------------|--|------|
|       | IDX |  | NODE DESCRIPTION                  |  | ROWS |

2 - READ COLUMNS : O_ORDERKEY, O_CUSTKEY
3 - INDEX COLUMNS : L_ORDERKEY
 HASH FILTER : {O_ORDERKEY} = L_ORDERKEY
4 - READ COLUMNS : L_ORDERKEY
<<< end print plan

```

## INDEX ACCESS (table\_name [ AS alias ], index\_name)

- It searches for records in table\_name using the index in index\_name.
- Node information
  - READ INDEX COLUMNS: A referencing column list which is the index key column
  - READ TABLE COLUMNS: A referencing column list excluding the index key column
  - AGGREGATIONS: An unnested aggregation list which is to be processed in a node
  - MIN RANGE: A min key range of an index
  - MAX RANGE: A max key range of an index
  - PHYSICAL KEY FILTER: An AND-filter for the comparison which does not requires type casting and whose only target is the key column
  - LOGICAL KEY FILTER: An AND-filter in the entire KEY FILTER, except for PHYSICAL KEY FILTER
  - PHYSICAL TABLE FILTER: An AND-filter for the comparison which does not require the type casting and includes columns which are not index key columns
  - LOGICAL TABLE FILTER: An AND-filter which excludes PHYSICAL TABLE FILTER from the entire TABLE FILTER

The following is an example.

```

gSQL> \explain plan only
 SELECT /*+ INDEX(lineitem) */ count(l_orderkey)
 FROM lineitem
 WHERE l_orderkey > 100 and l_linenumber > 0
 and mod(l_orderkey, 2) = 0 and l_quantity > 0
 and l_discount * l_tax > 100;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | 1 |
| 1 | INDEX ACCESS ("LINEITEM, LINEITEM_PK_INDEX") | 0 |
=====

```

```

1 - READ INDEX COLUMNS : L_ORDERKEY, L_LINENUMBER
 READ TABLE COLUMNS : L_QUANTITY, L_DISCOUNT, L_TAX
 AGGREGATIONS : COUNT(L_ORDERKEY)
 MIN RANGE : L_ORDERKEY > 100
 MAX RANGE : L_ORDERKEY IS NOT NULL
 PHYSICAL KEY FILTER : L_LINENUMBER > 0
 LOGICAL KEY FILTER : MOD(L_ORDERKEY,2) = 0
 PHYSICAL TABLE FILTER : L_QUANTITY > 0
 LOGICAL TABLE FILTER : (L_DISCOUNT * L_TAX) > 100

```

```
<<< end print plan
```

## INSERT STATEMENT

- It performs the INSERT statement.
- It has **INSERT (table\_name)** as a subordinate node.

The following is an example.

```

gSQL> \explain plan only
 INSERT INTO supplier VALUES (123, 'jhkim', 'KOREA', '0123456789');
>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | INSERT STATEMENT | |
| 1 | INSERT ("SUPPLIER") | 0 |
=====

<<< end print plan

```

## INSERT (table\_name)

It performs the INSERT operation for the specified table.

The following is an example.

```
gSQL> \explain plan only
 INSERT INTO supplier VALUES (123, 'jhkim', 'KOREA', '0123456789');
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |

```

|  |   |  |                     |  |   |  |
|--|---|--|---------------------|--|---|--|
|  | 0 |  | INSERT STATEMENT    |  |   |  |
|  | 1 |  | INSERT ("SUPPLIER") |  | 0 |  |

<<< end print plan

### INTERSECT ALL

It performs the INTERSECT ALL operation for subordinate nodes.

The following is an example.

```
gSQL> \explain plan only
 SELECT s_supkey FROM supplier
 INTERSECT ALL
 SELECT /*+ FULL(lineitem) */ l_supkey FROM lineitem
 INTERSECT ALL
 SELECT ps_supkey FROM partsupp;
```

>>> start print plan

< Execution Plan >

|  |     |  |                                              |  |      |  |
|--|-----|--|----------------------------------------------|--|------|--|
|  | IDX |  | NODE DESCRIPTION                             |  | ROWS |  |
|  | 0   |  | SELECT STATEMENT                             |  |      |  |
|  | 1   |  | INTERSECT-ALL                                |  | 0    |  |
|  | 2   |  | INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX") |  | 0    |  |
|  | 3   |  | TABLE ACCESS ("LINEITEM")                    |  | 0    |  |
|  | 4   |  | INDEX ACCESS ("PARTSUPP, PARTSUPP_PK_INDEX") |  | 0    |  |

- 2 - READ INDEX COLUMNS : S\_SUPPKEY
- 3 - READ COLUMNS : L\_SUPPKEY
- 4 - READ INDEX COLUMNS : PS\_SUPPKEY

<<< end print plan

### INTERSECT DISTINCT

It performs the INTERSECT DISTINCT operation for subordinate nodes.

The following is an example.

```
gSQL> \explain plan only
 SELECT s_supkey FROM supplier
```

```

INTERSECT DISTINCT
SELECT /*+ FULL(lineitem) */ l_suppkey FROM lineitem
INTERSECT DISTINCT
SELECT ps_suppkey FROM partsupp;

```

```
>>> start print plan
```

```
< Execution Plan >
```

```
=====
```

|       | IDX |  | NODE DESCRIPTION                             |  | ROWS |  |
|-------|-----|--|----------------------------------------------|--|------|--|
| ----- |     |  |                                              |  |      |  |
|       | 0   |  | SELECT STATEMENT                             |  |      |  |
|       | 1   |  | <b>INTERSECT-DISTINCT</b>                    |  | 0    |  |
|       | 2   |  | INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX") |  | 0    |  |
|       | 3   |  | TABLE ACCESS ("LINEITEM")                    |  | 0    |  |
|       | 4   |  | INDEX ACCESS ("PARTSUPP, PARTSUPP_PK_INDEX") |  | 0    |  |

```
=====
```

```

2 - READ INDEX COLUMNS : S_SUPPKEY
3 - READ COLUMNS : L_SUPPKEY
4 - READ INDEX COLUMNS : PS_SUPPKEY

```

```
<<< end print plan
```

## NESTED LOOP JOIN (join\_method)

- It performs a nested loop join for the two subordinate nodes.
- IDX of the outer node is smaller than IDX of the inner node. (The outer node is displayed on top.)
- join\_method
  - CROSS JOIN
  - INNER JOIN
  - LEFT OUTER JOIN
  - FULL OUTER JOIN
  - LEFT SEMI JOIN
  - INVERTED LEFT SEMI JOIN
  - LEFT ANTI SEMI JOIN
- Node information
  - JOINED COLUMNS: A column list which is to be a join result
  - JOIN FILTER: A filter which is to be applied as a join condition
  - WHERE FILTER: A filter which is to be applied after join operation

The following is an example.

```

gSQL> \explain plan only
 SELECT /*+ USE_NL(orders, lineitem)
 ORDERING(orders, lineitem) */ l_quantity

```

```

FROM orders FULL OUTER JOIN lineitem
 ON o_orderkey = l_orderkey
WHERE l_quantity > 10;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | NESTED LOOP JOIN (FULL OUTER JOIN) | 0 |
| 2 | TABLE ACCESS ("ORDERS") | 0 |
| 3 | TABLE ACCESS ("LINEITEM") | 0 |
=====
1 - JOINED COLUMNS : LINEITEM.L_QUANTITY
 JOIN FILTER : {O_ORDERKEY} = {L_ORDERKEY}
 WHERE FILTER : LINEITEM.L_QUANTITY > 10
2 - READ COLUMNS : O_ORDERKEY, O_TOTALPRICE
3 - READ COLUMNS : L_ORDERKEY, L_SUPPKEY, L_QUANTITY
<<< end print plan

```

## SELECT STATEMENT

It performs the SELECT statement.

The following is an example.

```

gSQL> \explain plan only SELECT s_suppkey FROM supplier;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX") | 0 |
=====
1 - READ INDEX COLUMNS : S_SUPPKEY
<<< end print plan

```

## SORT INSTANT ACCESS

- It configures the sort instance for the result of the subordinate node based on the sort key column.
- It is generated when using the ORDER BY clause or materializing the subquery in SELECT statement.

- Node information
  - SORT KEY: A column list of the sort instance to be a sort key column
  - RECORD COLUMNS: A column list of the sort instance which excludes the sort key column
  - READ COLUMNS: A column list which is read from the sort instant
  - MIN RANGE: A min key range of an index
  - MAX RANGE: A max key range of an index
  - PHYSICAL KEY FILTER: An AND-filter for the comparison which does not require type casting and whose only target is the key column
  - LOGICAL KEY FILTER: An AND-filter in the entire KEY FILTER, except for PHYSICAL KEY FILTER
  - PHYSICAL TABLE FILTER: An AND-filter for the comparison which does not require the type casting and includes columns which is not index key column
  - LOGICAL TABLE FILTER: An AND-filter which excludes PHYSICAL TABLE FILTER from the entire TABLE FILTER

The following is an example.

```
gSQL> \explain plan only
 SELECT /*+ USE_NL(lineitem, partsupp)
 ORDERING(lineitem, partsupp) */ l_orderkey
 FROM lineitem INNER JOIN
 (SELECT /*+ NO_QUERY_TRANSFORMATION */
 ps_partkey, ps_suppkey, ps_availqty
 FROM partsupp OFFSET 1)
 ON l_partkey = ps_partkey and l_suppkey = ps_suppkey
 and ps_suppkey > l_suppkey and ps_partkey + 1 > l_partkey
 and ps_availqty < l_quantity and ps_availqty * 10 > l_quantity;
>>> start print plan
< Execution Plan >
=====

| 1 | NESTED LOOP JOIN (INNER JOIN) | 0 |
| 2 | TABLE ACCESS ("LINEITEM") | 0 |
| 3 | SORT INSTANT ACCESS | 0 |
| 4 | VIEW | 0 |
| 5 | TABLE ACCESS ("PARTSUPP") | 0 |
=====
1 - JOINED COLUMNS : LINEITEM.L_ORDERKEY
2 - READ COLUMNS : L_ORDERKEY, L_PARTKEY, L_SUPPKEY, L_QUANTITY
3 - SORT KEY : "PARTSUPP.PS_SUPPKEY ASC NULLS LAST",
 "PARTSUPP.PS_PARTKEY ASC NULLS LAST"
```

```

RECORD COLUMNS : PS_AVAILQTY
READ COLUMNS : PS_SUPPKEY, PS_PARTKEY, PS_AVAILQTY
 MIN RANGE : PS_SUPPKEY = {L_SUPPKEY}
 AND PS_SUPPKEY > {L_SUPPKEY}
 MAX RANGE : PS_SUPPKEY = {L_SUPPKEY}
 PHYSICAL KEY FILTER : PS_PARTKEY = {L_PARTKEY}
 LOGICAL KEY FILTER : (PS_PARTKEY + 1) > {L_PARTKEY}
 PHYSICAL TABLE FILTER : PS_AVAILQTY < {L_QUANTITY}
 LOGICAL TABLE FILTER : (PS_AVAILQTY * 10) > {L_QUANTITY}
4 - COLUMNS : PS_PARTKEY, PS_SUPPKEY, PS_AVAILQTY
5 - READ COLUMNS : PS_PARTKEY, PS_SUPPKEY, PS_AVAILQTY
<<< end print plan

```

## SORT INSTANT ACCESS (UNIQUE)

- It configures the sort instance for the result of the subordinate node based on the sort key column.
  - However, it configures the sort instance by excluding the duplicates based on the entire sort key column list.
- The node is created when subquery result is materialized as a outer node of join.
- Node information
  - SORT KEY: A column list of the sort instance which is a sort key column
  - READ COLUMNS: A column list which is read from the sort instant

The following is an example.

```

gSQL> \explain plan only
 SELECT l_orderkey
 FROM lineitem
 WHERE EXISTS(SELECT /*+ NL_ISJ */ o_orderkey
 FROM orders WHERE o_orderkey = l_orderkey);
>>> start print plan
< Execution Plan >

```

## SORT JOIN INSTANT ACCESS

- It is the inner node of sort merge join.
- It configures the sort instance for the result of the subordinate node based on the column expression which is used as sort merge join condition (equi-join).
- Node information
  - SORT KEY: A column list of the sort instance which is a sort key column
  - RECORD COLUMNS: A column list of the sort instance which excludes the sort key column
  - READ COLUMNS: A column list which is read from the sort instant
  - MIN RANGE: The min key range of the sort instant
  - MAX RANGE: The max key range of the sort instant

The following is an example.

```

gSQL> \explain plan only
 SELECT /*+ USE_MERGE(orders, lineitem)
 ORDERING(orders, lineitem) */ l_quantity
 FROM orders INNER JOIN lineitem
 ON o_orderkey = l_orderkey
 and l_quantity * 20 > o_totalprice;

```

```
>>> start print plan
```

```
< Execution Plan >
```

```

=====

 MIN RANGE : L_ORDERKEY >= {O_ORDERKEY}
 MAX RANGE : L_ORDERKEY IS NOT NULL
4 - READ COLUMNS : L_ORDERKEY, L_QUANTITY
<<< end print plan

```

## SORT JOIN INSTANT ACCESS (UNIQUE)

- It configures the sort instance for the result of the subordinate node based on the column expression which is used as sort merge join condition (equi-join).
  - However, it configures the sort instance by excluding the duplicates based on the entire sort key column list.
- Node information
  - SORT KEY: A column list of the sort instance which is a sort key column
  - RECORD COLUMNS: A column list to be read from a sort instance
  - MIN RANGE: The min key range of the sort instant
  - MAX RANGE: The max key range of the sort instant

The following is an example.

```

gSQL> \explain plan only
 SELECT o_custkey
 FROM orders
 WHERE o_orderkey in
 (SELECT /*+ MERGE_SJ FULL(lineitem) */ l_orderkey FROM lineitem);
>>> start print plan
< Execution Plan >
=====

```

## SORT MERGE JOIN (join\_method) : EQUAL

- It performs a sort merge join for the two subordinate nodes.
- Inner node of the subordinate node consists of a sort instant.
- IDX of the outer node is smaller than IDX of the inner node. (The outer node is displayed on top.)
- join\_method
  - INNER JOIN
  - LEFT OUTER JOIN
  - FULL OUTER JOIN
  - LEFT SEMI JOIN
  - LEFT ANTI SEMI JOIN
- Node information
  - JOINED COLUMNS: A column list which is to be a join result
  - MERGE FILTER: A filter which is to be used as a equi-join condition
  - JOIN FILTER: A filter which is to be applied to the join condition
  - WHERE FILTER: A filter which is to be applied after join operation

The following is an example.

```

gSQL> \explain plan only
 SELECT /*+ USE_MERGE(orders, lineitem) */ l_quantity
 FROM orders FULL OUTER JOIN lineitem
 ON o_orderkey = l_orderkey and o_orderdate <> l_shipdate
 WHERE o_orderkey > 1;
>>> start print plan
< Execution Plan >

 JOIN FILTER : {O_ORDERDATE} <> {L_SHIPDATE}
 WHERE FILTER : ORDERS.O_ORDERKEY > 1
2 - READ INDEX COLUMNS : O_ORDERKEY
 READ TABLE COLUMNS : O_ORDERDATE
3 - SORT KEY : "LINEITEM.L_ORDERKEY ASC NULLS LAST"
 RECORD COLUMNS : L_SHIPDATE, L_QUANTITY
 READ COLUMNS : L_ORDERKEY, L_SHIPDATE, L_QUANTITY
4 - READ COLUMNS : L_ORDERKEY, L_QUANTITY, L_SHIPDATE
<<< end print plan

```

## SUB QUERY FUNCTION

- It processes the function which includes a subquery.
- Node information
  - FUNCTION: A function expression

The following is an example.

```

gSQL> \explain plan only
 SELECT exists (SELECT /*+ FULL(lineitem) */ l_orderkey
 FROM lineitem
 WHERE o_orderkey = l_orderkey) FROM orders;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | INDEX ACCESS ("ORDERS, ORDERS_PK_INDEX") | 0 |

| 4 | TABLE ACCESS ("LINEITEM") | 0 |
=====
1 - READ INDEX COLUMNS : O_ORDERKEY
3 - FUNCTION : EXISTS((L_ORDERKEY))
4 - READ COLUMNS : L_ORDERKEY
 PHYSICAL FILTER : {O_ORDERKEY} = L_ORDERKEY
<<< end print plan

```

## SUB QUERY FUNCTION (MATERIALIZED)

- It processes the function after materializing the subquery result.
- Node information
  - FUNCTION: A function expression

The following is an example.

```
gSQL> \explain plan only
 SELECT o_orderkey in
 (SELECT /*+ FULL(lineitem) */ l_orderkey FROM lineitem)
 FROM orders;
>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====

3	SUB QUERY FUNCTION (MATERIALIZED)	0
4	TABLE ACCESS ("LINEITEM")	0
=====

 1 - READ INDEX COLUMNS : O_ORDERKEY
 3 - FUNCTION : (O_ORDERKEY) IN (L_ORDERKEY)
 4 - READ COLUMNS : L_ORDERKEY
<<< end print plan
```

## SUB QUERY LIST

- It executes subqueries and transfers the results to the superordinate node.
- It makes an outer column, if exists, a constant, and transfers it to the superordinate node.
  - The subordinate node column which is referenced by the superordinate node is the outer column.
- Node information
  - READ COLUMNS: A column list consists of an outer column.

The following is an example.

```
gSQL> \explain plan only
 SELECT (SELECT count(*) FROM lineitem) = count(*) FROM orders;
>>> start print plan
< Execution Plan >
```

```

=====
| IDX | NODE DESCRIPTION | ROWS |
=====

 AGGREGATIONS : COUNT(*)
2 - READ COLUMNS : COUNT(*)
3 - READ INDEX COLUMNS : NOTHING
 AGGREGATIONS : COUNT(*)

<<< end print plan

```

## TABLE ACCESS (table\_name [ AS alias ])

- It searches for records in table\_name.
- Node information
  - READ COLUMNS: A referencing column list
  - AGGREGATIONS: An unnested aggregation list which is to be processed in a node
  - PHYSICAL FILTER: An AND-filter for the comparison operation which does not require type casting
  - LOGICAL FILTER: An AND-filter in the entire TABLE FILTER, except for PHYSICAL FILTER

The following is an example.

```

gSQL> \explain plan only
 SELECT /*+ FULL(lineitem) */ count(l_orderkey)
 FROM lineitem
 WHERE l_orderkey > 0
 and l_quantity * l_extendedprice > 100;

>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | TABLE ACCESS ("LINEITEM") | 0 |
=====

 AGGREGATIONS : COUNT(L_ORDERKEY)

```

**PHYSICAL FILTER :** L\_ORDERKEY > 0

**LOGICAL FILTER :** ( L\_QUANTITY \* L\_EXTENDEDPRICE ) > 100

<<< end print plan

## UNION ALL

It performs the UNION ALL operation for the subordinate nodes.

The following is an example.

```
gSQL> \explain plan only
 SELECT s_suppkey FROM supplier
 UNION ALL
 SELECT /*+ FULL(lineitem) */ l_suppkey FROM lineitem
 UNION ALL
 SELECT ps_suppkey FROM partsupp;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | UNION-ALL | 0 |
| 2 | INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX") | 0 |
| 3 | TABLE ACCESS ("LINEITEM") | 0 |
| 4 | INDEX ACCESS ("PARTSUPP, PARTSUPP_PK_INDEX") | 0 |
=====
 2 - READ INDEX COLUMNS : S_SUPPKEY
 3 - READ COLUMNS : L_SUPPKEY
 4 - READ INDEX COLUMNS : PS_SUPPKEY
<<< end print plan
```

## UNION DISTINCT

It performs the UNION DISTINCT operation for the subordinate nodes.

The following is an example.

```
gSQL> \explain plan only
 SELECT s_suppkey FROM supplier
 UNION DISTINCT
 SELECT /*+ FULL(lineitem) */ l_suppkey FROM lineitem
```

```

UNION DISTINCT
SELECT ps_supkey FROM partsupp;

```

```
>>> start print plan
```

```
< Execution Plan >
```

| IDX | NODE DESCRIPTION                             | ROWS |
|-----|----------------------------------------------|------|
| 0   | SELECT STATEMENT                             |      |
| 1   | <b>UNION-DISTINCT</b>                        | 0    |
| 2   | INDEX ACCESS ("SUPPLIER, SUPPLIER_PK_INDEX") | 0    |
| 3   | TABLE ACCESS ("LINEITEM")                    | 0    |
| 4   | INDEX ACCESS ("PARTSUPP, PARTSUPP_PK_INDEX") | 0    |

```

2 - READ INDEX COLUMNS : S_SUPPKEY
3 - READ COLUMNS : L_SUPPKEY
4 - READ INDEX COLUMNS : PS_SUPPKEY

```

```
<<< end print plan
```

## UPDATE STATEMENT

- It performs the UPDATE statement.
- It has the subordinate node, **UPDATE (table\_name)**.

The following is an example.

```
gSQL> \explain plan only UPDATE lineitem SET l_quantity = l_quantity + 1;
```

```
>>> start print plan
```

```
< Execution Plan >
```

| IDX | NODE DESCRIPTION          | ROWS |
|-----|---------------------------|------|
| 0   | <b>UPDATE STATEMENT</b>   |      |
| 1   | UPDATE ("LINEITEM")       | 0    |
| 2   | TABLE ACCESS ("LINEITEM") | 0    |

```

2 - READ COLUMNS : L_QUANTITY

```

```
<<< end print plan
```

## UPDATE (table\_name)

It performs the UPDATE operation for the specified table.

The following is an example.

```
gSQL> \explain plan only UPDATE lineitem SET l_quantity = l_quantity + 1;
>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
0	UPDATE STATEMENT	
1	UPDATE ("LINEITEM")	0
2	TABLE ACCESS ("LINEITEM")	0
=====

 2 - READ COLUMNS : L_QUANTITY
<<< end print plan
```

## USER ROWID ACCESS (table\_name [ AS alias ])

- It searches for a single record which matches the given rowid.
- Node information
  - READ COLUMNS: A referencing column list
  - AGGREGATIONS: An unnested aggregation list which is to be processed in a node
  - ROWID ACCESS EXPR: A rowid expression to be searched
  - PHYSICAL FILTER: An AND-filter for the comparison operation which does not require type casting
  - LOGICAL FILTER: An AND-filter in the entire TABLE FILTER, except for PHYSICAL FILTER

The following is an example.

```
gSQL> \explain plan only
 SELECT /*+ ROWID(T1) */ COUNT(l_orderkey)
 FROM lineitem
 WHERE rowid = null and l_orderkey > 0
 and l_quantity * l_extendedprice > 100;
>>> start print plan
< Execution Plan >

=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | USER ROWID ACCESS ("LINEITEM") | 0 |
=====
```

```
=====
1 - READ COLUMNS : L_ORDERKEY, L_QUANTITY, L_EXTENDEDPRICE
 AGGREGATIONS : COUNT(L_ORDERKEY)
 ROWID ACCESS EXPR : ROWID = NULL
 PHYSICAL FILTER : L_ORDERKEY > 0
 LOGICAL FILTER : (L_QUANTITY * L_EXTENDEDPRICE) > 100
<<< end print plan
```

## VIEW

- It performs a subordinate node which consists of inline view.
- Node information
  - COLUMNS: A referencing column list
  - FILTER: An AND-filter for the result of a view query

The following is an example.

```
gSQL> \explain plan only
SELECT /*+ ORDERED FULL(T1) */ count(*)
FROM lineitem AS T1,
 (SELECT /*+ FULL(lineitem) */ l_orderkey key FROM lineitem
 UNION ALL
 SELECT /*+ FULL(orders) */ o_orderkey FROM orders)
WHERE key = 1 or key = 2;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | HASH AGGREGATION | 0 |
| 2 | NESTED LOOP JOIN (INNER JOIN) | 0 |
| 3 | TABLE ACCESS ("LINEITEM AS T1") | 0 |
| 4 | VIEW | 0 |
| 5 | UNION-ALL | 0 |
| 6 | TABLE ACCESS ("LINEITEM") | 0 |
| 7 | TABLE ACCESS ("ORDERS") | 0 |
=====
1 - AGGREGATIONS : COUNT(*)
2 - JOINED COLUMNS : NOTHING
3 - READ COLUMNS : NOTHING
4 - COLUMNS : L_ORDERKEY
```

```

 FILTER : LINEITEM.L_ORDERKEY = 1 OR LINEITEM.L_ORDERKEY = 2
6 - READ COLUMNS : L_ORDERKEY
7 - READ COLUMNS : O_ORDERKEY
<<< end print plan

```

## VIEW (view\_name)

- It performs inline view, or a view with the view name.
- Node information
  - COLUMNS: A referencing column list
  - FILTER: An AND-filter for the result of querying a view

The following is an example.

```

gSQL> \explain plan only
 SELECT /*+ ORDERING(T1, V1) FULL(T1) */ count(*)
 FROM (SELECT /*+ FULL(lineitem) */ l_orderkey key FROM lineitem
 UNION ALL
 SELECT /*+ FULL(orders) */ o_orderkey FROM orders) V1,
 lineitem AS T1
 WHERE V1.key = 1 or V1.key = 2;
>>> start print plan
< Execution Plan >
=====
| IDX | NODE DESCRIPTION | ROWS |
=====
| 0 | SELECT STATEMENT | |
| 1 | HASH AGGREGATION | 0 |
| 2 | NESTED LOOP JOIN (INNER JOIN) | 0 |
| 3 | TABLE ACCESS ("LINEITEM AS T1") | 0 |
| 4 | VIEW ("V1") | 0 |
| 5 | UNION-ALL | 0 |
| 6 | TABLE ACCESS ("LINEITEM") | 0 |
| 7 | TABLE ACCESS ("ORDERS") | 0 |
=====
1 - AGGREGATIONS : COUNT(*)
2 - JOINED COLUMNS : NOTHING
3 - READ COLUMNS : NOTHING
4 - COLUMNS : L_ORDERKEY
 FILTER : LINEITEM.L_ORDERKEY = 1 OR LINEITEM.L_ORDERKEY = 2
6 - READ COLUMNS : L_ORDERKEY
7 - READ COLUMNS : O_ORDERKEY

```

|| <<< end print plan

## 15.5 SQL Trace Log

### Overview

An SQL trace log is a log which records the analizable information of a user's query execution. SQL trace log is created in `$GOLDILOCKS_DATA/trc` directory. They are classified as a process ID and a session ID, and each of them is separately created. SQL trace log consists of the several information such as the user query, SQL execution plan, SQL processing time of each procedure, and they are output to the file.

### Output

To output the SQL trace log, the `TRACE_LOG_ID` property value should be set by using the `ALTER SESSION` or the `ALTER SYSTEM` statement. For more information about the set value, refer to **TRACE\_LOG\_ID** of the server property.

A trace log can record both a successful SQL query and a failed SQL query, and this is set by combining the flag value of the `TRACE_LOG_ID`.

#### Note

A failed SQL query is the query which is failed during the execution (The execution phase of **SQL Processing**) after a execution plan is determined through parsing, validation, optimization of an SQL statement. Therefore, the query which failed before the determination of the query execution plan does not record the trace log.

The following is an example of output the SQL trace log by using the `TRACE_LOG_ID` property.

- It outputs a successful SQL query and a failed SQL query.

```
gSQL> ALTER SESSION SET TRACE_LOG_ID = 110000;
Session altered.
```

- It outputs a successful SQL query and a bind value.

```
gSQL> ALTER SYSTEM SET TRACE_LOG_ID = 100010;
System altered.
```

TRACE\_LOG\_ID is a property which is used to output SQL trace log. If TRACE\_LOG\_ID is set to ALTER SESSION, then it is applied only to the corresponding session. If TRACE\_LOG\_ID is set to ALTER SYSTEM, then it is applied to all sessions of all processes which are connected to the server.

Therefore, ALTER SESSION is used to retrieve SQL trace log of the current session. ALTER SYSTEM is used to retrieve SQL trace log of other processes or sessions in progress.

#### Caution

Note that if many processes and sessions are connected to the server when ALTER SYSTEM is set, then SQL trace log files are generated as many as that. Therefore, be cautious when using ALTER SYSTEM.

The SQL trace log file is created under *trc* directory. The rule for the file name is as follows.

`opt_p[processID]_s[sessionID].trc`

*opt* is added to the front of the file name, and it is followed by *p* identifier along with process ID, and then *s* identifier with session ID follows it. The delimiter is - and the file extension is *trc*.

If the amount of information generated in the same session of the same process exceeds the maximum size of the SQL trace log file, the old information changes the file name by adding current time to the end of the file name. Then it keeps recording by making a new file with current file name.

The following is an example of the SQL trace log file name.

`opt_p17104_s12.trc`

## Output Format

SQL trace logs are classified as <SQL query string>, <execution plan>, <execution type>, <bind param value>, and <time info>.

### <SQL Query String>

It outputs queries which are input by the user together with the current time, its success or failure, and the query processing time.

`[The current time] [success or failure][the query processing time] SQL statement`

[The current time] is an output of the data and the time up to us unit, [success or failure] is output an S (success) or a F (failure). The query processing time is output in us unit, and the SQL statement is a statement input by a user.

By the way, if the **TRACE\_LOG\_TIME\_DETAIL** property is not set to *ON*, then the query processing time is measured in 10 ms unit. Be cautious when setting this property to *ON* because it may degrade the query processing performance.

## 〈Execution Plan〉

It outputs the execution plan for the SQL statement. It is almost as same as **SQL Execution Plan**, and the total time column is additionally output on the execution plan node table.

The total time which is output on the statement is the time to perform all queries. The total time which is output on each other node is the time to respectively perform the query in each node, and the total time is output in 10 ms units.

The **TRACE\_LOG\_TIME\_DETAIL** property is used to output more detailed output time. Be cautious when setting this property to *ON* because it may degrade the query processing performance.

## 〈Execution Type〉

It is the execution form of the SQL statement. It outputs *DIRECT EXECUTE*, if the query is directly executed, and outputs *PREPARE EXECUTE*, if the query is executed by using *prepare*.

## 〈Bind Param Value〉

It outputs the information of bind param value when bind param value is used in the SQL statement. It outputs *No Bind Param* when bind param value is not used in the SQL statement.

## 〈Time Info〉

It outputs the execution time for each phase of SQL process. The time info is separately output into module, time, rate, and call. Module outputs the phase name such as parse, validate. Time outputs the actual execution time and rate outputs the ratio of the each step's execution time to the total execution time. Call outputs the number of times which each phase is called.

Module is divided to the seven phases and the total. The seven phases are parse, validate, code opt, optimizer, data opt, execute, and fetch.

Parse is a step of parsing the query, and validate is a step of validating the parsed query. Code opt is a pre processing step for performing SQL optimizer, and optimizer is a step of performing the actual SQL optimizer. Data opt is a step of preparing for the actual SQL execution plan, and execute is a step of executing

SQL execution plan. Fetch is a step of collecting and returning the results of queries such as SELECT statements.

If the plan cache is used, then validate, code opt, optimizer may not be called. Time which is less than 10 ms outputs zero because time outputs in 10 ms units. Rate is the ratio of the execution time of each step to the total execution time, so the total is 100 %, and it outputs the ratio of dividing each step's execution time by total. If each step's execution time is zero, the rate outputs 0 %.

The `TRACE_LOG_TIME_DETAIL` property can be used to output more detailed time. Be cautious when setting this property to `ON` because it may degrade the query processing performance.

## Examples

The following is an SQL statement without the bind param value.

```
SELECT O_TOTALPRICE, O_ORDERDATE, L_QUANTITY
FROM ORDERS, LINEITEM
WHERE O_ORDERKEY = L_ORDERKEY
 AND O_ORDERDATE >= DATE '1996-01-01'
 AND L_SHIPMODE = 'AIR';
```

The following is an SQL trace log which is output when performing the SQL statement above after set the `TRACE_LOG_ID` to 101111.

```
[2017-05-25 12:27:59.199657] [S][0.000000] SELECT O_TOTALPRICE, O_ORDERDATE, L_QUANTITY
FROM ORDERS, LINEITEM
WHERE O_ORDERKEY = L_ORDERKEY
 AND O_ORDERDATE >= DATE '1996-01-01'
 AND L_SHIPMODE = 'AIR'

## **SQL References**

## 16.1 ALTER AUDIT POLICY

### Function

It adds an auditing target to an audit policy object, or drops an auditing target from an audit policy object.

### Syntax

```

<alter audit policy statement> ::=
 ALTER AUDIT POLICY policy_name
 { <add_audit_option> | <drop_audit_option> }
 ;
<add_audit_option> ::=
 ADD { <privilege_audit_clause> | <action_audit_clause> | <privilege_audit_clause>
<action_audit_clause> }
<drop_audit_option> ::=
 DROP { <privilege_audit_clause> | <action_audit_clause> | <privilege_audit_clause>
<action_audit_clause> }
<privilege_audit_clause> ::=
 PRIVILEGES <database_privilege> [, ...]
<action_audit_clause> ::=
 ACTIONS { <object_action_audit> | <system_action_audit> } [, ...]
<object_action_audit> ::=
 ALL ON [schema_name.]object_name
 | <object_action> ON [schema_name.]object_name
<system_action_audit> ::=
 ALL
 | <system_action>

```

### Invocation and Access Rules

AUDIT SYSTEM ON DATABASE privilege is required to perform <alter audit policy statement>.

## Syntax Rules and Parameters

### **policy\_name**

It is the name of an audit policy object to be altered.

### **<add\_audit\_option>**

It adds an auditing target to an audit policy.

### **<drop\_audit\_option>**

It drops an auditing target from an audit policy.

### **<privilege\_audit\_clause>**

For more information, refer to **CREATE AUDIT POLICY**.

### **<action\_audit\_clause>**

For more information, refer to **CREATE AUDIT POLICY**.

## Description

It can alter an audit policy which is already activated, and it does not effect the existing session but it effects only the newly created session.

#### Note

When dropping ALL option as follows, not all actions are dropped, but only the corresponding ALL option is dropped.

```
CREATE AUDIT POLICY p1
 ACTIONS ALL ON u1.t1,
 SELECT ON u1.t1;
ALTER AUDIT POLICY p1 DROP
```

```
ACTIONS ALL ON u1.t1;
```

## Examples

The following is an example of adding a new audit option to an audit policy.

```
ALTER AUDIT POLICY policy_dml
 ADD ACTIONS SELECT ON u1.t1;
```

The following is an example of dropping an audit option from an audit policy.

```
ALTER AUDIT POLICY policy_dml
 DROP ACTIONS SELECT ON u1.t1;
```

## Compatibility

The SQL standard does not have the audit policy.

## For More Information

Refer to the followings.

- Managing audit policy object
  - **CREATE AUDIT POLICY**
  - **DROP AUDIT POLICY**
  - **ALTER AUDIT POLICY**
- Activating/ deactivating audit policy
  - **AUDIT POLICY**
  - **NOAUDIT POLICY**
- Enquiring audit trail: **AUDIT\_TRAIL**
- Dropping audit trail: **ALTER DATABASE CLEAR AUDIT TRAIL**

## 16.2 ALTER CLUSTER GROUP name ADD MEMBER

### Function

It adds a cluster member to a cluster group.

### Syntax

```
<alter cluster group add member statement> ::=
 ALTER CLUSTER GROUP group_name ADD
 <cluster member definition> [, ...]
 ;
<cluster member definition> ::=
 CLUSTER MEMBER member_name <connection attribute>
<connection attribute> ::
 HOST 'address' PORT port_no
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <alter cluster group add member statement>.

### Syntax Rules and Parameters

#### group\_name

It is the cluster group name.

## ⟨cluster member definition⟩

It defines a cluster member to be included in a cluster group.

A cluster group may include maximum 32 cluster members.

### member\_name

It is the name of a cluster member.

The cluster member name should be as same as the member name which was defined when the database of that cluster member was created.

There should not be the same cluster group, nor the same cluster member.

The length of the name should be shorter than 128 bytes.

The start-up phase for the cluster member should be OPEN.

## ⟨connection attribute⟩

It defines the connection information for the communication between the cluster members.

⟨connection attribute⟩ should be as same as the HOST and PORT which were defined when the database of that cluster member was created.

The combination of HOST and PORT should be unique in the cluster system.

- HOST 'address' uses ip v4 type.
- PORT port\_no should be in the range between 1024 ~ 49151.

## Description

⟨alter cluster group add member statement⟩ statement does not rebalance shards in the tables.

The following statement should be performed to rebalance shards on the added cluster member.

- ALTER DATABASE REBALANCE
- ALTER TABLE name REBALANCE

## Examples

The following is an example of adding two cluster members to a cluster group.

```
gSQL>
ALTER CLUSTER GROUP g1 ADD
 CLUSTER MEMBER g1n3 HOST '192.168.0.13' PORT 10130,
 CLUSTER MEMBER g1n4 HOST '192.168.0.14' PORT 10140
;
Cluster Group altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **CREATE CLUSTER GROUP**
- **DROP CLUSTER GROUP**
- **ALTER DATABASE REBALANCE**
- **ALTER TABLE name REBALANCE**

## 16.3 ALTER CLUSTER GROUP name OFFLINE MEMBER

### Function

It sets a cluster member of the cluster group to offline.

### Syntax

```
<alter cluster group offline member statement> ::=
 ALTER CLUSTER GROUP group_name OFFLINE
 <cluster member definition>
 ;
<cluster member definition> ::=
 CLUSTER MEMBER member_name
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <alter cluster group offline member statement>.

### Syntax Rules and Parameters

#### group\_name

It is the cluster group name.

## ⟨cluster member definition⟩

It defines a cluster member to be included in a cluster group.

A cluster group may include maximum 32 cluster members.

### member\_name

It is the name of a cluster member.

The cluster member name should be as same as the member name which was defined when the database of that cluster member was created.

There should not be the same cluster group, nor the same cluster member.

The length of the name should be shorter than 128 bytes.

The start-up phase for the cluster member should be OPEN.

## Description

⟨alter cluster group offline member statement⟩ statement does not rebalance shards in the tables.

## Examples

The following is an example of setting a specific cluster member to offline.

```
gSQL>
ALTER CLUSTER GROUP g1 OFFLINE
 CLUSTER MEMBER g1n3
;
Cluster Group altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- `CREATE CLUSTER GROUP`
- `DROP CLUSTER GROUP`
- `ALTER DATABASE REBALANCE`
- `ALTER TABLE name REBALANCE`

## 16.4 ALTER CLUSTER LOCATION

### Function

It alters a cluster location information.

### Syntax

```
<alter cluster location statement> ::=
 ALTER CLUSTER LOCATION member_name
 <cluster connection attribute>
 ;
<cluster connection attribute> ::
 HOST 'address' PORT port_no
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <alter cluster location statement>.

### Syntax Rules and Parameters

#### member\_name

It is the name of a cluster member.

The same cluster member name should exist in the registered cluster location information.

The length of the name should be shorter than 128 bytes.

#### <cluster connection attribute>

It defines the connection information for the communication between the cluster members.

The combination of HOST and PORT should be unique in the cluster system.

- HOST 'address' uses ip v4 type.
- PORT port\_no should be in the range between 1024 ~ 49151.

## Description

If the connection information of the cluster location is altered, the cluster member does not need to be dropped or recreated, but the connection information can be altered by using **ALTER CLUSTER LOCATION**.

## Examples

```
gSQL>
ALTER CLUSTER LOCATION g1n2
 HOST '192.168.0.12' PORT 10120,
;
Created
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **CREATE CLUSTER LOCATION**
- **DROP CLUSTER LOCATION**

## 16.5 ALTER DATABASE ADD LOGFILE

### Function

It adds log file groups or log file members to the database.

### Syntax

```

<alter database add logfile statement> ::=
 <add logfile member statement>
 | <add logfile group statement>
 ;
<add logfile member statement> ::=
 ALTER DATABASE ADD LOGFILE MEMBER <add logfile clause> [, ...] TO
 <group clause>
<add logfile group statement> ::=
 ALTER DATABASE ADD LOGFILE <group clause> ('logfile_name' [, ...])
 <size clause> [REUSE]
<group clause> ::=
 GROUP integer
<add logfile clause> ::=
 'logfile_name' [REUSE]
<size clause> ::=
 integer [M | G]

```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database add logfile statement>.

### Syntax Rules and Parameters

## ⟨alter database add logfile statement⟩

The database should be in MOUNT phase.

## ⟨add logfile member statement⟩

The log member is added to an existing log file group.

- ⟨add logfile clause⟩
  - 'logfile\_name' is the file name of logfile member to be added to the log file group.
  - If the file does not exist, a new file is created.
  - The length of the logfile\_name should be shorter than 1024 bytes.
- ⟨group clause⟩
  - It specifies the identifier of the logfile group to be added to the database.
  - Integer should be an identifier of the existing logfile group.
  - If an identifier for the integer does not exist, an error occurs.

## ⟨add logfile group statement⟩

It adds a new log file group.

- It is added as the next group of the CURRENT log file group.
- ⟨group clause⟩
  - It specifies the identifier of the logfile group to be added to the database.
  - Integer should be an identifier of the unexisting logfile group.
  - If an identifier for the integer exists, an error occurs.
- ⟨size clause⟩
  - The file size can be specified minimum of 10 MB to maximum of 10 GB.
  - The file size should be bigger than the sum of redo log buffer size and pending log buffer size.
- When logfile\_name already exists, and the REUSE option is used, if the file size is as same as another group member, then the existing log file is reused.

## Description

It is recommended to back up the control file just in case for the file damage because the newly added log file groups and log members are stored in the control file.

## Examples

The following is an example of adding two log file members to an existing log file group 3.

```
ALTER DATABASE ADD LOGFILE MEMBER 'logfile1.log', 'logfile2.log' TO GROUP 3;
```

The following is an example of adding a new log file group 4 to database. The size of log file group 4 is 100 M, and the log file name is 'logfile1.log'.

```
ALTER DATABASE ADD LOGFILE GROUP 4 ('logfile1.log') SIZE 100M;
```

### Note

When adding a log group, a single log file should be used, and multiple log files can be added to an existing group as a member.

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- ALTER DATABASE ADD LOGFILE
- ALTER DATABASE DROP LOGFILE
- ALTER DATABASE RENAME LOGFILE

## 16.6 ALTER DATABASE ARCHIVELOG

### Function

It alters an archive setting of the online log file in the database.

### Syntax

```
<alter database archivelog statement> ::=
 ALTER DATABASE { ARCHIVELOG | NOARCHIVELOG }
 ;
```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database archivelog statement>.

### Syntax Rules and Parameters

#### <alter database archivelog statement>

- The database should be in MOUNT phase.
- ARCHIVELOG
  - It archives the online log file.
- NOARCHIVELOG
  - It does not archive the online log file.

### Description

For the database backup and the media recovery using the backup, the system should be operated in ARCHIVELOG mode.

## Example

The following is an example of how to set up a database to archive mode.

```
ALTER DATABASE ARCHIVELOG;
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- ALTER DATABASE BACKUP
- ALTER TABLESPACE name BACKUP

## 16.7 ALTER DATABASE BACKUP

### Function

The backup state is set to ACTIVE or INACTIVE to perform a full backup of the database. Then, the incremental database backup and control file backup are performed.

### Syntax

```

<alter database backup statement> ::=
 <database begin backup statement>
 | <database end backup statement>
 | <database incremental backup statement>
 | <database controlfile backup statement>
 ;

<database begin backup statement> ::=
 ALTER DATABASE BEGIN BACKUP [AT <domain name>]
 ;

<database end backup statement> ::=
 ALTER DATABASE END BACKUP [AT <domain name>]
 ;

<database incremental backup statement> ::=
 ALTER DATABASE BACKUP INCREMENTAL
 <incremental backup option> [AT <domain name>] ;

<incremental backup option> ::=
 LEVEL integer [CUMULATIVE | DIFFERENTIAL]

<database controlfile backup statement> ::=
 ALTER DATABASE BACKUP CONTROLFILE TO 'target_name'
 [AT <domain name>] ;

```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database backup statement>.

## Syntax Rules and Parameters

### 〈database begin backup clause〉

The database is set to the state which the full backup is available.

- All tablespaces in ONLINE state, which are created and used in the database, are set to the state of which the full backup is available.
- The database should be OPEN state and operated in ARCHIVELOG mode.
- After starting BEGIN BACKUP, the following operations which require writing to the data file can not be performed.
  - SHUTDOWN NORMAL
  - OFFLINE / DROP TABLESPACE
  - ADD / DROP DATAFILE
- It may require media recovery on restart when a full backup is ACTIVE state and the instance is abnormally terminated.

### 〈database end backup clause〉

The database is set to the state which the full backup is not available.

- All tablespaces in ONLINE state, which are created and used in the database, are set to the state which the full backup is not available.
- The database should be in OPEN phase and operated in ARCHIVELOG mode.

### 〈database incremental backup statement〉

- An incremental backup is performed for the database.
- The database should be in OPEN phase and operated in ARCHIVELOG mode.

### 〈incremental backup option〉

- 'integer' can be specified from 0 to 4.
- LEVEL 0 can not specify CUMULATIVE or DIFFERENTIAL.
- CUMULATIVE | DIFFERENTIAL
  - CUMULATIVE
    - If 'integer' is n, it backs up all pages which are altered after the most recent backups of LEVEL 0 ~ LEVEL n-1.
  - DIFFERENTIAL
    - If 'integer' is n, it backs up all pages which are altered after the most recent backups of LEVEL 0 ~ LEVEL n.

- If it is omitted, DIFFERENTIAL is specified by default.

## ⟨database controlfile backup statement⟩

- The control file is backed up.
  - The length of 'target\_name' should be shorter than 1024 bytes.
  - If 'target\_name' already exists, the operation fails.
- The database should be in OPEN phase and operated in ARCHIVELOG mode.

### Note

The maximum length of the 'target\_name' managed by GOLDILOCKS is 1024 bytes. However, the maximum lengths of the file name varies depending on the OS, so the actual length of 'target\_name' which is available to be created can be shorter than 1024 bytes.

## ⟨domain name⟩

- It is a name of a member or a group for which the statement is performed.
- If it is omitted, it is performed for all groups.

## Description

It backs up data files and control files in the database. A full backup of the database begins with BEGIN BACKUP, and copies the datafiles using OS file copy, then ends with END BACKUP. The incremental backup file is created in the path set by the BACKUP\_DIR 1 property using a single statement.

## Examples

The following is an example of setting the entire backup state to ACTIVE.

```
ALTER SYSTEM BEGIN BACKUP;
```

The following is an example of setting the entire backup state to INACTIVE.

```
ALTER SYSTEM END BACKUP;
```

The following is an example to create the incremental backup of LEVEL 1 by using DIFFERENTIAL.

```
ALTER DATABASE BACKUP INCREMENTAL LEVEL 1 DIFFERENTIAL;
```

The following is an example to create the 'controlfile.bak' backup file for the control file. If the absolute path is not included, a backup file is created in the path set by the LOG\_DIR property.

```
ALTER DATABASE BACKUP CONTROLFILE TO 'controlfile.bak';
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- ALTER TABLESPACE name BACKUP
- ALTER DATABASE RECOVER

## 16.8 ALTER DATABASE CLEAR AUDIT TRAIL

### Function

It purges audit records which are accumulated when applying an audit policy.

### Syntax

```
<clear audit trail statement> ::=
 ALTER DATABASE CLEAR AUDIT TRAIL
 ;
```

### Invocation and Access Rules

AUDIT SYSTEM ON DATABASE privilege is required to perform <clear audit trail statement>.

### Description

If an audit policy is activated, an audit trails is getting longer as time goes by.

Tables configuring an audit trail are stored in MEM\_AUX\_TBS tablespace, and a user should be cautious not to let the audit trail keep increasing.

### Storing Audit Trail

A user should purge an audit trail after storing it according to the following procedure to store an audit trail when it is necessary.

- When performing it for the first time

```
CREATE TABLE backup_audit_trail AS SELECT * FROM AUDIT_TRAIL;
COMMIT;
```

- When repeatedly performing it

```
INSERT INTO backup_audit_trail SELECT * FROM AUDIT_TRAIL;
COMMIT;
```

- When purging an audit trail

```
ALTER DATABASE CLEAR AUDIT TRAIL;
```

## Examples

Purge an audit trail by using the following statement.

```
ALTER DATABASE CLEAR AUDIT TRAIL;
```

## Compatibility

The SQL standard does not have the audit policy.

## For More Information

Refer to the followings.

- Managing audit policy object
  - **CREATE AUDIT POLICY**
  - **DROP AUDIT POLICY**
  - **ALTER AUDIT POLICY**
- Activating/ deactivating audit policy
  - **AUDIT POLICY**
  - **NOAUDIT POLICY**
- Enquiring audit trail: **AUDIT\_TRAIL**
- Dropping audit trail: **ALTER DATABASE CLEAR AUDIT TRAIL**

# 16.9 ALTER DATABASE CLEAR PASSWORD HISTORY

## Function

It deletes the user's password change history which is accumulated due by applying the profile.

## Syntax

```
<clear password history statement> ::=
 ALTER DATABASE CLEAR PASSWORD HISTORY
 ;
```

## Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <clear password history statement>.

## Description

When a profile is applied to a user, the user's password change history is accumulated according to the PASSWORD\_REUSE\_MAX and PASSWORD\_REUSE\_TIME policies.

Table 16-1 Managing the change history

| PASSWORD_REUSE_MAX | PASSWORD_REUSE_TIME | Managing the change history                                                                                                        |
|--------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------|
| value              | value               | It manages only the change history within the value range, and the change history out of the value range is automatically deleted. |
| value              | UNLIMITED           | It accumulates all change history and it does not delete any change history because all change history should be checked.          |
| UNLIMITED          | value               | It accumulates all change history and it does not delete any change history because all change history should be checked.          |
| UNLIMITED          | UNLIMITED           | It does not manage the change history because the change history is not checked.                                                   |

⟨Clear password history statement⟩ deletes the accumulated user's password change history.

## Examples

The following is an example of executing ⟨clear password history statement⟩ statement.

```
gSQL> ALTER DATABASE CLEAR PASSWORD HISTORY;
Database altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- CREATE PROFILE
- CREATE USER

## 16.10 ALTER DATABASE DELETE BACKUP

### Function

It deletes the backup file and the backup information of incremental backup. It can delete all incremental backup of the database or no longer usable obsolete backup.

### Syntax

```
<alter database delete backup statement> ::=
 ALTER DATABASE DELETE <delete backup list option>
 BACKUP LIST [<including backup file option>]
 ;
<delete backup list option> ::=
 OBSOLETE
 | ALL
<including backup file option> ::=
 INCLUDING BACKUP FILES
```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database delete backup statement>.

### Syntax Rules and Parameters

#### <alter database delete backup statement>

The database should be in MOUNT or OPEN phase.

## ⟨delete backup list option⟩

It selects the backups to be deleted among the existing incremental backups.

- **OBSOLETE:** It selects backups of database or tablespaces to be deleted, which was backed up before the most recent database LEVEL 0 backup.
- **ALL:** It selects all incremental backups to be deleted.

## ⟨including backup file option⟩

- If it is omitted, it deletes only the backup information from the control file.
- It also deletes not only backup information but also the backup files.

## Description

Deletion of the OBSOLETE incremental backup deletes the incremental backup of which is before the most recent LEVEL 0 database backup. When non-LEVEL 0 incremental backup is performed, it is not deleted even if it includes the previously performed incremental backup. It is because it can be used when performing the incomplete recovery by using the incremental backups.

### Caution

Be cautious of deleting the backup file together when an incremental backup is deleted. It can not be recovered even by using the control file which has incremental backup information.

## Example

The following is an example to delete the backup information and backup files of all existing incremental backups.

```
ALTER DATABASE DELETE ALL BACKUP LIST INCLUDING BACKUP FILES;
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- ALTER TABLESPACE name BACKUP
- ALTER DATABASE RECOVER

## 16.11 ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS

### Function

It drops the entire inactive cluster member.

### Syntax

```
⟨alter database drop inactive members statement⟩ ::=
 ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform ⟨alter database drop inactive cluster members statement⟩.

### Description

It drops the entire inactive cluster member.

The inactive state of a cluster member means that it is not connected to the cluster system, and it occurs in the following cases.

- An error occurs on a cluster member in an operating cluster system.
- Trying to start-up the cluster system without driving the cluster member.

However, if the table shard is lost while dropping the cluster member, then an inactive cluster member cannot be dropped.

It is recommended to use ⟨alter database drop inactive members statement⟩ when an inactive cluster member

mber can not be included in the cluster system any more.

## Examples

The following is an example of executing <alter database drop inactive members statement>.

```
gSQL> ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS;
Database altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to **ALTER SYSTEM JOIN DATABASE**.

## 16.12 ALTER DATABASE DROP LOGFILE

### Function

It drops a log file group or a member which exists in the database.

### Syntax

```

<alter database drop logfile statement> ::=
 <drop logfile group statement>
 | <drop logfile member statement>
 ;
<drop logfile group statement> ::=
 ALTER DATABASE DROP LOGFILE <group clause>
<group clause> ::=
 GROUP integer
<drop logfile member statement> ::=
 ALTER DATABASE DROP LOGFILE MEMBER <logfile_list>
<logfile_list> ::=
 'logfile_name'
 | <logfile_list> , 'logfile_name'

```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database drop logfile statement>.

### Syntax Rules and Parameters

#### <alter database drop logfile statement>

The database should be in MOUNT phase.

An error occurs when the log file to be deleted is in CURRENT or ACTIVE stage.

At least four log file groups should be remained after dropping.

## ⟨drop logfile group statement⟩

It drops the existing log file group.

- ⟨group clause⟩
  - It specifies the log file group to be dropped.
  - An integer should be an identifier of the existing log file.
  - An error occurs if the integer does not exist.

## ⟨drop logfile member statement⟩

It drops the existing log file members.

- ⟨logfile\_list⟩
  - It is the list of the log file members to be dropped.
  - 'logfile\_name' should be an existing name.
  - An error occurs if 'logfile\_name' does not exist.

## Description

For more information, refer to the rules for each syntax.

## Examples

The following is an example of dropping the existing log file GROUP 3.

```
ALTER DATABASE DROP LOGFILE GROUP 3;
```

The following is an example of dropping logfile1.log and logfile2.log from the existing logfile GROUP 3.

```
ALTER DATABASE DROP LOGFILE MEMBER 'logfile1.log', 'logfile2.log';
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the respective syntax rules, and the followings.

- ALTER DATABASE ADD LOGFILE
- ALTER DATABASE RENAME LOGFILE

## 16.13 ALTER DATABASE MOVE SHARD

### Function

It rebalances shard of all tables in a specific cluster group to another cluster group.

### Syntax

```
<alter database move shard statement> ::=
 ALTER DATABASE MOVE SHARD FROM CLUSTER GROUP src_cluster_group
 TO CLUSTER GROUP dest_cluster_group [ONLINE | OFFLINE];
```

### Invocation and Access Rules

It can be performed in a cluster system.

ALTER DATABASE ON DATABASE privilege is required to perform <alter database move shard statement>.

### Syntax Rules and Parameters

#### src\_cluster\_group

It is a cluster group to which the table shard is moved.

#### dest\_cluster\_group

It is a target cluster group to which the table shard is moved.

#### [ ONLINE | OFFLINE ]

It determines whether to allow DML when rebalancing table shard.

- ONLINE
  - It allows INSERT, UPDATE, and DELETE.

- OFFLINE
  - It does not allow INSERT, UPDATE, DELETE.
- When it is omitted, the default value is ONLINE.

## Description

When adding a cluster member and a cluster group using the following statements, the table shard is not rebalanced.

- **CREATE CLUSTER GROUP**
- **ALTER CLUSTER GROUP name ADD MEMBER**

Perform <alter database rebalance statement> to rebalance the shard of the entire table which was not rebalanced when adding a cluster group and a cluster member.

<alter database move shard statement> is performed as the following concepts for tables which did not rebalance the shard.

```
ALTER TABLE t1 MOVE SHARD FROM CLUSTER GROUP src_group TO CLUSTER GROUP dest_group;
COMMIT;
ALTER TABLE t2 MOVE SHARD FROM CLUSTER GROUP src_group TO CLUSTER GROUP dest_group;
COMMIT;
ALTER TABLE t3 MOVE SHARD FROM CLUSTER GROUP src_group TO CLUSTER GROUP dest_group;
COMMIT;
...
...
ALTER TABLE t_n MOVE SHARD FROM CLUSTER GROUP src_group TO CLUSTER GROUP dest_group;
COMMIT;
```

The <alter database move shard statement> is proceeded even when the rebalancing the shard of a specific table fails. It does not rollback the table which succeeded in rebalancing the shard.

Therefore, when performing <alter database move shard statement> again after appropriately processed an error, then it rebalances only the shard for the table requiring the rebalancing. In this case, the table which succeeded in rebalancing the shard is not included in a target of the rebalancing.

## Examples

The following is an example of performing <alter database move shard statement>.

```
gSQL> ALTER DATABASE MOVE SHARD FROM CLUSTER GROUP G1 TO CLUSTER GROUP G2;
Database altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **ALTER TABLE name MOVE SHARD**
- **CREATE CLUSTER GROUP**
- **ALTER CLUSTER GROUP name ADD MEMBER**

## 16.14 ALTER DATABASE OFFLINE INACTIVE CLUSTER MEMBERS

### Function

It sets the entire inactive cluster member to offline. In other words, it sets the shard map for the cluster member to offline.

### Syntax

```
⟨alter database offline inactive cluster members statement⟩ ::=
 ALTER DATABASE OFFLINE INACTIVE CLUSTER MEMBERS
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform ⟨alter database offline inactive cluster members statement⟩.

### Syntax Rules and Parameters

It sets the entire inactive cluster member to offline.

The inactive state of a cluster member means that it is not connected to the cluster system, and it occurs in the following cases.

- An error occurs on a cluster member in an operating cluster system.
- Trying to start-up the cluster system without driving the cluster member.

## Description

It is recommended to use <alter database offline inactive members statement> when an inactive cluster member can not be included in the cluster system any more.

If an inactive cluster member can participate in a cluster system, then perform **ALTER SYSTEM JOIN DATABASE** to include it in a cluster system.

The cluster member which is set to offline can be shifted to online again by using the following statements after the join.

- **ALTER DATABASE REBALANCE**
- **ALTER TABLE name REBALANCE**

## Examples

```
gSQL> ALTER DATABASE OFFLINE INACTIVE CLUSTER MEMBERS;
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **ALTER SYSTEM JOIN DATABASE**
- **ALTER DATABASE REBALANCE**
- **ALTER TABLE name REBALANCE**

## 16.15 ALTER DATABASE REBALANCE

### Function

It rebalances shard of all tables.

### Syntax

```
⟨alter database rebalance statement⟩ ::=
 ALTER DATABASE REBALANCE [ONLINE | OFFLINE];
```

### Invocation and Access Rules

It can be performed in a cluster system.

ALTER DATABASE ON DATABASE privilege is required to perform ⟨alter database rebalance statement⟩.

### Syntax Rules and Parameters

#### [ ONLINE | OFFLINE ]

It determines whether to allow DML when rebalancing table shard.

- ONLINE
  - It allows INSERT, UPDATE, and DELETE.
- OFFLINE
  - It does not allow INSERT, UPDATE, DELETE.
- When it is omitted, the default value is ONLINE.

## Description

When adding a cluster member and a cluster group using the following statements, the table shard is not rebalanced.

- **CREATE CLUSTER GROUP**
- **ALTER CLUSTER GROUP name ADD MEMBER**

Perform `<alter database rebalance statement>` to rebalance the shard of the entire table which was not rebalanced when adding a cluster group and a cluster member.

`<alter database rebalance statement>` is performed as the following concepts for tables which did not rebalance the shard.

```
ALTER TABLE t1 REBALANCE;
COMMIT;
ALTER TABLE t2 REBALANCE;
COMMIT;
ALTER TABLE t3 REBALANCE;
COMMIT;
...
...
ALTER TABLE t_n REBALANCE;
COMMIT;
```

The `<alter database rebalance statement>` is proceeded even when the rebalancing the shard of a specific table fails. It does not rollback the table which succeeded in rebalancing the shard.

Therefore, when performing `<alter database rebalance statement>` again after appropriately processed an error, then it rebalances only the shard for the table requiring the rebalancing. In this case, the table which succeeded in rebalancing the shard is not included in a target of the rebalancing.

## Examples

The following is an example of performing `<alter database rebalance statement>`.

```
gSQL> ALTER DATABASE REBALANCE;
Database altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to **ALTER TABLE name REBALANCE**.

## 16.16 ALTER DATABASE REBALANCE EXCLUDE CLUSTER GROUP

### Function

It rebalances shard of all tables excluding shards of a specific cluster group.

### Syntax

```
<alter database rebalance exclude cluster group statement> ::=
 ALTER DATABASE REBALANCE EXCLUDE CLUSTER GROUP cluster_group_name [ONLINE | OFFLINE];
```

### Invocation and Access Rules

It can be performed in a cluster system.

ALTER DATABASE ON DATABASE privilege is required to perform <alter database rebalance exclude cluster group statement>.

### Syntax Rules and Parameters

#### cluster\_group\_name

It is a name of the cluster group excluding a shard of the table.

If the specified cluster group is the only cluster group, then the statement can not be performed.

#### [ ONLINE | OFFLINE ]

It determines whether to allow DML when rebalancing table shard.

- ONLINE
  - It allows INSERT, UPDATE, and DELETE.
- OFFLINE

- It does not allow INSERT, UPDATE, DELETE.
- When it is omitted, the default value is ONLINE.

## Description

To drop a cluster group by using **DROP CLUSTER GROUP**, there should not be a shard in the cluster group.

Perform `<alter database rebalance exclude cluster group statement>` to exclude a shard from the cluster group. `<alter database rebalance exclude cluster group statement>` is performed as the following concepts for tables which include a shard in the cluster group.

```
ALTER TABLE t1 REBALANCE EXCLUDE CLUSTER GROUP g3;
COMMIT;
ALTER TABLE t2 REBALANCE EXCLUDE CLUSTER GROUP g3;
COMMIT;
ALTER TABLE t3 REBALANCE EXCLUDE CLUSTER GROUP g3;
COMMIT;
...
...
ALTER TABLE t_n REBALANCE EXCLUDE CLUSTER GROUP g3;
COMMIT;
```

If the `<alter database rebalance exclude cluster group statement>` fails due to the lack of storage space, it does not rollback the table which succeed in excluding a shard.

Therefore, when performing `<alter database rebalance exclude cluster group statement>` again after appropriately processed an error, then it excludes and rebalances only the shard for the table requiring the rebalancing. In this case, the table which succeeded in excluding the shard is not included in a target of the rebalancing.

## Examples

The following is an example of performing `<alter database rebalance exclude cluster group statement>`.

```
gSQL> ALTER DATABASE REBALANCE EXCLUDE CLUSTER GROUP g3;
Database altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **DROP CLUSTER GROUP**
- **ALTER TABLE** name **REBALANCE EXCLUDE CLUSTER GROUP** cluster\_group\_list

## 16.17 ALTER DATABASE RENAME LOGFILE

### Function

It renames the logfile in the database.

### Syntax

```
<alter database rename logfile statement> ::=
 ALTER DATABASE RENAME LOGFILE <logfile_list> TO <logfile_list>
 ;
<logfile_list> ::=
 'logfile_name'
 | <logfile_list> , 'logfile_name'
```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required for performing <alter database rename logfile statement>.

### Syntax Rules and Parameters

#### <alter database rename logfile statement>

- The database should be in MOUNT phase.
- FROM <logfile\_list>
  - The name list of the logfiles to modify in the database.
- TO <logfile\_list>
  - The name list of the logfiles to be modified in the database.
  - <logfile\_list> should be an existing file.
  - An error occurs if the file does not exist.

## Description

For more information, refer to the rules for each syntax.

## Example

The following is an example of modifying the existing 'logfile.log' logfile to 'newlogfile.log'.

```
ALTER DATABASE RENAME LOGFILE 'logfile.log' TO 'newlogfile.log';
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- ALTER DATABASE ADD LOGFILE
- ALTER DATABASE DROP LOGFILE

## 16.18 ALTER DATABASE RECOVER

### Function

It recovers the entire data file or part of the data files in the database by using the online and archive log files.

### Syntax

```

<alter database recover statement> ::=
 <complete database recover statement>
 | <datafile recover statement>
 | <complete tablespace recover statement>
 | <incomplete database recover statement>
 ;

<complete database recover statement> ::=
 ALTER DATABASE RECOVER

<datafile recover statement> ::=
 ALTER DATABASE RECOVER DATAFILE <datafile recovery clause>

<datafile recovery clause> ::=
 <datafile recovery object> [, ...]

<datafile recovery object> ::=
 'datafile_name' [<recovery using backup option>] [<recovery corruption option>]

<recovery using backup option> ::=
 USING BACKUP 'backup_datafile_name'

<recovery corruption option> ::=
 CORRUPTION

<complete tablespace recover statement> ::=
 ALTER DATABASE RECOVER TABLESPACE tablespace_name

<incomplete database recover statement> ::=
 <batch incomplete recovery statement>
 | <interactive incomplete recovery statement>
 ;

<batch incomplete recovery statement> ::=
 ALTER DATABASE RECOVER <until clause> [<using backup controlfile option>]

<until clause> ::=

```

```

 UNTIL CHANGE integer
<using backup controlfile option> ::=
 USING BACKUP CONTROLFILE
<interactive incomplete recovery statement> ::=
 ALTER DATABASE <incomplete recovery option> [<using backup controlfile option>]
<incomplete recovery option> ::=
 BEGIN INCOMPLETE RECOVERY
 | END INCOMPLETE RECOVERY
 | RECOVER 'logfile name'
 | RECOVER AUTOMATICALLY
 | RECOVER SUGGESTION
 ;

```

## Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database recover statement>.

## Syntax Rules and Parameters

### <complete database recover statement>

The data files of the database are recovered up to date by using the online and archive log files.

- The recovery is performed for all tablespaces in the ONLINE state.
- The database should be in MOUNT phase and in ARCHIVELOG mode.
- If the required archived log file does not exist, it fails.

### <datafile recover statement>

It recovers the backedup datafile, the datafile of the tablespace which requires the recovery by using the archive logfile due to an error during the backup, or the datafile of the tablespace which was set to offline by an immediate option, to the latest status.

- Datafile can be recovered on MOUNT phase or OPEN phase.
- The datafile of the tablespace which is in OFFLINE state can be recovered on OPEN phase, and datafile which is either in ONLINE/OFFLINE state can be recovered in MOUNT phase.
- If the required archive logfile does not exist, then the recovery fails.
- <datafile recovery clause>
  - It specifies one or more datafile object list which is a target of the recovery.

- <datafile recovery object>
  - It sets the name of datafile which is a target of the recovery, and the recovery option.
- <recovery using backup option>
  - It sets the name of backup datafile of the datafile which is a target of the recovery.
- <recovery corruption option>
  - It determines whether to recover only the pages corrupted from the datafile which is a target of the recovery.

## <complete tablespace recover statement>

The data files of the tablespace is recovered up to date.

- Tablespace recovery should be performed when the database is in MOUNT or OPEN phase.
- The recovery in the OPEN phase can only be performed when the tablespaces is in the OFFLINE stage, and the recovery in MOUNT phase can be performed when the tablespace is either in ONLINE/ OFFLINE stage.
- If the required archive log file does not exist, it fails.
- The following is the case which requires the tablespace recovery operation.
  - The tablespace became OFFLINE by IMMEDIATE.
  - The backed up data file is used.
  - A failure occurred during the entire backup.

## <incomplete database recover statement>

### <batch incomplete database recover statement>

The datafiles in the database are recovered in a batch up to a specific point of time by using the online and archive logfile.

- The recovery is performed for all tablespaces in the ONLINE stage.
- The database should be in MOUNT phase and in ARCHIVELOG mode.
- It fails if using the data file containing data which is after the time of the incomplete recovery.
- The database should be OPEN by using RESETLOGS after completion of incomplete recovery.
- <until clause>
  - A specific point of time for incomplete recovery
  - UNTIL CHANGE: The point of time is specified for incomplete recovery in log units
- <using backup controlfile>
  - Deprecated

## ⟨interactive incomplete database recover statement⟩

The data files in the database are interactively recovered with a user up to a specific point of time by using online and archive log file.

- The recovery is performed for all tablespaces in the ONLINE stage.
- The database should be in MOUNT phase and in ARCHIVELOG mode.
- It fails if using the data file containing data which is after the time of the incomplete recovery.
- The database should be OPEN by using RESETLOGS after completion of incomplete recovery.
- ⟨incomplete recovery option⟩
  - It is an option to perform an interactive incomplete recovery in log units.
  - BEGIN INCOMPLETE RECOVERY: It starts an incomplete recovery.
  - END INCOMPLETE RECOVERY: It ends an incomplete recovery.
  - RECOVER 'logfile name': A user directly specifies the log file performing the recovery.
  - RECOVER AUTOMATICALLY: All recoverable archive log files are recovered.
  - RECOVER SUGGESTION: It recovers archive log files which are required for the recovery and recommended by the system.
- ⟨using backup controlfile⟩
  - Deprecated.

## Description

Incomplete recovery of the database is not easy to find a recovery completion point at a time. Therefore, the desired recovery point is found by performing it several times.

However, it becomes a new database if the database is started up with RESETLOGS option after an incomplete recovery. Therefore, the incomplete recovery should be performed several times after creating a copy of the archived log files and online redo log files.

## Examples

The following is an example of a complete recovery for entire database.

```
ALTER DATABASE RECOVER;
```

The following is an example of a datafile recovery.

```
ALTER DATABASE RECOVER DATAFILE 'test.dbf';
```

The following is an example of a tablespace recovery.

```
ALTER DATABASE RECOVER TABLESPACE test_tbs;
```

The following is an example of incomplete recovery for the entire database until LSN is 11123.

```
ALTER DATABASE RECOVER UNTIL CHANGE 11123;
```

The following is an example of interactive incomplete recovery until the recoverable archive log files.

```
ALTER DATABASE BEGIN INCOMPLETE RECOVERY;
ALTER DATABASE RECOVER AUTOMATICALLY;
ALTER DATABASE END INCOMPLETE RECOVERY;
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- ALTER DATABASE BACKUP
- ALTER TABLESPACE name BACKUP
- ALTER SYSTEM {MOUNT | OPEN} DATABASE

## 16.19 ALTER DATABASE REGISTER

### Function

It registers unrecoverable segments in the database.

### Syntax

```
<alter database register statement> ::=
 ALTER DATABASE REGISTER IRRECOVERALBE SEGMENT
 <segment physical identifier list>
 ;
<segment physical identifier list> ::=
 integer
 | <segment physical identifier list> , integer
```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database register statement>.

### Syntax Rules and Parameters

#### <alter database register statement>

It registers the unrecoverable segments in the database. The statement can be used on the assumption that the segment is not used any more, when the database is not recoverable and the backup does not exist.

- The database should be in MOUNT phase.
- The registered segment identifier list is initialized at restart.
- If a server restart is successful, the registered segment becomes 'UNUSABLE' state, and that segments should be deleted.

## ⟨segment physical identifier list⟩

The list of unrecoverable segment identifier

- Integer: 8 bytes integer segment identifier

## Description

When a server restarts after abnormal termination, the database performs the recovery process. During this process, it executes pages again by using the REDO log to recover pages which was not reflected in the disk in the previous service stage.

If an unexpected failure occurs during execution of the REDO operation, that statement can be used to ignore the failure and to execute the recovery.

## Example

The following is an example of giving up the recovery of the segment whose identifier is 4028679323648.

```
ALTER DATABASE REGISTER IRRECOVERABLE SEGMENT 4028679323648;
```

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- ALTER TABLESPACE name BACKUP
- ALTER DATABASE RECOVER

## 16.20 ALTER DATABASE RESET LOCAL CLUSTER MEMBER

### Function

It resets the local cluster member except for the tablespace object to the time of creating the database.

### Syntax

```
<alter database reset local cluster member statement> ::=
 ALTER DATABASE RESET LOCAL CLUSTER MEMBER
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

The start-up phase should be LOCAL OPEN.

ADMINISTRATION ON DATABASE privilege is required to perform <alter database reset local cluster member statement>.

### Description

It resets the local cluster member except for the tablespace object to the time of creating the database. It drops all objects created by a user except for the tablespace object.

<alter database reset local cluster member statement> statement resets an inactive cluster member, and makes the new cluster member to participate in a cluster system.

An inactive cluster member which is disconnected from the cluster system is processed as follows.

- If it can join in a cluster system again, then use JOIN statement to make it join.
  - **ALTER SYSTEM JOIN DATABASE**
- If it can not join in a cluster system again, then use DROP statement to exclude it.

- **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS**

In this case, the device corresponding to the cluster member which is excluded from a cluster system can be used again by using the following two methods.

- Method 1: Recreate the database of the local cluster member.
- Method 2: Reset the local cluster member by using `<alter database reset local cluster member statement>`.

The method 2 reduces the cost of recreating the tablespace comparing to the method 1.

## Examples

The following is an example of a reset by using `<alter database reset local cluster member statement>` after driving the local cluster member, which is excluded from the cluster system, up to LOCAL OPEN phase.

```
gSQL> \startup nomount
Startup success
gSQL> ALTER SYSTEM MOUNT DATABASE;
System altered.
gSQL> ALTER SYSTEM OPEN LOCAL DATABASE;
System altered.
gSQL> ALTER DATABASE RESET LOCAL CLUSTER MEMBER;
Database altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **ALTER SYSTEM JOIN DATABASE**
- **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS**

## 16.21 ALTER DATABASE RESTORE

### Function

It restores the data files in the database or tablespace by using the incremental backup.

### Syntax

```
<alter database restore statement> ::=
 <database restore statement>
 | <tablespace restore statement>
 | <controlfile restore statement>
 ;

<database restore statement> ::=
 ALTER DATABASE RESTORE [<until clause>]

<until clause> ::=
 UNTIL CHANGE integer

<tablespace restore statement> ::=
 ALTER DATABASE RESTORE TABLESPACE tablespace_name

<controlfile restore statement> ::=
 ALTER DATABASE RESTORE CONTROLFILE FROM 'file_name'
```

### Invocation and Access Rules

ALTER DATABASE ON DATABASE privilege is required to perform <alter database restore statement>.

### Syntax Rules and Parameters

#### <database restore statement>

It restores the data files in the database by using the incremental backup.  
The database should be in MOUNT phase.

## ⟨tablespace restore statement⟩

It restores the data files in the tablespace by using the incremental backup.

- The database should be in MOUNT or OPEN phase.
- The recovery in OPEN state can be performed only for the tablespaces in OFFLINE state. The recovery in MOUNT phase can be performed for the tablespace is either in ONLINE state or OFFLINE state.

## ⟨controlfile restore statement⟩

The control file is recovered using 'file\_name'.

- The database should be in NOMOUNT phase.
- The absolute path is recommended for 'file\_name' but if relative path is described, then <GOLDILOC KS\_HOME>/wal/'file\_name' is used.

## Description

The data recovery using full backup uses OS copy command to directly copy the backup file to the data file path. The data recovery using incremental backup restores only the deleted data files or old data files.

## Examples

The following is an example of recovering the database by using the incremental backup.

```
ALTER DATABASE RESTORE;
```

The following is an example of recovering the tablespace by using the incremental backup.

```
ALTER DATABASE RESTORE TABLESPACE test_tbs;
```

The following is an example of recovering the database by using only the incremental backup whose LSN is smaller than 11123.

```
ALTER DATABASE RESTORE UNTIL CHANGE 11123;
```

The following is an example of recovering the control file by using controlfile.bak.

**ALTER DATABASE RESTORE CONTROLFILE FROM 'controlfile.bak'**

## Compatibility

The SQL standard does not define ALTER DATABASE statement.

## For More Information

Refer to the followings.

- **ALTER DATABASE BACKUP**
- **ALTER TABLESPACE name BACKUP**
- **ALTER DATABASE RECOVER**

## 16.22 ALTER INDEX

### Function

It alters the index definition.

### Syntax

```
<alter index statement> ::=
 <alter index physical attribute statement>
 | <rename index statement>
 | <aging index statement>
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <alter index statement>.

- The owner of that index
- The owner of the table to which the index belongs
- CONTROL TABLE ON TABLE for the table to which the index belongs.
- (ALTER INDEX or CONTROL SCHEMA) ON SCHEMA for the schema to which the index belongs
- ALTER ANY INDEX ON DATABASE

### Syntax Rules and Parameters

#### <alter index physical attribute statement>

It alters physical attributes of the index.

For more information, refer to **ALTER INDEX name STORAGE**.

## ⟨rename index statement⟩

It alters the index name.

For more information, refer to **ALTER INDEX name RENAME TO**.

## ⟨aging statement⟩

It deletes the empty page of the index.

For more information, refer to **ALTER INDEX name AGING**.

## Description

Refer to the descriptions of each detailed statement.

## Examples

Refer to the examples of each detailed statement.

## Compatibility

The SQL standard does not define the concepts of the index.

## 16.23 ALTER INDEX name AGING

### Function

It deletes an empty page of the index.

### Syntax

```
<aging index statement> ::=
 ALTER INDEX index_name AGING
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <aging index statement>.

- The owner of that index
- The owner of the table to which the index belongs
- CONTROL TABLE ON TABLE for the table to which the index belongs.
- (ALTER INDEX or CONTROL SCHEMA) ON SCHEMA for the schema to which the index belongs
- ALTER ANY INDEX ON DATABASE

### Syntax Rules and Parameters

#### index\_name

It is the name of the target index.

### Description

This syntax returns pages whose all keys are deleted among index pages to a segment. Aging is processed in two steps which are logical deletion and physical deletion. A logical deletion is disconnection of inde

x page, and it is performed when SCN of when deleting the last key of a page is smaller than the agable S CN of the system. Then the physical deletion is performed when the SCN of the logical deletion is smaller than the agable SCN of the system.

#### Caution

If the agable SCN of the system does not increase, then the empty page may not be deleted even though the index AGING statement succeeded.

## Examples

The following is an example of aging the index.

```
gSQL> select index_name, empty_blocks from user_indexes where index_name = 'T1X';
INDEX_NAME EMPTY_BLOCKS

T1X 2
1 row selected.
gSQL> alter index t1x aging;
Index altered.
gSQL> select index_name, empty_blocks from user_indexes where index_name = 'T1X';
INDEX_NAME EMPTY_BLOCKS

T1X 0
1 row selected.
```

## Compatibility

The SQL standard does not define the concepts of the index.

## For More Information

Refer to the followings.

- CREATE INDEX

- ALTER INDEX
- DROP INDEX

## 16.24 ALTER INDEX name STORAGE

### Function

It alters the physical attributes of the index.

### Syntax

```
<alter index physical attribute statement> ::=
 ALTER INDEX index_name
 | <physical attribute clause>
 | [STORAGE (<segment attr clause> [...])]
 ;

<physical attribute clause> ::=
 PCTFREE integer
 | INITTRANS integer
 | MAXTRANS integer

<segment attr clause> ::=
 INITIAL <size_clause>
 | NEXT <size_clause>
 | MINSIZE <size_clause>
 | MAXSIZE <size_clause>

<size clause> ::=
 integer [K | M | G | T]
```

### Invocation and Access Rules

One of the following privileges is required to perform <alter index physical attribute statement>.

- The owner of that index
- The owner of the table to which the index belongs
- CONTROL TABLE ON TABLE for the table to which the index belongs.
- (ALTER INDEX or CONTROL SCHEMA) ON SCHEMA for the schema to which the index belongs
- ALTER ANY INDEX ON DATABASE

## Syntax Rules and Parameters

### index\_name

It is the target index name.

### ⟨physical attribute clause⟩

It defines the physical attribute information of the index.

- PCTFREE integer
  - Definition
    - The reserved space to adjust the frequency of page splits caused by inserting the key in the page.
    - It is applied only when the index bottom-up build.
  - It can use of the value from 0 to 99.
  - If it is omitted, the value set in DEFAULT\_INDEX\_PCTFREE property is used by default.
- INITRANS integer
  - Definition
    - The initial number of transactions simultaneously accessing the page.
    - If the number of users accessing the index is small, then INITRANS is set low. If the number of users simultaneously accessing the index is big, then INITRANS is set high.
    - If necessary, it is automatically increased to the specified MAXTRANS.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 4.
- MAXTRANS integer
  - Definition
    - It specifies the maximum number of transactions simultaneously accessing the page.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 8.

### ⟨segment attr clause⟩

It specifies the information for the index storage space.

- INITIAL integer
  - Definition
    - It specifies the size of physical storage space which is initially allocated when creating the index.

- This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'INITIAL 100' is actually operated as 8192 bytes.)
  - The size (aligned to the EXTENT size of TABLESPACE) should be equal to or bigger than MIN EXTENTS, or it should be equal to or less than MAXEXTENTS.
  - It is applied only when the index bottom-up build.
- The minimum value is 1, and the maximum value depends on the system environment.
- If it is omitted, the default value is one EXTENT size of TABLESPACE to which the table belongs.
- NEXT integer
  - Definition
    - It specifies the physical space size to be allocated when adding the space to the index.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'NEXT 100' is actually operated as 8192 bytes.)
    - NEXT operates as follows depending on the remaining space size of the currently available in dex. (Obtained by subtracting the amount of currently used space from the MAXEXTENTS size)
  - If the remaining space size is 0, then it can not extend the space.
  - If the remaining space size is bigger than 0, but smaller than NEXT, then it allocates the space as big as the remaining space.
  - If the remaining space size is bigger than NEXT, then it allocates the space as big as the NEXT.
  - The minimum value is 1 and the maximum value depends on the system environment.
  - If it is omitted, the default value is one EXTENT size of TABLESPACE to which the index belongs.
- MINSIZE integer
  - Definition
    - It is the minimum space size of the index.
    - The value should be equal to or smaller than MAXSIZE.
  - This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
  - The minimum value is 1 and the maximum value depends on the system environment.
  - If it is smaller than the size of two EXTENT, it is specified to the size of two EXTENT.
  - If it is omitted, the default value is the size of two EXTENT.
- MAXSIZE integer
  - Definition
    - It is the maximum space size of the index.
    - The value should be equal to or bigger than MINSIZE.
  - This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
  - The minimum value is 1 and the maximum value depends on the system environment.
  - If it is omitted, the default value is EXTENT size \* 2147483647(The maximum positive integer of INT32).

## ⟨size clause⟩

It specifies the file size in byte. (If it is omitted, the default unit is bytes.)

- K: Kilobytes
- M: Megabytes
- G: Gigabytes
- T: Terabytes

## Description

Refer to the syntax rules of each statement.

## Examples

The following is an example of altering the physical attributes of the index.

```
gSQL> ALTER INDEX idx_t1_id PCTFREE 10 INITRANS 4 MAXTRANS 8;
Index altered.
```

## Compatibility

The SQL standard does not define the concepts of the index.

## For More Information

Refer to the followings.

- CREATE INDEX
- ALTER INDEX
- DROP INDEX

## 16.25 ALTER INDEX name RENAME TO

### Function

It alters the index name.

### Syntax

```
<rename index statement> ::=
 ALTER INDEX index_name
 RENAME TO new_index_name
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <rename index statement>.

- The owner of that index
- The owner of the table to which the index belongs
- CONTROL TABLE ON TABLE for the table to which the index belongs
- (ALTER INDEX or CONTROL SCHEMA) ON SCHEMA for the schema to which the index belongs
- ALTER ANY INDEX ON DATABASE

### Syntax Rules and Parameters

#### index\_name

It is the name of the target index.

The schema name can not be described and it has the same schema name as same as that of the existing index.

## new\_index\_name

It is the name of the new index, and it should be a unique index name within the schema.

## Description

Refer to the syntax rules of each statement.

## Examples

The following is an example of altering the index name.

```
gSQL> ALTER INDEX t1_idx1 RENAME TO idx_t1_id;
Index altered.
```

## Compatibility

The SQL standard does not define the concepts of the index.

## For More Information

Refer to the followings.

- CREATE INDEX
- ALTER INDEX
- DROP INDEX

## 16.26 ALTER PROFILE

### Function

It alters the password management method.

### Syntax

```

<alter profile statement> ::=
 ALTER PROFILE profile_name LIMIT
 { <password_parameters>, ... }
 ;

<password parameters> ::=
 FAILED_LOGIN_ATTEMPTS { integer | UNLIMITED | DEFAULT }
 | PASSWORD_LOCK_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_LIFE_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_GRACE_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_REUSE_MAX { integer | UNLIMITED | DEFAULT }
 | PASSWORD_REUSE_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_VERIFY_FUNCTION { <verify_policy> | NULL | DEFAULT }

<verify_policy> ::=
 KISA_VERIFY_FUNCTION
 | ORA12C_VERIFY_FUNCTION
 | ORA12C_STRONG_VERIFY_FUNCTION
 | VERIFY_FUNCTION_11G
 | VERIFY_FUNCTION

<password_parameter_number_interval> ::=
 integer
 | integer / integer

```

### Invocation and Access Rules

ALTER PROFILE ON DATABASE privilege is required to perform <alter profile statement>.

## Syntax Rules and Parameters

### **profile\_name**

It is a profile name to be altered.

### **FAILED\_LOGIN\_ATTEMPTS**

It sets the number of consecutive login attempts allowed to fail.

For more information, refer to **CREATE PROFILE**.

### **PASSWORD\_LOCK\_TIME**

It sets an account lockout duration (day) after the consecutive login failures.

For more information, refer to **CREATE PROFILE**.

### **PASSWORD\_LIFE\_TIME**

It sets the password lifetime (day).

For more information, refer to **CREATE PROFILE**.

### **PASSWORD\_GRACE\_TIME**

It sets a password expiration grace period when log in after **PASSWORD\_LIFE\_TIME**.

For more information, refer to **CREATE PROFILE**.

### **PASSWORD\_REUSE\_MAX**

It specifies the number of the recent passwords which can not be reused when a user wants to reuse the old password.

For more information, refer to **CREATE PROFILE**.

### **PASSWORD\_REUSE\_TIME**

It specifies the duration which the password can not be reused when a user wants to reuse the old password.

For more information, refer to **CREATE PROFILE**.

## PASSWORD\_VERIFY\_FUNCTION

It sets the password complexity verification method.

For more information, refer to **CREATE PROFILE**.

### Examples

The following is an example of changing the profile to control the account lockout.

```
gSQL> ALTER PROFILE prof1 LIMIT
 FAILED_LOGIN_ATTEMPTS 3
 PASSWORD_LOCK_TIME 3;
Profile altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of changing the profile to control the password lifetime.

```
gSQL> ALTER PROFILE prof1 LIMIT
 PASSWORD_LIFE_TIME 90
 PASSWORD_GRACE_TIME 7;
Profile altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of changing the profile to control the password reusability.

```
gSQL> ALTER PROFILE prof1 LIMIT
 PASSWORD_REUSE_MAX DEFAULT
 PASSWORD_REUSE_TIME DEFAULT;
Profile altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of changing the profile to control the password complexity verification.

```
gSQL> ALTER PROFILE prof1 LIMIT
 PASSWORD_VERIFY_FUNCTION KISA_VERIFY_FUNCTION;
Profile altered.
gSQL> COMMIT;
```

 Commit complete.

## Compatibility

The SQL standard does not define the concepts of the profile.

## For More Information

Refer to **DROP PROFILE**.

## 16.27 ALTER SEQUENCE

### Function

It alters the sequence.

### Syntax

```

<alter sequence generator statement> ::=
 ALTER SEQUENCE sequence_name <alter sequence generator options>
 ;
<alter sequence generator options> ::=
 <alter sequence generator option> [, ...]
<alter sequence generator option> ::=
 <alter sequence generator restart option>
 | <basic sequence generator option>
<alter sequence generator restart option> ::=
 RESTART [WITH integer]
<basic sequence generator option> ::=
 <sequence generator increment by option>
 | <sequence generator maxvalue option>
 | <sequence generator minvalue option>
 | <sequence generator cycle option>
 | <sequence generator cache option>
<sequence generator increment by option> ::=
 INCREMENT BY integer
<sequence generator maxvalue option> ::=
 MAXVALUE integer
 | (NO MAXVALUE | NOMAXVALUE)
<sequence generator minvalue option> ::=
 MINVALUE integer
 | (NO MINVALUE | NOMINVALUE)
<sequence generator cycle option> ::=
 CYCLE
 | (NO CYCLE | NOCYCLE)
<sequence generator cache option> ::=
 CACHE integer

```

| (NO CACHE | NOCACHE)

## Invocation and Access Rules

One of the following privileges is required to perform `<alter sequence generator statement>`.

- The owner of that sequence
- (ALTER SEQUENCE or CONTROL SCHEMA) ON SCHEMA for the schema to which the sequence belongs
- ALTER ANY SEQUENCE ON DATABASE

## Syntax Rules and Parameters

### `sequence_name`

It is the sequence name to be altered.

It can define schema to which the sequence belongs such as `schema_name.sequence_name` and if `schema_name` is omitted, the default schema name of the user performing the statement is used.

### `<alter sequence generator restart option>`

It sets NEXT VALUE of the sequence.

However, it does not change the value of START WITH which is defined in **CREATE SEQUENCE** statement.

- RESTART
  - If the value is not specified, the value of START WITH defined in `<sequence generator definition>` is set as the next value of the sequence.
- RESTART WITH integer
  - It sets an integer value as the next value of the sequence.
  - The integer value should be between MINVALUE and MAXVALUE.

If `<alter sequence generator restart option>` clause is not specified, it changes the sequence attributes based on the current sequence value.

### `<sequence generator increment by option>`

It changes the interval of the sequence number.

The constraints and characteristics are as follows.

- A positive or negative value can be used, but 0 can not be used.
- The absolute value of the interval should be smaller than the difference between MINVALUE and MAXVALUE.
- If it is a positive value, it is an ascending sequence. If it is a negative value, it is a descending sequence.

## 〈sequence generator maxvalue option〉

It changes the maximum value which the sequence can generate.

However, the MAXVALUE should not be smaller than the current sequence value.

- MAXVALUE integer
  - The maximum value is in the range between the minimum (-9,223,372,036,854,775,808) and the maximum (+9,223,372,036,854,775,807) of 64 bit integer.
  - It should be equal to or bigger than the value of START WITH, and bigger than the value of MINVALUE.
- NO MAXVALUE | NOMAXVALUE
  - It changes the maximum value as follows.
    - If it is an ascending sequence, it is the maximum value (+9,223,372,036,854,775,807) of the 64 bit integer.
    - If it is a descending sequence, the value is -1.
    - NO MAXVALUE (SQL standard) and NOMAXVALUE are the reserved words with the same meaning, and either of them can be used.

## 〈sequence generator minvalue option〉

It changes the minimum value which the sequence can generate.

However, the MINVALUE should not be bigger than the current sequence value.

- MINVALUE integer
  - The minimum value is in the range between the minimum (-9,223,372,036,854,775,808) and the maximum (+9,223,372,036,854,775,807) of 64bit integer.
  - It should be equal to or smaller than the value of START WITH, and smaller than the value of MAXVALUE.
- NO MINVALUE | NOMINVALUE
  - It changes the minimum value as follows.
    - If it is an ascending sequence, the value is 1.
    - If it is a descending sequence, it is the minimum value (-9,223,372,036,854,775,808) of the 64bit integer.
  - NO MINVALUE (SQL standard) and NOMINVALUE are the reserved words with the same meaning.

g, and either of them can be used.

## ⟨sequence generator cycle option⟩

It changes whether to continue generating a value when the sequence value becomes the maximum or minimum value.

- **CYCLE**
  - If an ascending sequence becomes the maximum value, it generates the value again from the minimum value.
  - If a descending sequence becomes the minimum value, it generates the value again from the maximum value.
- **NO CYCLE | NOCYCLE**
  - It can not generate the value sequence when it becomes the maximum value or the minimum value.
  - **NO CYCLE** (SQL standard) and **NOCYCLE** are the reserved words with the same meaning, and either of them can be used.

## ⟨sequence generator cache option⟩

For quick access of a sequence, it defines the number of sequence values to be pre-loaded on the memory.

When restarting the database, the sequence value loaded on the memory is lost, and it starts from the value after loading.

- **CACHE integer**
  - The **CACHE** value should be equal to or bigger than 2.
  - If **CYCLE** exists, the **CACHE** value should not be bigger than the length of **CYCLE**.
    - The length of **CYCLE**:  $\text{CEIL}(\text{MAXVALUE} - \text{MINVALUE}) / \text{ABS}(\text{INCREMENT})$
- **NO CACHE | NOCACHE**
  - It does not pre-load the sequence value in memory.

## Description

It can not change **START WITH** which is one of the sequence attributes defined in **CREATE SEQUENCE** statement. To change **START WITH** attribute, it should be re-created by performing **CREATE SEQUENCE** statement after performing **DROP SEQUENCE** statement.

## Examples

The following is an example of restating the sequence value by using RESTART option, then assigning a new ID.

```
gSQL> SELECT id, name FROM t1 ORDER BY 1;
ID NAME
--- -----
10 leekmo
42 mkkim
51 jhkim
172 ehpark
4 rows selected.
gSQL> ALTER SEQUENCE seq1 RESTART;
Sequence altered.
gSQL> UPDATE t1 SET id = seq1.NEXTVAL;
4 rows updated.
gSQL> SELECT id, name FROM t1 ORDER BY 1;
ID NAME
-- -----
1 leekmo
2 mkkim
3 jhkim
4 ehpark
4 rows selected.
```

## Compatibility

The SQL standard does not define CACHE/ NO CACHE statement.

**Table 16-2** SQL standard compatibility

| Feature ID | Description                                       | Compatibility |
|------------|---------------------------------------------------|---------------|
| T176       | Sequence generator support                        | O             |
| T177       | Sequence generator support: simple restart option | O             |

## For More Information

Refer to the followings.

- [CREATE SEQUENCE](#)
- [DROP SEQUENCE](#)

## 16.28 ALTER SESSION CLEANUP GLOBAL TEMPORARY SEGMENT POOL;

### Function

It returns all segments which were caught to be reused in a session to tablespaces.

### Syntax

```
<alter session cleanup global temporary segment pool statement> ::=
 ALTER SESSION CLEANUP GLOBAL TEMPORARY SEGMENT POOL
 ;
```

### Description

It cleans up only the segments of a segment cache in the performed session.

### Examples

The following is an example of cleaning up the segment cache of the session.

```
gSQL> ALTER SESSION CLEANUP GLOBAL TEMPORARY SEGMENT POOL;
Session altered.
```

### Compatibility

The SQL standard does not define the concepts of the segment cache of a global temporary table and a global temporary index.

## For More Information

Refer to [Global Temporary Table](#).

## 16.29 ALTER SESSION SET property\_name

### Function

It sets the property value of the session.

### Syntax

```
<alter session set statement> ::=
 ALTER SESSION SET <property name> { = <property value> | TO DEFAULT }
 ;
```

### Syntax Rules and Parameters

#### <property name>

It is the property name to be set.

For more information, refer to **Server Property** in an administration manual.

#### <property value>

It is the property value to be set.

#### TO DEFAULT

It sets the session property value as a system property value.

### Description

For more information about property, refer to **Server Property** in an administration manual.

## Examples

The following is an example of an error when setting ERROR HINT property so the hint clause includes an error.

```
gSQL> ALTER SESSION SET HINT_ERROR = ON;
Session altered.
gSQL> SELECT /*+ INDEX(t1, invalid_index) */ name FROM t1 WHERE id = 1;
ERR-42000(16058): not applicable hint :
SELECT /*+ INDEX(t1, invalid_index) */ name FROM t1 WHERE id = 1
 *
ERROR at line 1:
```

The following is an example of setting the session property value as the system property value.

```
gSQL> ALTER SESSION SET HINT_ERROR TO DEFAULT;
Session altered.
```

## Compatibility

The SQL standard does not define the concepts of the session property.

## For More Information

Refer to **ALTER SESSION SET property\_name**.

## 16.30 ALTER SYSTEM CHECKPOINT

### Function

It performs CHECKPOINT.

### Syntax

```
<alter system checkpoint statement> ::=
 ALTER SYSTEM CHECKPOINT
 [AT <domain name>]
 ;
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform <alter system checkpoint statement>.

### Syntax Rules and Parameters

#### <alter system checkpoint statement>

CHECKPOINT is an operation to ensure that all altered data by the committed transactions are written to disk.

- The database should be in OPEN phase.
- The database should be in TDS mode.
- When a full backup is in progress, the altered pages are not recorded in the data file, but only the REDO logs and control files are written to the disk. If the server is abnormally terminated in this situation, a media recovery should be performed.

#### <domain name>

- It is a name of a member or a group for which the statement is performed.
- If it is omitted, it is performed for all groups.

## Description

The checkpoint operation records all changes by the committed transactions to disk, so it enables a rapid recovery at system error.

## Example

The following is an example of performing CHECKPOINT.

```
ALTER SYSTEM CHECKPOINT;
```

## Compatibility

The SQL standard does not define the concepts of CHECKPOINT.

## 16.31 ALTER SYSTEM CLEANUP PLAN

### Function

It cleans up all SQL plans.

### Syntax

```
⟨alter system cleanup plan statement⟩ ::=
 ALTER SYSTEM CLEANUP PLAN
 [AT ⟨domain name⟩]
 ;
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform ⟨alter system cleanup plan statement⟩.

### Syntax Rules and Parameters

#### ⟨alter system cleanup plan statement⟩

There is not any syntax rules or parameters for ⟨alter system cleanup plan statement⟩.

#### ⟨domain name⟩

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

### Description

It cleans up all of the cached SQL plan. However, the plan whose V\$SQL CACHE.REF COUNT is bigger than 0 (the plan referenced by the prepared statement) is excluded from cleanup.

## Examples

The following is an example of executing CLEANUP PLAN.

```
ALTER SYSTEM CLEANUP PLAN;
```

## Compatibility

The SQL standard does not define the concepts of CLEANUP PLAN.

## 16.32 ALTER SYSTEM IRRECOVERABLE CLUSTER MEMBER

### Function

It specifies an irrecoverable cluster member.

### Syntax

```
⟨alter system irrecoverable cluster member statement⟩ ::=
 ALTER SYSTEM IRRECOVERABLE CLUSTER MEMBER ⟨domain name⟩
 ;
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform ⟨alter system irrecoverable cluster member statement⟩.

### Syntax Rules and Parameters

#### ⟨alter system irrecoverable cluster member statement⟩

There is not any syntax rules or parameters for ⟨alter system irrecoverable cluster member statement⟩.

#### ⟨domain name⟩

It is a name of an irrecoverable member.

It is not allowed to specify all members in a group as an irrecoverable member.

## Description

It is used to restart the system excluding the corresponding member if the cluster failed to restart due to an irrecoverable member. The corresponding member should be dropped by using **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS** after the system succeeded to restart.

## Examples

The following is an example of executing IRRECOVERABLE CLUSTER MEMBER.

```
gSQL> ALTER SYSTEM IRRECOVERABLE CLUSTER MEMBER g1n1;
```

## Compatibility

The SQL standard does not define the concepts of IRRECOVERABLE CLUSTER MEMBER.

## 16.33 ALTER SYSTEM JOIN DATABASE

### Function

It includes a specific inactive cluster member in a cluster system again.

### Syntax

```
<alter system join database statement> ::=
 ALTER SYSTEM JOIN DATABASE
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <alter system join database statement>.

### Description

The inactive state of a cluster member means that it is not connected to the cluster system, and it occurs in the following cases.

- An error occurs on a cluster member in an operating cluster system.
- Trying to start-up the cluster system without driving the cluster member included in the cluster system.

If a specific cluster member is inactive, then the member can be included in a cluster system again according to the following procedure.

- Start-up the unstarted cluster member to the local open phase.

```
$ gsql sys gliese --as sysdba --dsn=G3N2
gSQL> \startup
```

- Include it in a cluster system by using <alter system join database statement>.

```
$ gsql sys gliese --as sysdba --dsn=G3N2
gSQL> ALTER SYSTEM JOIN DATABASE;
```

Use <alter system join database statement> to make an inactive cluster member which is started up to the local open phase to participate in the cluster system without shutting it down.

To make the inactive cluster member to participate in the cluster system again, the database state of the cluster system and that of the inactive cluster member should be same.

The inactive cluster member can not participate in the cluster system again after the transaction altering the database in the cluster system completed.

To operate the cluster system normally the inactive cluster members should be dropped according to the following procedure when multiple inactive cluster members exist.

1. JOIN inactive cluster members which can participate in the cluster system.

```
gSQL> ALTER SYSTEM JOIN DATABASE;
```

2. DROP inactive cluster members which can not participate in the cluster system.

```
gSQL> ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS;
```

All inactive cluster members which can participate in the cluster system should be included in the cluster system before dropping because all inactive cluster members are dropped from the cluster system when performing <alter database drop inactive cluster member statement>.

## Examples

```
gSQL> ALTER SYSTEM JOIN DATABASE;
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to **ALTER DATABASE DROP INACTIVE CLUSTER MEMBERS**.

# 16.34 ALTER SYSTEM {MOUNT | OPEN} DATABASE

## E

### Function

It mounts the database on system, or alters the database to the state which is available for the service.

### Syntax

```

<alter system database statement> ::=
 ALTER SYSTEM <alter system database clause>
 ;
<alter system database clause> ::=
 MOUNT DATABASE
 | OPEN [<database_scope>] DATABASE [<open_database_option>]
<open_database_option> ::=
 READ WRITE [NORESETLOGS | RESETLOGS]
 | READ ONLY
<database_scope> ::=
 LOCAL
 | GLOBAL

```

### Invocation and Access Rules

ADMINISTRATION ON DATABASE privilege is required to perform <alter system database statement>.

### Syntax Rules and Parameters

#### <alter system database clause>

- MOUNT DATABASE
  - It mounts the database on the system.
- OPEN DATABASE

- It changes the database to the state which is available for the service.

## ⟨open database option⟩

- READ ONLY / READ WRITE
  - It specifies the read/write mode and drives the database.
  - If it is omitted, it is driven in READ WRITE.
- RESETLOGS / NORESETLOGS
  - It determines whether to keep the online redo logs after recovering the database.
  - NORESETLOGS maintains the existing redo log, but RESETLOGS initializes it.
  - RESETLOGS should be specified when the database is incompletely recovered.
  - If it is omitted, NORESETLOGS is specified by default.

## ⟨database\_scope⟩

- LOCAL
  - It starts up the LOCAL server to the OPEN phase.
- GLOBAL
  - It starts up the GLOBAL server, the entire server, to the OPEN phase.
- If it is omitted in a cluster environment, it starts up the GLOBAL server.

## Examples

The following is an example of driving the database in read only.

```
ALTER SYSTEM OPEN DATABASE READ ONLY;
```

The following is an example of driving the database in read/write, and initializing the online redo logs.

```
ALTER SYSTEM OPEN DATABASE READ WRITE RESETLOGS;
```

## Compatibility

The SQL standard does not define the concepts of MOUNT or OPEN in the database.

## For More Information

Refer to **ALTER DATABASE RECOVER**.

## 16.35 ALTER SYSTEM [KILL | DISCONNECT] SESSION

### Function

It terminates a session.

### Syntax

```
<alter system end session statement> ::=
 ALTER SYSTEM DISCONNECT SESSION [<member_position>,<session_id>,<serial#> [<disconnect_option>] [AT <domain name>]
 | ALTER SYSTEM KILL SESSION [<member_position>,<session_id>,<serial#> [AT <domain name>]
 ;
<disconnect_option> ::=
 POST_TRANSACTION
 | IMMEDIATE
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform <alter system end session statement>.

### Syntax Rules and Parameters

#### <member\_position>

It is a member position of a session which is a disconnect/kill target in a cluster environment.

#### <session\_id>

It is the session ID.

**<serial#>**

It is the SERIAL NUMBER of the session.

**<disconnect\_option>**

- POST\_TRANSACTION: The session is terminated after completion of the transaction.
- IMMEDIATE: The session is immediately terminated without waiting for the completion of the transaction.

If <disconnect\_option> is not used, then it is operated in IMMEDIATE.

**<domain name>**

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## Description

DISCONNECT SESSION can specify the options such as POST TRANSACTION and IMMEDIATE.

POST TRANSACTION terminates the session after the currently running transaction is completed. IMMEDIATE terminates the session after immediately cleaning up the currently running transaction.

KILL SESSION terminates the abnormal session which remains on the system without its process.

## Example

```
gSQL> SELECT USER_NAME, SESSION_ID, SERIAL_NO, SESSION_STATUS, PROGRAM_NAME FROM V$SESSION
WHERE USER_NAME = 'TEST';
```

| USER_NAME | SESSION_ID | SERIAL_NO | SESSION_STATUS | PROGRAM_NAME |
|-----------|------------|-----------|----------------|--------------|
| TEST      | 62         | 49        | CONNECTED      | gsq1         |
| TEST      | 65         | 109       | CONNECTED      | gsq1net      |
| TEST      | 66         | 130       | CONNECTED      | gsq1         |

3 rows selected.

```
gSQL> ALTER SYSTEM DISCONNECT SESSION 65, 109;
```

System altered.

## Compatibility

The SQL standard does not define it.

## 16.36 ALTER SYSTEM RECONNECT GLOBAL CONNECTION

### Function

It determines whether to reconnect to the session which is connected in GLOBAL CONNECTION form.

### Syntax

```
<alter system reconnect global connection statement> ::=
 ALTER SYSTEM RECONNECT GLOBAL CONNECTION
 ;
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform <alter system reconnect global connection statement>.

### Description

Whether the GLOBAL CONNECTION client reconnects is determined by comparing SCN of a system object acquired from a server at the first connection and SCN of current server system object. This statement leads the client to reconnect by increasing SCN of the system object.

The client does not necessarily reconnect immediately after this statement is performed. The client reconnects by comparing SCN when the client executes a command in a server, and it does not try to reconnect if connections to all members from a client are valid.

## Examples

The following is an example of executing the statement.

```
gSQL> ALTER SYSTEM RECONNECT GLOBAL CONNECTION;
System altered.
```

## Compatibility

The SQL standard does not define the concepts of GLOBAL CONNECTION.

## 16.37 ALTER SYSTEM RESET property\_name

### Function

It removes a property value from the property file.

### Syntax

```
<alter system reset statement> ::=
 ALTER SYSTEM { RESET | UNSET } <property name>
 [SCOPE = { FILE | SPFILE }]
 [AT <domain name>]
 ;
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform <alter system reset statement>.

### Syntax Rules and Parameters

#### { RESET | UNSET }

RESET and UNSET are the reserved words with the same meaning, so either of them can be used.

#### <property name>

It is the property name to be removed.

For more information, refer to **Server Property** in an administration manual.

#### [ SCOPE = { FILE | SPFILE } ]

It removes the property from a property file, so only SCOPE=FILE/SPFILE can be used.

- SCOPE = FILE

- FILE and SPFILE are the reserved words with the same meaning, so either of them can be used.
- A property is removed from FILE, and is not applied to the current state.
- When restarting the database, the changes are applied.

If SCOPE clause is not specified, the default value is SCOPE = FILE.

## ⟨domain name⟩

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## Description

If a property is altered by using SCOPE=FILE/SPFILE, the updated property value is stored in the property file, and it is applied when restarting the database.

When executing RESET, the updated property value is removed from the property file and the default value is used when restarting the database.

## Examples

The following is an example of altering the property by using SCOPE=FILE.

```
gSQL> ALTER SYSTEM SET PROCESS_MAX_COUNT=128 SCOPE=FILE;
System altered.
gSQL> alter system set DEFAULT_INDEX_LOGGING=YES scope=FILE;
System altered.
```

The following is an example of removing the property altered above.

```
gSQL> ALTER SYSTEM RESET PROCESS_MAX_COUNT SCOPE=FILE;
System altered.
gSQL> ALTER SYSTEM RESET PROCESS_MAX_COUNT SCOPE=SPFILE;
System altered.
gSQL> ALTER SYSTEM RESET PROCESS_MAX_COUNT;
System altered.
gSQL> ALTER SYSTEM RESET DEFAULT_INDEX_LOGGING;
System altered.
```

```
gSQL> ALTER SYSTEM UNSET DEFAULT_INDEX_LOGGING;
System altered.
```

## Compatibility

The SQL standard does not define the concepts of the system property.

## For More Information

Refer to **ALTER SYSTEM SET property\_name**.

## 16.38 ALTER SYSTEM SET property\_name

### Function

It sets the system property value.

### Syntax

```
<alter system set statement> ::=
 ALTER SYSTEM SET <property name> { = <property value> | TO DEFAULT }
 [DEFERRED]
 [SCOPE = [MEMORY | { FILE | SPFILE } | BOTH]]
 [AT <domain name>]
 ;
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform <alter system set statement>.

### Syntax Rules and Parameters

#### <property name>

It is the property name to be set.

For more information, refer to 10. **Server Property** in an administration manual.

#### <property value>

It is the property value to be set.

## TO DEFAULT

It sets the system property value as the initial value of system driving.

## [ DEFERRED ]

It defines the point of time to apply the altered property.

- DEFERRED
  - It does not effect the current SESSION, but it is applied to the newly generated SESSION.
  - It can be applied when ISSYS\_MODIFIABL property value is IMMEDIATE/DEFERRED. It should be explicitly specified.
  - It is not applicable when the SYS\_MODIFIABLE property value is FALSE.

If SYS\_MODIFIABLE property value is IMMEDIATE, and DEFERRED is not explicitly specified, then it is immediately applied to all sessions.

## [ SCOPE = [ MEMORY | { FILE | SPFILE } | BOTH ] ]

It specifies the range which is affected by the property changes of the system.

- SCOPE = MEMORY
  - The changes are applied only to the current state, and the value is lost when restarting the database.
- SCOPE = FILE
  - FILE and SPFILE are the reserved words with the same meaning, so either of them can be used.
  - The changes are stored in FILE, and not applied to the current state.
  - The changes are applied when restarting the database.
- SCOPE = BOTH
  - The changes are stored in FILE, and applied to the current state.

If SCOPE clause is omitted, the default value is SCOPE = MEMORY.

If SYS\_MODIFIABLE property value is FALSE, it should be specified as SCOPE=FILE/SPFILE.

## <domain name>

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## Description

For more information, refer to **Server Property** in an administration manual.

## Examples

The following is an example of changing the property whose SYS\_MODIFIABLE property is DEFERRED.

```
gSQL> ALTER SYSTEM SET HINT_ERROR = ON;
ERR-22000(13019): Invalid property modify mode.(HINT_ERROR)
gSQL> ALTER SYSTEM SET HINT_ERROR = ON DEFERRED;
System altered.
```

The following is an example of changing the property whose SYS\_MODIFIABLE property is FALSE.

```
gSQL> ALTER SYSTEM SET PROCESS_MAX_COUNT=128;
ERR-22000(13018): Specified property cannot be modified with this SCOPE
option.(PROCESS_MAX_COUNT)
gSQL> ALTER SYSTEM SET PROCESS_MAX_COUNT=128 SCOPE=FILE;
System altered.
```

The following is an example of changing the altered property to the default value of when the session was connected.

```
gSQL> ALTER SYSTEM SET TRANSACTION_COMMIT_WRITE_MODE=0;
System altered.
gSQL> ALTER SYSTEM SET TRANSACTION_COMMIT_WRITE_MODE TO DEFAULT;
System altered.
gSQL> ALTER SYSTEM SET TRANSACTION_COMMIT_WRITE_MODE TO DEFAULT DEFERRED;
System altered.
```

## Compatibility

The SQL standard does not define the concepts of the system property.

## For More Information

Refer to **ALTER SYSTEM RESET property\_name**.

## 16.39 ALTER SYSTEM SWITCH LOGFILE

### Function

It alters the log files in CURRENT state to ACTIVE state in database.

### Syntax

```
⟨alter system switch logfile statement⟩ ::=
 ALTER SYSTEM SWITCH LOGFILE
 [AT ⟨domain name⟩]
 ;
```

### Invocation and Access Rules

ALTER SYSTEM ON DATABASE privilege is required to perform ⟨alter system switch logfile statement⟩.

### Syntax Rules and Parameters

#### ⟨alter system switch logfile statement⟩

The database should be in MOUNT or OPEN phase.

#### ⟨domain name⟩

It is a name of a member or a group for which the statement is performed.  
If it is omitted, it is performed for all groups.

## Description

Basically, if the log file in CURRENT state is filled, the log switch automatically occurs. That statement is used to forcibly execute log switch in special circumstances.

## Example

```
ALTER SYSTEM SWITCH LOGFILE;
```

## Compatibility

The SQL standard does not define the concepts of the LOGFILE.

## For More Information

Refer to **ALTER SYSTEM {MOUNT | OPEN} DATABASE**.

## 16.40 ALTER TABLE

### Function

It alters the table definition.

### Syntax

```
<alter table statement> ::=
 <alter table physical attribute statement>
 | <rename table statement>
 | <add column definition>
 | <drop column definition>
 | <alter column definition>
 | <rename column statement>
 | <add table constraint definition>
 | <drop table constraint definition>
 | <alter table constraint definition>
 | <add table supplemental log statement>
 | <drop table supplemental log statement>
 | <rebalance statement>
 | <move shard statement>
 | <split shard statement>
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <alter table statement>.

- (ALTER or CONTROL TABLE) ON TABLE for the table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### ⟨alter table physical attribute statement⟩

It alters physical attributes of a table.

For more information, refer to **ALTER TABLE name STORAGE**.

### ⟨rename table statement⟩

It renames the table.

For more information, refer to **ALTER TABLE name RENAME TO**.

### ⟨add column definition⟩

It adds columns to the table.

For more information, refer to **ALTER TABLE name ADD COLUMN**.

### ⟨drop column definition⟩

It drops a column from the table.

For more information, refer to **ALTER TABLE name SET UNUSED COLUMN**.

### ⟨alter column definition⟩

It alters the column definition in the table.

For more information, refer to **ALTER TABLE name ALTER COLUMN**.

### ⟨rename column statement⟩

It renames the column in the table.

For more information, refer to **ALTER TABLE name RENAME COLUMN**.

### ⟨add table constraint definition⟩

It adds constraints to the table.

For more information, refer to **ALTER TABLE name ADD CONSTRAINT**.

## ⟨drop table constraint definition⟩

It drops the constraints of the table.

For more information, refer to **ALTER TABLE name DROP CONSTRAINT**.

## ⟨alter table constraint definition⟩

It alters the constraints of the table.

For more information, refer to **ALTER TABLE name ALTER CONSTRAINT**.

## ⟨rename table constraint statement⟩

It renames the constraints of the table.

For more information, refer to **ALTER TABLE name RENAME CONSTRAINT**.

## ⟨add table supplemental log statement⟩

It sets to add information to the redo log when the data is altered in the table.

For more information, refer to **ALTER TABLE name ADD SUPPLEMENTAL LOG**.

## ⟨drop table supplemental log statement⟩

It sets not to add information to the redo log when the data is altered in the table.

For more information, refer to **ALTER TABLE name DROP SUPPLEMENTAL LOG**.

## ⟨rebalance statement⟩

It restores consistency by rebalancing the shard of the table or by synchronizing the broken shard in a cluster environment.

For more information, refer to **ALTER TABLE name REBALANCE**.

## ⟨move shard statement⟩

It rebalances a specific shard of a table on a specific cluster group in a cluster environment.

For more information, refer to **ALTER TABLE name MOVE SHARD**.

## ⟨split shard statement⟩

It rebalances a specific shard of a table on a specific cluster group by splitting the shard in a cluster environment.

For more information, refer to **ALTER TABLE name SPLIT SHARD**.

## ⟨rename shard statement⟩

It renames a specific shard of a table in cluster environment.

For more information, refer to **ALTER TABLE name RENAME SHARD**.

## ⟨read { only | write } statement⟩

It sets READ ( only | write ) to a table.

For more information, refer to **ALTER TABLE name READ { ONLY | WRITE }**.

## Description

For more information, refer to the description of each detailed statement.

## Example

Refer to the examples of each detailed statement.

## Compatibility

The SQL standard does not define the following statements.

- ⟨alter table physical attribute statement⟩
- ⟨rename table statement⟩
- ⟨rename column statement⟩
- ⟨rename table constraint statement⟩
- ⟨add table supplemental log statement⟩
- ⟨drop table supplemental log statement⟩
- ⟨rebalance statement⟩
- ⟨move shard statement⟩

- <split shard statement>
- <rename shard statement>
- <read { only | write } statement>

## 16.41 ALTER TABLE name ADD COLUMN

### Function

It adds a column to the table.

### Syntax

```
<add column definition> ::=
 ALTER TABLE table_name ADD [COLUMN] <column definition>
 | ALTER TABLE table_name ADD [COLUMN] (<column definition> [, ...])
 ;
```

### Invocation and Access Rules

The user should satisfy the following conditions to perform <add column definition>.

- At least one of the following privileges is required to alter the table.
  - (ALTER or CONTROL TABLE) ON TABLE for that table
  - (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - ALTER ANY TABLE ON DATABASE
- If the constraints are specified with the added columns, the conditions should be satisfied to generate the constraints as follows.
  - One of the following privileges is required for the schema in which constraints are to be generated.
    - (ADD CONSTRAINT or CONTROL SCHEMA) ON SCHEMA for the schema
    - ALTER ANY TABLE ON DATABASE
  - If the key constraint is to be generated, one of the following privileges is required for the tablespace in which an index is to be created.
    - CREATE OBJECT ON TABLESPACE for the tablespace
    - USAGE TABLESPACE ON DATABASE
- The table owner has the following privileges for the added columns.
  - Privileges on all added columns
    - SELECT(columns) ON TABLE WITH GRANT OPTION

- INSERT(columns) ON TABLE WITH GRANT OPTION
- UPDATE(columns) ON TABLE WITH GRANT OPTION
- REFERENCES(columns) ON TABLE WITH GRANT OPTION
- Privilege on the constraint generated together
  - The owner of that constraint
  - The index owner generated together with the constraint

## Syntax Rules and Parameters

### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

### ADD [ COLUMN ]

The reserved word COLUMN can be omitted.

### <column definition>

It defines the column to be added. For more information, refer to <column definition> clause of CREATE TABLE statement.

There should not be columns with the same name in a table.

If DEFAULT clause is specified when defining the column, the default value of all rows are stored in the added column.

If <identity column specification> clause is specified when defining the column, each automatically generated value of all rows is stored in the added column.

If NOT NULL constraint is specified when defining the column, the table should be empty or it should be specified together with DEFAULT or <identity column specification> clause.

### ( <column definition> [, ...] )

It adds multiple columns.

It lists multiple <column definition> inside the parentheses.

## Description

The added column is positioned at the end of the existing columns.

When specifying DEFAULT or <identity column specification> clause, the processing time is increased in proportion to the number of the rows in the table.

## Examples

The following is an example of adding a column.

```
gSQL> ALTER TABLE region ADD COLUMN r_new_comment VARCHAR(152);
Table altered.
```

The following is an example of adding multiple columns.

```
gSQL> ALTER TABLE partsupp ADD COLUMN (
 ps_retailprice NUMERIC(12,2),
 ps_acctbal NUMERIC(12,2), ps_mktsegment CHAR(10));
Table altered.
```

The following is an example of adding the identity column and the column including DEFAULT clause.

```
gSQL> ALTER TABLE region ADD COLUMN (
 r_regionkey INTEGER GENERATED BY DEFAULT AS IDENTITY PRIMARY KEY,
 r_comment VARCHAR(152) DEFAULT 'N/A');
```

Table altered.

```
gSQL> SELECT r_regionkey, r_name, r_comment FROM region;
```

| R_REGIONKEY | R_NAME      | R_COMMENT |
|-------------|-------------|-----------|
| 1           | AFRICA      | N/A       |
| 2           | AMERICA     | N/A       |
| 3           | ASIA        | N/A       |
| 4           | EUROPE      | N/A       |
| 5           | MIDDLE EAST | N/A       |

5 rows selected.

The following is an example of adding the column including the deferrable constraint.

```
gSQL> ALTER TABLE t1 ADD COLUMN (id INTEGER CONSTRAINT t1_uk UNIQUE DEFERRABLE);
Table altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define of adding multiple column definitions.

## For More Information

Refer to the followings.

- **ALTER TABLE**
- **ALTER TABLE name SET UNUSED COLUMN**
- **ALTER TABLE name ALTER COLUMN**
- **ALTER TABLE name RENAME COLUMN**

## 16.42 ALTER TABLE name SET UNUSED COLUMN

### Function

It drops a table column.

### Syntax

```
<drop column definition> ::=
 ALTER TABLE table_name <drop column clause>
 ;
<drop column clause> ::=
 SET UNUSED [COLUMN] <column_name_list> [<drop behavior>]
<column name list> ::=
 column_name
 | (column_name [, ...])
<drop behavior> ::=
 RESTRICT
 | CASCADE
 | CASCADE CONSTRAINTS
```

### Invocation and Access Rules

One of the following privileges is required to perform <drop column definition>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

## table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

## SET UNUSED [ COLUMN ]

It sets the column not to be used.

## column\_name\_list

One or more column names to be dropped.

- e.g. ALTER TABLE t1 SET UNUSED COLUMN c1
- e.g. ALTER TABLE t1 SET UNUSED COLUMN (c1, c2)

## column\_name

It is the column name to be dropped.

It also drops the constraints and indexes which use the column.

## drop behavior

When it is omitted, the default value is RESTRICT.

Currently, RESTRICT/CASCADE is operated in the same way.

## Description

SET UNUSED COLUMN does not delete the data physically, so it ensures consistent performance regardless of the number of the rows.

## Example

The following is an example of setting the column not to be used.

```
gSQL> ALTER TABLE t1 SET UNUSED COLUMN (addr);
Table altered.
```

## Compatibility

The SQL standard does not define the following clauses.

- SET UNUSED
- CASCADE CONSTRAINTS
- Listing multiple columns

**Table 16-3** SQL standard compatibility

| Feature ID | Description                               | Compatibility |
|------------|-------------------------------------------|---------------|
| F033       | ALTER TABLE statement: DROP COLUMN clause | X             |

## For More Information

Refer to the followings.

- ALTER TABLE
- ALTER TABLE name ADD COLUMN
- ALTER TABLE name ALTER COLUMN
- ALTER TABLE name RENAME COLUMN

## 16.43 ALTER TABLE name ALTER COLUMN

### Function

It alters the column definition.

### Syntax

```

<alter column definition> ::=
 ALTER TABLE table_name
 ALTER [COLUMN] column_name <alter column action>
<alter column action> ::=
 <set column default clause>
 | <drop column default clause>
 | <set column not null clause>
 | <drop column not null clause>
 | <alter column data type clause>
 | <alter identity column specification>
 | <drop identity property clause>
 ;
<set column default clause> ::=
 SET DEFAULT <default option>
<drop column default clause> ::=
 DROP DEFAULT
<set column not null clause> ::=
 SET [CONSTRAINT constraint_name] NOT NULL [<constraint characteristics>]
<constraint characteristics> ::=
 [NOT] DEFERRABLE [<constraint check time>]
 | <constraint check time> [[NOT] DEFERRABLE]
<constraint check time> ::=
 INITIALLY DEFERRED
 | INITIALLY IMMEDIATE
<drop column not null clause> ::=
 DROP NOT NULL
<alter column data type clause> ::=
 SET DATA TYPE <data type>
<alter identity column specification> ::=

```

```

 <set identity column generation clause> [<alter identity column option> ...]
 | <alter identity column option> ...
<set identity column generation clause> ::=
 SET GENERATED { ALWAYS | BY DEFAULT }
<alter identity column option> ::=
 <alter sequence generator restart option>
 | [SET] <basic sequence generator option>
<alter sequence generator restart option> ::=
 RESTART [WITH integer]
<basic sequence generator option> ::=
 <sequence generator increment by option>
 | <sequence generator maxvalue option>
 | <sequence generator minvalue option>
 | <sequence generator cycle option>
 | <sequence generator cache option>
<drop identity property clause> ::=
 DROP IDENTITY

```

## Invocation and Access Rules

One of the following privileges is required to performing <alter column definition>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

## ALTER [ COLUMN ]

The reserved word COLUMN can be omitted.

### column\_name

It is the column name to be altered.

### ⟨set column default clause⟩

It sets the default value of the column.

It should not be an identity column.

The default value set when using the DEFAULT clause is used in INSERT statement later.

The data type of DEFAULT expression should be compatible with the data type of the column.

If there is insufficient space or the data type is not compatible, an error occurs when using DEFAULT in INSERT, UPDATE statements.

For more information, refer to ⟨default clause⟩ of CREATE TABLE statement.

### ⟨drop column default clause⟩

It drops the default value of the column.

It should not be an identity column.

If the default value is dropped, NULL is set when using DEFAULT clause in INSERT statement.

### ⟨set column not null clause⟩

- SET [CONSTRAINT constraint\_name] NOT NULL [ ⟨constraint characteristics⟩ ]
  - It sets NOT NULL constraint on the column.
  - NULL is not allowed as the column value.
  - NULL should not exist in the column.
- If [CONSTRAINT constraint\_name] is omitted, the constraint name is automatically given.
- If ⟨constraint characteristics⟩ is omitted, it has NOT DEFERRABLE INITIALLY IMMEDIATE property.
- The Identity column can not have DEFERRABLE property.

For more information about the DEFERRABLE constraint, refer to SET CONSTRAINTS.

## ⟨drop column not null clause⟩

- DROP NOT NULL
  - It drops NOT NULL constraint from the column.

## ⟨alter column data type clause⟩

- SET DATA TYPE ⟨data type⟩
  - It changes the data type of the column.

### Note

SET DATA TYPE is a DDL statement which is automatically committed.

The type conversion can be executed among the same family, and it should satisfy the following conditions.

**Table 16-4** Conversion of character string type

| from <b>W</b> to | CHAR(n) | VARCHAR(n) | LONG VARCHAR |
|------------------|---------|------------|--------------|
| CHAR(m)          | X       | X          | X            |
| VARCHAR(m)       | X       | n ≥ m      | X            |
| LONG VARCHAR     | X       | X          | O            |

The conversion of char length unit should satisfy the following condition.

**Table 16-5** Conversion of character length unit

| from <b>W</b> to | OCTETS | CHARACTERS |
|------------------|--------|------------|
| OCTETS           | O      | O          |
| CHARACTERS       | X      | O          |

**Table 16-6** Conversion of binary string type

| from <b>W</b> to | BINARY(n) | VARBINARY(n) | LONG VARBINARY |
|------------------|-----------|--------------|----------------|
| BINARY(m)        | X         | X            | X              |
| VARBINARY(m)     | X         | n ≥ m        | X              |
| LONG VARBINARY   | X         | X            | O              |

Table 16-7 Conversion of numeric type

| from<br>to   | SMALLINT                                   | INTEGER                                      | BIGINT                                       | NUMERIC                                      | NUMERIC(q)                                 | NUMERIC(q,t)                                   | NUMERIC(q)                                     | NUMBER(q,t)                                    | REAL       | DOUBLE PRECISION | FLOAT | FLOAT(q)                | NUMBER |
|--------------|--------------------------------------------|----------------------------------------------|----------------------------------------------|----------------------------------------------|--------------------------------------------|------------------------------------------------|------------------------------------------------|------------------------------------------------|------------|------------------|-------|-------------------------|--------|
| SMALLINT     | O                                          | O                                            | O                                            | O                                            | $q \geq 5$                                 | $q \geq 5$<br>$t \geq 0$<br>$(q-t) \geq 5$     | $q \geq 5$                                     | $q \geq 5$<br>$t \geq 0$<br>$(q-t) \geq 5$     | O          | O                | O     | $\text{ddc}(q) \geq 5$  | O      |

All numeric types are managed in the same structure, and each numeric type is as same as the following NUMBER (p, s) expression.

**Table 16-9** NUMBER expressions of the numeric types

| Numeric type | NUMBER(p,s) expression |
|--------------|------------------------|
| SMALLINT     | NUMBER(5,0)            |
| INTEGER      | NUMBER(10,0)           |
| BIGINT       | NUMBER(19,0)           |
| NUMERIC      | NUMBER(38,0)           |

| Numeric type     | NUMBER(p,s) expression       |
|------------------|------------------------------|
| NUMERIC(p)       | NUMBER(p,0)                  |
| NUMERIC(p,s)     | NUMBER(p,s)                  |
| NUMBER(p)        | NUMBER(p,0)                  |
| NUMBER(p,s)      | NUMBER(p,s)                  |
| REAL             | NUMBER(8,N/A) <= FLOAT(24)   |
| DOUBLE PRECISION | NUMBER(16,N/A) <= FLOAT(53)  |
| FLOAT            | NUMBER(38,N/A) <= FLOAT(126) |
| FLOAT(p)         | NUMBER( ddc(p), N/A )        |
| NUMBER           | NUMBER(38, N/A )             |

Native numeric type is as same with as C language numeric type, and it can not be converted to another type.

**Table 16-10** Conversion of native numeric type

| from W to       | NATIVE_SMALLINT | NATIVE_INTEGER | NATIVE_BIGINT | NATIVE_REAL | NATIVE_DOUBLE |
|-----------------|-----------------|----------------|---------------|-------------|---------------|
| NATIVE_SMALLINT | O               | X              | X             | X           | X             |
| NATIVE_INTEGER  | X               | O              | X             | X           | X             |

| from $\mathbb{W}$ to | ROWID |
|----------------------|-------|
| ROWID                | O     |

## ⟨alter identity column specification⟩

It alters the identity property of the column.

The column should be an identity column.

- SET GENERATED [ ALWAYS | BY DEFAULT ]
  - It changes the method of generating the identity column.
  - For more information, refer to ⟨identity column specification⟩ of CREATE TABLE statement.
- ⟨alter sequence generator restart option⟩
  - It changes NEXT VALUE of the identity column.
  - For more information, refer to ⟨alter sequence generator restart option⟩ clause of ALTER SEQUENCE statement.
- ⟨basic sequence generator option⟩
  - It changes the property of the identity column.
  - In SQL standard, it is defined to be described in the form of SET ⟨basic sequence generator option⟩, but it can be omitted.
  - For more information, refer to ALTER SEQUENCE statement.

## ⟨drop identity property clause⟩

It drops the identity property of the column.

The column should be the identity column.

## Description

SET NOT NULL clause requires the time for checking null in proportion to the number of table rows.

The following columns do not allow NULL values. In other words, even if DROP NOT NULL clause is performed, NULL is not allowed in the following cases.

- A column which includes NOT NULL constraint
- A column which is included in primary key constraint
- An identity column

The change of the default value using SET DEFAULT clause and the change of the identity property using <alter identity column specification> clause, is applied to INSERT or UPDATE statement which is performed later.

## Examples

The following is an example of setting DEFAULT property to the column.

```
gSQL> ALTER TABLE region ALTER COLUMN r_comment SET DEFAULT 'N/A';
Table altered.
```

The following is an example of dropping DEFAULT property from the column.

```
gSQL> ALTER TABLE region ALTER COLUMN r_comment DROP DEFAULT;
Table altered.
```

The following is an example of setting NOT NULL constraint to the column.

```
gSQL> ALTER TABLE region ALTER COLUMN r_regionkey SET NOT NULL;
Table altered.
```

The following is an example of dropping the NOT NULL constraint from the column.

```
gSQL> ALTER TABLE region ALTER COLUMN r_regionkey DROP NOT NULL;
Table altered.
```

The following is an example of extending the data type size of the column.

```
gSQL> ALTER TABLE region ALTER COLUMN r_comment SET DATA TYPE VARCHAR(512);
Table altered.
```

The following is an example of restarting the next value of the identity column.

```
gSQL> ALTER TABLE region ALTER COLUMN r_regionkey RESTART;
Table altered.
```

The following is an example of dropping the identity property from the column.

```
gSQL> ALTER TABLE region ALTER COLUMN r_regionkey DROP IDENTITY;
Table altered.
```

## Compatibility

**Table 16-16** The SQL standards compatibility

| Feature ID | Description                              | Compatibility |
|------------|------------------------------------------|---------------|
| F381       | Extended schema manipulation             | X             |
| F382       | Alter column data type                   | O             |
| F383       | Set column not null clause               | O             |
| F384       | Drop identity property value             | O             |
| F385       | Drop column generation expression clause | X             |
| F386       | Set identity column generation clause    | O             |
| S043       | Enhanced reference types                 | X             |
| T174       | Identity columns                         | O             |
| T178       | Identity columns: simple restart option  | O             |

## For More Information

Refer to the followings.

- **ALTER TABLE**
- **ALTER TABLE name ADD COLUMN**
- **ALTER TABLE name SET UNUSED COLUMN**
- **ALTER TABLE name RENAME COLUMN**

## 16.44 ALTER TABLE name RENAME COLUMN

### Function

It renames the table column.

### Syntax

```
<rename column statement> ::=
 ALTER TABLE table_name
 RENAME COLUMN old_column_name TO new_column_name
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <rename column statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

#### old\_column\_name

It is the old column name to be altered.

## new\_column\_name

It is the new column name to be altered.

The same column name should not exist in a table.

## Description

Even when the column name is altered it does not require the object change such as index, constraint which is generated based on the previous column.

## Example

The following is an example of exchanging the names of two columns, col\_1 and col\_2.

```
gSQL> ALTER TABLE t1 RENAME COLUMN col_1 TO col_temp;
Table altered.
gSQL> ALTER TABLE t1 RENAME COLUMN col_2 TO col_1;
Table altered.
gSQL> ALTER TABLE t1 RENAME COLUMN col_temp TO col_2;
Table altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define <rename column statement>.

## For More Information

Refer to the followings.

- ALTER TABLE
- ALTER TABLE name ADD COLUMN
- ALTER TABLE name SET UNUSED COLUMN
- ALTER TABLE name ALTER COLUMN

## 16.45 ALTER TABLE name ADD CONSTRAINT

### Function

It adds a table constraint.

### Syntax

```
<add table constraint definition> ::=
 ALTER TABLE table_name
 ADD <table constraint definition>
 ;
```

### Invocation and Access Rules

The user should satisfy the following conditions to perform <add table constraint definition> clause.

- One of the following privileges is required on the table to create the constraint.
  - (ALTER or CONTROL TABLE) ON TABLE for that table
  - (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - ALTER ANY TABLE ON DATABASE
- One of the following privileges is required on the schema to create the constraint.
  - (ADD CONSTRAINT or CONTROL SCHEMA) ON SCHEMA for the schema
  - ALTER ANY TABLE ON DATABASE
- One of the following privileges is required for the tablespace in which the index is to be created to create the key constraint
  - CREATE OBJECT ON TABLESPACE for the tablespace
  - USAGE TABLESPACE ON DATABASE
- The owner of the created constraint is determined as follows.
  - The owner of the schema to which the constraint belongs.
  - If the schema to which the constraint belongs is PUBLIC, then it is the user who executed the statement.

**Note**

Constraints of PRIMARY KEY, UNIQUE in a cluster system should include all sharding keys.

## Syntax Rules and Parameters

### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

### <table constraint definition>

It defines the constraint to be added.

NOT NULL constraint can not be added by using ALTER TABLE .. ADD CONSTRAINT statement, and it can be defined by using **ALTER TABLE name ALTER COLUMN** statement as follows.

```
ALTER TABLE t1 ALTER COLUMN c1 SET NOT NULL;
```

For more information, refer to <table constraint definition> clause of **CREATE TABLE** statement.

## Description

When adding the key constraints such as primary key, unique key, the index is automatically created for them.

## Examples

The following is an example of adding the primary key constraint to the table.

```
gSQL> ALTER TABLE t1 ADD PRIMARY KEY (id);
Table altered.
```

The following is an example of specifying the constraint name when adding a primary key constraint to th

e table.

```
gSQL> ALTER TABLE t1 ADD CONSTRAINT t1_pk PRIMARY KEY (id);
Table altered.
```

The following is an example of adding a DEFERRABLE constraint.

```
gSQL> ALTER TABLE t1 ADD CONSTRAINT t1_uk UNIQUE (id) DEFERRABLE INITIALLY DEFERRED;
Table altered.
gSQL> COMMIT;
Commit complete.
```

# Compatibility

**Table 16-17** SQL standard compatibility

| Feature ID | Description                  | Compatibility |
|------------|------------------------------|---------------|
| F381       | Extended schema manipulation | O             |

# For More Information

Refer to the followings.

- CREATE TABLE
- CREATE INDEX
- ALTER TABLE
- ALTER TABLE name DROP CONSTRAINT

## 16.46 ALTER TABLE name DROP CONSTRAINT

### Function

It drops a table constraint.

### Syntax

```

<drop table constraint definition> ::=
 ALTER TABLE table_name
 DROP <constraint object>
 [<drop behavior>]
 ;
<constraint object> ::=
 CONSTRAINT constraint_name
 | PRIMARY KEY
 | UNIQUE (column_name [, ...])
<drop behavior> ::=
 RESTRICT
 | CASCADE
 | CASCADE CONSTRAINTS

```

### Invocation and Access Rules

One of the following privileges is required to perform <drop table constraint definition>.

- The owner of that constraint
- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

### CONSTRAINT constraint\_name

It is the constraint name to be dropped.

### PRIMARY KEY

It is the primary key constraint for the table.

### UNIQUE( column\_name [, ...] )

It is the unique constraint for the columns.

### <drop behavior>

When it is omitted, the default value is RESTRICT.

Currently, RESTRICT/CASCADE is operated in the same way.

## Description

<drop column not null clause> of ALTER TABLE name ALTER COLUMN is used to drop NOT NULL constraint without using the constraint name.

## Examples

The following is an example of dropping a primary key constraint from the table.

```
gSQL> ALTER TABLE t1 DROP PRIMARY KEY;
```

```
Table altered.
```

The following is an example of dropping the table constraint by specifying the constraint name.

```
gSQL> ALTER TABLE t1 DROP CONSTRAINT t1_pk;
Table altered.
```

## Compatibility

The SQL standard does not define the following clauses.

- DROP PRIMARY KEY
- DROP UNIQUE ( column\_name [, ...] )
- CASCADE CONSTRAINTS

**Table 16-18** SQL standard compatibility

| Feature ID | Description                  | Compatibility |
|------------|------------------------------|---------------|
| F381       | Extended schema manipulation | O             |

## For More Information

Refer to the followings.

- ALTER TABLE
- ALTER TABLE name ADD CONSTRAINT
- DROP INDEX

## 16.47 ALTER TABLE name ALTER CONSTRAINT

### Function

It alters the characteristics of the table constraint.

### Syntax

```
<alter table constraint definition> ::=
 ALTER TABLE table_name
 ALTER <constraint object> <constraint characteristics>
 ;
<constraint object> ::=
 CONSTRAINT constraint_name
 | PRIMARY KEY
 | UNIQUE (column_name [, ...])
<constraint characteristics> ::=
 [NOT] DEFERRABLE [<constraint check time>]
 | <constraint check time> [[NOT] DEFERRABLE]
<constraint check time> ::=
 INITIALLY DEFERRED
 | INITIALLY IMMEDIATE
```

### Invocation and Access Rules

One of the following privileges is required to perform <alter table constraint definition>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

#### Note

Cluster does not support the deferrable constraints.

## Syntax Rules and Parameters

### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

### <constraint object>

The constraint to be altered is specified as follows.

- CONSTRAINT constraint\_name
  - The constraint name to be altered.
- PRIMARY KEY
  - PRIMARY KEY constraint of the table
- UNIQUE( column [,...] )
  - UNIQUE constraint which satisfies the column list.

### DEFERRABLE | NOT DEFERRABLE

It alters whether the constraint state is deferrable.

- DEFERRABLE
  - The constraint is altered to be deferrable.
- NOT DEFERRABLE
  - The constraint is altered not to be deferrable.

### INITIALLY IMMEDIATE | INITIALLY DEFERRED

It alters an initial value of the check point for the constraint.

- INITIALLY IMMEDIATE
  - It checks the constraints at the time of DML.
- INITIALLY DEFERRED
  - It checks the constraints at the time of COMMIT.

The constraints defined as NOT DEFERRABLE can not be altered to INITIALLY DEFERRED.

# Description

For more information about the deferrable constraints, refer to **SET CONSTRAINTS**.

# Example

The following is an example that the constraint t1\_uk is set as deferrable and its checking time is set as DEFERRED.

```
gSQL> ALTER TABLE t1 ALTER CONSTRAINT t1_uk DEFERRABLE INITIALLY DEFERRED;
Table altered.
gSQL> COMMIT;
Commit complete.
```

# Compatibility

The SQL standard does not define the following clauses.

- ALTER PRIMARY KEY clause
- ALTER UNIQUE(column [...]) clause

**Table 16-19** SQL standard compatibility

| Feature ID | Description                           | Compatibility |
|------------|---------------------------------------|---------------|
| F492       | Optional table constraint enforcement | X             |

## 16.48 ALTER TABLE name RENAME CONSTRAINT

### Function

It renames the table constraints.

### Syntax

```
<rename table constraint statement> ::=
 ALTER TABLE table_name
 RENAME <constraint object> TO new_constraint_name
 ;
<constraint object> ::=
 CONSTRAINT constraint_name
 | PRIMARY KEY
 | UNIQUE (column_name [, ...])
```

### Invocation and Access Rules

One of the following privileges is required to perform <rename table constraint statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

## ⟨constraint object⟩

The existing name of the constraint to be altered is specified as follows.

- CONSTRAINT constraint\_name
  - The constraint name to be altered
- PRIMARY KEY
  - PRIMARY KEY constraint of the table
- UNIQUE( column [,...] )
  - UNIQUE constraint which satisfies the column list

## new\_column\_name

It is the new name of a constraint to be altered.

## Description

The index name which was automatically created with a key constraint such as primary key, unique key is not altered. Use **ALTER INDEX name RENAME TO** statement to rename the index.

## Examples

The following is an example of renaming the primary key constraint of the table.

```
gSQL> ALTER TABLE t1 RENAME PRIMARY KEY TO pk_t1;
Table altered.
```

The following is an example of renaming the table constraint by specifying the constraint name.

```
gSQL> ALTER TABLE t1 RENAME CONSTRAINT pk_t1 TO t1_pk;
Table altered.
```

## Compatibility

The SQL standard does not define the ⟨rename table constraint statement⟩ statement.

## For More Information

Refer to the followings.

- ALTER TABLE
- ALTER TABLE name ADD CONSTRAINT
- ALTER TABLE name DROP CONSTRAINT
- ALTER TABLE name ALTER CONSTRAINT

## 16.49 ALTER TABLE name ADD GLOBAL SECONDARY INDEX

### Function

It creates a global secondary index in a table.

### Syntax

```

<alter table add global secondary index definition> ::=
 ALTER TABLE table_name
 ADD GLOBAL SECONDARY INDEX
 [<index attributes> [...]] [TABLESPACE tablespace_name]
 ;
<index attributes> ::=
 <physical attribute clause>
 | STORAGE (<segment attr clause> [...])
 | <logging clause>
 | <parallel clause>
<physical attribute clause> ::=
 PCTFREE integer
 | INITTRANS integer
 | MAXTRANS integer
<segment attr clause> ::=
 INITIAL <size_clause>
 | NEXT <size_clause>
 | MINSIZE <size_clause>
 | MAXSIZE <size_clause>
<size clause> ::=
 integer [K | M | G | T]
<logging clause> ::=
 LOGGING
 | NOLOGGING
<parallel clause> ::=
 NOPARALLEL
 | PARALLEL [integer]

```

## Invocation and Access Rules

⟨alter table add global secondary index definition⟩ can be defined in a cluster system, and a user should satisfy the following conditions.

- At least one of the following privileges for a table in which the index is to be created is required.
  - (ALTER or CONTROL TABLE) ON TABLE for that table
  - (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs.
  - ALTER ANY TABLE ON DATABASE
- At least one of the following privileges for a tablespace in which the index is to be created is required.
  - CREATE OBJECT ON TABLESPACE for that tablespace
  - USAGE TABLESPACE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a table in which the index is to be created.

It can define a schema to which the table belongs such as schema\_name.table\_name.

If schema\_name is omitted, the default schema name of the user performing the statement is used.

### ⟨physical attribute clause⟩

It defines the physical attribute information of the index.

- PCTFREE integer
  - Definition
    - The reserved space to adjust the frequency of page splits caused by inserting the key in the page.
    - It is applied only when the index bottom-up build.
  - It can use of the value from 0 to 99.
  - If it is omitted, the value set in DEFAULT\_INDEX\_PCTFREE property is used by default.
- INITRANS integer
  - Definition
    - The initial number of transactions simultaneously accessing the page.
    - If the number of users accessing the index is small, then INITRANS is set low. If the number of users simultaneously accessing the index is big, then INITRANS is set high.
    - If necessary, it is automatically increased to the specified MAXTRANS.

- It can use the value from 1 to 32.
- If it is omitted, the default value is 4.
- MAXTRANS integer
  - Definition
    - It specifies the maximum number of transactions simultaneously accessing the page.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 8.

## ⟨segment attr clause⟩

It specifies the information for the index storage space.

- INITIAL integer
  - Definition
    - It specifies the size of physical storage space which is initially allocated when creating the index.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'INITIAL 100' is actually operated as 8192 bytes.)
    - The size (aligned to the EXTENT size of TABLESPACE) should be equal to or bigger than MIN EXTENTS, or it should be equal to or less than MAXEXTENTS.
  - The minimum value is 1, and the maximum value depends on the system environment.
  - If it is omitted, the default value is one EXTENT size of TABLESPACE to which the table belongs.
- NEXT integer
  - Definition
    - It specifies the physical space size to be allocated when adding the space to the index.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'NEXT 100' is actually operated as 8192 bytes.)
    - NEXT operates as follows, depending on the remaining space size of the index available currently. (Obtained by subtracting the amount of currently used space from the MAXEXTENTS size)
  - If the remaining space size is 0, then it can not extend the space.
  - If the remaining space size is bigger than 0, but smaller than NEXT, then it allocates the space as big as the remaining space.
  - If the remaining space size is bigger than NEXT, then it allocates the space as big as the NEXT.
  - The minimum value is 1 and the maximum value depends on the system environment.
  - If it is omitted, the default value is one EXTENT size of TABLESPACE to which the index belongs.
- MINSIZE integer
  - Definition
    - It is the minimum space size of the index.
    - The value should be equal to or smaller than MAXSIZE.

- This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
- The minimum value is 1 and the maximum value depends on the system environment.
- If it is smaller than the size of two EXTENT, it is specified to the size of two EXTENT.
- If it is omitted, the default value is the size of two EXTENT.
- MAXSIZE integer
  - Definition
    - It is the maximum space size of the index.
    - The value should be equal to or bigger than MINSIZE.
  - This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
  - The minimum value is 1 and the maximum value depends on the system environment.
  - If it is omitted, the default value is EXTENT size \* 2147483647 (The maximum positive integer of INT32).

## ⟨size clause⟩

It specifies the file size in byte. (If it is omitted, the default unit is bytes.)

- K: Kilobytes
- M: Megabytes
- G: Gigabytes
- T: Terabytes

## LOGGING | NOLOGGING

It specifies whether to redo log the index.

If it is omitted, the default value is NOLOGGING.

## NOPARALLEL | PARALLEL [ integer ]

It specifies the number of threads to be used when building an index.

- NOPARALLEL
  - It does not build an index in parallel.
- PARALLEL [integer]
  - It builds an index in parallel.
  - If an integer is omitted or set as 0, then it follows the property (INDEX\_BUILD\_PARALLEL\_FACTOR).
  - The minimum value of an integer is 0 and the maximum value is 16.
  - If the property value is 0, then the system determines the optimal value.
- If it is omitted, the default value is PARALLEL.

## TABLESPACE *tablespace\_name*

It specifies the name of the tablespace in which the index is to be stored.

- If it specifies *tablespace\_name*
  - The *tablespace\_name* of LOGGING index should be a data tablespace.
  - The *tablespace\_name* of NOLOGGING index should be a temporary tablespace or a nologging tablespace.
- If it omits TABLESPACE clause
  - If INDEX TABLESPACE *tablespace\_name* of USER is specified
    - The defined tablespace is used.
  - If INDEX TABLESPACE of USER is NULL
    - LOGGING index uses the user's default data tablespace.
    - NOLOGGING index uses the user's default temporary tablespace.

## Description

A non-deterministic query requires the global secondary index. LOGGING index and NOLOGGING index have the following trade-offs.

- LOGGING index
  - Advantage: It does not separately build an index because the index is automatically restored by using the log when starting up the system.
  - Disadvantage: A disk I/O occurs because the changes on the index are recorded on the log when altering the row.
- NOLOGGING index
  - Advantage: A disk I/O does not occur for the changes on the index when altering the row.
  - Disadvantage: It automatically rebuilds the index when starting up the system because the log information of the index does not exist.

## Examples

The following is an example of adding a global secondary index to the table T1.

```
gSQL> ALTER TABLE T1 ADD GLOBAL SECONDARY INDEX;
Table altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of creating a global secondary index with a logging option on the tablespace USER\_DATA\_TBS of table T1.

```
gSQL> ALTER TABLE T1 ADD GLOBAL SECONDARY INDEX LOGGING TABLESPACE USER_DATA_TBS;
Table altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of creating a global secondary index with a nologging option on the tablespace USER\_TEMP\_TBS of table T1.

```
gSQL> ALTER TABLE T1 ADD GLOBAL SECONDARY INDEX NOLOGGING TABLESPACE USER_TEMP_TBS;
Table altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define the concepts of the global secondary index.

## For More Information

Refer to the followings.

- ALTER TABLE name DROP GLOBAL SECONDARY INDEX
- ALTER TABLE name ALTER GLOBAL SECONDARY INDEX
- CREATE TABLE

## 16.50 ALTER TABLE name DROP GLOBAL SECONDARY INDEX

### Function

It drops a global secondary index from the table.

### Syntax

```
<alter table drop global secondary index definition> ::=
 ALTER TABLE table_name
 DROP GLOBAL SECONDARY INDEX
 ;
```

### Invocation and Access Rules

<alter table drop global secondary index definition> statement can be defined in a cluster system, and the user should satisfy the following conditions.

- The following privilege for the table from which the index is to be dropped is required
  - (ALTER or CONTROL TABLE) ON TABLE for that table
  - (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the name of a table from which the index is to be dropped.

## Description

A global secondary index is required to enqueue a non-deterministic query.

## Examples

It drops a global secondary index from the table T1.

```
gSQL> ALTER TABLE T1 DROP GLOBAL SECONDARY INDEX;
Table altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define the concepts of the global secondary index.

## For More Information

Refer to the followings.

- ALTER TABLE name ADD GLOBAL SECONDARY INDEX
- ALTER TABLE name ALTER GLOBAL SECONDARY INDEX

## 16.51 ALTER TABLE name ALTER GLOBAL SECONDARY INDEX

### Function

It alters the physical attributes of the global secondary index in the table.

### Syntax

```

<alter table alter global secondary index storage statement> ::=
 ALTER TABLE table_name ALTER GLOBAL SECONDARY INDEX
 <physical attribute clause>
 | [STORAGE (<segment attr clause> [...])]
 ;

<physical attribute clause> ::=
 PCTFREE integer
 | INITTRANS integer
 | MAXTRANS integer

<segment attr clause> ::=
 INITIAL <size_clause>
 | NEXT <size_clause>
 | MINSIZE <size_clause>
 | MAXSIZE <size_clause>

<size clause> ::=
 integer [K | M | G | T]

```

### Invocation and Access Rules

One of the following privileges is required to perform <alter table alter global secondary index storage statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a table in which the index is to be created.

It can define a schema to which the table belongs such as schema\_name.table\_name.

If schema\_name is omitted, the default schema name of the user performing the statement is used.

### ⟨physical attribute clause⟩

It defines the physical attribute information of the index.

- PCTFREE integer
  - Definition
    - The reserved space to adjust the frequency of page splits caused by inserting the key in the page.
    - It is applied only when the index bottom-up build.
  - It can use of the value from 0 to 99.
  - If it is omitted, the value set in DEFAULT\_INDEX\_PCTFREE property is used by default.
- INITRANS integer
  - Definition
    - The initial number of transactions simultaneously accessing the page.
    - If the number of users accessing the index is small, then INITRANS is set low. If the number of users simultaneously accessing the index is big, then INITRANS is set high.
    - If necessary, it is automatically increased to the specified MAXTRANS.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 4.
- MAXTRANS integer
  - Definition
    - It specifies the maximum number of transactions simultaneously accessing the page.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 8.

### ⟨segment attr clause⟩

It specifies the information for the index storage space.

- INITIAL integer
  - Definition

- It specifies the size of physical storage space which is initially allocated when creating the index.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'INITIAL 100' is actually operated as 8192 bytes.)
    - The size (aligned to the EXTENT size of TABLESPACE) should be equal to or bigger than MIN EXTENTS, or it should be equal to or less than MAXEXTENTS.
  - The minimum value is 1, and the maximum value depends on the system environment.
  - If it is omitted, the default value is one EXTENT size of TABLESPACE to which the table belongs.
- NEXT integer
    - Definition
      - It specifies the physical space size to be allocated when adding the space to the index.
      - This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'NEXT 100' is actually operated as 8192 bytes.)
      - NEXT operates as follows, depending on the remaining space size of the index available currently. (Obtained by subtracting the amount of currently used space from the MAXEXTENTS size)
        - If the remaining space size is 0, then it can not extend the space.
        - If the remaining space size is bigger than 0, but smaller than NEXT, then it allocates the space as big as the remaining space.
        - If the remaining space size is bigger than NEXT, then it allocates the space as big as the NEXT.
    - The minimum value is 1 and the maximum value depends on the system environment.
    - If it is omitted, the default value is one EXTENT size of TABLESPACE to which the index belongs.
- MINSIZE integer
    - Definition
      - It is the minimum space size of the index.
      - The value should be equal to or smaller than MAXSIZE.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
    - The minimum value is 1 and the maximum value depends on the system environment.
    - If it is smaller than the size of two EXTENT, it is specified to the size of two EXTENT.
    - If it is omitted, the default value is the size of two EXTENT.
- MAXSIZE integer
    - Definition
      - It is the maximum space size of the index.
      - The value should be equal to or bigger than MINSIZE.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
    - The minimum value is 1 and the maximum value depends on the system environment.
    - If it is omitted, the default value is EXTENT size \* 2147483647 (The maximum positive integer of INT32).

## ⟨size clause⟩

It specifies the file size in byte. (If it is omitted, the default unit is bytes.)

- K: Kilobytes
- M: Megabytes
- G: Gigabytes
- T: Terabytes

## Description

A global secondary index is required to enquire a non-deterministic query.

## Examples

It alters the maximum available size to be used by a global secondary index in the table T1 to 100 MBytes.

```
gSQL> ALTER TABLE T1 ALTER GLOBAL SECONDARY INDEX STORAGE(MAXSIZE 100M);
Table altered.
gSQL> COMMIT;
Commit complete.
```

It alters the INITRANS value and the MAXTRANS value to 2 and 4 each which are to be used by a global secondary index in the table T1

```
gSQL> ALTER TABLE T1 ALTER GLOBAL SECONDARY INDEX INITRANS 2 MAXTRANS 4;
Table altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define the concepts of the global secondary index.

## For More Information

Refer to the followings.

- `ALTER TABLE name ADD GLOBAL SECONDARY INDEX`
- `ALTER TABLE name DROP GLOBAL SECONDARY INDEX`

## 16.52 ALTER TABLE name MOVE SHARD

### Function

It rebalances a specific shard of a table, or the entire shard in a specific cluster group to a specific cluster group.

### Syntax

```
<alter table move shard statement> ::=
 ALTER TABLE table_name MOVE SHARD
 { shard_name_list | FROM CLUSTER GROUP src_cluster_group }
 TO CLUSTER GROUP dest_cluster_group [ONLINE | OFFLINE]
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

One of the following privileges is required to perform <alter table move shard statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name.

It can define a schema to which the table belongs such as schema\_name.table\_name.

If schema\_name is omitted, the default schema name of the user performing the statement is used.

The statement can be performed only when that table is a cluster group specific table.

## shard\_name\_list

It is the shard name list to be rebalanced.

If the shard does not exist in that table, then the statement can not be performed.

## src\_cluster\_group

It is the name of a specific cluster group to be rebalanced.

## dest\_cluster\_group

It is the name of a target cluster group on which the shard of the table is to be rebalanced.

If the shard of the table already exists in the specified cluster group, the statement cannot be performed.

## [ ONLINE | OFFLINE ]

It determines whether to allow DML when rebalancing table shard.

- ONLINE
  - It allows INSERT, UPDATE, and DELETE.
- OFFLINE
  - It does not allow INSERT, UPDATE, DELETE.
- When it is omitted, the default value is ONLINE.

## Description

It rebalances a specific shard of the table from a specific cluster group to another cluster group.

To drop a specific cluster group, rebalance the shard of the table then perform the **DROP CLUSTER GROUP** statement.

To move shards of all tables from a specific cluster group to another cluster group, then perform the **ALTER DATABASE MOVE SHARD FROM CLUSTER GROUP TO CLUSTER GROUP** statement.

## Examples

The following is an example of executing the <alter table move shard statement> statement.

```
gSQL> ALTER TABLE t1 MOVE SHARD shard1, shard2 TO CLUSTER GROUP g3;
```

Table altered.

```
gSQL> ALTER TABLE t1 MOVE SHARD FROM CLUSTER GROUP g1 TO CLUSTER GROUP g3;
```

Table altered.

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to **ALTER DATABASE MOVE SHARD**.

## 16.53 ALTER TABLE name REBALANCE

### Function

It rebalances the shard in a table.

### Syntax

```
<alter table rebalance statement> ::=
 ALTER TABLE table_name REBALANCE [ONLINE | OFFLINE]
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

One of the following privileges is required to perform <alter table rebalance statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

#### [ ONLINE | OFFLINE ]

It determines whether to allow DML when rebalancing table shard.

- ONLINE
  - It allows INSERT, UPDATE, and DELETE.
- OFFLINE
  - It does not allow INSERT, UPDATE, DELETE.
- When it is omitted, the default value is ONLINE.

## Description

It does not rebalance shards in a table when adding a cluster member or a cluster group by using the following statements.

- **CREATE CLUSTER GROUP**
- **ALTER CLUSTER GROUP name ADD MEMBER**

To rebalance the shards of a table in the added cluster group and the cluster member, perform the `<alter table rebalance statement>` statement. The operation succeeds without a separate rebalancing if the shard of the table is already rebalanced.

To rebalance shards in all tables, perform the **ALTER DATABASE REBALANCE** statement.

## Examples

The following is an example of executing the `<alter table rebalance statement>` statement.

```
gSQL> ALTER TABLE t1 REBALANCE;
Table altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## 16.54 ALTER TABLE name REBALANCE EXCLUDE CLUSTER GROUP cluster\_group\_list

### Function

It rebalances the shard of the table not to include a shard in a specific cluster group.

### Syntax

```
<alter table rebalance exclude cluster group statement> ::=
 ALTER TABLE table_name REBALANCE
 EXCLUDE CLUSTER GROUP cluster_group_list [ONLINE | OFFLINE]
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

One of the following privileges is required to perform <alter table rebalance exclude cluster group statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name.

It can define a schema to which the table belongs such as schema\_name.table\_name.

If schema\_name is omitted, the default schema name of the user performing the statement is used.

The statement can be performed only when that table is a cluster-wide table.

## cluster\_group\_list

It is a list of the cluster group which does not include a shard of a table.

If the cluster group to be excluded from the rebalancing is the entire group, the statement can not be performed.

## [ ONLINE | OFFLINE ]

It determines whether to allow DML when rebalancing table shard.

- ONLINE
  - It allows INSERT, UPDATE, and DELETE.
- OFFLINE
  - It does not allow INSERT, UPDATE, DELETE.
- When it is omitted, the default value is ONLINE.

## Description

It excludes a specific cluster group and rebalances the shard of the table.

If the shard of the table does not exist in that cluster group, the operation succeeds without a separate rebalancing.

It rebalances the shard based on the cluster group in which the shard of the table is located.

To drop a specific cluster group, rebalance the shard of the table and perform **DROP CLUSTER GROUP** statement.

To rebalance the shard excluding a cluster group from all tables, perform the **ALTER DATABASE REBALANCE EXCLUDE CLUSTER GROUP** statement.

## Examples

The following is an example of executing the <alter table rebalance exclude cluster group statement> statement.

```
gSQL> ALTER TABLE t1 REBALANCE EXCLUDE CLUSTER GROUP g3;
Table altered.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## 16.55 ALTER TABLE name SPLIT SHARD

### Function

It rebalances a specific shard of a table by splitting it in a cluster environment.

### Syntax

```

<alter table split shard statement> ::=
 ALTER TABLE table_name SPLIT SHARD source_shard_name
 INTO (<split shard placement> [, ...])
 ;
<split shard placement> ::=
 <split shard bound def> AT CLUSTER GROUP dest_group_name
<split shard bound def> ::=
 <split list shard def>
 | <split range shard def>
<split list shard def> :=
 SHARD dest_shard_name VALUES IN (<split list value clause>)
<split list value clause> :=
 <split list value> [, ...]
<split list value> :=
 constant
 | NULL
<split range shard def> :=
 SHARD dest_shard_name VALUES LESS THAN (<split range value clause>)
<split range value clause> :=
 <split range value> [, ...]
<split range value> :=
 constant

```

### Invocation and Access Rules

It can be performed in a cluster system.

One of the following privileges is required to perform `<alter table split shard statement>`.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the table name.

It can define a schema to which the table belongs such as `schema_name.table_name`.

If `schema_name` is omitted, the default schema name of the user performing the statement is used.

The statement can be performed only when that table is a cluster group specific table, and when the shard is a list shard or a range shard.

### source\_shard\_name

It is the name of an original shard to be split.

If the shard does not exist in that table, the statement can not be performed.

### <split shard placement>

It defines the target shard to which the original shard is rebalanced by splitting.

### <split shard bound def>

It defines the bound of a target shard to be split.

It can be defined as one of two following bound defs.

- `<split list shard def>`
- `<split range shard def>`

### <split list shard def>

It defines a split shard bound for a list shard.

- `dest_shard_name`
  - It is the name of a target shard.

- **<split list value clause>**
  - **<split list value>** should be an integer.
  - **<split list value>** can not be NULL.
  - **<split list value>** can not be DEFAULT.
  - S1 : ( 1, 11, 21, 31, NULL ) SPLIT SHARD S1 INTO ( **<split list value clause>** .. )
    - (O) SHARD S11 VALUES IN ( 1 )
    - (O) SHARD S11 VALUES IN ( 1, NULL )
    - (O) SHARD S11 VALUES IN ( 1, 11, 21, 31 )
    - (X) SHARD S11 VALUES IN ( 2 )
    - (X) SHARD S11 VALUES IN ( DEFAULT )
    - (X) SHARD S11 VALUES IN ( 1, 11, 21, 31, NULL )

### **<split range shard def>**

It defines a split shard bound for a range shard.

- **<split range value clause>**
  - **<split list value>** should be an integer.
  - **<split list value>** can not be NULL.
  - **<split list value>** can not be MAXVALUE.
  - S1 : ( 100, 100 ), S2 : ( 50, 50 ) SPLIT SHARD S1 INTO ( **<split range value clause>** .. )
    - (O) SHARD S11 VALUES IN ( 50, 100 )
    - (O) SHARD S11 VALUES IN ( 100, 50 )
    - (O) SHARD S11 VALUES IN ( 60, 60 )
    - (X) SHARD S11 VALUES IN ( 50, NULL )
    - (X) SHARD S11 VALUES IN ( 50, 50 )
    - (X) SHARD S11 VALUES IN ( 100, 100 )
    - (X) SHARD S11 VALUES IN ( 100, 110 )
    - (X) SHARD S11 VALUES IN ( MAXVALUE, 100 )

### **dest\_group\_name**

It is the name of a cluster group in which the split shard is to be rebalanced.

## **Description**

It splits a specific shard of a specific table and rebalances it to a random cluster group.

This is used to distribute records and loads by splitting the shards when records corresponding to a specific shard is too much or when a specific group member is overloaded.

## Examples

The following is an example of executing the <alter table split shard statement> statement.

```
gSQL> ALTER TABLE t1 SPLIT SHARD shard1 INTO (SHARD shard11 VALUES IN (11) AT CLUSTER GROUP G2);
```

Table altered.

```
gSQL> ALTER TABLE t1 SPLIT SHARD shard1 INTO (SHARD shard11 VALUES LESS THAN (11) AT CLUSTER GROUP G2);
```

Table altered.

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- ALTER TABLE name REBALANCE
- ALTER TABLE name REBALANCE EXCLUDE CLUSTER GROUP cluster\_group\_list
- ALTER TABLE name MOVE SHARD

## 16.56 ALTER TABLE name RENAME SHARD

### Function

It renames a specific shard of a table in cluster environment.

### Syntax

```
<alter table rename shard statement> ::=
 ALTER TABLE table_name
 RENAME SHARD shard_name TO new_shard_name
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

One of the following privileges is required to perform <alter table rename shard statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name to be altered.

It can define a schema to which the table belongs such as schema\_name.table\_name.

If schema\_name is omitted, the default schema name of the user performing the statement is used.

## shard\_name

It is the existing name of a shard to be altered.

If the shard does not exist in that table, then the statement can not be performed.

## new\_shard\_name

It is the new name of a shard to be altered.

The same shard name should not exist in the table.

## Description

It alters the name of a specific shard of a hash, a range, or a list table. This statement can not be performed for a cloned table.

## Examples

The following is an example of executing <alter table rename shard statement> statement.

```
gSQL> ALTER TABLE t_range RENAME SHARD r_01 TO r_new_01;
Table altered.
gSQL> ALTER TABLE t_list RENAME SHARD l_01 TO l_new_01;
Table altered.
gSQL> ALTER TABLE t_hash RENAME SHARD shard_000000 TO h_new_00;
Table altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- ALTER TABLE
- ALTER TABLE name MOVE SHARD
- ALTER TABLE name SPLIT SHARD
- ALTER TABLE name REBALANCE

## 16.57 ALTER TABLE name READ { ONLY | WRITE }

### Function

It sets READ { ONLY | WRITE } in a table.

### Syntax

```
<alter table read { only | write } statement> ::=
 ALTER TABLE table_name
 READ { ONLY | WRITE }
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <alter table read { only | write } statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name.

It can define a schema to which the table belongs such as schema\_name.table\_name.

If schema\_name is omitted, the default schema name of the user performing the statement is used.

## Description

It sets table property to READ { ONLY | WRITE }.

If it is set to READ ONLY, neither SELECT .. FOR UPDATE statement, nor DML/ DDL statement which updates table data can be used. However, DDL statement which does not update the table data is allowed.

### Note

Disallowed SQL statements when it is set to READ ONLY

- INSERT, UPDATE, DELETE
- TRUNCATE
- SELECT .. FOR UPDATE
- ALTER TABLE RENAME/DROP COLUMN
- ALTER TABLE SET COLUMN UNUSED

Allowed SQL statements when it is set to READ ONLY

- SELECT
- CREATE/ALTER/DROP INDEX
- ALTER TABLE ADD/ALTER COLUMN
- ALTER TABLE ADD/ALTER/RENAME/DROP CONSTRAINT
- ALTER TABLE for physical property changes
- ALTER TABLE DROP UNUSED COLUMNS
- ALTER TABLE RENAME TO
- DROP TABLE
- ALTER TABLE ADD/DROP SUPPLEMENTAL LOG
- LOCK TABLE

## Examples

The following is an example of executing <alter table read { only | write } statement>.

```
gSQL> ALTER TABLE t1 READ ONLY;
Table altered.
gSQL> ALTER TABLE t1 READ WRITE;
Table altered.
```

## Compatibility

The SQL standard does not define `<alter table read { only | write } statement>`.

## For More Information

Refer to **ALTER TABLE**.

## 16.58 ALTER TABLE name RENAME TO

### Function

It renames the table.

### Syntax

```
<rename table statement> ::=
 ALTER TABLE table_name
 RENAME TO new_table_name
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <rename table statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the existing name of the table.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

#### new\_table\_name

It is a new name of the table.

The same table name should not exist in the schema.

## Description

Even when the table is renamed, the object referring to the table such as index, constraint does not need to be renamed.

## Example

The following is an example of exchanging the name of the two tables t1, t2.

```
gSQL> ALTER TABLE t1 RENAME TO t_temp;
Table altered.
gSQL> ALTER TABLE t2 RENAME TO t1;
Table altered.
gSQL> ALTER TABLE t_temp RENAME TO t2;
Table altered.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not define <rename table statement>.

## For More Information

Refer to **ALTER TABLE**.

## 16.59 ALTER TABLE name STORAGE

### Function

It alters physical attributes of a table.

### Syntax

```

<alter table physical attribute statement> ::=
 ALTER TABLE table_name
 [<physical attribute clause>]
 | [STORAGE (<segment attr clause> [...])]
 ;

<physical attribute clause> ::=
 PCTFREE integer
 | PCTUSED integer
 | INITTRANS integer
 | MAXTRANS integer

<segment attr clause> ::=
 NEXT <size_clause>
 | MINSIZE <size_clause>
 | MAXSIZE <size_clause>

<size clause> ::=
 integer [K | M | G | T]

```

### Invocation and Access Rules

One of the following privileges is required to perform <alter table physical attribute statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

### ⟨physical attribute clause⟩

It alters the physical attribute of a page which configures the table.

It is not applied to the already allocated page, but is applied to the newly allocated page.

For more information, refer to ⟨table physical attribute clause⟩ of CREATE TABLE.

### ⟨segment attr clause⟩

It alters the physical attribute of the extent configuring the segment. It is not applied to the already allocated extent but is applied to the newly allocated extent.

- MAXSIZE integer
  - It alters the space size of the segment which can be allocated.
  - If the newly allocated space is smaller than the already allocated space, the MAXSIZE is altered to the currently allocated space size.

## Description

For more information, refer to the rules for each syntax.

## Example

The following is an example of changing the physical attribute of the table.

```
gSQL> ALTER TABLE t1 PCTFREE 10 PCTUSED 40 STORAGE (NEXT 10M MAXSIZE 100M);
Table altered.
```

## Compatibility

The SQL standard does not define the physical attribute of a table.

## For More Information

Refer to **ALTER TABLE**.

## 16.60 ALTER TABLE name ADD SUPPLEMENTAL LOG

### Function

If the primary key exists in the table when table data is altered, it sets to add the primary key value to redo log.

### Syntax

```
<add table supplemental log statement> ::=
 ALTER TABLE table_name
 ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY) COLUMNS
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <add table supplemental log statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

Even when the primary key does not exist in the table, the statement can be executed.

## Description

It additionally records SUPPLEMENTAL LOG when executing UPDATE/DELETE on the corresponding TABLE. The recorded SUPPLEMENTAL LOG is used to analyze logs or tools such as CDC.

To record SUPPLEMENTAL LOG of every TABLE, set the property as *SUPPLEMENTAL\_LOG\_DATA\_PRIMARY\_KEY = YES*.

## Example

The following is an example of setting to additionally add a primary key value to the redo log when changing the data in the table.

```
gSQL> ALTER TABLE t1 ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY) COLUMNS;
Table altered.
```

## Compatibility

The SQL standard does not cover <add table supplemental log statement>.

## For More Information

Refer to **ALTER TABLE name DROP SUPPLEMENTAL LOG**.

## 16.61 ALTER TABLE name DROP SUPPLEMENTAL LOG

### Function

It sets not to leave the primary key information on the redo log when changing the data in the table.

### Syntax

```
<add table supplemental log statement> ::=
 ALTER TABLE table_name
 DROP SUPPLEMENTAL LOG DATA (PRIMARY KEY) COLUMNS
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <drop table supplemental log statement>.

- (ALTER or CONTROL TABLE) ON TABLE for that table
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### table\_name

It is the table name to be altered.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

It should have been set by using **ALTER TABLE name ADD SUPPLEMENTAL LOG** statement.

## Description

For more information, refer to the rules for each syntax.

## Example

The following is an example of setting not to leave the primary key information on the redo log when changing the data in the table.

```
gSQL> ALTER TABLE t1 DROP SUPPLEMENTAL LOG DATA (PRIMARY KEY) COLUMNS;
Table altered.
```

## Compatibility

The SQL standard does not cover <drop table supplemental log statement>.

## 16.62 ALTER TABLESPACE

### Function

It alters the tablespace definition.

### Syntax

```
<alter tablespace statement> ::=
 <rename tablespace statement>
 | <backup tablespace statement>
 | <on/offline tablespace statement>
 | <add file statement>
 | <drop file statement>
 | <rename datafile statement>
 ;
```

### Invocation and Access Rules

ALTER TABLESPACE privilege is required to perform <alter tablespace statement>.

### Syntax Rules and Parameters

#### <rename tablespace statement>

It renames the tablespace.

For more information, refer to **ALTER TABLESPACE name RENAME TO** statement.

#### <backup tablespace statement>

It backs up the tablespace.

For more information, refer to **ALTER TABLESPACE name BACKUP** statement.

## ⟨on-offline tablespace statement⟩

It changes all files in the tablespace to the online state or offline state.

For more information, refer to **ALTER TABLESPACE name [ONLINE|OFFLINE]** statement.

## ⟨add file statement⟩

It adds a file to the tablespace.

For more information, refer to **ALTER TABLESPACE name ADD [DATAFILE|MEMORY]** statement.

## ⟨drop file statement⟩

It drops a file from the tablespace.

For more information, refer to **ALTER TABLESPACE name DROP [DATAFILE|MEMORY]** statement.

## ⟨rename datafile statement⟩

It renames the datafile in the data tablespace.

For more information, refer to **ALTER TABLESPACE name RENAME DATAFILE** statement.

## Description

Unlike other Data Definition Language (DDL), ALTER TABLESPACE statement is not allowed to ROLLBACK, and its transaction is automatically committed after executing the statement.

## Example

Refer to the examples of each detailed statement.

## Compatibility

The SQL standard does not define the concepts of the tablespace.

## For More Information

Refer to the followings.

- `CREATE TABLESPACE`
- `DROP TABLESPACE`

## 16.63 ALTER TABLESPACE name RENAME TO

### Function

It renames the tablespace.

### Syntax

```
<rename tablespace statement> ::=
 ALTER TABLESPACE tablespace_name RENAME TO <new_tablespace_name>
 ;
```

### Invocation and Access Rules

ALTER TABLESPACE ON DATABASE privilege required to perform <rename space statement>.

### Syntax Rules and Parameters

#### tablespace\_name

It is a name of the old tablespace.

- The built-in tablespace can not be renamed.
- The OFFLINE tablespace can not be renamed.

#### new\_tablespace\_name

It is a name of the new tablespace.

## Description

Even when the tablespace is renamed, the table or index which was already created in the existing tablespace does not need to be renamed.

## Example

The following is an example of renaming the tablespace.

```
gSQL> ALTER TABLESPACE space1 RENAME TO space2;
Tablespace altered.
```

## Compatibility

The SQL standard does not define the concepts of the tablespace.

## For More Information

Refer to **ALTER TABLESPACE**.

## 16.64 ALTER TABLESPACE name BACKUP

### Function

It switches the tablespace to backup enabled state and backup disabled state to perform backup.

### Syntax

```

<backup tablespace statement> ::=
 <tablespace begin backup statement>
 | <tablespace end backup statement>
 | <tablespace incremental backup statement>
 ;

<tablespace begin backup statement> ::=
 ALTER TABLESPACE tablespace_name BEGIN BACKUP [AT <domain_name>]
 ;

<tablespace end backup statement> ::=
 ALTER TABLESPACE tablespace_name END BACKUP [AT <domain_name>]
 ;

<tablespace incremental backup statement> ::=
 ALTER TABLESPACE tablespace_name
 BACKUP INCREMENTAL <incremental backup option> [AT <domain_name>] ;

<incremental backup option> ::=
 LEVEL integer [CUMULATIVE | DIFFERENTIAL]

```

### Invocation and Access Rules

ALTER TABLESPACE ON DATABASE privilege is required to perform <backup space statement>.

### Syntax Rules and Parameters

## ⟨tablespace begin backup statement⟩

It sets the tablespace to the backup enabled state.

- The tablespace being used is set to the backup enabled state.
- The backup state of the tablespace such as OFFLINE/ temporary can not be switched.

## tablespace\_name

It is the tablespace name whose backup state is to be switched.

## ⟨tablespace end backup statement⟩

It sets the tablespace to the backup disabled state.

## ⟨tablespace incremental backup statement⟩

It performs the incremental backup of the tablespace.

The database is in OPEN phase and it should be operated in ARCHIVELOG mode.

## ⟨incremental backup option⟩

- An 'Integer' can be specified from 0 to 4.
- 'LEVEL 0' can not specify CUMULATIVE or DIFFERENTIAL.
- CUMULATIVE | DIFFERENTIAL
  - CUMULATIVE
    - If 'integer' is n, it backs up all pages which are altered after the most recent backups of LEVEL 0 ~ LEVEL n-1.
  - DIFFERENTIAL
    - If 'integer' is n, it backs up all pages which are altered after the most recent backups of LEVEL 0 ~ LEVEL n.
  - If it is omitted, DIFFERENTIAL is specified by default.

## ⟨domain name⟩

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## Description

It backs up the datafiles which are created in the tablespace. A full backup of the tablespace begins with BEGIN BACKUP, and copies the datafiles by OS file copy and ends with END BACKUP. The incremental backup file is created in the path set by BACKUP\_DIR 1 property using a single statement.

## Examples

The following is an example of setting the full backup state to 'ACTIVE' for the tablespace DICTIONARY\_TBS.

```
ALTER TABLESPACE DICTIONARY_TBS BEGIN BACKUP;
```

The following is an example of setting the full backup state to 'INACTIVE' for the tablespace DICTIONARY\_TBS.

```
ALTER TABLESPACE DICTIONARY_TBS END BACKUP;
```

The following is an example of generating the LEVEL 0 incremental backup of the tablespace DICTIONARY\_TBS.

```
ALTER TABLESPACE DICTIONARY_TBS BACKUP INCREMENTAL LEVEL 0;
```

## Compatibility

The SQL standard does not define the concepts of the tablespace.

## For More Information

Refer to the followings.

- ALTER TABLESPACE
- ALTER TABLESPACE name [ONLINE|OFFLINE]

## 16.65 ALTER TABLESPACE name [ONLINE|OFFLINE ]

### Function

It alters the tablespace status.

### Syntax

```
<on/off tablespace statement> ::=
 ALTER TABLESPACE tablespace_name { ONLINE | OFFLINE [NORMAL | IMMEDIATE] }
 [AT <domain name>]
 ;
```

### Invocation and Access Rules

ALTER TABLESPACE ON DATABASE privilege is required to perform <on/off tablespace statement>.

### Syntax Rules and Parameters

#### ONLINE

It alters the tablespace status in OFFLINE state to ONLINE state.

#### OFFLINE NORMAL

It alters the tablespace status in ONLINE state to OFFLINE state.

The media recovery is not required in ONLINE state because the tablespace which was altered to OFFLINE state is in consistent state.

**Note**

OFFLINE NORMAL is not allowed in MOUNT phase.

(However, if the previous instance is terminated by \SHUTDOWN NORMAL, OFFLINE NORMAL is allowed.)

## OFFLINE IMMEDIATE

It alters the tablespace status in ONLINE state to OFFLINE state.

The media recovery is required in ONLINE state because the tablespace which was altered to OFFLINE state is in inconsistent state.

**Note**

The SYSTEM tablespace can not be altered to OFFLINE state.

OFFLINE IMMEDIATE requires the media recovery, so it can be performed only in ARCHIVELOG mode.

## <domain name>

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## Description

For more information, refer to the rules for each syntax.

## Examples

The following is an example of setting the tablespace to OFFLINE.

```
gSQL> ALTER TABLESPACE space1 OFFLINE;
Tablespace altered.
```

The following is an example of that OFFLINE NORMAL for the tablespace fails in MOUNT phase.

```
gSQL> ALTER TABLESPACE space1 OFFLINE;
ERR-42000(16290): OFFLINE NORMAL is only allowed if the database is in OPEN phase :
ALTER TABLESPACE space1 OFFLINE
 *
ERROR at line 1:
gSQL> ALTER TABLESPACE space1 OFFLINE NORMAL;
ERR-42000(16290): OFFLINE NORMAL is only allowed if the database is in OPEN phase :
ALTER TABLESPACE space1 OFFLINE NORMAL
 *
ERROR at line 1:
```

## Compatibility

The SQL standard does not define the concepts of the tablespace.

## For More Information

Refer to the followings.

- **ALTER TABLESPACE**
- **ALTER TABLESPACE name BACKUP**

## 16.66 ALTER TABLESPACE name ADD [DATAFILE|MEMORY]

### Function

It extends the space of the tablespace.

### Syntax

```

<add space statement> ::=
 ALTER TABLESPACE tablespace_name ADD <space specification>
 [AT <domain name>]
 ;
<space specification> ::=
 MEMORY <memory clause> [, ...]
 | DATAFILE <add datafile clause> [, ...]
<size clause> ::=
 integer [K | M | G | T]
<memory clause>
 'memory_name' { SIZE <size clause> }
<add datafile clause> ::=
 'filename'
 { SIZE <size clause> | REUSE | SIZE <size clause> REUSE }

```

### Invocation and Access Rules

ALTER TABLESPACE ON DATABASE privilege is required to perform <add space statement>.

### Syntax Rules and Parameters

## tablespace\_name

It is the tablespace name to be altered.

## ⟨file specification⟩

The following syntax should be used according to the tablespace type.

- Memory data tablespace
  - DATAFILE ⟨add datafile clause⟩
- Memory temporary tablespace
  - MEMORY ⟨memory clause⟩

## ⟨add datafile clause⟩

It defines the memory datafile to be added.

- 'filename'
  - It is the file name to store and manage the data.
  - It is the space to store the checkpoint image for the memory data.
  - The filename can be either the new file or existing file.
  - The length of filename should be shorter than 1024 bytes.
- SIZE ⟨size clause⟩
  - For the new file, the initial size is specified by using SIZE clause.
  - An error occurs if the file exists.
  - The file size can be specified from 1M to 30G.
- REUSE
  - If the file exists, it uses REUSE clause.
  - If the file does not exist, a new file is created.
  - The size of newly created file
    - For the data tablespace, it is determined by MEMORY\_DATA\_TABLESPACE\_SIZE property.
    - For the temporary table space, it is determined by MEMORY\_TEMP\_TABLESPACE\_SIZE property.
- SIZE ⟨size clause⟩ REUSE
  - If both of SIZE clause and REUSE clause are specified, it is operated as follows based on the presence of the filename.
    - For the new filename, the initial file size is specified by using SIZE clause.
    - For the existing filename, it is adjusted to the SIZE clause value by using the existing file.

## ⟨memory clause⟩

- ⟨size clause⟩
  - It defines the memory to be added.

For more information, refer to ⟨memory clause⟩ of CREATE MEMORY TEMPORARY TABLESPACE statement.

## ⟨domain name⟩

It is a name of a member or a group for which the statement is performed.  
If it is omitted, it is performed for all groups.

## Description

For more information, refer to the rules for each syntax.

## Example

The following is an example of adding datafile to the tablespace.

```
gSQL> ALTER TABLESPACE space1 ADD DATAFILE 'test_file_a2.dbf' SIZE 10M REUSE;
Tablespace altered.
```

## Compatibility

The SQL standard does not define the concepts of the tablespace.

## For More Information

Refer to the followings.

- CREATE MEMORY DATA TABLESPACE
- CREATE MEMORY TEMPORARY TABLESPACE
- ALTER TABLESPACE

## 16.67 ALTER TABLESPACE name DROP [DATAFILE|MEMORY]

### Function

It reduces the space of the tablespace.

### Syntax

```
<drop space statement> ::=
 ALTER TABLESPACE tablespace_name DROP <file specification>
 [AT <domain name>]
 ;
<file specification> ::=
 DATAFILE 'filename'
 | MEMORY 'memory_name'
```

### Invocation and Access Rules

ALTER TABLESPACE ON DATABASE privilege is required to perform <drop space statement>.

### Syntax Rules and Parameters

#### tablespace\_name

It is the tablespace name to be altered.

#### <file specification>

The following syntax should be used according to the tablespace type.

- Memory data tablespace
  - DATAFILE 'filename'

- Memory temporary tablespace
  - MEMORY 'memory\_name'

#### Note

The file of OFFLINE tablespace can not be dropped.

The first file of the tablespace can not be dropped.

The data file which has been used once can not be dropped.

## <domain name>

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## Description

For more information, refer to the rules for each syntax.

## Example

The following is an example of dropping the file from the tablespace.

```
gSQL> ALTER TABLESPACE space1 DROP DATAFILE 'test_file_f2.dbf';
Tablespace altered.
```

## Compatibility

The SQL standard does not define the concepts of the tablespace.

## For More Information

Refer to the followings.

- ALTER TABLESPACE
- ALTER TABLESPACE name ADD [DATAFILE|MEMORY]
- ALTER TABLESPACE name RENAME DATAFILE

# 16.68 ALTER TABLESPACE name RENAME DATAFILE

## Function

It renames the datafiles that configure the tablespace.

## Syntax

```
<rename datafile statement> ::=
 ALTER TABLESPACE tablespace_name RENAME DATAFILE <filename_list> TO <filename_list>
 ;
 <filename_list> ::=
 'filename' [, ...]
```

## Invocation and Access Rules

ALTER TABLESPACE ON DATABASE privilege is required to perform <rename datafile statement>.

### Note

ONLINE tablespace file can not be altered when it is in TDS mode and the database is in OPEN phase. (Except for the temporary memory tablespace.)

The file should exist even after the alteration.

## Syntax Rules and Parameters

### tablespace\_name

It is the tablespace name to be altered.

## 'filename'

The memory temporary tablespace is 'memory\_name' and the other kinds of tablespace is 'filename'.

## <domain name>

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## Description

The tablespace status determines whether the operation can be performed.

- OFFLINE: It can be performed in MOUNT or OPEN phase.
- ONLINE: It can be performed only in MOUNT phase.

## Example

The following is an example of renaming 'test.dbf' to 'test1.dbf'.

```
gSQL> ALTER TABLESPACE TEST_TBS RENAME DATAFILE 'test.dbf' TO 'test1.dbf';
Tablespace altered.
```

## Compatibility

The SQL standard does not define the concepts of the tablespace.

## For More Information

Refer to the followings.

- ALTER TABLESPACE
- ALTER TABLESPACE name ADD [DATAFILE|MEMORY]
- ALTER TABLESPACE name DROP [DATAFILE|MEMORY]

## 16.69 ALTER USER

### Function

It alters the user definition of the database.

### Syntax

```

<alter user statement> ::=
 ALTER USER user_identifier <alter user action>
 | ALTER USER PUBLIC <alter schema path>
 ;

<alter user action> ::=
 <alter password>
 | <alter profile>
 | <password expire>
 | <account lock>
 | <alter default tablespace>
 | <alter temporary tablespace>
 | <alter schema path>

<alter password> ::=
 IDENTIFIED BY new_password [REPLACE old_password]

<alter profile> ::=
 PROFILE { profile_name | DEFAULT | NULL }

<password expire> ::=
 PASSWORD EXPIRE

<account lock> ::=
 ACCOUNT { LOCK | UNLOCK }

<alter default tablespace> ::=
 DEFAULT TABLESPACE tablespace_name

<alter temporary tablespace> ::=
 TEMPORARY TABLESPACE tablespace_name

<alter schema path> ::=
 SCHEMA PATH ({ schema_name | CURRENT PATH } [, ...])

```

## Invocation and Access Rules

ALTER USER ON DATABASE privilege is required to perform <alter user statement>.

However, <alter password> can be performed without any privilege, when the user and user\_identifier are identical.

## Syntax Rules and Parameters

### user\_identifier

It is the username to be altered.

### <alter password>

It alters the user's password.

- IDENTIFIED BY new\_password
  - The new password is encrypted and stored.
  - The length of the password should be shorter than 128 bytes.
  - The password is case sensitive.
- REPLACE old\_password
  - It can be omitted when ALTER USER ON DATABASE privilege is given.
  - It can not be omitted when ALTER USER ON DATABASE privilege is not given.
    - The user and the user\_identifier should be identical.

### <alter profile>

It alters the profile for the password management policy.

- PROFILE profile\_name
  - It allocates profile\_name which is created by a user.
- PROFILE DEFAULT
  - It allocates "DEFAULT" which is the default profile.
- PROFILE NULL
  - It does not allocate the profile.

## ⟨password expire⟩

It expires the user's password.

## ⟨account lock⟩

- ACCOUNT LOCK
  - It locks the user account.
- ACCOUNT UNLOCK
  - It unlocks the user account.

## ⟨alter default tablespace⟩

It alters the user's default tablespace.

The tablespace\_name should be a data tablespace.

## ⟨alter temporary tablespace⟩

It alters the user's temporary tablespace.

The tablespace\_name should be a temporary tablespace.

## ⟨alter index tablespace⟩

It alters an index tablespace of the user.

- It specifies INDEX TABLESPACE tablespace\_name.
  - If the data tablespace is specified, then it should be a LOGGING index.
  - If the temporary tablespace is specified, then it should be a NOLOGGING index.
- INDEX TABLESPACE NULL
  - It does not specify an index tablespace.

## ⟨alter schema path⟩

It alters the user's schema access path.

If the schema is not specified in user's SQL statement, the schema access path is determined in the schema order for the naming resolution of the object.

If the schema name is as same as another schema which is previously listed, it is not applied.

The following is an example of objects existing in a schema when performing *ALTER USER u1 SCHEMA PATH ( u1, s2, public );* statement.

| Schema name | u1 | s2 | public |
|-------------|----|----|--------|
| -           | t1 | -  | t1     |
| -           | -  | t2 | -      |
| -           | -  | -  | t3     |

The object name whose schema name is not specified when the user u1 executes the schema is interpreted by the SCHEMA PATH as follows.

- CREATE statement
  - CREATE TABLE t1 ( c1 INTEGER );
    - Error: CREATE TABLE u1.t1 ( c1 INTEGER );
  - CREATE TABLE t2 ( c1 INTEGER );
    - Execution: CREATE TABLE u1.t2 ( c1 INTEGER );
- SELECT statement
  - SELECT \* FROM t1;
    - Execution: SELECT \* FROM u1.t1;
  - SELECT \* FROM t2;
    - Execution: SELECT \* FROM s2.t2;
  - SELECT \* FROM t3;
    - Execution: SELECT \* FROM public.t3;

## CURRENT PATH

It is the current user's schema path.

A new schema path can be added using CURRENT PATH maintaining the existing schema path as follows.

- The u1's current schema path
  - (u1, public)
- The statement execution
  - ALTER USER u1 SCHEMA PATH ( s1, CURRENT PATH, s2 );
- The u1's schema path is altered as follows.
  - (s1, u1, public, s2)

## ALTER USER PUBLIC <alter schema path>

It alters the schema path of PUBLIC account.

The schema path of PUBLIC account is included in every user's schema path.

The initial schema path which is allocated to PUBLIC account is as follows.

- DICTIONARY\_SCHEMA
- INFORMATION\_SCHEMA
- DEFINITION\_SCHEMA
- PERFORMANCE\_VIEW\_SCHEMA
- FIXED\_TABLE\_SCHEMA

## Description

For more information, refer to the rules for each syntax.

## Examples

The following is an example of altering the user's password.

```
gSQL> ALTER USER u1 IDENTIFIED BY new_password;
User altered.
```

The following is an example of allocating the profile to the user.

```
gSQL> ALTER USER u1 PROFILE prof1;
User altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of dropping the user's profile.

```
gSQL> ALTER USER u1 PROFILE NULL;
User altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of expiring the user's password.

```
gSQL> ALTER USER u1 PASSWORD EXPIRE;
User altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of unlocking the user's account.

```
gSQL> ALTER USER u1 ACCOUNT UNLOCK;
User altered.
gSQL> COMMIT;
Commit complete.
```

The following is an example of altering the user's DEFAULT TABLESPACE.

```
gSQL> ALTER USER u1 DEFAULT TABLESPACE mem_data_tbs;
User altered.
```

The following is an example of altering the user's TEMPORARY TABLESPACE.

```
gSQL> ALTER USER u1 TEMPORARY TABLESPACE mem_temp_tbs;
User altered.
```

The following is an example of altering the user's INDEX TABLESPACE.

```
gSQL> ALTER USER u1 INDEX TABLESPACE mem_temp_tbs;
User altered.
```

The following is an example of altering the user's schema path.

```
gSQL> ALTER USER u1 SCHEMA PATH (s1, CURRENT PATH);
User altered.
```

## Compatibility

SQL standard covers the concepts of a user, but it does not define the SQL statements associated with creating, altering, dropping a user.

## For More Information

Refer to the followings.

- [CREATE USER](#)
- [DROP USER](#)

## 16.70 ALTER VIEW

### Function

It alters the view definition.

### Syntax

```
<alter view statement> ::=
 ALTER VIEW view_name <alter view action>
 ;
<alter view action> ::=
 COMPILE
```

### Invocation and Access Rules

One of the following privileges is required to perform <alter view statement>.

- (ALTER or CONTROL TABLE) ON TABLE for the view
- (ALTER TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the view belongs
- ALTER ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### view\_name

It is the view name to be altered.

It can define the schema to which the view belongs, such as schema\_name.view\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

## COMPILE

It compiles the view again.

COMMENT which is given to the view column is initialized.

## Description

When the table or the view which is referenced by the view is altered or dropped, then it affects that view.

This information can be retrieved from INFORMATION\_SCHEMA.VIEWS.

- IS\_COMPILED column
  - TRUE: The view was successfully created.
  - FALSE: The view was created with FORCE option when an error exists.
- IS\_AFFECTED column
  - TRUE: The table and the view which was referenced by the view was altered.
  - FALSE: After creation and compilation of a view, the table and the view which was referenced by the view was not altered.

## Example

The following is an example of compiling the view which is affected by the table change referenced by that view.

```
gSQL> SELECT TABLE_NAME, IS_AFFECTED
 FROM INFORMATION_SCHEMA.VIEWS
 WHERE TABLE_SCHEMA = 'PUBLIC'
 AND TABLE_NAME = 'V1';
TABLE_NAME IS_AFFECTED

V1 TRUE
1 row selected.
gSQL> ALTER VIEW v1 COMPILE;
View altered.
COMMIT;
Commit complete.
gSQL> SELECT TABLE_NAME, IS_AFFECTED
```

```
FROM INFORMATION_SCHEMA.VIEWS
WHERE TABLE_SCHEMA = 'PUBLIC'
AND TABLE_NAME = 'V1';
TABLE_NAME IS_AFFECTED

V1 FALSE
1 row selected.
```

## Compatibility

The SQL standard does not define <alter view statement>.

## For More Information

Refer to the followings.

- [CREATE VIEW](#)
- [DROP VIEW](#)

## 16.71 ANALYZE SYSTEM

### Function

It controls the statistics information of the system.

### Syntax

```
<analyze system statement> ::=
 ANALYZE SYSTEM [<analyze action>]
 ;
<analyze action> ::=
 COMPUTE STATISTICS
 | DELETE STATISTICS
```

### Invocation and Access Rules

ANALYZE ANY ON DATABASE privilege is required to perform <analyze system statement>.

### Syntax Rules and Parameters

#### <analyze action>

When it is omitted, the default value is COMPUTE STATISTICS.

#### COMPUTE STATISTICS

It builds the following statistics information related to the system.

- CPU\_OPS (Operations Per Second)
  - It is the number of operations of which the CPU can process per second.
- NETWORK\_IOPS (I/O operations Per Second)
  - It is valid for the cluster.

- It is the number of the network I/O which can be processed per second.

## DELETE STATISTICS

It deletes the statistics information of the system.

## Description

The built statistics information of the system is used to calculate the cost of optimization for the query process.

## Examples

The following is an example of building the statistics information of the system by using the <analyze system statement> statement.

```
gSQL> ANALYZE SYSTEM COMPUTE STATISTICS;
analyzed.
```

The following is an example of retrieving the built statistics information of the system.

```
gSQL>
SELECT * FROM DBA_STAT_SYSTEM;
CPU_OPS NETWORK_IOPS NETWORK_BUFSIZE LAST_ANALYZED

53000412 2914 65536 2017-03-30 16:49:42.200000
1 row selected.
```

## Compatibility

The SQL standard does not define the concepts of the statistics information.

## For More Information

Refer to **ANALYZE TABLE**.

## 16.72 ANALYZE TABLE

### Function

It controls the statistics information of the table.

### Syntax

```
<analyze table statement> ::=
 ANALYZE TABLE table_name
 [<parallel clause>]
 [<analyze action>]
 ;
<parallel clause> ::=
 NOPARALLEL
 | PARALLEL [thread_count]
<analyze action> ::=
 COMPUTE STATISTICS [<for_clause>]
 | ESTIMATE STATISTICS <sample_clause> [<for_clause>]
 | DELETE STATISTICS
<sample_clause>
 SAMPLE row_count ROWS
 | SAMPLE percentage PERCENT
<for_clause>
 FOR ALL COLUMNS
 | FOR ALL INDEXED COLUMNS
 | FOR COLUMNS column_name [, ...]
 | FOR ALL INDEXES
 | FOR INDEXES index_name [, ...]
```

### Invocation and Access Rules

ANALYZE ANY ON DATABASE privilege is required to perform <analyze table statement>.

## Syntax Rules and Parameters

### table\_name

It is the table name.

It can define the schema to which the table belongs, such as schema\_name.table\_name. If schema\_name is omitted, the default schema name of the user performing the statement is used.

### ⟨parallel clause⟩

It specifies the number of threads to be used in a analyzing process.

If it is not specified, the default value is PARALLEL.

- NOPARALLEL
  - It does not analyze in parallel.
- PARALLEL [thread\_count]
  - It analyzes in parallel.
  - The minimum value of the thread\_count is 0, and the maximum value is 64.
  - If the thread\_count value is 0 or it is omitted, then it is determined by the number of CPUs in the system.

### ⟨analyze action⟩

When it is omitted, the default value is COMPUTE STATISTICS.

## COMPUTE STATISTICS

It builds the following statistics information related to the table through the all inspection.

- The table statistics information
  - Row count
- The statistics information of each column
  - The number of different values
  - The number of NULL values
  - The average length of the value
  - The minimum value
  - The maximum value
- The statistics information of an index
  - The number of different keys

The statistics information which is built according to the data type of the column is as follows.

**Table 16-20** Statistics information built according to the data type

| Data type       | NUM_DISTINCT | NUM_NULLS | AVG_LENGTH | MIN/MAX                                     |
|-----------------|--------------|-----------|------------|---------------------------------------------|
| BOOLEAN         | O            | O         | O          | X                                           |
| NATIVE_SMALLINT | O            | O         | O          | O                                           |
| NATIVE_INTEGER  | O            | O         | O          | O                                           |
| NATIVE_BIGINT   | O            | O         | O          | O                                           |
| NATIVE_REAL     | O            | O         | O          | O                                           |
| NATIVE_DOUBLE   | O            | O         | O          | O                                           |
| NUMBER          | O            | O         | O          | O                                           |
| NUMERIC         | O            | O         | O          | O                                           |
| FLOAT           | O            | O         | O          | O                                           |
| CHAR(n)         | O            | O         | O          | It is built when it is 64 bytes or smaller. |
| VARCHAR(n)      | O            | O         | O          | It is built when it is 64 bytes or smaller. |
| LONG VARCHAR    | X            | X         | X          | X                                           |
| BINARY          | O            | O         | O          | X                                           |
| VARBINARY       | O            | O         | O          | X                                           |
| LONG VARBINARY  | X            | X         | X          | X                                           |
| DATE            | O            | O         | O          | O                                           |
| TIME            | O            | O         | O          | O                                           |
| TIMESTAMP       | O            | O         | O          | O                                           |
| INTERVAL        | O            | O         | O          | O                                           |
| ROWID           | O            | O         | O          | X                                           |

## ESTIMATE STATISTICS <sample\_clause>

It builds the statistics information of the column and the index by using as many samples as the specified <sample\_clause>.

- SAMPLE row\_count ROWS
  - It uses as many samples as the specified number of rows.
  - row\_count is a positive integer bigger than 0.
- SAMPLE percentage PERCENT
  - It uses as many samples as the specified ratio.
  - The percentage is a positive integer in the range between 1 and 99.

If the number of the sampling rows is smaller than the value of **MIN\_SAMPLE\_ROW\_COUNT** property, then it follows the property value.

## ⟨for\_clause⟩

If it is omitted, it builds the statistics information of all possible columns and indexes.

### FOR ALL COLUMNS

It builds the statistics information of all possible columns.

It does not build the statistics information of an index.

### FOR ALL INDEXED COLUMNS

It builds the statistics information of all columns included in an index.

It does not build the statistics information of other columns.

It does not build the statistics information of an index.

### FOR COLUMNS column\_name [, ...]

It builds the statistics information of the listed columns.

It does not build the statistics information of unlisted columns.

It does not build the statistics information of an index.

### FOR ALL INDEXES

It builds the statistics information of all indexes.

It does not build the statistics information of columns.

### FOR INDEXES index\_name [, ...]

It builds the statistics information of the listed indexes.

It does not build the statistics information of unlisted indexes.

It does not build the statistics information of a column.

### DELETE STATISTICS

It deletes the statistics information of the table.

## Description

The statistics information of the table affects the query optimization, so it is very important information.

The time to build the statistics information is increased in proportion to the data volumes in a table. Therefore, when the data volume is big, then it is recommended to build the statistics information by using the sampling or to build only the statistics of major information which affects the query.

- The following is an example of building the statistics information by using the sampling.

```
ANALYZE TABLE lineitem ESTIMATE STATISTICS SAMPLE 10 PERCENT;
```

- The following is an example of building the statistics information only of major columns and the index.

```
ANALYZE TABLE lineitem COMPUTE STATISTICS FOR ALL INDEXED COLUMNS;
ANALYZE TABLE lineitem COMPUTE STATISTICS FOR ALL INDEXES;
```

## Examples

The following is an example of building the statistics information through the all inspection.

```
gSQL> ANALYZE TABLE orders;
Table analyzed.
```

The following is an example of retrieving the built statistics information of the table.

```
gSQL>
SELECT
 TABLE_NAME
 , NUM_ROWS
FROM
 DICTIONARY_SCHEMA.USER_TABLES
WHERE
 TABLE_SCHEMA = 'PUBLIC'
 AND TABLE_NAME = 'ORDERS'
;
TABLE_NAME NUM_ROWS

ORDERS 1500000
```

1 row selected.

gSQL>

```
SELECT
 TABLE_NAME
 , COLUMN_NAME
 , NUM_DISTINCT
 , NUM_NULLS
 , LOW_VALUE
 , HIGH_VALUE
FROM
 DICTIONARY_SCHEMA.USER_TAB_COLUMNS
WHERE
 TABLE_SCHEMA = 'PUBLIC'
 AND TABLE_NAME = 'ORDERS'
;
TABLE_NAME COLUMN_NAME NUM_DISTINCT NUM_NULLS LOW_VALUE HIGH_VALUE

ORDERS O_ORDERKEY 1500000 0 1 6000000
ORDERS O_CUSTKEY 99996 0 1 149999
ORDERS O_ORDERSTATUS 3 0 F P
ORDERS O_TOTALPRICE 1464556 0 857.71 555285.16
ORDERS O_ORDERDATE 2406 0 1992-01-01 00:00:00 1998-08-02 00:00:00
ORDERS O_ORDERPRIORITY 5 0 1-URGENT 5-LOW
ORDERS O_CLERK 1000 0 Clerk#000000001 Clerk#0000001000
ORDERS O_SHIPPRIORITY 1 0 0 0
ORDERS O_COMMENT 1482071 0 null null
```

9 rows selected.

gSQL>

```
SELECT
 TABLE_NAME
 , INDEX_NAME
 , DISTINCT_KEYS
FROM
 DICTIONARY_SCHEMA.USER_INDEXES
WHERE
 TABLE_SCHEMA = 'PUBLIC'
 AND TABLE_NAME = 'ORDERS'
;
TABLE_NAME INDEX_NAME DISTINCT_KEYS

ORDERS ORDERS_PK_INDEX 1500000
```

|        |                   |       |
|--------|-------------------|-------|
| ORDERS | ORDERS_CUSTKEY_FK | 99996 |
|--------|-------------------|-------|

2 rows selected.

## Compatibility

The SQL standard does not define the concepts of the statistics information.

## For More Information

Refer to **ANALYZE SYSTEM**.

## 16.73 AUDIT POLICY

### Function

It activates the audit policy.

### Syntax

```
<audit policy statement> ::=
 AUDIT POLICY policy_name
 [<specified_user_option>]
 [<specified_success_option>]
 ;
<specified_user_option> ::=
 BY user_name [, ...]
 | EXCEPT user_name [, ...]
<specified_success_option> ::=
 WHENEVER SUCCESSFUL
 | WHENEVER NOT SUCCESSFUL
```

### Invocation and Access Rules

AUDIT SYSTEM ON DATABASE privilege is required to perform <audit policy statement>.

### Syntax Rules and Parameters

#### policy\_name

It is the name of the audit policy object to be activated.

The activated audit policy does not effect on the existing session, and it effects only on the newly created session.

## <specified\_user\_option>

It specifies the user to be audited.

If omitted, all users are audited.

BY clause and EXCEPT clause can not be used together for the same audit policy.

- BY user\_list: If the user to be audited is specified, then use BY clause.
- EXCEPT user\_list: If other users excluding a specific user is to be audited, use EXCEPT clause.

## <specified\_success\_option>

- WHENEVER SUCCESSFUL
  - If an action succeeds, then the audit record is created.
- WHENEVER NOT SUCCESSFUL
  - If an action fails, then the audit record is created.
- If omitted, both when an action succeeds and fails, the audit record is created.

## Description

Activating the audit policy does not affect the existing session, but it starts to audit the newly created session.

## Retrieving Audit Record

The audit record is created when it corresponds to the audit policy, and it can be retrieved through DICTIONARY\_SCHEMA.AUDIT\_TRAIL view as follows.

```
SELECT logon_user
 , event_timestamp
 , action_name
 , object_name
 , sql_text
FROM audit_trail
WHERE policy_name = 'P1'
;
```

SELECT privilege should be given to an ordinary user to retrieve AUDIT\_TRAIL.

```
GRANT SELECT ON DICTIONARY_SCHEMA.AUDITrail TO user_name;
```

## Retrieving Audit Policy Information

The information about the audit policy object can be retrieved through `DICTIONARY_SCHEMA.AUDIT_POLICY_OPTIONS` view.

```
SELECT policy_name
 , audit_option
 , object_schema
 , object_name
FROM audit_policy_options
;
```

The information about whether the audit policy object is activated can be retrieved through `DICTIONARY_SCHEMA.AUDIT_POLICY_ENABLED` view.

```
SELECT policy_name
 , enabled_opt
 , user_name
 , when_success
 , when_failure
FROM audit_policy_enabled
;
```

## Cautions When Using BY and EXCEPT Clauses

Activate the users group if multiple AUDIT POLICY BY clauses are used for the same audit policy. In other words, the following two examples have the same meaning.

- Example 1: It activates the p1 audit policy for u1 and u2.

```
AUDIT POLICY p1 BY u1;
AUDIT POLICY p1 BY u2;
```

- Example 2: It activates the p1 audit policy for u1 and u2.

```
AUDIT POLICY p1 BY u1, u2;
```

If multiple AUDIT POLICY EXCEPT clauses are used for the same audit policy, only the last AUDIT POLICY clause is valid.

In other words, the following two examples have different meanings.

- Example 1: Only the last clause is valid, and activates the p1 audit policy excluding u2.

```
AUDIT POLICY p1 EXCEPT u1;
AUDIT POLICY p1 EXCEPT u2;
```

- Example 2: It activates the p1 audit policy excluding u1 and u2.

```
AUDIT POLICY p1 EXCEPT u1, u2;
```

BY and EXCEPT can not be used together for the same policy.

- If the audit policy is activated with BY clause, then only BY clause can be used afterwards.

```
AUDIT POLICY p1 BY u1;
```

- Error

```
AUDIT POLICY p1 EXCEPT u2;
```

- If the audit policy is activated with EXCEPT clause, then only EXCEPT clause can be used afterwards.

```
AUDIT POLICY p1 EXCEPT u1;
```

- Error: It corresponds to *by all users*.

```
AUDIT POLICY p1;
```

If a user wants to convert the audit policy activated with BY to EXCEPT or to convert the audit policy activated with EXCEPT to BY, the activated audit policy should be deactivated first, then it can be converted.

Deactivate the audit policy with NOAUDIT POLICY statement as follows.

- AUDIT POLICY p1 BY u1, u2;
  - NOAUDIT POLICY p1 BY u1, u2;
- AUDIT POLICY p1;
  - NOAUDIT POLICY p1;
- AUDIT POLICY p1 EXCEPT u1, u2;
  - NOAUDIT POLICY p1;
  - NOAUDIT POLICY statement does not have an EXCEPT option.

WHENEVER clause which is used together with BY clause is accumulated.

The following two examples have the same meaning.

- Example 1: It creates the audit record regardless of success/ failure.

```
AUDIT POLICY p1 BY u1 WHENEVER SUCCESSFUL;
AUDIT POLICY p1 BY u1 WHENEVER NOT SUCCESSFUL;
```

- Example 2: It creates the audit record regardless of success/ failure.

```
AUDIT POLICY p1 BY u1;
```

If WHENEVER clauses are used together with EXCEPT clause, only the last WHENEVER clause is valid.

The following two examples have different meanings.

- Example 1: It creates the audit record when it fails.

```
AUDIT POLICY p1 EXCEPT u1 WHENEVER SUCCESSFUL;
AUDIT POLICY p1 EXCEPT u1 WHENEVER NOT SUCCESSFUL;
```

- Example 2: It creates the audit record regardless of success/ failure.

```
AUDIT POLICY p1 EXCEPT u1;
```

## Examples

The following is an example of activating the audit policy for all users.

```
AUDIT POLICY table_pol;
```

The information about activation can be viewed through the following query.

```
SELECT policy_name
 , enabled_opt
 , user_name
FROM audit_policy_enabled
WHERE policy_name = 'TABLE_POL';
```

| POLICY_NAME | ENABLED_OPT | USER_NAME |
|-------------|-------------|-----------|
| TABLE_POL   | BY          | ALL USERS |

The following is an example of activating the audit policy by defining specific users.

```
AUDIT POLICY dml_pol BY u1, u2;
```

The following is an example of activating the audit policy by excluding a specific user.

```
AUDIT POLICY read_seq_pol EXCEPT sys;
```

The following is an example of auditing the failure of SQL statement by a specific user.

```
AUDIT POLICY delete_pol BY u1 WHENEVER NOT SUCCESSFUL;
```

## Compatibility

The SQL standard does not have the audit policy.

## For More Information

Refer to the followings.

- Managing audit policy object
  - **CREATE AUDIT POLICY**
  - **DROP AUDIT POLICY**
  - **ALTER AUDIT POLICY**
- Activating/ deactivating audit policy
  - **AUDIT POLICY**
  - **NOAUDIT POLICY**
- Viewing audit trail: **AUDIT\_TRAIL**
- Clearing audit trail: **ALTER DATABASE CLEAR AUDIT TRAIL**

## 16.74 CLOSE cursor\_name

### Function

It closes a cursor.

### Syntax

```
<close statement> ::=
 CLOSE cursor_name
 ;
```

### Syntax Rules and Parameters

#### cursor\_name

The cursor should be open.

The cursor should be declared with **DECLARE cursor\_name** statement in the session.

### Description

The cursor is an object which exists in the session and it does not affect the cursor in a different session.

### Example

The following is an example of DECLARE, OPEN, FETCH, and CLOSE the cursor by using gsql (interactive SQL tool).

```
gSQL> DECLARE cur1 CURSOR FOR SELECT id, data FROM t1;
Cursor declared.
gSQL> OPEN cur1;
Cursor is open.
```

```
gSQL> \var v_id INTEGER
gSQL> \var v_data VARCHAR(128)
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA

 2 data_2
1 row fetched.
gSQL> FETCH cur1 INTO :v_id, :v_data;
no rows fetched.
gSQL> CLOSE cur1;
Cursor closed.
```

## Compatibility

Table 16-21 SQL standard compatibility

| Feature ID | Description       | Compatibility |
|------------|-------------------|---------------|
| B031       | Basic dynamic SQL | O             |

## For More Information

Refer to the followings.

- `DECLARE cursor_name`
- `OPEN cursor_name`
- `FETCH cursor_name`

## 16.75 COMMENT ON name IS

### Function

It stores the comments about the object in the dictionary.

### Syntax

```

<comment statement> ::=
 COMMENT ON <comment object> IS 'comment string'
 ;
<comment object> ::=
 CLUSTER GROUP group_name
 | CLUSTER MEMBER member_name
 | DATABASE
 | PROFILE profile_name
 | AUTHORIZATION user_name
 | TABLESPACE tablespace_name
 | SCHEMA schema_name
 | TABLE [schema_name].table_name
 | COLUMN [schema_name].table_name.column_name
 | INDEX [schema_name].index_name
 | SEQUENCE [schema_name].sequence_name
 | CONSTRAINT [schema_name].constraint_name
 | PROCEDURE [schema_name].procedure_name

```

### Invocation and Access Rules

The altering privileges on each object are required to perform <comment statement> as follows.

- CLUSTER GROUP
  - ALTER SYSTEM ON DATABASE
- CLUSTER MEMBER
  - ALTER SYSTEM ON DATABASE
- DATABASE

- ALTER DATABASE ON DATABASE
- PROFILE
  - ALTER PROFILE ON DATABASE
- AUDIT POLICY
  - AUDIT SYSTEM ON DATABASE
- AUTHORIZATION (user)
  - ALTER USER ON DATABASE
- AUTHORIZATION (role)
  - ALTER ROLE ON DATABASE
- TABLESPACE
  - ALTER TABLESPACE ON DATABASE
- SCHEMA: One of the following privileges is required.
  - The owner of the schema
  - CONTROL SCHEMA ON SCHEMA for the schema
  - ALTER SCHEMA ON DATABASE
- TABLE: One of the following privileges is required.
  - The owner of the table
  - CONTROL TABLE ON TABLE for the table
  - CONTROL SCHEMA ON SCHEMA for the schema to which the table belongs
  - ALTER ANY TABLE ON DATABASE
- COLUMN: One of the following privileges is required.
  - The owner of the table to which the column belongs
  - CONTROL TABLE ON TABLE for the table to which the column belongs
  - CONTROL SCHEMA ON SCHEMA for the schema of the table to which the column belongs
  - ALTER ANY TABLE ON DATABASE
- INDEX: One of the following privileges is required.
  - The owner of the index
  - CONTROL SCHEMA ON SCHEMA for the schema to which the index belongs
  - ALTER ANY INDEX ON DATABASE
- SEQUENCE
  - The owner of the sequence
  - CONTROL SCHEMA ON SCHEMA for the schema to which the sequence belongs
  - ALTER ANY SEQUENCE ON DATABASE
- CONSTRAINT
  - The owner of that constraint
  - CONTROL SCHEMA ON SCHEMA for the schema to which the constraint belongs
  - ALTER ANY TABLE ON DATABASE
- PROCEDURE
  - The owner of the stored procedure/function
  - CONTROL SCHEMA ON SCHEMA for the schema to which the stored procedure/function belong

- ALTER ANY PROCEDURE ON DATABASE

## Syntax Rules and Parameters

### ⟨comment object⟩

It is an object in which the comments are to be stored. The comments for the following database objects are stored.

- Cluster object
  - CLUSTER GROUP
  - CLUSTER MEMBER
- Non-schema object
  - DATABASE
  - PROFILE
  - AUDIT POLICY
  - AUTHORIZATION (User or role)
  - TABLESPACE
  - SCHEMA
- Schema object
  - TABLE or VIEW
  - COLUMN
  - INDEX
  - SEQUENCE
  - CONSTRAINT
  - PROCEDURE or FUNCTION

If schema\_name for the schema object is not specified, the schema name is determined by **Schema Path** of the user performing the statement.

```
COMMENT ON TABLE test_table IS 'test comment';
→ COMMENT ON TABLE user_default_schema.test_table IS 'test comment';
```

### 'comment string'

It describes the comments to be stored.

Use the empty string ('') to delete the comments as follows.

```
COMMENT ON TABLE test_table IS '';
```

The length of the comment string can not exceed 1024 bytes.

## Description

The information can be retrieved from the COMMENTS column of the following dictionary view per each object type.

- Cluster objects
  - CLUSTER GROUP & CLUSTER MEMBER
    - `DICTIONARY_SCHEMA.DBA_CLUSTER_COMMENTS` view
- Non-schema objects
  - DATABASE
    - `DICTIONARY_SCHEMA.ALL_NONSCHEMA_COMMENTS` view
    - `DICTIONARY_SCHEMA.DBA_NONSCHEMA_COMMENTS` view
  - PROFILE
    - `DICTIONARY_SCHEMA.DBA_NONSCHEMA_COMMENTS` view
  - AUDIT POLICY
    - `DICTIONARY_SCHEMA.AUDIT_POLICIES` view
  - USER
    - `DICTIONARY_SCHEMA.ALL_NONSCHEMA_COMMENTS` view
    - `DICTIONARY_SCHEMA.DBA_NONSCHEMA_COMMENTS` view
  - TABLESPACE
    - `DICTIONARY_SCHEMA.ALL_NONSCHEMA_COMMENTS` view
    - `DICTIONARY_SCHEMA.DBA_NONSCHEMA_COMMENTS` view
  - SCHEMA
    - `DICTIONARY_SCHEMA.ALL_NONSCHEMA_COMMENTS` view
    - `DICTIONARY_SCHEMA.DBA_NONSCHEMA_COMMENTS` view
- SQL schema objects
  - TABLE
    - `DICTIONARY_SCHEMA.USER_TAB_COMMENTS` view
    - `DICTIONARY_SCHEMA.ALL_TAB_COMMENTS` view
    - `DICTIONARY_SCHEMA.DBA_TAB_COMMENTS` view
  - VIEW
    - `DICTIONARY_SCHEMA.USER_TAB_COMMENTS` view
    - `DICTIONARY_SCHEMA.ALL_TAB_COMMENTS` view
    - `DICTIONARY_SCHEMA.DBA_TAB_COMMENTS` view
  - COLUMN
    - `DICTIONARY_SCHEMA.USER_COL_COMMENTS` view

- `DICTIONARY_SCHEMA.ALL_COL_COMMENTS` view
- `DICTIONARY_SCHEMA.DBA_COL_COMMENTS` view
- INDEX
  - `DICTIONARY_SCHEMA.USER_INDEXES` view
  - `DICTIONARY_SCHEMA.ALL_INDEXES` view
  - `DICTIONARY_SCHEMA.DBA_INDEXES` view
- SEQUENCE
  - `DICTIONARY_SCHEMA.USER_SEQUENCES` view
  - `DICTIONARY_SCHEMA.ALL_SEQUENCES` view
  - `DICTIONARY_SCHEMA.DBA_SEQUENCES` view
- CONSTRAINT
  - `DICTIONARY_SCHEMA.USER_CONSTRAINTS` view
  - `DICTIONARY_SCHEMA.ALL_CONSTRAINTS` view
  - `DICTIONARY_SCHEMA.DBA_CONSTRAINTS` view
- PROCEDURE & FUNCTION
  - `DICTIONARY_SCHEMA.USER_PROCEDURES` view
  - `DICTIONARY_SCHEMA.ALL_PROCEDURES` view
  - `DICTIONARY_SCHEMA.DBA_PROCEDURES` view

For more information about the detailed description of each view, refer to **DICTIONARY\_SCHEMA**.

## Examples

The following is an example of creating the comment on the table.

```
gSQL> COMMENT ON TABLE t1 IS 'test comment on table t1';
Comment created.
```

The following is an example of creating the comment on the column.

```
gSQL> COMMENT ON COLUMN t1.id IS 'test comment on column t1.id';
Comment created.
```

The following is an example of creating the comment on the schema.

```
gSQL> COMMENT ON SCHEMA s1 IS 'test comment on schema s1';
Comment created.
```

## Compatibility

⟨comment statement⟩ does not exist in SQL standard.

## 16.76 COMMIT

### Function

It terminates the current transaction and makes all changes permanent.

### Syntax

```

<commit statement> ::=
 COMMIT [WORK]
 [[<commit comment clause>] [<commit write clause>] |
 [<commit force clause>] [<commit comment clause>]]
 ;
<commit comment clause> ::=
 COMMENT 'comment_string'
<commit write clause> ::=
 WRITE [WAIT | NOWAIT]
<commit force clause> ::=
 FORCE 'xid_string'

```

### Syntax Rules and Parameters

#### WORK

It is the reserved word which does not affect the operation.

#### <commit comment clause>

- COMMENT 'comment\_string'
  - It specifies the comment to the transaction when committing the transaction.

#### <commit write clause>

It determines whether to wait until the redo logs generated by the commit operation are written on the redo log file.

- **WAIT**
  - It waits until the redo logs generated by the commit operation are written to the redo log file, and then the operation is terminated.
- **NOWAIT**
  - The operation is terminated when the redo logs generated by the commit operation are written to the redo log buffer.
- If it is not specified, it follows the property.

## ⟨commit force clause⟩

It is used to manually commit a distributed transaction.

- **FORCE 'xid\_string'**
  - It commits the distributed transaction 'xid\_string'.
  - 'xid\_string' consists of '*format\_id.transaction\_id.branch\_id*'.

## Description

COMMIT statement completes the following statements which were executed in a transaction.

- **Data Manipulation Language (DML) statement**
  - It is the statement which changes data, such as INSERT, UPDATE, DELETE.
- **Data Definition Language (DDL) statement**
  - It is the statement which changes the structure and definition of the objects, such as CREATE, DROP, ALTER, TRUNCATE, GRANT, REVOKE.

Exceptionally, the following DDL statements which manage the OS resources or change the DATA TYPE are automatically committed.

- **CREATE TABLESPACE**
- **DROP TABLESPACE**
- **ALTER TABLESPACE**
- **ALTER TABLE .. ALTER COLUMN .. SET DATA TYPE: ⟨alter column data type clause⟩**

When performing COMMIT, the cursor opened by WITHOUT HOLD option is automatically closed. For more information about cursors, refer to the following cursor related statements.

- **DECLARE cursor\_name**
- **OPEN cursor\_name**

If the transaction violates the DEFERRED constraint, the COMMIT statement fails and the transaction is rolled back.

led back. For more information about DEFERRED constraint, refer to **SET CONSTRAINTS**.

## Example

The following is an example of performing COMMIT after executing INSERT statement.

```
gSQL> INSERT INTO t1 VALUES (1, 'anonymous');
1 row created.
gSQL> COMMIT WORK COMMENT 'INSERT T1';
Commit complete.
```

## Compatibility

Table 16-22 SQL standard compatibility

| Feature ID | Description          | Compatibility |
|------------|----------------------|---------------|
| T261       | Chained transactions | X             |

## For More Information

Refer to the followings.

- ROLLBACK
- SAVEPOINT savepoint\_specifier

## 16.77 CREATE AUDIT POLICY

### Function

It creates an audit policy object.

AUDIT POLICY should be performed to activate the created audit policy object.

### Syntax

```

<audit policy definition> ::=
 CREATE AUDIT POLICY policy_name
 { <privilege_audit_clause> | <action_audit_clause> | <privilege_audit_clause>
 <action_audit_clause> }
 ;
<privilege_audit_clause> ::=
 PRIVILEGES <database_privilege> [, ...]
<action_audit_clause> ::=
 ACTIONS { <object_action_audit> | <system_action_audit> } [, ...]
<object_action_audit> ::=
 ALL ON [schema_name.]object_name
 | <object_action> ON [schema_name.]object_name
<system_action_audit> ::=
 ALL
 | DDL
 | <system_action>

```

### Invocation and Access Rules

AUDIT SYSTEM ON DATABASE privilege is required to perform <audit policy definition>.

## Syntax Rules and Parameters

### policy\_name

It is the name of the audit policy to be created.

### <privilege\_audit\_clause>

The privilege audit is auditing when the SQL statement is successfully performed by using the database privilege.

It can audit a specific user performing SQL statement by using the database privilege, and it does not record the privilege audit for SYS user who is the owner of the database.

The following is an example of granting SELECT ANY TABLE privilege to user u1 and activating the audit policy.

```
CREATE AUDIT POLICY p1
 PRIVILEGES SELECT ANY TABLE;
AUDIT POLICY p1;
```

If the user u1 performs the following SQL statement, the privilege audit differently operates.

- SELECT \* FROM u1.t1;
  - It does not create the audit record by performing SQL statement with the privilege as an owner of table u1.t1.
- SELECT \* FROM u2.t1;
  - It creates the audit record by performing SQL statement with SELECT ANY TABLE privilege.

<database\_privilege> which can be described in the privilege audit can be viewed with the following query.

```
SELECT PRIVILEGE_NAME FROM V$AUDITABLE_DB_PRIVILEGES;
```

### <action\_audit\_clause>

It audits an action for a specific object and an action for the entire database.

## <object\_action\_audit>

### ALL ON object\_name

It means all actions which can list objects corresponding to object\_name.

The following table describes audit actions of which each object type can audit.

**Table 16-23** Audit action per object type

| Object type               | Action                                                                     |
|---------------------------|----------------------------------------------------------------------------|
| Table                     | ALTER, COMMENT, DELETE, GRANT, INDEX, INSERT, LOCK, RENAME, SELECT, UPDATE |
| View                      | ALTER, COMMENT, GRANT, SELECT                                              |
| Sequence                  | ALTER, COMMENT, GRANT, SELECT                                              |
| Stored Function/Procedure | ALTER, COMMENT, EXECUTE, GRANT                                             |

## <object\_action> ON object\_name

Each separate action per a specific object should be listed by specifying ON clause as follows.

```
CREATE AUDIT POLICY p1
 ACTIONS INSERT ON u1.t1
 , DELETE ON u1.t1
 , UPDATE ON u1.t1
;
```

### Caution of EXECUTE action

Auditing the success or the failure of stored function or stored procedure is determined only based on whether it is executable at the time of execution.

- WHENEVER NOT SUCCESSFUL creates the audit record when neither the stored function nor procedure is executable.
- WHENEVER SUCCESSFUL creates the audit record even though an error occurs while executing SQL statement within the stored function or the procedure
- If an auditing for the failure of SQL statement within the stored function or the procedure is required, then the audit target should include the corresponding SQL statement.

## <system\_action\_audit>

It audits the system action which occurs in the database regardless of a specific object.

- <system\_action>

The valid system action can be retrieved by using the following query.

```
SELECT ACTION_NAME FROM V$AUDITABLE_SYSTEM_ACTIONS;
```

- ALL

It means all system actions.

- DDL

It means all Data Definition Language (DDL).

## Description

An audit policy object is an object which defines auditing targets.

Perform AUDIT POLICY statement to activate an audit policy.

Though it is possible to define and activate multiple audit policies, but it is recommended to maintain certain number of audit policies.

It is also recommended to bind multiple small pieces of policies into a small number of groups.

The information about an option of the created audit policy object can be retrieved through AUDIT\_POLICY\_OPTIONS view as follows.

```
SELECT audit_option
 , audit_option_type
 , object_schema
 , object_name
FROM audit_policy_options
WHERE policy_name = 'P1'
;
```

| AUDIT_OPTION | AUDIT_OPTION_TYPE | OBJECT_SCHEMA | OBJECT_NAME |
|--------------|-------------------|---------------|-------------|
| DELETE       | OBJECT ACTION     | U1            | T1          |
| INSERT       | OBJECT ACTION     | U1            | T1          |
| UPDATE       | OBJECT ACTION     | U1            | T1          |

## Creating Audit Record

If an action corresponding to multiple audit policies occurs, then one or more audit records are created.

If similar audit options are listed as follows, then one audit record is created.

- Defining an audit policy

```
CREATE AUDIT POLICY p1
 PRIVILEGES SELECT ANY TABLE
 ACTIONS SELECT;
AUDIT POLICY p1;
```

- Performing an audit action

```
SELECT * FROM other_user.t1;
```

If two different audit options are listed as follows, then two audit records are created.

- Defining an audit policy

```
CREATE AUDIT POLICY p1
 ACTIONS SELECT ON u1.t1
 , SELECT ON u2.t2;
AUDIT POLICY p1;
```

- Performing an audit action

```
SELECT COUNT(*) FROM u1.t1 A, u2.t2 B WHERE A.id = B.id;
```

If multiple audit policies are activated for the same action as follows, then two audit records are created.

- Defining an audit policy

```
CREATE AUDIT POLICY p1
 PRIVILEGES SELECT ANY TABLE;
AUDIT POLICY p1;
CREATE AUDIT POLICY p2
 ACTIONS SELECT;
AUDIT POLICY p2;
```

- Performing an audit action

```
SELECT * FROM other.t1;
```

## Examples

The following is an example of defining an audit policy which audits an privilege.

```
CREATE AUDIT POLICY policy_table
 PRIVILEGES CREATE ANY TABLE
 , DROP ANY TABLE
;
```

The following is an example of defining an audit policy which audits an action for an object.

```
CREATE AUDIT POLICY policy_dml
 ACTIONS INSERT ON u1.t1
 , DELETE ON u1.t1
 , UPDATE ON u1.t1
 , ALL ON u1.t2
;
```

The following is an example of defining an audit policy which audits the system action.

```
CREATE AUDIT POLICY policy_drop
 ACTIONS DROP TABLE, TRUNCATE TABLE
;
```

The following is an example of defining an audit policy which combines all examples above.

```
CREATE AUDIT POLICY policy_group
 PRIVILEGES CREATE ANY TABLE
 , DROP ANY TABLE
 ACTIONS INSERT ON u1.t1
 , DELETE ON u1.t1
 , UPDATE ON u1.t1
 , ALL ON u1.t2
 , DROP TABLE
 , TRUNCATE TABLE
;
```

## Compatibility

The audit policy does not exist in SQL standard.

## For More Information

Refer to the followings.

- Managing audit policy object
  - **CREATE AUDIT POLICY**
  - **DROP AUDIT POLICY**
  - **ALTER AUDIT POLICY**
- Activating/ deactivating audit policy
  - **AUDIT POLICY**
  - **NOAUDIT POLICY**
- Retrieving audit trail: **AUDIT\_TRAIL**
- Clearing audit trail: **ALTER DATABASE CLEAR AUDIT TRAIL**

## 16.78 CREATE CLUSTER GROUP

### Function

It creates a cluster group which is to participate in a cluster system.

### Syntax

```
<cluster group definition> ::=
 CREATE CLUSTER GROUP group_name
 <cluster member definition> [, ...]
 ;
<cluster member definition> ::=
 CLUSTER MEMBER member_name <connection attribute>
<connection attribute> ::
 HOST 'address' PORT port_no
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <cluster group definition>.

### Syntax Rules and Parameters

#### **group\_name**

It is the name of a cluster group.

An identical cluster group name or a cluster member name should not exist.

The name length should be shorter than 128 bytes.

## ⟨cluster member definition⟩

It defines a cluster member to be included in a cluster group.

A cluster group can include maximum 32 cluster members.

A cluster group which is created first in a cluster system can define only one cluster member, and should include itself as a cluster member.

### member\_name

It is the name of a cluster member.

The name of a cluster member should be same as the name of the member which was defined when creating the database of that member.

An identical cluster group name or a cluster member name should not exist.

The name length should be shorter than 128 bytes.

The start-up phase of the cluster member should be the OPEN phase.

## ⟨connection attribute⟩

It defines the connection information for the communication between the cluster members.

⟨connection attribute⟩ should be as same as the HOST and PORT which were defined when the database of that cluster member was created.

The combination of HOST and PORT should be unique in the cluster system.

- HOST address uses ip v4 type.
- PORT port\_no should be in the range between 1024 ~ 49151.

## Description

⟨cluster group definition⟩ statement does not rebalance the shard of tables.

Perform the following statements to rebalance the shard to an added cluster group.

- **ALTER DATABASE REBALANCE**
- **ALTER TABLE name REBALANCE**

## Examples

The following is an example of creating a cluster group which consists of two cluster members.

```
gSQL>
CREATE CLUSTER GROUP g1
 CLUSTER MEMBER g1n1 HOST '192.168.0.11' PORT 10110
;
Cluster Group created.
gSQL>
ALTER CLUSTER GROUP g1
 ADD CLUSTER MEMBER g1n2 HOST '192.168.0.12' PORT 10120
;
Cluster Group altered.
gSQL>
CREATE CLUSTER GROUP g2
 CLUSTER MEMBER g2n1 HOST '192.168.0.21' PORT 10210,
 CLUSTER MEMBER g2n2 HOST '192.168.0.22' PORT 10220
;
Cluster Group created.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **DROP CLUSTER GROUP**
- **ALTER CLUSTER GROUP name ADD MEMBER**

## 16.79 CREATE CLUSTER LOCATION

### Function

It creates the connection information of a cluster member.

### Syntax

```
<cluster location definition> ::=
 CREATE CLUSTER LOCATION member_name
 <cluster connection attribute>
 ;
<cluster connection attribute> ::
 HOST 'address' PORT port_no
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <cluster location definition>.

### Syntax Rules and Parameters

#### member\_name

It is the name of a cluster member.

The same cluster member name should not exist in the registered cluster location information.

The length of the name should be shorter than 128 bytes.

#### <cluster connection attribute>

It defines the connection information for the communication between the cluster members.

The combination of HOST and PORT should be unique in the cluster system.

- HOST address uses ip v4 type.
- PORT port\_no should be in the range between 1024 ~ 49151.

## Description

Generally, the information of the cluster location is automatically created by using the connection information provided when creating the cluster group or adding the cluster member. The created information is deleted together when deleting the cluster member and the cluster group.

If the information of the cluster location is modified, then the connection information can be modified by using **ALTER CLUSTER LOCATION** without deleting or recreating the cluster member.

## Examples

```
gSQL>
CREATE CLUSTER LOCATION g1n2
 HOST '192.168.0.12' PORT 10120,
;
Created
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to **DROP CLUSTER LOCATION**.

## 16.80 CREATE INDEX

### Function

It creates an index.

### Syntax

```

<index definition> ::=
 CREATE [UNIQUE] INDEX index_name
 ON table_name (<index column element> [, ...])
 [<index attributes> [...]]
 [TABLESPACE tablespace_name]
 ;
<index column element> ::=
 column_name [ASC | DESC] [NULLS FIRST | NULLS LAST]
<index attributes> ::=
 <physical attribute clause>
 | STORAGE (<segment attr clause> [...])
 | <logging clause>
 | <parallel clause>
<physical attribute clause> ::=
 PCTFREE integer
 | INITTRANS integer
 | MAXTRANS integer
<segment attr clause> ::=
 INITIAL <size_clause>
 | NEXT <size_clause>
 | MINSIZE <size_clause>
 | MAXSIZE <size_clause>
<size clause> ::=
 integer [K | M | G | T]
<logging clause> ::=
 LOGGING
 | NOLOGGING
<parallel clause> ::=
 NOPARALLEL

```

| PARALLEL [ integer ]

## Invocation and Access Rules

The user should satisfy the following conditions to perform <index definition>.

- One of the following privileges is required to create an index on the table.
  - (INDEX or CONTROL TABLE ON) TABLE for that table
  - CONTROL SCHEMA ON SCHEMA for the schema to which the table belongs
  - CREATE ANY INDEX ON DATABASE
- One of the following privileges is required for the schema on which the index to be created.
  - (CREATE INDEX or CONTROL SCHEMA) ON SCHEMA for the schema
  - CREATE ANY INDEX ON DATABASE
- One of the following privileges is required for the tablespace on which the index to be created.
  - CREATE OBJECT ON TABLESPACE for that tablespace
  - USAGE TABLESPACE ON DATABASE
- The owner of the index is determined as follows.
  - The owner of the schema to which the index belongs.
  - If the schema to which the index belongs is PUBLIC, then it is the user who executed the statement.

### Note

Unique indexes in a cluster system should include all sharding keys.

## Syntax Rules and Parameters

### UNIQUE

It does not allow duplicate values for the columns of the index.

## index\_name

It is the index name to be created and it should be a unique name within the schema.

If the schema name is omitted, the index is created in the schema to which the referring table belongs.

The length of the index name should be shorter than 128 bytes.

## table\_name

It is the table name which creates the index.

The schema to which a table belongs, such as schema\_name.table\_name, can be defined. If schema\_name is omitted, the default schema name of the user performing the statement is used.

## column\_name

It is the column name to be used as an index key.

One or more columns should be defined, and maximum 32 columns can be used as an index key.

The following constraints can occur depending on the implementation.

- If the column data type included in an index is LONG CHARACTER VARYING, LONG BINARY VARYING, an index can not be created.
- An index is created only when the sum of the column precisions is less than half of the page size.

## ASC | DESC

It specifies the sort order of a column.

- ASC: It is sorted in ascending order.
- DESC: It is sorted in descending order.
- If not specified, the default value is ASC.

## NULLS FIRST | NULLS LAST

It specifies the sort order of the NULL value.

- NULLS FIRST: It precedes the non-NULL values.
- NULLS LAST: It is behind the non-NULL values.
- If not specified, the default value is NULLS LAST.

## ⟨physical attribute clause⟩

It defines the physical attribute of the index.

- PCTFREE integer
  - Definition
    - It is the reserved space for adjusting the page split frequency caused by the key inserted in the page.
    - It applies only to the index bottom-up build.
  - It can use the value from 0 to 99.
  - If it is omitted, the default value is the value set in DEFAULT\_INDEX\_PCTFREE property.
- INITRANS integer
  - Definition
    - It specifies the initial number of transactions which can simultaneously access the page.
    - If the number of users who access the index is small, INITRANS is set to low, and if the number of users who simultaneously access the index is big, INITRANS is set to high.
    - If necessary, it is automatically increased to the specified MAXTRANS.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 4.
- MAXTRANS integer
  - Definition
    - It specifies the maximum number of transactions which can simultaneously access the page.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 8.

## ⟨segment attr clause⟩

It specifies the information for the index storage space.

- INITIAL integer
  - Definition
    - It specifies the size of physical storage space which is initially allocated when creating the index.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'INITIAL 100' is actually operated as 8192 bytes.)
    - The size (aligned to the EXTENT size of TABLESPACE) should be equal to or bigger than MIN EXTENTS, or it should be equal to or less than MAXEXTENTS.
  - The minimum value is 1, and the maximum value depends on the system environment.
  - If it is omitted, the default value is one EXTENT size of TABLESPACE to which the table belongs.
- NEXT integer

- Definition
    - It specifies the physical space size to be allocated when adding the space to the index.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'NEXT 100' is actually operated as 8192 bytes.)
    - NEXT operates as follows, depending on the remaining space size of the index available currently. (Obtained by subtracting the amount of currently used space from the MAXEXTENTS size)
      - If the remaining space size is 0, then it can not extend the space.
      - If the remaining space size is bigger than 0, but smaller than NEXT, then it allocates the space as big as the remaining space.
      - If the remaining space size is bigger than NEXT, then it allocates the space as big as the NEXT.
  - The minimum value is 1 and the maximum value depends on the system environment.
  - If it is omitted, the default value is one EXTENT size of TABLESPACE to which the index belongs.
- MINSIZE integer
    - Definition
      - It is the minimum space size of the index.
      - The value should be equal to or smaller than MAXSIZE.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
    - The minimum value is 1 and the maximum value depends on the system environment.
    - If it is smaller than the size of two EXTENT, it is specified to the size of two EXTENT.
    - If it is omitted, the default value is the size of two EXTENT.
  - MAXSIZE integer
    - Definition
      - It is the maximum space size of the index.
      - The value should be equal to or bigger than MINSIZE.
    - This size is aligned to the EXTENT size of the TABLESPACE to which the index belongs.
    - The minimum value is 1 and the maximum value depends on the system environment.
    - If it is omitted, the default value is EXTENT size \* 2147483647 (The maximum positive integer of INT32).

## ⟨size clause⟩

It specifies the file size in bytes. (If the unit is omitted, the default value is bytes.)

- K: Kilobytes
- M: Megabytes
- G: Gigabytes
- T: Terabytes

## LOGGING | NOLOGGING

It specifies whether the index performs redo logging.

If not specified, the default value is NOLOGGING.

## NOPARALLEL | PARALLEL [ integer ]

It specifies the number of threads to be used when building an index.

- NOPARALLEL
  - It does not build an index in parallel.
- PARALLEL [integer]
  - It builds an index in parallel.
  - If an integer is omitted or set as 0, then it follows the property (INDEX\_BUILD\_PARALLEL\_FACTOR).
  - The minimum value of an integer is 0 and the maximum value is 16.
  - If the property value is 0, then the system determines the optimal value.
- If it is omitted, the default value is PARALLEL.

## TABLESPACE tablespace\_name

It specifies the name of the tablespace in which the index is to be stored.

- If it specifies tablespace\_name
  - The tablespace\_name of LOGGING index should be a data tablespace.
  - The tablespace\_name of NOLOGGING index should be a temporary tablespace or a nologging tablespace.
- If it omits TABLESPACE clause
  - If INDEX TABLESPACE tablespace\_name of USER is specified
    - The defined tablespace is used.
  - If INDEX TABLESPACE of USER is NULL
    - LOGGING index uses the user's default data tablespace.
    - NOLOGGING index uses the user's default temporary tablespace.

## Description

LOGGING index and NOLOGGING index have the following trade-offs.

- LOGGING index

- Advantage: It does not separately build an index because the index is automatically restored by using the log when starting up the system.
- Disadvantage: A disk I/O occurs because the changes on the index are recorded on the log when altering the row.
- NOLOGGING index
  - Advantage: A disk I/O does not occur for the changes on the index when altering the row.
  - Disadvantage: It automatically rebuilds the index when starting up the system because the log information of the index does not exist.

## Examples

The following is an example of creating the unique index.

```
gSQL> CREATE UNIQUE INDEX idx_t1_id ON t1(id);
Index created.
```

The following is an example of creating an index for multiple columns.

```
gSQL> CREATE INDEX idx_t1_id_name ON t1(id, name);
Index created.
```

The following is an example of specifying the sort order of the index column.

```
gSQL> CREATE INDEX idx_t1_dept_id ON t1(dept_id DESC);
Index created.
```

The following is an example of specifying the sort order of NULL value of the index column.

```
gSQL> CREATE INDEX idx_t1_name ON t1(name NULLS FIRST);
Index created.
```

The following is an example of setting information about the space in which index is stored.

```
gSQL> CREATE INDEX idx_t1_id ON t1(id)
 STORAGE (INITIAL 10M NEXT 1M MINSIZE 10M MAXSIZE 100M);
Index created.
```

The following is an example of creating the redo logging for the index.

```
gSQL> CREATE INDEX idx_t1_id ON t1(id) LOGGING;
Index created.
```

The following is an example of creating the index with parallel option.

```
gSQL> CREATE INDEX idx_t1_name ON t1(name) PARALLEL;
Index created.
```

The following is an example of specifying the tablespace when creating an index.

```
gSQL> CREATE INDEX idx_t1_name ON t1(name) NOLOGGING TABLESPACE mem_temp_tbs;
Index created.
```

## Compatibility

The SQL standard does not cover the concepts of the index.

## For more information

Refer to **DROP INDEX**.

## 16.81 CREATE PROFILE

### Function

It is the statement which creates the profile, and it sets the password management method. When a profile is allocated to a user, the user's password is managed in the way defined in the profile.

### Syntax

```

<profile definition> ::=
 CREATE PROFILE profile_name LIMIT
 { <password_parameters>, ... }
 ;

<password parameters> ::=
 FAILED_LOGIN_ATTEMPTS { integer | UNLIMITED | DEFAULT }
 | PASSWORD_LOCK_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_LIFE_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_GRACE_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_REUSE_MAX { integer | UNLIMITED | DEFAULT }
 | PASSWORD_REUSE_TIME { password_parameter_number_interval | UNLIMITED | DEFAULT }
 | PASSWORD_VERIFY_FUNCTION { <verify_policy> | NULL | DEFAULT }

<verify_policy> ::=
 KISA_VERIFY_FUNCTION
 | ORA12C_VERIFY_FUNCTION
 | ORA12C_STRONG_VERIFY_FUNCTION
 | VERIFY_FUNCTION_11G
 | VERIFY_FUNCTION

<password_parameter_number_interval> ::=
 integer
 | integer / integer

```

### Invocation and Access Rules

CREATE PROFILE ON DATABASE privilege is required to perform <profile definition>.

# Syntax Rules and Parameters

## profile\_name

It specifies the profile name to be created.

## password\_parameters

It sets the parameters for password management.

- The following parameters are to be set.
  - FAILED\_LOGIN\_ATTEMPTS
  - PASSWORD\_LOCK\_TIME
  - PASSWORD\_LIFE\_TIME
  - PASSWORD\_GRACE\_TIME
  - PASSWORD\_REUSE\_MAX
  - PASSWORD\_REUSE\_TIME
  - PASSWORD\_VERIFY\_FUNCTION

The omitted parameters follow the "DEFAULT" profile policy.

## FAILED\_LOGIN\_ATTEMPTS

It sets the number of consecutive login attempts allowed to fail.

If the failed attempts exceed the specified number, the account is locked.

- FAILED\_LOGIN\_ATTEMPTS integer
  - The value range should be a positive integer bigger than 0.
- FAILED\_LOGIN\_ATTEMPTS UNLIMITED
  - Account lockout which is due to a login failure does not occur.
- FAILED\_LOGIN\_ATTEMPTS DEFAULT
  - It follows the "DEFAULT" profile policy.

## PASSWORD\_LOCK\_TIME

It sets the period (days) which the account is locked after consecutive login failure.

- PASSWORD\_LOCK\_TIME constant\_expression
  - It is the lock duration (day).
  - The default unit is a day.
  - Hours(n/24), minutes (n/1440), seconds (n/86400) can be specified for testing.

- The value range is from one second (1/86400) to 100,000 days.
- PASSWORD\_LOCK\_TIME UNLIMITED
  - If an account lockout occurs, the lock is not release until performing ALTER USER user\_name ACCOUNT UNLOCK statement.
- PASSWORD\_LOCK\_TIME DEFAULT
  - It follows the "DEFAULT" profile policy.

## PASSWORD\_LIFE\_TIME

It sets the life time of the password (day).

- PASSWORD\_LIFE\_TIME constant\_expression
  - It is the life time of the password (day).
  - The default unit is a day.
  - Hours(n/24), minutes (n/1440), seconds (n/86400) can be specified for testing.
  - The value range is from one second (1/86400) to 100,000 days.
- PASSWORD\_LIFE\_TIME UNLIMITED
  - The password does not have the expiration date.
- PASSWORD\_LIFE\_TIME DEFAULT
  - It follows the "DEFAULT" profile policy.

## PASSWORD\_GRACE\_TIME

It sets the grace period of password expiration when logging in after PASSWORD\_LIFE\_TIME.

- PASSWORD\_GRACE\_TIME constant\_expression
  - The grace period for password expiration (day)
  - The default unit is a day.
  - Hours (n/24), minutes (n/1440), seconds (n/86400) can be specified for testing.
  - The value range is from one second (1/86400) to 100,000 days.
- PASSWORD\_GRACE\_TIME UNLIMITED
  - It continues to defer the password expiration.
- PASSWORD\_GRACE\_TIME DEFAULT
  - It follows the "DEFAULT" profile policy.

PASSWORD\_GRACE\_TIME starts at first login trial after the password life time. If the password is not altered during the grace period, the password expires.

## PASSWORD\_REUSE\_MAX

It sets the number of the recent passwords which can not be reused when the user wants to reuse the old password.

PASSWORD\_REUSE\_MAX should be used together with PASSWORD\_REUSE\_TIME.

- PASSWORD\_REUSE\_MAX integer
  - The value range should be a positive integer bigger than 0.
- PASSWORD\_REUSE\_MAX UNLIMITED
  - If PASSWORD\_REUSE\_TIME is UNLIMITED, all old passwords can be reused.
  - If PASSWORD\_REUSE\_TIME is not UNLIMITED, any old password can not be reused.
- PASSWORD\_REUSE\_MAX DEFAULT
  - It follows the "DEFAULT" profile policy.

## PASSWORD\_REUSE\_TIME

It sets the duration which the password can not be reused when the user wants to reuse the old password.

PASSWORD\_REUSE\_TIME should be used together with PASSWORD\_REUSE\_MAX.

- PASSWORD\_REUSE\_TIME constant\_expression
  - It is the duration which the password can not be reused. (day)
  - The default unit is a day.
  - Hours(n/24), minutes (n/1440), seconds (n/86400) can be specified for testing.
  - The value range is from one second (1/86400) to 100,000 days.
- PASSWORD\_REUSE\_TIME UNLIMITED
  - If PASSWORD\_REUSE\_MAX is UNLIMITED, all old passwords can be reused.
  - If PASSWORD\_REUSE\_MAX is not UNLIMITED, any old password can not be reused.
- PASSWORD\_REUSE\_TIME DEFAULT
  - It follows the "DEFAULT" profile policy.

## PASSWORD\_VERIFY\_FUNCTION

It sets the password complexity verification methods.

- PASSWORD\_VERIFY\_FUNCTION null
  - The password complexity verification is not performed.
- PASSWORD\_VERIFY\_FUNCTION DEFAULT
  - It follows the "DEFAULT" profile policy.
- PASSWORD\_VERIFY\_FUNCTION <verify policy>
  - The password complexity verification methods can be specified as follows.

- KISA\_VERIFY\_FUNCTION
- ORA12C\_VERIFY\_FUNCTION
- ORA12C\_STRONG\_VERIFY\_FUNCTION
- VERIFY\_FUNCTION\_11G
- VERIFY\_FUNCTION

## KISA\_VERIFY\_FUNCTION

It is the password verification method of KISA (Korea Internet & Security Agency).

- 8 or more letters
- One or more characters
- One or more numbers
- One or more special characters

## ORA12C\_VERIFY\_FUNCTION

It is the password verification method of Oracle, ORA12C\_VERIFY\_FUNCTION.

- 8 or more letters
- 1 or more characters
- 1 or more numbers
- The database name should not be included.
- The username or the reversed username should not be included.
- *goldilocks* should not be included.
- *oracle* should not be included.
- The following simple passwords are not allowed.
  - welcome1, database1, account1, user1234, password1, oracle123, computer1, abcdefg1, change\_on\_intall
- At least 3 characters of the new password should be different from the old password.

## ORA12C\_STRONG\_VERIFY\_FUNCTION

It is the password verification method of Oracle, ORA12C\_STRONG\_VERIFY\_FUNCTION.

- 9 or more letters
- 2 or more uppercases
- 2 or more lowercases
- 2 or more numbers
- 2 or more special characters
- At least 4 characters of the new password should be different from the old password.

## VERIFY\_FUNCTION\_11G

It is the password verification method of Oracle, VERIFY\_FUNCTION\_11G.

- 8 or more letters
- 1 or more characters
- 1 or more numbers
- The username should not be included.
- At least 3 characters of the new password should be different from the old password.

## VERIFY\_FUNCTION

It is the password verification method of Oracle, VERIFY\_FUNCTION.

- It should not be as same as the username.
- 4 or more letters
- 1 or more characters
- 1 or more numbers
- 1 or more special characters
- The following simple passwords are not allowed.
  - welcome, database, account, user, password, oracle, computer, abcd
- At least 3 characters of the new password should be different from the old password.

## Description

### Account Lockout

The followings are the parameters affecting the account lockout.

- FAILED\_LOGIN\_ATTEMPTS
- PASSWORD\_LOCK\_TIME

For example, when a user and a profile are created as follows.

```
CREATE PROFILE prof LIMIT
 FAILED_LOGIN_ATTEMPTS 4
 PASSWORD_LOCK_TIME 30;
ALTER USER u1 PROFILE prof;
```

If the user u1 fails to log in more than four times, the account is locked for 30 days. Then the account lockout is released after 30 days.

If PASSWORD\_LOCK\_TIME is UNLIMITED, the account lockout should be explicitly released by using ALTER USER statement.

```
ALTER USER user1 ACCOUNT UNLOCK;
```

## Password Expiration

The followings are the parameters affecting the password expiration.

- PASSWORD\_LIFE\_TIME
- PASSWORD\_GRACE\_TIME

The password is expired in the following order.

1. The password is set.
  - The time of the password expiration is set to the time elapsed as much as PASSWORD\_LIFE\_TIME since when a password is altered.
  - The password expiration status is OPEN, and it allows a normal login.
2. When a user logs in after the password expiration
  - The login succeeds but the password expiration status becomes EXPIRED (GRACE) and the following warnings occur.
    - ERR-28000(16310): The password will expire in n days
    - ERR-28000(16311): The password will expire soon
    - The SQL standard does not cover the concepts of password expiration.
    - 28000 is the authentication warning or SQL standard status code of an error. 16310, 16311 are the GOLDILOCKS error code.
  - The time of the password expiration is reset to the time elapsed as much as PASSWORD\_GRACE\_TIME since when a user logged in.
3. When a user logs in after the grace time
  - The password expiration status becomes EXPIRED, the user can not log in, and the following error occurs.
    - ERR-28000(16312): The password has expired
    - The SQL standard does not cover the concepts of password expiration.
    - 28000 is the authentication warning or SQL standard status code of an error. 16312 is the GOLDILOCKS error code.
    - GOLDILOCKS internal error code of 16312 should be used to control password reentering using program.

**Table 16-24** Password expiration status transition

| Step | Point of time            | login   | Status |
|------|--------------------------|---------|--------|
| 1    | The password is changed. | Success | OPEN   |

| Step | Point of time                   | login                | Status         |
|------|---------------------------------|----------------------|----------------|
| 2    | PASSWORD_LIFE_TIME is elapsed.  | Success with warning | EXPIRED(GRACE) |
| 3    | PASSWORD_GRACE_TIME is elapsed. | Error                | EXPIRED        |

The following is another example.

```
CREATE PROFILE prof LIMIT
 PASSWORD_LIFE_TIME 90
 PASSWORD_GRACE_TIME 3;
ALTER USER u1 PROFILE prof;
```

The example above describes that the user u1 succeeds in login after 90 days of password expiration. However, the user receives a warning that the password expires in three days.

If the password is not changed within three days, the password expires.

Once the password expires, it reminds that the new password should be entered when logging in, and the account access is denied.

## Password Reusability

The followings are the parameters affecting the password reusability.

- PASSWORD\_REUSE\_MAX
- PASSWORD\_REUSE\_TIME

The password reusability of the two parameters above is determined according to the following table.

**Table 16-25** Conditions for the password reusability

| PASSWORD_REUSE_MAX | PASSWORD_REUSE_TIME | Reusable condition                                                                                 |
|--------------------|---------------------|----------------------------------------------------------------------------------------------------|
| value              | value               | It can be reused when both conditions of PASSWORD_REUSE_TIME and PASSWORD_REUSE_MAX are satisfied. |
| value              | UNLIMITED           | It can not be reused.                                                                              |
| UNLIMITED          | value               | It can not be reused.                                                                              |
| UNLIMITED          | UNLIMITED           | It can always be reused.                                                                           |

If a profile is created as follows,

```
CREATE PROFILE prof LIMIT
 PASSWORD_REUSE_MAX 5
 PASSWORD_REUSE_TIME 3;
```

the password can not be reused if it is the five recent passwords or the password changed within three d

ays.

The following is an example of the user u1's password change history. If the current password is P # \_000 007 and the current date is 2015-08-08, the reusability of existing passwords is as follows.

**Table 16-26** Examples of password reusability

| Password  | Password_date | Password reusability               |
|-----------|---------------|------------------------------------|
| P#_000001 | 2015-08-01    | It can be reused.                  |
| P#_000002 | 2015-08-02    | It can be reused.                  |
| P#_000003 | 2015-08-03    | It violates REUSE_MAX.             |
| P#_000004 | 2015-08-04    | It violates REUSE_MAX.             |
| P#_000005 | 2015-08-05    | It violates REUSE_MAX, REUSE_TIME. |
| P#_000006 | 2015-08-06    | It violates REUSE_MAX, REUSE_TIME. |
| P#_000007 | 2015-08-07    | It violates REUSE_MAX, REUSE_TIME. |

The password change history accumulated for checking the password reusability can be deleted by using the following statement.

```
ALTER DATABASE CLEAR PASSWORD HISTORY;
```

## DEFAULT profile

When creating the database, the following "DEFAULT" profile is automatically created. The password parameters of the "DEFAULT" profile are as follows.

**Table 16-27** Configuration of DEFAULT profile

| Parameter                | Value     |
|--------------------------|-----------|
| FAILED_LOGIN_ATTEMPTS    | 10        |
| PASSWORD_LOCK_TIME       | 1         |
| PASSWORD_LIFE_TIME       | 180       |
| PASSWORD_GRACE_TIME      | 7         |
| PASSWORD_REUSE_MAX       | UNLIMITED |
| PASSWORD_REUSE_TIME      | UNLIMITED |
| PASSWORD_VERIFY_FUNCTION | NULL      |

The default values of "DEFAULT" profile have the following characteristics.

- Account lockout
  - The account is locked for one day (PASSWORD\_LOCK\_TIME) after ten consecutive login failure (FAILED\_LOGIN\_ATTEMPTS).
- Password expiration
  - The password expires after the grace period of seven days (PASSWORD\_GRACE\_TIME) after 180

days (PASSWORD\_LIFE\_TIME) are exceeded.

- Password reusability
  - The old password can be reused.
- Password complexity verification
  - It is not performed.

DEFAULT profile can not be dropped but it can be altered as follows.

```
ALTER PROFILE DEFAULT LIMIT ...
```

## Examples

The following is an example of creating the profile to control the account lockout. The account is locked for three days after three consecutive login failures.

```
gSQL> CREATE PROFILE prof1 LIMIT
 FAILED_LOGIN_ATTEMPTS 3
 PASSWORD_LOCK_TIME 3;
Profile created.
gSQL> COMMIT;
Commit complete.
```

The following is an example of creating the profile to control the password expiration. The life time of the password is 90 days, and the grace time of the password is seven days.

```
gSQL> CREATE PROFILE prof1 LIMIT
 PASSWORD_LIFE_TIME 90
 PASSWORD_GRACE_TIME 7;
Profile created.
gSQL> COMMIT;
Commit complete.
```

The following is an example of creating the profile to control whether the password is reusable. The following example does not verify the old password when changing the password.

```
gSQL> CREATE PROFILE prof1 LIMIT
 PASSWORD_REUSE_MAX DEFAULT
 PASSWORD_REUSE_TIME DEFAULT;
Profile created.
gSQL> COMMIT;
```

Commit complete.

The following is an example of creating the profile to control the password complexity check.

```
gSQL> CREATE PROFILE prof1 LIMIT
 PASSWORD_VERIFY_FUNCTION KISA_VERIFY_FUNCTION;
Profile created.
gSQL> COMMIT;
Commit complete.
```

The following is an example of creating the profile by setting all parameter.

```
gSQL> CREATE PROFILE prof1 LIMIT
 FAILED_LOGIN_ATTEMPTS 3
 PASSWORD_LOCK_TIME 3
 PASSWORD_LIFE_TIME 90
 PASSWORD_GRACE_TIME 7
 PASSWORD_REUSE_MAX DEFAULT
 PASSWORD_REUSE_TIME DEFAULT
 PASSWORD_VERIFY_FUNCTION KISA_VERIFY_FUNCTION;
Profile created.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not cover the concepts of the profile.

## For More Information

Refer to the followings.

- DROP PROFILE
- ALTER PROFILE
- CREATE USER
- ALTER USER
- ALTER DATABASE CLEAR PASSWORD HISTORY

## 16.82 CREATE SCHEMA

### Function

It defines the schema.

### Syntax

```
<schema definition> ::=
 CREATE SCHEMA <schema name clause>
 [<schema element> [...]]
 ;
<schema name clause> ::=
 schema_name
 | AUTHORIZATION user_identifier
 | schema_name AUTHORIZATION user_identifier
<schema element> ::=
 <table definition>
 | <view definition>
 | <index definition>
 | <sequence generator definition>
 | <grant privilege statement>
 | <comment statement>
```

### Invocation and Access Rules

The user should satisfy the following conditions to perform <schema definition>.

- CREATE SCHEMA ON DATABASE privilege is required to create the schema.
- If <schema element> exists, the privilege to perform each <schema element> is required.  
For more information about the access privilege, refer to *invocation and access rules* in the following statements.
  - CREATE TABLE
  - CREATE VIEW
  - CREATE INDEX

- **CREATE SEQUENCE**
- **GRANT privileges TO**
- **COMMENT ON name IS**
- The user who is `user_identifier` has the following privileges for the created schema.
  - The owner of the created schema, which is `schema_name`
  - The owner of the object which is created by `<schema element>` clause
- An appropriate privilege for the schema is required to create an object because a separate privilege on the created schema is not granted.  
 For more information about schema privilege types, refer to `<schema privilege>` of GRANT privileges TO statement.  
 For more information about usage example, refer to **Examples** of CREATE USER statement.

## Syntax Rules and Parameters

### `schema_name`

It is the schema name to be created.

An identical schema name should not exist in the database.

The length of the schema name should be shorter than 128 bytes.

### **AUTHORIZATION `user_identifier`**

If the schema name is omitted, a schema with the same name as the `user_identifier` is created.

If the AUTHORIZATION is not specified, the `user_identifier` of the user performing the statement is used.

### **`schema_name AUTHORIZATION user_identifier`**

It specifies the schema name and schema owner to be created.

The owner can not be a role or PUBLIC.

### **`<schema element>`**

It defines the objects to be created in the schema along with the schema creation.

The `schema_element` is executed in the listed order, and they are separated by a white space without a comma (,).

The object can not be defined in a schema which has different name from the schema to be created.

- The <grant privilege statement> can be specified only for the following privileges.
  - <schema privilege>
  - <table privilege>
  - <sequence privilege>
- The <comment statement> can be specified only for the following objects.
  - SCHEMA schema\_name
  - TABLE [schema\_name].table\_name
  - COLUMN [schema\_name].table\_name.column\_name
  - INDEX [schema\_name].index\_name
  - SEQUENCE [schema\_name].sequence\_name
  - CONSTRAINT [schema\_name].constraint\_name

## Description

A schema is an object which logically classifies SQL schema objects such as table, view, index, sequence and constraint.

In GOLDDLOCKS, the relationship between the user and the schema is 1 : N. In other words, the schema owned by a user may not exist, or the user may own multiple schemas.

The SQL standard does not explicitly define the relationship of the non-schema objects such as user, schema, database, but each DBMS defines the relationship between the non-schema objects as a different concept. Refer to the following note.

### Note

The relationship between user and schema in other DBMS

- Oracle
  - User : schema = 1 : 1
- DB2
  - User : schema = 1 : N

- Postgres
  - User : schema = 1 : N
  
- MySQL
  - Database : schema = 1 : 1
  - User is a subordinate object of a database (schema).

## Examples

The following is an example of creating a schema.

```
gSQL> CREATE SCHEMA s1;
Schema created.
```

The following is an example of creating a schema and assigning the schema owner.

```
gSQL> CREATE SCHEMA s1 AUTHORIZATION test;
Schema created.
```

The following is an example of creating a schema together with the objects which belong to the schema.

```
gSQL> CREATE SCHEMA s1
 CREATE TABLE t1 (id INTEGER, name VARCHAR(128))
 CREATE INDEX idx_t1_id ON t1 (id)
 COMMENT ON TABLE t1 IS 'comment on s1.t1'
;
Schema created.
```

## Compatibility

Table 16-28 SQL standard compatibility

| Feature ID | Description                                    | Compatibility |
|------------|------------------------------------------------|---------------|
| S071       | SQL paths in function and type name resolution | X             |
| F461       | Named character sets                           | X             |
| F171       | Multiple schemas per user                      | O             |

| Feature ID | Description    | Compatibility |
|------------|----------------|---------------|
| T332       | Extended roles | X             |

## For More Information

Refer to the followings.

- DROP SCHEMA
- CREATE USER
- CREATE TABLE
- CREATE VIEW
- CREATE INDEX
- CREATE SEQUENCE
- GRANT privileges TO
- COMMENT ON name IS

## 16.83 CREATE SEQUENCE

### Function

It creates a sequence.

### Syntax

```

<sequence generator definition> ::=
 CREATE SEQUENCE [schema_name.] sequence_name
 [<sequence generator option> [, ...]]
 ;

<sequence generator option> ::=
 <sequence generator start with option>
 | <basic sequence generator option>

<sequence generator start with option> ::=
 START WITH integer

<basic sequence generator option> ::=
 <sequence generator increment by option>
 | <sequence generator maxvalue option>
 | <sequence generator minvalue option>
 | <sequence generator cycle option>
 | <sequence generator cache option>

<sequence generator increment by option> ::=
 INCREMENT BY integer

<sequence generator maxvalue option> ::=
 MAXVALUE integer
 | (NO MAXVALUE | NOMAXVALUE)

<sequence generator minvalue option> ::=
 MINVALUE integer
 | (NO MINVALUE | NOMINVALUE)

<sequence generator cycle option> ::=
 CYCLE
 | (NO CYCLE | NOCYCLE)

<sequence generator cache option> ::=
 CACHE integer
 | (NO CACHE | NOCACHE)

```

## Invocation and Access Rules

The user should have one of the following privileges to perform <sequence generator definition> statement.

- (CREATE SEQUENCE or CONTROL SCHEMA) ON SCHEMA for the schema to which the sequence belongs
- CREATE ANY SEQUENCE ON DATABASE

The sequence owner is determined as follows.

- The owner of the schema to which the sequence belongs
- If the schema to which the sequence belongs is PUBLIC, then it is the user who executed the statement.

The sequence owner has USAGE ON SEQUENCE WITH GRANT OPTION privilege.

One of the following privileges is required to use the created sequence.

- USAGE ON SEQUENCE for the sequence
- (USAGE SEQUENCE or CONTROL SCHEMA) ON SCHEMA for the schema to which the sequence belongs
- USAGE ANY SEQUENCE ON DATABASE

## Syntax Rules and Parameters

### sequence\_name

It is the sequence name to be created, and it should be a unique name within the schema.

The schema to which the sequence belongs, such as schema\_name.sequence\_name, can be defined. If schema\_name is omitted, the default schema name of the user performing the statement is used.

The length of the sequence name should be shorter than 128 bytes.

### <sequence generator option>

If any of <sequence generator option> is not used, the following two statements have the same meaning.

- CREATE SEQUENCE test\_seq;
- CREATE SEQUENCE test\_seq START WITH 1 INCREMENT BY 1 NO MINVALUE NO MAXVALUE NO CYCLE CACHE 20;

## ⟨sequence generator start with option⟩

It defines the first sequence number to be generated.

Depending on the ascending or the descending order, it has the following features.

- Ascending sequence (INCREMENT BY a positive number)
  - It is used when starting the sequence with bigger sequence value than the minimum value.
  - If START WITH clause is omitted, the default value is the minimum value (MINVALUE value).
- Descending sequence (INCREMENT BY a negative number)
  - It is used when starting the sequence with smaller sequence value than the maximum value.
  - If START WITH clause is omitted, the default value is the maximum value (MAXVALUE value).

## ⟨sequence generator increment by option⟩

It defines the interval of sequence numbers.

The constraints and features are as follows.

- A positive number or a negative number is allowed, but 0 is not allowed.
- The absolute value of the interval should be smaller than the difference between MINVALUE and MAXVALUE.
- The ascending sequence is generated if it is a positive number, and the descending sequence is generated if it is a negative number.
- If INCREMENT BY clause is omitted, the default is a positive number 1.

## ⟨sequence generator maxvalue option⟩

It defines the maximum value of which the sequence can generate.

- MAXVALUE integer
  - The maximum value range is between the minimum (-9,223,372,036,854,775,808) and the maximum (+9,223,372,036,854,775,807) of the 64 bit integer.
  - It should be equal to or bigger than START WITH value, and bigger than MINVALUE value.
- NO MAXVALUE | NOMAXVALUE
  - The maximum value is defined as follows.
    - If it is an ascending sequence, it is the maximum value (+9,223,372,036,854,775,807) of the 64 bit integer.
    - If it is a descending sequence, it is -1.
  - NO MAXVALUE(SQL standard) and NOMAXVALUE are the reserved words with the same meaning, so either of them can be used.
- If MAXVALUE and NO MAXVALUE are not specified, the default value is NO MAXVALUE.

## ⟨sequence generator minvalue option⟩

It defines the minimum value of which the sequence can generate.

- MINVALUE integer
  - The minimum value range is between the minimum (-9,223,372,036,854,775,808) and the maximum (+9,223,372,036,854,775,807) of the 64 bit integer.
  - It should be equal to or smaller than START WITH value, and smaller than MAXVALUE.
- NO MINVALUE | NOMINVALUE
  - The minimum value is defined as follows.
    - If it is an ascending sequence, it is 1.
    - If it is a descending sequence, it is the minimum value (-9,223,372,036,854,775,808) of the 64 bit integer.
  - NO MINVALUE(SQL standard) and NOMINVALUE are the reserved words with the same meaning, so either of them can be used.
- If MINVALUE and NO MINVALUE are not specified, the default value is NO MINVALUE.

## ⟨sequence generator cycle option⟩

It specifies whether to continue generating a value when the sequence value becomes the maximum value or the minimum value.

- CYCLE
  - When the ascending sequence becomes the maximum value, it generates the value again from the minimum value.
  - When the descending sequence becomes the minimum value, it generates the value again from the maximum value.
- NO CYCLE | NOCYCLE
  - When the sequence value becomes the maximum value or the minimum value, it does not generate a sequence value.
  - NO CYCLE(SQL standard) and NOCYCLE are the reserved words with the same meaning, so either of them can be used.
- If CYCLE and NO CYCLE are not specified, the default value is NO CYCLE.

## ⟨sequence generator cache option⟩

For quick access of a sequence, it defines the number of the sequence values to be preloaded in memory. When restarting database, the sequence values loaded in memory are lost, and it starts from the value since being loaded.

- CACHE integer
  - CACHE value should be equal to or bigger than 2.

- CACHE value should not be bigger than CYCLE length, if CYCLE exists.
  - $\text{CYCLE length: CEIL}(\text{MAXVALUE} - \text{MINVALUE}) / \text{ABS}(\text{INCREMENT})$
- NO CACHE | NOCACHE
  - The sequence values are not preloaded in memory.
- If CACHE and NO CACHE are not specified, the default value is CACHE 20.

## Description

The sequence values of the created sequence objects are used by using **NEXTVAL** and **CURRVAL** functions.

The sequence value does not have a transaction property. The sequence value maintains the most recent value, even when an error occurs in the SQL statement in which the sequence function is used or when an explicit ROLLBACK is performed.

CURRVAL function returns NEXTVAL value from the most recent call by a session.

Therefore, using this feature, the sequence value obtained by NEXTVAL can still be usable in the other SQL statements. However, when the session does not call NEXTVAL, using CURRVAL function generates an error.

## Examples

The object seq1 without the defined sequence options is an ascending sequence of the same meanings as the object seq2 in the following example.

```
gSQL> CREATE SEQUENCE seq1;
Sequence created.
gSQL> CREATE SEQUENCE seq2 START WITH 1 INCREMENT BY 1 NO MINVALUE NO MAXVALUE NO CYCLE CACHE
20;
Sequence created.
```

The following is an example of a sequence which generates an odd value.

```
gSQL> CREATE SEQUENCE seq1 START WITH 1 INCREMENT BY 2;
Sequence created.
```

The following is an example of generating sequence which repeatedly generates an even number starting from 0 to 1000.

```
gSQL> CREATE SEQUENCE seq1 START WITH 0 MINVALUE 0 MAXVALUE 1000 INCREMENT BY 2 CYCLE;
Sequence created.
```

The following is an example of generating a descending sequence starting from -1.

```
gSQL> CREATE SEQUENCE seq1 INCREMENT BY -1;
Sequence created.
```

## Compatibility

The SQL standard does not define <sequence generator cache option> clause.

**Table 16-29** SQL standard compatibility

| Feature ID | Description                | Compatibility |
|------------|----------------------------|---------------|
| T176       | Sequence generator support | O             |

## For More Information

Refer to the followings.

- DROP SEQUENCE
- ALTER SEQUENCE
- NEXTVAL
- CURRVAL

## 16.84 CREATE SYNONYM

### Function

It creates a synonym. A synonym is an alternative name for a table, view, sequence, or another synonym, and it can be used in the following statements.

- DML: SELECT, INSERT, UPDATE, DELETE, LOCK TABLE, CALL
- DDL: GRANT, REVOKE, COMMENT

### Syntax

```
<table definition> ::=
 CREATE [OR REPLACE] [PUBLIC] SYNONYM [schema_name.]synonym_name
 FOR [schema_name.]object_name
 ;
```

### Invocation and Access Rules

The user should satisfy the following conditions to perform <synonym definition> statement.

- CREATE PUBLIC SYNONYM ON DATABASE privilege is required to create public synonym by explicitly specifying PUBLIC.
- The owner of public synonym is PUBLIC. The user who created the synonym does not have any privilege.
- One of the following privileges is required to create the private synonym.
  - (CREATE SYNONYM or CONTROL SCHEMA) ON SCHEMA for that schema
  - CREATE ANY SYNONYM ON DATABASE
- The private synonym owner is determined as follows.
  - The owner of the schema to which the private synonym belongs
  - If the schema to which the private synonym belongs is PUBLIC, then it is the user who executed the statement.
- If the user does not have privilege on the base object, the user is not allowed to execute the statement.

nt using its synonym even when the user created the synonym.

- Be cautious when allowing the privilege on the synonym because it means allowing privilege on the base object to which the synonym indicates.

## Syntax Rules and Parameters

### [ OR REPLACE ]

It replaces the existing synonym if the synonym already exists.

### [ PUBLIC ]

It is specified when creating public synonym.

If it is omitted, private synonym is created.

### synonym\_name

It is the synonym name to be created, and it should be a unique name within the schema.

The schema to which the synonym belongs, such as schema\_name.synonym\_name, can be defined. If schema\_name is omitted, default schema name of the user performing the statement is used.

The length of the synonym name should be shorter than 128 bytes.

Public synonym is a non-schema object. Therefore, a schema name can not be specified when creating public synonym by explicitly specifying PUBLIC.

### object\_name

The schema to which the object belongs, such as schema\_name.object\_name, can be defined. If schema\_name is omitted, default schema name of the user performing the statement is used.

The object types which can specify the object\_name are as follows.

- Table
- View
- Sequence
- Another synonym

Existence of the target object, cycle check and privilege check are performed when executing the statement using the synonym.

## Description

A synonym is an alternative name for a table, view, sequence, or another synonym.

If synonym is created, the applications do not need to be modified even when the base object is changed instead only the synonyms should be redefined. Therefore, it is convenient.

Also, the database security is improved by hiding the objects' real names and their schemas, and the usability is enhanced by changing the object's long name to a shorter name.

The synonym is literally an alternative name so creating the synonym does not mean that the synonym can be used to access the object. The proper privilege is required to access the object.

When executing the statement using the synonym, the object access procedure is as follows.

1. Find a table of the corresponding name.
2. If the table does not exist, find the private synonym of the corresponding name.
3. If the private synonym does not exist, find the public synonym of the corresponding name.

```
gSQL> CREATE PUBLIC SYNONYM syn1 FOR u1.t1;
Synonym created.
gSQL> CREATE PUBLIC SYNONYM syn2 FOR syn1;
Synonym created.
gSQL> SELECT * FROM syn2;
```

The example above is the object access procedure in SELECT statement.

1. It searched for the table syn2, but it does not exist.
2. It searched for the private synonym syn2, but it does not exist.
3. It searched for the public synonym syn2, and it exists.
  - I. It searched for the table syn1, but it does not exist.
  - II. It searched for the private synonym syn1, but it does not exist.
  - III. It searched for the public synonym syn2, and it exists.
    - i. It searched for the table u1.t1, and it exists.

## Examples

The following is an example of creating a private synonym.

```
gSQL> CREATE SYNONYM MyEmp FOR branch.Employee;
Synonym created.
```

```
gSQL> SELECT * FROM MyEmp;
```

The following is an example of creating a public synonym.

```
gSQL> CREATE PUBLIC SYNONYM MainEmp FOR main.Employee;
Synonym created.
gSQL> SELECT * FROM MainEmp;
```

## Compatibility

The SQL standard does not define the CREATE SYNONYM statement.

## For More Information

Refer to **DROP SYNONYM**.

## 16.85 CREATE TABLE

### Function

It defines a table.

### Syntax

```

<table definition> ::=
 CREATE TABLE table_name
 (<table element> [, ...])
 [<table sharding strategy>]
 [<table attribute clause> [...]]
 [TABLESPACE tablespace_name]
 [<table global secondary index clause>]
 ;
<table element> ::=
 <column definition>
 | <table constraint definition>
<column definition> ::=
 column_name <data type>
 [<default clause> | <identity column specification>]
 [<column constraint definition>]
<data type> ::=
 <character string type>
 | <binary string type>
 | <numeric type>
 | <boolean type>
 | <datetime type>
 | <interval type>
<character string type> ::=
 CHARACTER [(integer [<character length units>])]
 | CHAR [(integer [<character length units>])]
 | CHARACTER VARYING (integer [<character length units>])
 | CHAR VARYING (integer [<character length units>])
 | VARCHAR (integer [<character length units>])
 | CHARACTER LONG VARYING

```

| LONG VARCHAR

<character length units> ::=

CHARACTERS

| CHAR

| OCTETS

| BYTE

<binary string type> ::=

BINARY [ ( length ) ]

| BINARY VARYING ( length )

| VARBINARY ( length )

| LONG BINARY VARYING

| LONG VARBINARY

<numeric type> ::=

<exact numeric type>

| <approximate numeric type>

| <native numeric type>

<exact numeric type> ::=

 | WITHOUT GLOBAL SECONDARY INDEX

```

## Invocation and Access Rules

The differences between the stand-alone database and the cluster database are as follows.

- Stand-alone
  - It can not define <table sharding strategy>.
  - It can not define <table global secondary index clause>.
- Cluster
  - Constraints of PRIMARY KEY, UNIQUE should include all sharding keys.
  - It can not define the deferrable constraints.

The user should satisfy the following conditions to perform <table definition> statement.

- One of the following privileges is required for the schema in which a table is to be created.
  - (CREATE TABLE or CONTROL SCHEMA) ON SCHEMA for that schema
  - CREATE ANY TABLE ON DATABASE
- One of the following privileges is required for the tablespace in which a table is to be created.
  - CREATE OBJECT ON TABLESPACE for that tablespace
  - USAGE TABLESPACE ON DATABASE
- One of the following privileges is required for the schema in which the constraints are to be created when the constraints exists which were created together.
  - (ADD CONSTRAINT or CONTROL SCHEMA) ON SCHEMA for that schema
  - ALTER ANY TABLE ON DATABASE

- One of the following privileges is required for the tablespace in which the index is to be created when the key constraint is created together.
  - CREATE OBJECT ON TABLESPACE for that tablespace
  - USAGE TABLESPACE ON DATABASE
- The owner of the table is determined as follows.
  - The owner of the schema to which the table belongs
  - If the schema to which the table belongs is PUBLIC, then it is the user who executed the statement.
- The table owner has the following privileges for the created table.
  - The privilege for the table
    - SELECT ON TABLE WITH GRANT OPTION
    - INSERT ON TABLE WITH GRANT OPTION
    - UPDATE ON TABLE WITH GRANT OPTION
    - DELETE ON TABLE WITH GRANT OPTION
    - TRIGGER ON TABLE WITH GRANT OPTION
    - REFERENCES ON TABLE WITH GRANT OPTION
    - LOCK ON TABLE WITH GRANT OPTION
    - INDEX ON TABLE WITH GRANT OPTION
    - ALTER ON TABLE WITH GRANT OPTION
  - The privilege for all columns in the table.
    - SELECT(columns) ON TABLE WITH GRANT OPTION
    - INSERT(columns) ON TABLE WITH GRANT OPTION
    - UPDATE(columns) ON TABLE WITH GRANT OPTION
    - REFERENCES(columns) ON TABLE WITH GRANT OPTION
  - The privilege for the constraint which was generated together
    - The owner of that constraint
    - The owner of the index which was generated together with the constraint

⟨table sharding strategy⟩ statement can be used in a cluster system.

## Syntax Rules and Parameters

### table\_name

It is the table name to be created and it should be a unique name within the schema.

The schema to which the table belongs, such as schema\_name.table\_name, can be defined. If schema\_name is omitted, the default schema name of the user performing the statement is used.

The length of the table name should be shorter than 128 bytes.

## ⟨column definition⟩

It defines the columns which configure the table.

The table should include one or more column definitions.

It can specify the column data type, default value, automatically generated value, and constraints.

## column\_name

It is name of the column which configures a table and each column should have a unique name within the table.

The length of the column name should be shorter than 128 bytes.

## ⟨data type⟩

- ⟨character string type⟩
- ⟨binary string type⟩
- ⟨numeric type⟩
- ⟨exact numeric type⟩
- ⟨approximate numeric type⟩
- ⟨boolean type⟩
- ⟨datetime type⟩
- ⟨interval type⟩
- ⟨interval qualifier⟩
- ⟨non-second primary datetime field⟩

It defines the data type of the column.

When defining the column including automatically generated values(⟨identity column specification⟩), its data type should be one of SMALLINT, INTEGER or BIGINT.

For more information about data types, refer to **Data Type**.

## ⟨character length units⟩

It specifies the length unit of a single character for the character type.

- CHARACTERS/ CHAR assigns the maximum bytes of a single character as the length of a single character. Therefore, the length of multi-bytes single character such as Hangul is 1.
- OCTETS/ BYTE assigns one byte for the length of a single character. Therefore, the length of multi-bytes single character such as Hangul is multi-bytes.
- If it is omitted, it follows CHAR\_LENGTH UNITS property which is used when creating the database.

The SQL standard defines CHARACTERS as a default value.

**Note**

The default value of the char length unit in other DBMS are as follows.

- Oracle, DB2: OCTETS
- MS-SQL, MySQL, PostgreSQL: CHARACTERS

## [ <default clause> | <identity column specification> ]

It specifies the default value of a column.

<default clause> and <identity column specification> can not be used together.

When both of them are omitted, the default value is NULL.

### <default clause>

The DEFAULT clause defines the default value to be used when DEFAULT is specified in INSERT, UPDATE statements or the corresponding column name is omitted.

- When DEFAULT clause is used
  - e.g. CREATE TABLE t1 ( id INTEGER, name VARCHAR(32) DEFAULT 'anonymous' );
  - When the column is omitted
    - INSERT INTO t1(id) VALUES ( 1 );
    - INSERT INTO t1(id) SELECT id FROM other\_table;
  - When the DEFAULT is specified
    - INSERT INTO t1 DEFAULT VALUES;
    - INSERT INTO t1 VALUES ( 2, DEFAULT );
    - UPDATE t1 SET name = DEFAULT;

The data type of DEFAULT expression should be compatible with the data type of the column.

If the data type is not compatible or the space is insufficient, an error occurs when using DEFAULT in INSERT, UPDATE statements.

- CREATE TABLE t1 ( user\_name VARCHAR(1) DEFAULT CURRENT\_USER );
- e.g. error: INSERT INTO t1 VALUES (DEFAULT);
- e.g. error: UPDATE t1 SET user\_name = DEFAULT;

DEFAULT expression can use any built-in functions but it can not use the followings.

- Logical operators (AND, OR, NOT), comparison operators (=, >, ...)

- Stored function
- Column name
- Subquery expression

## ⟨identity column specification⟩

It defines a column which has automatically generated values.

The table can have only one identity column.

The identity column becomes *not nullable* column even though NOT NULL constraint is not specified.

⟨identity column specification⟩ clause can not be specified together with DEFAULT clause.

⟨identity column specification⟩ clause, like as DEFAULT clause, specifies DEFAULT in INSERT, UPDATE statements or it defines the default value to be used when the column name is omitted.

The generation method is defined as follows.

- GENERATED BY DEFAULT AS IDENTITY

A user defined value is applied if defined, but the value is automatically generated, like as DEFAULT clause, when the default value should be used.

- CREATE TABLE t1 ( id INTEGER GENERATED BY DEFAULT AS IDENTITY, name VARCHAR(32) );
- (O) INSERT INTO t1 VALUES ( 12345, 'GOLDILOCKS' );
  - It inserts the user defined value (12345).
- (O) INSERT INTO t1(name) VALUES ( 'GOLDILOCKS' );
  - It inserts the automatically generated value in an id column.
- (O) INSERT INTO t1(id, name) SELECT other\_id, other\_name FROM other\_table;
  - It inserts the user defined value.
- (O) INSERT INTO t1(name) SELECT other\_name FROM other\_table;
  - It inserts the automatically generated value in an id column.
- (O) UPDATE t1 SET id = 10000 WHERE id = 12345;
  - It inserts the user defined value
- (O) UPDATE t1 SET id = DEFAULT WHERE id = 12345;
  - It inserts the automatically generated value in an id column.

- GENERATED ALWAYS AS IDENTITY

A user can not define the value and the default value should be generated like as DEFAULT clause.

- CREATE TABLE t1 ( id INTEGER GENERATED ALWAYS AS IDENTITY, name VARCHAR(32) );
- (X) INSERT INTO t1 VALUES ( 12345, 'GOLDILOCKS' );
  - Error, a user can not define the value.
- (O) INSERT INTO t1(name) VALUES ( 'GOLDILOCKS' );
  - It inserts the automatically generated value in an id column.
- (X) INSERT INTO t1(id, name) SELECT other\_id, other\_name FROM other\_table;

- Error, a user can not define the value.
- (O) INSERT INTO t1(name) SELECT other\_name FROM other\_table;
  - It inserts the automatically generated value in an id column.
- (X) UPDATE t1 SET id = 10000 WHERE id = 12345;
  - Error, a user can not define the value.
- (O) UPDATE t1 SET id = DEFAULT WHERE id = 12345;
  - It inserts the automatically generated value in an id column.

For more information about <common sequence generator option> and <basic sequence generator option>, which are options to create an identity column, refer to **CREATE SEQUENCE**.

## <column constraint definition>

It defines the following constraints for a column.

- NOT NULL constraints
- UNIQUE constraints
- PRIMARY KEY constraints

## constraint\_name

It is the constraint name and it can be omitted.

If the constraint\_name is omitted, it is automatically set as follows.

If the automatically generated name is duplicated, the constraint\_name should be explicitly specified.

- NOT NULL constraints
  - "table\_name" + "\_" + "NOT\_NULL" + "\_" + "column\_name"
- UNIQUE constraints
  - "table\_name" + "\_" + "UNIQUE" + "\_" + "column\_name"
- PRIMARY KEY constraints
  - "table\_name" + "\_" + "PRIMARY\_KEY"

The length of the constraint name should be shorter than 128 bytes.

## NOT NULL Constraint

NULL is not allowed for the column value.

## UNIQUE Constraint

The identical value is not allowed for the column value, but NULL is allowed.

## PRIMARY KEY Constraint

NULL or the identical value is not allowed as the column value. A single PRIMARY KEY constraint can be defined on a single table.

### ⟨index name clause⟩

It defines the index name to be created when defining UNIQUE constraint and PRIMARY KEY constraint.

- INDEX index\_name
  - It defines the index name for the constraint.
  - It can not be used together with a schema name and it is created in the same schema where the constraint is created.

When defining UNIQUE constraint and PRIMARY KEY constraint, if INDEX clause is omitted, an index which satisfies the constraints is automatically created.

"constraint\_name" + "INDEX" is added to the name of index which is automatically generated.

- ⟨index attributes⟩
  - It specifies the physical attributes of the index to be created.
  - For more information, refer to **CREATE INDEX**.
- TABLESPACE index\_tablespace\_name
  - It specifies the tablespace where the index is to be created.
  - For more information, refer to **CREATE INDEX**.

### ⟨table constraint definition⟩

⟨unique constraint definition⟩

- When defining a table, the constraints can be classified in two ways depending on the location in the statement.
  - When defining a column, column constraints can be specified by using ⟨column constraint definition⟩.
  - On the other hand, the table constraint definition clause, ⟨table constraint definition⟩, can be specified separately from the column definition and the constraints on one or more columns can be specified.

The table constraint definition has the following syntactic difference compared to the column constraint definition.

- NOT NULL constraint
  - It can not be specified by using the table constraint definition.
- It should explicitly specify the column unlike the column constraint definition.
  - UNIQUE constraint <unique constraint definition>
    - UNIQUE ( column\_name [, ...] )
  - PRIMARY KEY CONSTRAINT <unique constraint definition>
    - PRIMARY KEY ( column\_name [, ...] )

## key column element

It specifies the column to be a target of the key.

- column name
  - It is name of the column which creates the key.
- ASC | DESC
  - ASC: It is sorted in an ascending order.
  - DESC: It is sorted in a descending order.
  - If not specified, the default value is ASC.
- NULLS FIRST | NULLS LAST
  - NULLS FIRST: It is located before non-NULL values.
  - NULLS LAST: It is located after non-NULL values.
  - If not specified, the default value is NULLS LAST.

## <table sharding strategy>

It defines the sharding strategy of a table.

It can be defined as one of the four following strategies.

- <cloned strategy>
- <hash sharding strategy>
- <range sharding strategy>
- <list sharding strategy>

If it is omitted, it is determined by **DEFAULT\_SHARDING** property value.

- If DEFAULT\_SHARDING value is 0
  - <cloned strategy>
- If DEFAULT\_SHARDING value is 1
  - <hash sharding strategy>

## ⟨cloned strategy⟩

It clones all data in a table.

## ⟨clone placement⟩

It defines the placement strategy of a clone.

- AT CLUSTER WIDE
  - It places clones in all cluster members of all cluster groups in a cluster system.
  - A clone can be relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster group and a cluster member.
- AT CLUSTER GROUP group\_list
  - It places clones in all cluster members of a specified cluster groups.
  - A clone can be relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster member in a specified cluster group.
  - Adding a cluster group does not affect the relocation of the clone.
- When it is omitted, the default value is AT CLUSTER WIDE.

## ⟨hash sharding strategy⟩

It shards the table data according to the hash value of the sharding key.

## SHARDING BY [HASH] ( column\_list )

It defines a sharding key for a hash sharding.

- It can list maximum 32 columns.
- It can not use a duplicate column.
- It can not use a LONG VARCHAR type column or a LONG VARBINARY type column.

## ⟨hash shard count⟩

It defines the number of the hash shards to be sharded.

The number of shards can be defined from 1 to 512.

If it is omitted, the default value is 24.

## ⟨hash shard placement⟩

It defines the placement strategy of a hash shard.

- AT CLUSTER WIDE
  - It places shards in all cluster members of all cluster groups in a cluster system.
  - A shard can be relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster group and a cluster member.
- AT CLUSTER GROUP group\_list
  - It places hash shards in all cluster members of a specified cluster groups.
  - The number of group\_list should be equal to or smaller than the value of <hash shard count>.
  - Unlike a range shard and a list shard, the cluster group on which the specific hash shard is to be located can not be specified, but the system automatically determines a cluster group on which the shard is to be located.
  - A shard can be relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster member in a specified cluster group.
  - Adding a cluster group does not affect the relocation of the hash shard.
- When it is omitted, the default value is AT CLUSTER WIDE.

## <range sharding strategy>

It shards the table data according to the range value of the sharding key.

## SHARDING BY RANGE ( column\_list )

It defines a sharding key for the range sharding.

- It can list maximum 32 columns.
- It can not use a duplicate column.
- It can not use a LONG VARCHAR type column or a LONG VARBINARY type column.

## <cluster-wide range shard placement>

It automatically places range shards in all cluster groups of a cluster system.

AT CLUSTER WIDE statement is described before describing <range shard definition>.

Shards can be relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster group and a cluster member.

- Create a range sharded table.
- Place six shards in the existing cluster groups (g1, g2, g3).

```
CREATE TABLE t1
(
 id INTEGER,
 name VARCHAR(32)
)
```

```
SHARDING BY RANGE (id)
 AT CLUSTER WIDE
 SHARD s1 VALUES LESS THAN (200000),
 SHARD s2 VALUES LESS THAN (400000),
 SHARD s3 VALUES LESS THAN (500000),
 SHARD s4 VALUES LESS THAN (600000),
 SHARD s5 VALUES LESS THAN (800000),
 SHARD s6 VALUES LESS THAN (MAXVALUE)
;
```

- Add a cluster group.

```
CREATE CLUSTER GROUP g4
 CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;
```

- Relocate the range shard.
- Place six shards in the cluster groups (g1, g2, g3, g4) including the added g4.

```
ALTER TABLE t1 REBALANCE;
```

## ⟨group-specific range shard placement⟩

It places range shards in a specified cluster group.

It describes AT CLUSTER GROUP group\_name statement which places that shard together with ⟨range shard definition⟩.

Shards can be automatically relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster member to a specified cluster group.

Adding a cluster group does not affect the relocation of the range shard.

- Create a range sharded table.
- Place each range shard in a specified cluster group.

```
CREATE TABLE t1
(
 id INTEGER,
 name VARCHAR(32)
)
SHARDING BY RANGE (id)
 SHARD s1 VALUES LESS THAN (200000) AT CLUSTER GROUP g1,
 SHARD s2 VALUES LESS THAN (400000) AT CLUSTER GROUP g2,
```

```

SHARD s3 VALUES LESS THAN (500000) AT CLUSTER GROUP g3,
SHARD s4 VALUES LESS THAN (600000) AT CLUSTER GROUP g2,
SHARD s5 VALUES LESS THAN (800000) AT CLUSTER GROUP g3,
SHARD s6 VALUES LESS THAN (MAXVALUE) AT CLUSTER GROUP g1
;

```

- Add a cluster group.

```

CREATE CLUSTER GROUP g4
 CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;

```

- Relocate a range shard.
- The shard is not placed in a newly created cluster group g4.

```

ALTER TABLE t1 REBALANCE;

```

## ⟨range shard definition⟩

SHARD range\_name should be unique in a table.

It can define maximum 512 of ⟨range shard definition⟩.

The listed ⟨range shard definition⟩ is sorted in an order of ⟨range value clause⟩, and it should use each different ⟨range value clause⟩.

The ⟨range shard definition⟩ whose all values are define as MAXVALUE is a MAX shard. MAX shard should exist, and it should be a single one.

- It should include a MAX shard.

```

gSQL>
CREATE TABLE t1
(
 id INTEGER,
 name VARCHAR(32)
)
SHARDING BY RANGE (id)
 AT CLUSTER WIDE
 SHARD s1 VALUES LESS THAN (100000),
 SHARD s2 VALUES LESS THAN (200000),
 SHARD s3 VALUES LESS THAN (MAXVALUE)

```

```
;
```

Table created.

- If it does not include a MAX shard, then an error occurs.

```
gSQL>
CREATE TABLE t1
(
 id INTEGER,
 name VARCHAR(32)
)
SHARDING BY RANGE (id)
 AT CLUSTER WIDE
 SHARD s1 VALUES LESS THAN (100000),
 SHARD s2 VALUES LESS THAN (200000),
 SHARD s3 VALUES LESS THAN (300000)
;
ERR-42000(16377): MAX shard not defined :
 SHARD s3 VALUES LESS THAN (300000)
*
ERROR at line 10:
```

## ⟨range value clause⟩

⟨range value⟩ should be a constant or a MAXVALUE (a maximum value).

NULL can not be used as ⟨range value⟩.

- (O) SHARD s1 VALUES LESS THAN ( 1 )
- (O) SHARD s2 VALUES LESS THAN ( 1 + 1 )
- (O) SHARD s3 VALUES LESS THAN ( MAXVALUE )
- (X) SHARD s4 VALUES LESS THAN ( SYSDATE )
- (X) SHARD s5 VALUES LESS THAN ( NULL )

MAXVALUE is always bigger than any other value, and it includes null.

If there are multiple sharding keys, only a MAXVALUE can be specified after the MAXVALUE.

- (O) SHARD s1 VALUES LESS THAN ( 100, MAXVALUE )
- (X) SHARD s2 VALUES LESS THAN ( MAXVALUE, 100 )
- (O) SHARD s3 VALUES LESS THAN ( MAXVALUE, MAXVALUE )

If a sharding key is defined by using multiple columns, a MAX shard which is listed with MAXVALUE for it

s all values like as the SHARD s3 below should exist.

```
CREATE TABLE t1
(
 id INTEGER,
 name VARCHAR(32)
)
SHARDING BY RANGE (id, name)
 AT CLUSTER WIDE
 SHARD s1 VALUES LESS THAN (100000, MAXVALUE),
 SHARD s2 VALUES LESS THAN (200000, 200000),
 SHARD s3 VALUES LESS THAN (MAXVALUE, MAXVALUE)
;
```

## ⟨list sharding strategy⟩

It shards the table data according to the listed value of the sharding key.

## SHARDING BY LIST ( column\_name )

It defines a sharding key for a list sharding.

- It can use only one column.
- It can not use a LONG VARCHAR type column or a LONG VARBINARY type column.

## ⟨cluster-wide list shard placement⟩

It automatically places list shards in all cluster groups of a cluster system.

AT CLUSTER WIDE statement is described before describing ⟨range shard definition⟩.

Shards can be relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster group and a cluster member.

- Create a list sharded table.
- Place five shards in the existing cluster groups (g1, g2, g3).

```
CREATE TABLE city
(
 id INTEGER,
 name VARCHAR(32)
)
SHARDING BY LIST (name)
```

```

 AT CLUSTER WIDE
 SHARD s1 VALUES IN ('SEOUL'),
 SHARD s2 VALUES IN ('PUSAN', 'ULSAN', 'DAEGU'),
 SHARD s3 VALUES IN ('DAEJEON', 'GWANGJU'),
 SHARD s4 VALUES IN ('ANSAN', 'GOYANG'),
 SHARD s5 VALUES IN (DEFAULT)
;

```

- Add a cluster group.

```

CREATE CLUSTER GROUP g4
 CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;

```

- Relocate a list shard.
- Place five shards in the cluster groups (g1, g2, g3, g4) including the added g4.

```

ALTER TABLE t1 REBALANCE;

```

## ⟨group-specific list shard placement⟩

It places list shards in a specified cluster group.

It describes AT CLUSTER GROUP group\_name statement which places that shard together with ⟨list shard definition⟩.

Shards can be automatically relocated by using **ALTER TABLE name REBALANCE** statement when adding a cluster member to a specified cluster group.

Adding a cluster group does not affect the relocation of the list shard.

- Create a list sharded table.
- Place each list shard in a specified cluster group.

```

CREATE TABLE city
(
 id INTEGER,
 name VARCHAR(32)
)
SHARDING BY LIST (name)
 SHARD s1 VALUES IN ('SEOUL') AT CLUSTER GROUP g1,
 SHARD s2 VALUES IN ('PUSAN', 'ULSAN', 'DAEGU') AT CLUSTER GROUP g2,
 SHARD s3 VALUES IN ('DAEJEON', 'GWANGJU') AT CLUSTER GROUP g3,
 SHARD s4 VALUES IN ('ANSAN', 'GOYANG') AT CLUSTER GROUP g2,

```

```
SHARD s5 VALUES IN (DEFAULT) AT CLUSTER GROUP g1
;
```

- Add a cluster group.

```
CREATE CLUSTER GROUP g4
 CLUSTER MEMBER g4n1 HOST '192.168.0.41' PORT 10401
;
```

- Relocate a list shard.
- The shard is not placed in a newly added cluster group g4.

```
ALTER TABLE t1 REBALANCE;
```

## ⟨list shard definition⟩

LIST list\_name should be unique in a table.

It can define maximum 512 of ⟨list shard definition⟩.

All ⟨list value⟩ of the listed ⟨list shard definition⟩ should be different each other.

DEFAULT are other values which is not the listed ⟨list value⟩.

DEFAULT can not be defined together with another value.

A shard including DEFAULT is a DEFAULT shard.

MAX shard should exist, and it should be a single one.

- It should include a DEFAULT shard.

```
gSQL>
CREATE TABLE t1
(
 category INTEGER,
 name VARCHAR(32)
)
SHARDING BY LIST (category)
 AT CLUSTER WIDE
 SHARD s1 VALUES IN (1, 3, 5, 7),
 SHARD s2 VALUES IN (2, 4, 6, 8),
 SHARD s3 VALUES IN (DEFAULT)
;
```

Table created.

- If it does not include a DEFAULT shard, then an error occurs.

```
gSQL>
CREATE TABLE t1
(
 category INTEGER,
 name VARCHAR(32)
)
SHARDING BY LIST (category)
AT CLUSTER WIDE
SHARD s1 VALUES IN (1, 3, 5, 7),
SHARD s2 VALUES IN (2, 4, 6, 8),
SHARD s3 VALUES IN (9, 10)
;
ERR-42000(16385): DEFAULT shard not defined :
 SHARD s3 VALUES IN (9, 10)
 *
ERROR at line 10:
```

## ⟨list value clause⟩

⟨list value⟩ should be a constant.

NULL or DEFAULT can be used as ⟨list value⟩.

- (O) SHARD s1 VALUES IN ( 1, 1 + 1, 3, 4 )
- (O) SHARD s2 VALUES IN ( 5, 6, 7, NULL )
- (O) SHARD s3 VALUES IN ( DEFAULT )
- (X) SHARD s4 VALUES IN ( DEFAULT, 8, 9, 10 )
- (X) SHARD s5 VALUES IN ( current\_timestamp, systimestamp )
- (X) SHARD s6 VALUES IN ( c1, c2 )

## ⟨table physical attribute clause⟩

It defines the physical attribute information of the table.

- PCTFREE integer
  - Definition
    - The reserved space in case the row size is increased when altering or updating a row in a page.
    - The initial input is input in other space except for this reserved space.
    - If PCTFREE is not enough ROW MIGRATION occurs when altering or updating the data.

- It can use of the value from 0 to 99.
- If it is omitted, the default value is 10.
- PCTUSED integer
  - Definition
    - It is the minimum percentage which can be used for the row data and overhead before adding a new row to a page.
    - It can be input only on this page when the value got smaller than PCTUSED due to alteration or deletion of the existing data.
  - It can use of the value from 0 to 99.
  - If it is omitted, the default value is 40.
- INITRANS integer
  - Definition
    - It specifies the initial number of transactions which can simultaneously access the page.
    - If the number of users who access the index is small, INITRANS is set to low, and if the number of users who simultaneously access the index is big, INITRANS is set to high.
    - If necessary, it is automatically increased to the specified MAXTRANS.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 4.
- MAXTRANS integer
  - Definition
    - It specifies the maximum number of transactions which can simultaneously access the page.
  - It can use the value from 1 to 32.
  - If it is omitted, the default value is 8.

## ⟨index physical attribute clause⟩

It defines the physical attributes of the index.

- PCTFREE integer
  - Definition
    - It is a reserved space for adjusting the frequency of page splits caused by the key insertion in the page.
    - It is applied only to the index bottom-up build.
  - It can use the value from 0 to 99.
  - If it is omitted, the value set in DEFAULT\_INDEX\_PCTFREE property is used.
- INITRANS integer
  - It is as same as INITRANS in ⟨table physical attribute clause⟩.
- MAXTRANS integer
  - It is as same as MAXTRANS in ⟨table physical attribute clause⟩.

## <segment attr clause>

It describes the information about the space in which the table is stored.

- INITIAL integer
  - Definition
    - It specifies the size of physical storage space which is initially allocated when creating the table.
    - The size is aligned to the EXTENT size of TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'INITIAL 100' actually operates as 8192 bytes.)
    - The size (aligned to the size of TABLESPACE EXTENT) should be equal to or bigger than the size of MINEXTENTS, and it should be equal to or smaller than the size of the MAXEXTENTS.
  - The minimum value is 1, and the maximum value depends on the system environment.
  - If it is omitted, the default value is a single EXTENT size of TABLESPACE where the table belongs.
- NEXT integer
  - Definition
    - It specifies the physical space size to be allocated when adding the space to the table.
    - The size is aligned to EXTENT size of TABLESPACE to which the table belongs. (e.g. If the EXT size is 8192 bytes, 'INITIAL 100' actually operates as 8192 bytes.)
    - NEXT is operated as follows according to the size of the remaining space of the currently available table. (The size of subtracting the currently used space from the size of MAXEXTENTS.)
  - If the remaining space size is 0, then it can not extend the space.
  - If the remaining space size is bigger than 0, but smaller than NEXT, then it allocates the space as big as the remaining space.
  - If the remaining space size is bigger than NEXT, then it allocates the space as big as the NEXT.
  - The minimum value is 1, and the maximum value depends on the system environment.
  - If it is omitted, the default value is a single EXTENT size of TABLESPACE to which the table belongs.
- MINSIZE integer
  - Definition
    - It is the minimum space size which the table should maintain.
    - It should be equal to or smaller than the value of MAXSIZE.
  - It is aligned to the EXTENT size of TABLESPACE to which the table belongs.
  - The minimum value is 1, and the maximum value depends on the system environment.
  - If it is smaller than the size of two EXTENT, the size of two EXTENT is allocated.
  - If it is omitted, the default value is the size of two EXTENT.
- MAXSIZE integer
  - Definition
    - It is the maximum space size which can be allocated to a table.
    - It should be equal to or bigger than the value of MINSIZE.

- This size is aligned to the EXTENT size of TABLESPACE to which the table belongs.
- The minimum value is 1, and the maximum value depends on the system environment.
- If it is omitted, the default value is EXTENT size \* 2147483647 (The maximum positive integer of INT32).

## ⟨size clause⟩

It specifies the file size in bytes. (If it is omitted, the default unit is bytes.)

- K: Kilobytes
- M: Megabytes
- G: Gigabytes
- T: Terabytes

## TABLESPACE tablespace\_name

It specifies the tablespace name in which a table is to be stored.

If TABLESPACE clause is omitted, the default tablespace\_name of the user performing the statement is used.

## LOGGING | NOLOGGING

It specifies whether to perform redo logging of the index.

If not specified, the default value is NOLOGGING.

## TABLESPACE index\_tablespace\_name

It specifies the tablespace name in which an index is to be stored.

If the TABLESPACE clause is omitted, LOGGING index uses the user's default data tablespace and NOLOGGING index uses the user's default temporary tablespace.

## ⟨constraint characteristics⟩

It defines characteristics of the constraint.

When defining constraints, the following characteristics can be set.

- DEFERRABLE | NOT DEFERRABLE
- ⟨constraint check time⟩

If ⟨constraint characteristics⟩ is omitted, it is set to NOT DEFERRABLE INITIALLY IMMEDIATE.

## DEFERRABLE | NOT DEFERRABLE

It sets whether the constraints checking is deferrable so that the constraints can be checked when executing COMMIT without checking when executing DML statements.

The checking time of the deferrable constraint is controlled by **SET CONSTRAINTS**.

- NOT DEFERRABLE
  - The checking point is not deferrable, and the constraints are checked when executing INSERT/DELETE/UPDATE statements.
- DEFERRABLE
  - The checking point can be controlled by **SET CONSTRAINTS** statement.
  - SET CONSTRAINTS constraint\_name IMMEDIATE
    - The constraint is checked when executing DML statement.
  - SET CONSTRAINTS constraint\_name DEFERRED
    - The constraint is checked when executing COMMIT statement.
- If not specified, the default value is determined in accordance with the <constraint check time>.
  - If INITIALLY IMMEDIATE is specified, the constraint check time is NOT DEFERRABLE.
  - If INITIALLY DEFERRED is specified, the constraint check time is DEFERRABLE.
  - If <constraint check time> is not specified, the constraint check time is NOT DEFERRABLE.

## <constraint check time>

If the constraints are DEFERRABLE, it sets an initial value for the checking time.

- INITIALLY IMMEDIATE
  - The constraint is checked when executing the DML statements.
- INITIALLY DEFERRED
  - The constraint is checked when executing the COMMIT statements.
  - It can not be used together with NOT DEFERRABLE.
- If not specified, the default value is INITIALLY IMMEDIATE.

For more information about the deferrable constraints, refer to **SET CONSTRAINTS**.

## <table global secondary index clause>

It defines a global secondary index of the table.

- WITH GLOBAL SECONDARY INDEX [ <index attributes> [...] ] [ TABLESPACE tablespace\_name ]
  - It creates a global secondary index when creating a table in a cluster system environment.
  - <index attribute>
    - It sets an index attribute of a global secondary index.
  - TABLESPACE tablespace\_name

- It specifies a tablespace to create a global secondary index.
- WITHOUT GLOBAL SECONDARY INDEX
  - It does not create a global secondary index when creating a table in a cluster system environment.

## Description

### Constraint Characteristics

GOLDILOCKS automatically creates an index to check the uniqueness when generating key constraints.

The following columns do not allow NULL value.

- A column including NOT NULL constraint
- A column which is included in primary key constraints
- An identity column

### Cluster Table

A table manages data using one of the following sharding strategies in a cluster environment.

- Cloned table
  - It duplicates all table data and places them in a cluster system.
- Hash sharded table
  - It divides the table data into several shards based on the hash value of a sharding key, then places them in the cluster system.
- Range sharded table
  - It divides the table data into several shards based on the range value of a sharding key, then places them in the cluster system.
- List sharded table
  - It divides the table data into several shards based on the list value of a sharding key, then places them in the cluster system.

The sharding strategy is determined considering the followings when creating a table. Tables operated in a cluster system are specified as a code table and a fact table based on its features.

- Code table
  - It is a table such as a product list or a provider list whose data is relatively small and is not often altered
  - This table is referenced often together with a fact table.
- Fact table
  - It is a table such as a transaction history or a call history whose data is relatively big and is often altered.

- Its data is big so required to be sharded.

⟨cloned strategy⟩ is appropriate for a code table, and an appropriate ⟨table sharding strategy⟩ should be determined according to the table access pattern in case of a fact table.

## Examples

The following is an example of generating an ordinary table.

```
gSQL> CREATE TABLE region
(
 r_regionkey INTEGER
 , r_name CHAR(25)
 , r_comment VARCHAR(152)
);
```

Table created.

The following is an example of specifying the constraints on the columns when creating a table.

```
gSQL> CREATE TABLE supplier
(
 s_supkey INTEGER PRIMARY KEY
 , s_name CHAR(25) NOT NULL
 , s_address VARCHAR(40)
 , s_nationkey INTEGER
 , s_phone CHAR(15)
 , s_acctbal NUMERIC(12,2)
 , s_comment VARCHAR(101)
);
```

Table created.

The following is an example of specifying the constraint which includes multiple columns when creating a table.

```
gSQL> CREATE TABLE partsupp
(
 ps_partkey INTEGER
 , ps_supkey INTEGER
 , ps_availqty INTEGER
 , ps_supplycost NUMERIC(12,2)
```

```
, ps_comment VARCHAR(199)
, CONSTRAINT ps_unique_key UNIQUE(ps_partkey, ps_suppkey)
);
Table created.
```

The following is an example of specifying whether constraints are deferrable when creating a table.

```
gSQL> CREATE TABLE t1
(
 id NUMBER PRIMARY KEY
 NOT DEFERRABLE INITIALLY IMMEDIATE
, name VARCHAR(128) CONSTRAINT t1_nn NOT NULL
 DEFERRABLE INITIALLY IMMEDIATE
, addr VARCHAR(1024)
, CONSTRAINT t1_uk UNIQUE (id, name)
 DEFERRABLE INITIALLY DEFERRED
);
Table created.
gSQL> COMMIT;
Commit complete.
```

The following is an example of specifying a column including automatically generated values and the default value when creating a table.

```
CREATE TABLE customer
(
 c_custkey INTEGER GENERATED BY DEFAULT AS IDENTITY
, c_name VARCHAR(25)
, c_address VARCHAR(40) DEFAULT 'N/A'
, c_nationkey INTEGER
, c_phone CHAR(15)
, c_acctbal NUMERIC(12,2)
, c_mktsegment CHAR(10)
, c_comment VARCHAR(117)
);
Table created.
```

The following is an example of specifying the tablespace which is to be stored when creating a table.

```
gSQL> CREATE TABLE lineitem
(
 l_orderkey INTEGER
```

```

, l_partkey INTEGER
, l_supkey INTEGER
, l_linenum INTEGER
, l_quantity NUMERIC(12,2)
, l_extendedprice NUMERIC(12,2)
, l_discount NUMERIC(12,2)
, l_tax NUMERIC(12,2)
, l_returnflag CHAR(1)
, l_linestatus CHAR(1)
, l_shipdate DATE
, l_commitdate DATE
, l_receiptdate DATE
, l_shipinstruct CHAR(25)
, l_shipmode CHAR(10)
, l_comment VARCHAR(44)
, PRIMARY KEY (l_orderkey, l_linenum) INDEX lineitem_pk_idx TABLESPACE mem_temp_tbs
) TABLESPACE mem_data_tbs;
Table created.

```

The following is an example of defining a cluster-wide cloned table. The table data is copied and placed all over the cluster system.

```

gSQL>
CREATE TABLE region
(
 r_regionkey INTEGER
, r_name CHAR(25)
, r_comment VARCHAR(152)
)
CLONED
AT CLUSTER WIDE
;
Table created.

```

The following is an example of defining a group-specific cloned table. The table data is copied and placed in a cluster group g1 and g2 specified by a user.

```

gSQL>
CREATE TABLE region
(
 r_regionkey INTEGER
, r_name CHAR(25)

```

```
, r_comment VARCHAR(152)
)
CLONED
AT CLUSTER GROUP g1, g2
;
Table created.
```

The following is an example of defining a cluster-wide hash sharded table. The table data is divided into 24 shards based on the hash value of a `ps_partkey` column, and each shard is automatically placed all over the cluster system.

```
gSQL>
CREATE TABLE partsupp
(
 ps_partkey INTEGER
, ps_suppkey INTEGER
, ps_availqty INTEGER
, ps_supplycost NUMERIC(12,2)
, ps_comment VARCHAR(199)
)
SHARDING BY HASH (ps_partkey)
SHARD COUNT 24
AT CLUSTER WIDE
;
Table created.
```

The following is an example of defining a group-specific hash sharded table. The table data is divided into 24 shards based on the hash value of a `ps_partkey` column, and each shard is automatically placed in the specified cluster groups `g2` and `g3`.

```
gSQL>
CREATE TABLE partsupp
(
 ps_partkey INTEGER
, ps_suppkey INTEGER
, ps_availqty INTEGER
, ps_supplycost NUMERIC(12,2)
, ps_comment VARCHAR(199)
)
SHARDING BY HASH (ps_partkey)
SHARD COUNT 24
AT CLUSTER GROUP g2, g3
```

```
;
```

Table created.

The following is an example of defining a cluster-wide range sharded table. The table data is divided into 24 shards based on the range value of D\_ID column, and each shard is automatically placed all over the cluster system.

```
gSQL>
```

```
CREATE TABLE DISTRICT (
 D_ID INTEGER,
 D_W_ID INTEGER,
 D_NAME VARCHAR(10),
 D_STREET_1 VARCHAR(20),
 D_STREET_2 VARCHAR(20),
 D_CITY VARCHAR(20),
 D_STATE CHAR(2),
 D_ZIP CHAR(9),
 D_TAX NUMERIC(4,4),
 D_YTD NUMERIC(15,2),
 D_NEXT_O_ID INTEGER,
 PRIMARY KEY (D_W_ID, D_ID) INDEX DISTRICT_PK_IDX
)
SHARDING BY RANGE (D_ID)
AT CLUSTER WIDE
SHARD s1 VALUES LESS THAN (100),
SHARD s2 VALUES LESS THAN (200),
SHARD s3 VALUES LESS THAN (300),
SHARD s4 VALUES LESS THAN (400),
SHARD s5 VALUES LESS THAN (500),
SHARD s6 VALUES LESS THAN (600),
SHARD s7 VALUES LESS THAN (700),
SHARD s8 VALUES LESS THAN (MAXVALUE);
;
```

Table created.

The following is an example of defining a group-specific range sharded table. The table data is divided into three range values based on the range value of a NO\_D\_ID column, and a shard s1 is placed in a cluster group g1, a shard s2 is placed in a cluster group g2, a shard s3 is placed in a cluster group g3.

```
gSQL>
```

```
CREATE TABLE NEW_ORDER
(
```

```

 NO_O_ID INTEGER,
 NO_D_ID INTEGER,
 NO_W_ID INTEGER,
 PRIMARY KEY(NO_W_ID, NO_D_ID, NO_O_ID) INDEX NEW_ORDER_PK_IDX
)
SHARDING BY RANGE (NO_D_ID)
SHARD s1 VALUES LESS THAN (5) AT CLUSTER GROUP g1,
SHARD s2 VALUES LESS THAN (8) AT CLUSTER GROUP g2,
SHARD s3 VALUES LESS THAN (MAXVALUE) AT CLUSTER GROUP g3
;
Table created.

```

The following is an example of defining a cluster-wide list sharded table. A list shard is divided into five based on a city column, and each shard is automatically placed all over the cluster system.

```

gSQL>
CREATE TABLE t1
(
 id INTEGER
, name VARCHAR(32)
, city VARCHAR(128)
)
SHARDING BY LIST (city)
 AT CLUSTER WIDE
 SHARD s1 VALUES IN ('seoul'),
 SHARD s2 VALUES IN ('busan', 'ulsan'),
 SHARD s3 VALUES IN ('suwon', 'ansan', 'osan'),
 SHARD s4 VALUES IN ('goyang', 'paju', 'guri'),
 SHARD s5 VALUES IN (DEFAULT)
;
Table created.

```

The following is an example of defining a group-specific list sharded table. A list shard is divided into five based on a city column, and each shard is placed in a specified cluster group.

```

gSQL>
CREATE TABLE t1
(
 id INTEGER
, name VARCHAR(32)
, city VARCHAR(128)
)

```

```

SHARDING BY LIST (city)
 SHARD s1 VALUES IN ('seoul') AT CLUSTER GROUP g1,
 SHARD s2 VALUES IN ('busan', 'ulsan') AT CLUSTER GROUP g2,
 SHARD s3 VALUES IN ('suwon', 'ansan', 'osan') AT CLUSTER GROUP g1,
 SHARD s4 VALUES IN ('goyang', 'paju', 'guri') AT CLUSTER GROUP g2,
 SHARD s5 VALUES IN (DEFAULT) AT CLUSTER GROUP g3
;

```

Table created.

A table T1 is created without a global secondary index.

```

gSQL> CREATE TABLE T1 (I1 INTEGER, I1 CHAR(32)) WITHOUT GLOBAL SECONDARY INDEX;

```

Table created.

A global secondary index is created after creating a table T1.

```

gSQL> CREATE TABLE T1 (I1 INTEGER, I1 CHAR(32)) WITH GLOBAL SECONDARY INDEX;

```

Table created.

A global secondary index of table T1 is created in a tablespace USER\_DATA\_TBS with a logging option after creating a table T1.

```

gSQL> CREATE TABLE T1 (I1 INTEGER, I1 CHAR(32))
 WITH GLOBAL SECONDARY INDEX
 LOGGING TABLESPACE USER_DATA_TBS;

```

Table created.

A global secondary index of table T1 is created in a tablespace USER\_TEMP\_TBS with a nologging option after creating a table T1.

```

gSQL> CREATE TABLE T1 (I1 INTEGER, I1 CHAR(32))
 WITH GLOBAL SECONDARY INDEX
 NOLOGGING TABLESPACE USER_TEMP_TBS;

```

Table created.

## Compatibility

The SQL standard does not define the following clauses.

- The physical concepts of TABLESPACE clause and <physical attribute clause> clause.
- The SQL standard does not allow an operation in DEFAULT clause.

**Table 16-30** SQL standard compatibility

Feature ID	Description	Compatibility
T171	LIKE clause in table definition	X
F531	Temporary tables	X
S051	Create table of type	X
S043	Enhanced reference types	X
S081	Subtables	X
T173	Extended LIKE clause in table definition	X
T180	System-versioned tables	X
F692	Extended collation support	X
T174	Identity columns	O
T175	Generated columns	X
S071	SQL paths in function and type name resolution	X
F321	User authorization	O
T322	Extended roles	X
F762	CURRENT_CATALOG	O
F763	CURRENT_SCHEMA	O

## For More Information

Refer to the followings.

- DROP TABLE
- ALTER TABLE
- CREATE TABLESPACE
- CREATE SCHEMA
- CREATE INDEX
- CREATE SEQUENCE
- SET CONSTRAINTS
- ALTER TABLE name ADD GLOBAL SECONDARY INDEX

## 16.86 CREATE TABLE AS SELECT

### Function

It creates a new table from the query result.

### Syntax

```

<table definition: AS query expression> ::=
 CREATE TABLE table_name
 [(column_name [, ...])]
 [<table sharding strategy>]
 [<table attribute clause> [, ...]]
 [TABLESPACE tablespace_name]
 [<table global secondary index clause>]
 AS <query expression> [WITH [NO] DATA]
 ;

<table sharding strategy> ::=
 <cloned strategy>
 | <hash sharding strategy>
 | <range sharding strategy>
 | <list sharding strategy>

<cloned strategy> ::=
 CLONED [<clone placement>]

<clone placement> ::=
 AT CLUSTER WIDE
 | AT CLUSTER GROUP group_list

<hash sharding strategy> ::=
 SHARDING BY [HASH] (column_list)
 [<hash shard count>]
 [<hash shard placement>]

<hash shard count> ::=
 SHARD COUNT integer

<hash shard placement> ::=
 AT CLUSTER WIDE
 | AT CLUSTER GROUP group_list

<range sharding strategy> ::=

```

```

 SHARDING BY RANGE (column_list)
 { <cluster-wide range shard placement> | <group-specific range shard placement> }
<cluster-wide range shard placement> ::=
 AT CLUSTER WIDE
 <range shard definition> [, ...]
<group-specific range shard placement> ::=
 <group-specific range shard definition> [, ...]
<group-specific range shard definition> ::=
 <range shard definition> AT CLUSTER GROUP group_name
<range shard definition> ::=
 SHARD range_name VALUES LESS THAN (<range value clause>)
<range value clause> ::=
 <range value> [, ...]
<range value> ::=
 constant
 | MAXVALUE
<list sharding strategy> ::=
 SHARDING BY LIST (column_name)
 { <cluster-wide list shard placement> | <group-specific list shard placement> }
<cluster-wide list shard placement> ::=
 AT CLUSTER WIDE
 <list shard definition> [, ...]
<group-specific list shard placement> ::=
 <group-specific list shard definition> [, ...]
<group-specific list shard definition> ::=
 <list shard definition> AT CLUSTER GROUP group_name
<list shard definition> ::=
 SHARD shard_name VALUES IN (<list value clause>)
<list value clause> ::=
 <list value> [, ...]
<list value> ::=
 constant
 | NULL
 | DEFAULT
<table attribute clause> ::=
 [<table physical attribute clause>]
 | [STORAGE (<segment attr clause> [...])]
<table physical attribute clause> ::=
 PCTFREE integer
 | PCTUSED integer
 | INITRANS integer

```

```

 | MAXTRANS integer
<index physical attribute clause> ::=
 PCTFREE integer
 | INITTRANS integer
 | MAXTRANS integer
<segment attr clause> ::=
 INITIAL <size_clause>
 | NEXT <size_clause>
 | MINSIZE <size_clause>
 | MAXSIZE <size_clause>
<size clause> ::=
 integer [K | M | G | T]
<table global secondary index clause> ::=
 WITH GLOBAL SECONDARY INDEX [<index attributes> [...]] [TABLESPACE tablespace_name]
 | WITHOUT GLOBAL SECONDARY INDEX

```

## Invocation and Access Rules

A user should satisfy the following conditions to perform <table definition:AS query expression>statement.

- Table creation privilege
  - Refer to the access privilege in **CREATE TABLE**.
- SELECT access privilege
  - Refer to the access privilege in **SELECT**.

## Syntax Rules and Parameters

### table\_name

It is the table name to be created.

For more information, refer to **table\_name**.

### column\_name\_list

These are the names of the columns that configure the table, and it should be unique names within the table.

The number of columns should be as same as the number of result columns in SELECT clause.

If not specified, the column names of SELECT clause in <query expression> are used.

However, if an expression (such as a function, operation, or subquery) is used instead of a column in SELECT clause, the alias or column name should be specified.

The length of the column name should be shorter than 128 bytes.

## WITH [NO] DATA

If WITH DATA is specified, the result of SELECT clause is inserted to the table to be created.

If WITH NO DATA is specified, the result of SELECT clause is not inserted to the table to be created.

If not specified, it is operated as same as when WITH DATA is specified.

## Other Syntax

For more information about other syntaxes, refer to the syntax in **CREATE TABLE** statement.

## Description

When executing CREATE TABLE AS SELECT, if a column including a NOT NULL constraint is specified in SELECT list, the NOT NULL constraint is also created in the new table.

However, if the NOT NULL constraint is deferrable, then NOT NULL constraint is not created in the new table.

On the other hand, the NOT NULL constraint is not created in the new table if NOT NULL constraint was not explicitly created but there is NOT NULL property such as primary key column or identity column.

## Examples

The following is an example of executing CREATE TABLE AS SELECT statement.

```
gSQL> CREATE TABLE recent_orders
 AS SELECT order_id, order_item, order_date
 FROM orders
 WHERE order_date >= '2015-03-03'
```

Table created.

The following is an example of specifying the column name.

```
gSQL> CREATE TABLE recent_orders (order_id, order_item, order_date)
 AS SELECT order_id, order_item, order_date
 FROM orders
 WHERE order_date >= '2015-03-03'
```

Table created.

The following is an example of a function in SELECT list.

```
gSQL> CREATE TABLE recent_orders (order_date, order_count)
 AS SELECT order_date, COUNT(*)
 FROM orders
 WHERE order_date >= '2015-03-03'
 GROUP BY order_date;
```

Table created.

The following is an example of the statement including WITH DATA.

```
gSQL>CREATE TABLE orders
(
 order_id NUMBER
 , order_item VARCHAR(128)
 , order_date DATE
);
gSQL> COMMIT;
gSQL> INSERT INTO orders VALUES (1, 'Pen', '2010-01-01');
gSQL> INSERT INTO orders VALUES (2, 'Book', '2015-03-03');
gSQL> COMMIT;
gSQL> CREATE TABLE recent_orders
 AS SELECT order_id, order_item, order_date
 FROM orders
 WHERE order_date >= '2015-03-03'
```

WITH DATA;

Table created.

```
gSQL> SELECT COUNT(*) FROM recent_orders;
```

```
COUNT(*)
```

```

```

```
1
```

1 row selected.

The following is an example of the statement including WITH NO DATA.

```

gSQL>CREATE TABLE orders
(
 order_id NUMBER
 , order_item VARCHAR(128)
 , order_date DATE
);
gSQL> COMMIT;
gSQL> INSERT INTO orders VALUES (1, 'Pen', '2010-01-01');
gSQL> INSERT INTO orders VALUES (2, 'Book', '2015-03-03');
gSQL> COMMIT;
gSQL> CREATE TABLE recent_orders
 AS SELECT order_id, order_item, order_date
 FROM orders
 WHERE order_date >= '2015-03-03'
 WITH NO DATA;
Table created.
gSQL> SELECT COUNT(*) FROM recent_orders;
COUNT(*)

 0
1 row selected.

```

## Compatibility

CREATE TABLE AS SELECT statement follows SQL standard. However, the following is an extension of SQL standard.

- SQL standard requires parentheses outside SELECT clause, but it is optional in GOLDBLOCKS.
- SQL standard requires WITH [NO] DATA clause, but it is optional in GOLDBLOCKS.
- The concepts of tablespace in GOLDBLOCKS is an extended concept, and it is not supported in SQL standard.

**Table 16-31** SQL standard compatibility

Feature ID	Description	Compatibility
T172	AS subquery clause in table definition	O

## For More Information

Refer to the followings.

- [CREATE TABLE](#)
- [SELECT](#)

## 16.87 CREATE GLOBAL TEMPORARY TABLE

### Function

It creates a new global temporary table.

### Syntax

```
<global temporary table definition> ::=
 CREATE GLOBAL TEMPORARY TABLE table_name
 (<table element> [, ...])
 [<table commit action clause>]
 [TABLESPACE tablespace_name]
 ;
<global temporary table definition: AS query expression> ::=
 CREATE GLOBAL TEMPORARY TABLE table_name
 [TABLESPACE tablespace_name]
 AS <query expression> [WITH [NO] DATA]
 ;
<table commit action clause> ::=
 ON COMMIT { PRESERVE | DELETE } ROWS
```

#### Note

The definition of <table element> is as same as those in <table\_definition>. For more information, refer to **CREATE TABLE**.

### Invocation and Access Rules

A user should satisfy the following conditions to perform <global temporary table definition> statement.

- Table creation privilege
  - Refer to the access privilege in **CREATE TABLE**.
- SELECT access privilege

- Refer to the access privilege in **SELECT**.

## Syntax Rules and Parameters

### table\_name

It is the table name to be created.  
For more information, refer to **table\_name**.

### other syntax

For more information about other syntaxes, refer to the syntax in **CREATE TABLE** and in **CREATE TABLE AS SELECT** statement.

## Description

GLOBAL TEMPORARY TABLE is used to store the data which is maintained while a transaction or a session is performed.

It is used for the purpose as same as that of the variable of which a developer temporarily stores the mid-data of the operation when developing an application.

The global temporary table has the following features.

- The definition of the global temporary table can be viewed in every session.
- The physical segment is not allocated when defining the global temporary table, but the segment subordinated to that session is allocated when it is inserted for the first time.
- The data of the global temporary table can be viewed in a session or a transaction which was inserted.
- The tablespace to store the data of the global temporary table is determined as follows.

Whether to specify tablespace	The tablespace in which the table is created
It specifies the tablespace.	It is created in the specified tablespace.
It does not specify the tablespace.	It is created in the default temporary tablespace of the current session user.

- The index for the global temporary table is subordinate to the same session of the corresponding table, and the time duration is as same as that of the table.
- It can define the view for the global temporary table.
- It can not specify <table sharding strategy> statement which describe the cluster-related features of the table for the global temporary table, nor <table global secondary index clause> statement.

- It can not specify <table attribute clause> which describes the physical attributes of the table for the global temporary table, nor <index attribute clause> which describes the physical attributes of the index.
- <index attribute clause> which describes the physical attributes of the index can not be specified for the index which is created based on the global temporary table.
- If a transaction is terminated by <table commit action clause>, it can determine how to process the remaining data.

Table commit action	Description
ON COMMIT PRESERVE ROWS	It maintains the data remained in a table even after COMMIT or ROLLBACK.
ON COMMIT DELETE ROWS (default)	It deletes all data remained in a table at the time of COMMIT or ROLLBACK (TRUNCATE).

- It supports most of DDLs for an ordinary table. (Including ALTER and TRUNCATE)
  - It does not support CLUSTER-related statement (SHARD and global secondary index-related statement).
  - DDL for the global temporary table which is currently used in its own session or in another session causes an error.
  - DDL is available after removing all segments which is used as TRUNCATE TABLE or COMMIT in all sessions in use.
- It supports all DMLs and select statements for an ordinary table.
- All alteration for the global temporary table (DML) do not leave the redo log.
- All alteration for the global temporary table (DML) leaves the undo log, the location of the undo log is determined according to TEMP\_UNDO\_ENABLED property.

TEMP_UNDO_ENABLED value	Description
TRUE	The undo log is recorded in the default temporary tablespace of the database system.
FALSE	The undo log is recorded in the undo tablespace of the database system.

- TRUNCATE command for the global temporary table truncates only the segment of the corresponding session.
- If the session is terminated, all segments are TRUNCATED and then returned.

## Examples

The following is an example of performing CREATE GLOBAL TEMPORARY TABLE statement.

```
gSQL> CREATE GLOBAL TEMPORARY TABLE SESSION_TABLE1(
 COL1 CHAR(10)
 ,COL2 VARCHAR2(20)
```

```
 ,COL3 NUMBER(10)
) ON COMMIT DELETE ROWS;
Table created.
```

The following is an example of performing CREATE GLOBAL TEMPORARY TABLE ... AS SELECT statement.

```
gSQL> CREATE GLOBAL TEMPORARY TABLE SESSION_TABLE2
 ON COMMIT PRESERVE ROWS
 AS SELECT *
 FROM EMPLOYEES;
Table created.
```

## Compatibility

CREATE GLOBAL TEMPORARY TABLE and CREATE GLOBAL TEMPORARY TABLE AS SELECT statements follow the definition of SQL standard <table definition>. However, the following is an extension of SQL standard.

- SQL standard requires parentheses outside SELECT clause, but it is optional in GOLDILOCKS.
- SQL standard requires WITH [NO] DATA clause, but it is optional in GOLDILOCKS.
- The concepts of tablespace in GOLDILOCKS is an extended concept, and it is not supported in SQL standard.

Table 16-32 SQL standard compatibility

Feature ID	Description	Compatibility
T171	LIKE clause in table definition	X
T172	AS subquery clause in table definition	O
F531	Temporary tables	X
S051	Create table of type	X
S043	Enhanced reference types	X
S081	Subtables	X
T173	Extended LIKE clause in table definition	X
T180	System-versioned tables	X
F692	Extended collation support	X
T174	Identity columns	O
T175	Generated columns	X
S071	SQL paths in function and type name resolution	X
F321	User authorization	O
T322	Extended roles	X

Feature ID	Description	Compatibility
F762	CURRENT_CATALOG	O
F763	CURRENT_SCHEMA	O

## For More Information

Refer to the followings.

- [CREATE TABLE](#)
- [CREATE TABLE AS SELECT](#)

## 16.88 CREATE TABLESPACE

### Function

It creates a tablespace.

### Syntax

```
<create tablespace statement> ::=
 <memory data tablespace statement>
 | <memory temporary tablespace statement>
 ;
```

### Invocation and Access Rules

CREATE TABLESPACE ON DATABASE privilege is required to perform <create tablespace statement>.

The user who performed the statement has CREATE OBJECT ON TABLESPACE privilege on the created tablespace.

One of the following privileges is required to create the objects on the created tablespace.

- CREATE OBJECT ON TABLESPACE for that tablespace
- USAGE TABLESPACE ON DATABASE

### Syntax Rules and Parameters

#### <memory data tablespace statement>

- [ MEMORY ] TEMPORARY

It is a memory temporary tablespace to store the no logging indexes or the temporary objects such as intermediate results which are generated during the query processing.

The reserved word MEMORY can be omitted.

## ⟨memory data tablespace clause⟩

It defines a memory data tablespace.

For more information, refer to **CREATE MEMORY DATA TABLESPACE**.

## ⟨memory temporary tablespace definition⟩

It defines a memory temporary tablespace.

For more information, refer to **CREATE MEMORY TEMPORARY TABLESPACE**.

## Description

For more information, refer to the description of each detailed statement.

## Example

For more information, refer to usage example of each detailed statement.

## Compatibility

The SQL standard does not cover the concepts of the tablespace.

## For More Information

Refer to the followings.

- **DROP TABLESPACE**
- **ALTER TABLESPACE**

## 16.89 CREATE MEMORY DATA TABLESPACE

### Function

It defines a memory data tablespace.

### Syntax

```

<memory data tablespace statement> ::=
 CREATE [MEMORY] [DATA] TABLESPACE tablespace_name
 DATAFILE <memory datafile clause> [, ...]
 [<data tablespace management clause> [, ...]]
<memory datafile clause> ::=
 'filename'
 [SIZE <size clause> | REUSE | SIZE <size clause> REUSE]
 [AT <domain_name>]
<size clause> ::=
 integer [K | M | G | T]
<data tablespace management clause> ::=
 { ONLINE | OFFLINE }
 | EXTSIZE <size clause>

```

### Invocation and Access Rules

CREATE TABLESPACE ON DATABASE privilege is required to perform <memory data tablespace definition>.

The user who performed the statement has CREATE OBJECT ON TABLESPACE privilege on the created tablespace.

One of the following privileges is required to create the objects on the created tablespace.

- CREATE OBJECT ON TABLESPACE for that tablespace
- USAGE TABLESPACE ON DATABASE

## Syntax Rules and Parameters

### [ MEMORY ] [ DATA ]

It is a memory tablespace to store the permanent objects such as tables, indexes, etc.

The reserved words, MEMORY and DATA, can be omitted.

### tablespace\_name

It is the tablespace name to be created.

The length of the tablespace name should be shorter than 128 bytes.

### ⟨memory datafile clause⟩

- 'filename'
  - It is the file name to store and manage the data.
  - It is the space to store the checkpoint image for the memory data.
  - filename can be either a new file or an already existing file.
  - The length of the filename should be shorter than 1024 bytes.
- SIZE ⟨size clause⟩
  - The initial size is assigned for a new file by using the SIZE clause.
  - An error occurs if the file already exists.
  - The file size can be specified between minimum 1M and maximum 30G.
- REUSE
  - If the file already exists, REUSE clause is used.
  - If the file does not exist, a new file is created.
  - The newly created file size is
    - determined by MEMORY\_DATA\_TABLESPACE\_SIZE property in case of the data tablespace.
    - determined by MEMORY\_TEMP\_TABLESPACE\_SIZE property in case of the temporary tablespace.
- SIZE ⟨size clause⟩ REUSE
  - If both SIZE clause and REUSE clause are specified, it is operated as follows according to the presence of the filename.
    - For the new filename, the initial file size is assigned by using the SIZE clause.
    - For the existing filename, the size is adjusted to the value of SIZE clause by using the existing file.

## ⟨size clause⟩

It specifies the file size in bytes. (If it is omitted, the default unit is bytes.)

- K: Kilobytes
- M: Megabytes
- G: Gigabytes
- T: Terabytes

## ⟨domain name⟩

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## ONLINE | OFFLINE

It sets ONLINE or OFFLINE of the tablespace.

- ONLINE is the state which a tablespace can be used as soon as it is created.
- OFFLINE is the state which a tablespace is unable to be used, it can be used after switching to ONLINE state.

## EXTSIZE ⟨size clause⟩

It specifies extent size of the tablespace.

- The extent size is specified in bytes, and one of the five (64K, 128K, 256K, 512K, 1M) is selected.
- If the extent size is defined as a value between 64K ~ 128K, 128K is set. If the extent size is defined as 1M or bigger, 1M is set.

## Description

The data tablespace is an object which provides the physical space to store the SQL schema object such as a table, an index (with LOGGING option).

## Examples

The following is an example of creating a memory data tablespace.

```
gSQL> CREATE TABLESPACE space1 DATAFILE 'test_file_1.dbf' SIZE 10M REUSE;
Tablespace created.
```

The following is an example of creating a tablespace which consists of multiple data files.

```
gSQL> CREATE TABLESPACE space1
 DATAFILE 'test_file_3_1.dbf' SIZE 10M REUSE,
 'test_file_3_2.dbf' SIZE 10M REUSE;
Tablespace created.
```

## Compatibility

The SQL standard does not cover the concepts of the tablespace.

## For More Information

Refer to the followings.

- **DROP TABLESPACE**
- **ALTER TABLESPACE**

# 16.90 CREATE MEMORY TEMPORARY TABLESPACE

## Function

It defines a memory temporary tablespace.

## Syntax

```
<memory temporary tablespace statement> ::=
 CREATE [MEMORY] TEMPORARY TABLESPACE tablespace_name
 MEMORY <memory clause> [, ...]
 <temporary tablespace management clause>
<memory clause>
 'memory_name' { SIZE <size clause> } [AT <domain_name>]
<temporary tablespace management clause> ::=
 EXTSIZE <size clause>
```

## Invocation and Access Rules

CREATE TABLESPACE ON DATABASE privilege is required to perform <memory temporary tablespace definition>.

The user who performed the statement has CREATE OBJECT ON TABLESPACE privilege on the created tablespace.

One of the following privileges is required to create the objects on the created tablespace.

- CREATE OBJECT ON TABLESPACE for the tablespace.
- USAGE TABLESPACE ON DATABASE

## Syntax Rules and Parameters

### [ MEMORY ] TEMPORARY

It is a memory temporary tablespace to store the no logging indexes or the temporary objects such as intermediate results which are generated during the query processing.

The reserved word, MEMORY, can be omitted.

### tablespace\_name

It is the tablespace name to be created.

The length of the tablespace name should be shorter than 128 bytes.

### ⟨memory clause⟩

- 'memory\_name'
  - It is a memory name to store the temporary data.
  - memory\_name should be guaranteed to be unique within the tablespace.
  - The length of the memory\_name should be shorter than 1024 bytes.
- SIZE ⟨size clause⟩
  - It specifies the initial size.
  - It can be specified between minimum 1M and maximum 30G.

### ⟨size clause⟩

It specifies the size of shared memory space in bytes.(If it is omitted, the default unit is bytes.)

The image is not managed as a file in case of the temporary memory data.

- K: Kilobytes
- M: Megabytes
- G: Gigabytes
- T: Terabytes

### ⟨domain name⟩

It is a name of a member or a group for which the statement is performed.

If it is omitted, it is performed for all groups.

## EXTSIZE <size clause>

It specifies extent size of the tablespace.

- The extent size is specified in bytes, and one of the five (64K, 128K, 256K, 512K, 1M) is selected.
- If the extent size is defined as a value between 64K ~ 128K, 128K is set. If the extent size is defined as 1M or bigger, 1M is set.

## Description

The temporary tablespace is an object which provides the physical space to store the SQL schema objects such as an index (with NOLOGGING option), and to store the intermediate results for sorting, hashing during the query processing.

## Examples

The following is an example of creating a temporary tablespace.

```
gSQL> CREATE TEMPORARY TABLESPACE temp_space1 MEMORY 'test_memory_1' SIZE 10M;
Tablespace created.
```

The following is an example of creating a temporary tablespace which includes multiple memory spaces.

```
gSQL> CREATE TEMPORARY TABLESPACE temp_space1
 MEMORY 'test_memory_3_1' SIZE 10M,
 'test_memory_3_2' SIZE 10M;
Tablespace created.
```

## Compatibility

The SQL standard does not cover the concepts of the tablespace.

## For More Information

Refer to the followings.

- `DROP TABLESPACE`
- `ALTER TABLESPACE`

## 16.91 CREATE USER

### Function

It defines a database user.

### Syntax

```
<user definition> ::=
 CREATE USER user_identifier IDENTIFIED BY password
 [PROFILE { profile_name | DEFAULT | NULL }]
 [PASSWORD EXPIRE]
 [ACCOUNT { LOCK | UNLOCK }]
 [DEFAULT TABLESPACE tablespace_name]
 [TEMPORARY TABLESPACE tablespace_name]
 [INDEX TABLESPACE { tablespace_name | NULL }]
 [<schema clause>]
 ;
<schema clause> ::=
 WITH SCHEMA [schema_name]
 | WITHOUT SCHEMA
```

### Invocation and Access Rules

CREATE USER ON DATABASE privilege is required to perform <user definition>.

The created user, user\_identifier, has the privilege, which is the owner the schema created by using <schema clause>.

#### Note

A separate privilege is not granted to the created user\_identifier.

The appropriate privileges should be granted to user\_identifier to access and perform SQL statements.

## Syntax Rules and Parameters

### user\_identifier

It is the username to be created.

The identical username (user identifier) or role (role name) should not exist.

The length of user\_identifier should be shorter than 128 bytes.

### password

It is the user's password to be created. It is encrypted and stored.

The length of password should be shorter than 128 bytes.

The password should start with an alphabetic character, and it can include alphabetic characters, number, underscore (\_), and \$.

The other special characters should be enclosed in double quotes (").

### PROFILE { profile\_name | DEFAULT | NULL }

The profile for password management policy is assigned.

- PROFILE profile\_name
  - It allocates the profile\_name which is created by a user.
- PROFILE DEFAULT
  - It allocates the default profile "DEFAULT".
- PROFILE NULL
  - It does not allocate the profile.

If PROFILE clause is omitted, it is as same as PROFILE NULL, and the profile is not applied.

For more information about the password management policy, refer to **16.81** CREATE PROFILE.

### PASSWORD EXPIRE

It expires the user's password.

It is used when a user attempts to change the password by force before login.

## ACCOUNT { LOCK | UNLOCK }

- ACCOUNT LOCK
  - It locks the user account.
- ACCOUNT UNLOCK
  - It unlocks the user account.

## DEFAULT TABLESPACE tablespace\_name

It specifies the default TABLESPACE to store objects such as the table created by the user, the indexes (with NOLOGGING option).

If DEFAULT TABLESPACE clause is omitted, default data tablespace(MEM\_DATA\_TBS) is specified, which was defined when creating DATABASE.

## TEMPORARY TABLESPACE tablespace\_name

It specifies the TABLESPACE which stores the temporary tables created by a user, indexes (NO LOGGING), and the intermediate results generated by the query processing.

If TEMPORARY TABLESPACE clause is omitted, default temporary tablespace (MEM\_TEMP\_TBS) is specified, which was defined when creating DATABASE.

## INDEX TABLESPACE { tablespace\_name | NULL }

It specifies the default TABLESPACE which stores the index objects created by a user.

- Specifying INDEX TABLESPACE tablespace\_name
  - If it specifies the data tablespace, then it should be the LOGGING index.
  - If it specifies the temporary tablespace, then it should be the NOLOGGING index.
- INDEX TABLESPACE NULL
  - It does not specify the index tablespace.

If INDEX TABLESPACE clause is omitted, then it is INDEX TABLESPACE NULL.

## <schema clause>

It creates a schema which a user uses by default.

The schema name should be unique in the database.

- WITH SCHEMA [schema\_name]
  - If schema\_name is not assigned, the schema is created whose name is as same as user\_identifier.

- SCHEMA PATH of the user is set as follows.
  - schema\_name, PUBLIC
- WITHOUT SCHEMA
  - It does not create the schema which is to be owned by a user.
  - SCHEMA PATH of the user is set as PUBLIC.

If <schema clause> is not specified, the default value is WITH SCHEMA and the schema is created whose name is as same as user\_identifier.

The schema to be owned by the user can be additionally created by using **CREATE SCHEMA** statement.

## Description

A user is an authorization object which consists of a set of privileges.

When <user definition> statement is executed for the first time, a user without any privilege is created, and the appropriate privileges should be granted as follows.

In GOLDBLOCKS, the relationship between user and schema is 1 : N.

In other words, a user does not own any schema, or a user can own multiple schemas.

The SQL standard does not explicitly define the relationship of the non-schema objects such as a user, a schema, or a database. Each DBMS defines the relationship of non-schema objects in different concept as follows.

### Note

The relationship between user and schema in other DBMS.

- Oracle
  - User : schema = 1 : 1.
- DB2
  - It is as same as the OS user.
  - The separate SQL statements which creates or deletes a user do not exist.
- Postgres
  - User : schema = 1 : N.
- MySQL
  - Database : schema = 1 : 1.

° User is a subordinate object of database (schema).

## Examples

At least the following privileges should be granted to create a user, and for the created user to create the objects, manipulate data.

The following is an example of creating a user and granting privileges.

- Create a user.

```
gSQL> CREATE USER u1 IDENTIFIED BY u1_password
 DEFAULT TABLESPACE mem_data_tbs
 TEMPORARY TABLESPACE mem_temp_tbs
 INDEX TABLESPACE NULL;
```

User created.

```
gSQL> COMMIT;
```

Commit complete.

- Grant database privileges.

```
gSQL> GRANT CREATE SESSION ON DATABASE TO u1;
```

Grant succeeded.

```
COMMIT;
```

Commit complete.

- Grant schema privileges.

```
GRANT CREATE TABLE, CREATE VIEW, CREATE INDEX, CREATE SEQUENCE, ADD CONSTRAINT
 ON SCHEMA u1 TO u1;
```

Grant succeeded.

```
COMMIT;
```

Commit complete.

- Grant tablespace privileges.

```
GRANT CREATE OBJECT ON TABLESPACE mem_data_tbs TO u1;
```

Grant succeeded.

```
GRANT CREATE OBJECT ON TABLESPACE mem_temp_tbs TO u1;
```

Grant succeeded.

```
COMMIT;
Commit complete.
```

The following is an example of creating objects by the user.

- It needs CREATE SESSION ON DATABASE.

```
gSQL> \connect u1 u1_password
```

- It needs CREATE TABLE ON SCHEMA u1.
- It needs CREATE OBJECT ON TABLESPACE mem\_data\_tbs.

```
gSQL> CREATE TABLE u1.t1 (c1 INTEGER, c2 INTEGER) TABLESPACE mem_data_tbs;
Table created.
gSQL> COMMIT;
```

- It needs CREATE INDEX ON SCHEMA u1.
- It needs CREATE OBJECT ON TABLESPACE mem\_temp\_tbs.

```
gSQL> CREATE INDEX u1.idx ON t1 (c2) TABLESPACE mem_temp_tbs;
Index created.
gSQL> COMMIT;
```

- It needs ADD CONSTRAINT ON SCHEMA u1.

```
gSQL> ALTER TABLE t1 ADD CONSTRAINT u1.t1_pk PRIMARY KEY (c1) ;
Table altered.
gSQL> COMMIT;
```

- It needs CREATE SEQUENCE ON SCHEMA u1.

```
gSQL> CREATE SEQUENCE u1.seq;
Sequence created.
gSQL> COMMIT;
gSQL> INSERT INTO u1.t1 VALUES (u1.seq.NEXTVAL, u1.seq.NEXTVAL);
1 row created
gSQL> COMMIT;
```

## Compatibility

The SQL standard covers the concepts of the user, but it does not define the SQL statements associated with the creation and deletion of user.

## For More Information

Refer to the followings.

- [DROP USER](#)
- [ALTER USER](#)
- [CREATE SCHEMA](#)

## 16.92 CREATE VIEW

### Function

It defines a view.

### Syntax

```
<view definition> ::=
 CREATE [OR REPLACE] [FORCE | NO FORCE]
 VIEW view_name [(column_name [, ...])]
 AS <query expression>
 ;
```

### Invocation and Access Rules

The user should satisfy the following conditions to perform <view definition> statement.

- One of the following privileges is required to create a view.
  - (CREATE VIEW or CONTROL SCHEMA) ON SCHEMA for the schema to which the view belongs
  - CREATE ANY VIEW ON DATABASE
- When using OR REPLACE clause, if a view already exists, then one of the following privileges is required to remove the existing view.
  - The owner of that view
  - CONTROL TABLE ON TABLE for that view.
  - (DROP VIEW or CONTROL SCHEMA) ON SCHEMA for the schema to which the view belongs
  - DROP ANY VIEW ON DATABASE
- One of the following privileges is required for all tables used in <Query expression>.
  - SELECT(columns) ON TABLE for all columns used in the statement among table columns
  - (SELECT or CONTROL TABLE) ON TABLE for the table
  - (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - SELECT ANY TABLE ON DATABASE
- The owner of the created view is determined as follows.

- The owner of the schema to which the view belongs.
- If the schema to which the view belongs is PUBLIC, then it is the user who executed the statement.
- The owner of the view has the following privileges for the created view.
  - SELECT ON TABLE WITH GRANT OPTION
  - INSERT ON TABLE WITH GRANT OPTION
  - UPDATE ON TABLE WITH GRANT OPTION
  - DELETE ON TABLE WITH GRANT OPTION
  - TRIGGER ON TABLE
  - LOCK ON TABLE WITH GRANT OPTION
  - ALTER ON TABLE WITH GRANT OPTION

## Syntax Rules and Parameters

### [ OR REPLACE ]

It replaces the existing view when a view already exists.

### [ FORCE | NO FORCE ]

- FORCE
  - A view is created regardless of the validity of <query expression>.
- NO FORCE
  - A view is created when <Query expression> is valid.
- The default value is NO FORCE.

### view\_name

It is the view name to be created, and it should be a unique name within the schema.

The schema to which the view belongs, such as schema\_name.view\_name, can be defined. If schema\_name is omitted, the default schema name of the user performing the statement is used.

The length of the view name must be shorter than 128 bytes.

### [ ( column\_name [, ...] ) ]

It defines a column name which will configure the view.

Each column name should be unique within the view.

The number of columns should be as same as the number of result columns in SELECT clause.

If the list of column names is omitted, the column names of SELECT clause in <query expression> are used.

## AS <query expression>

It is the **SELECT** query which will create a view.

<query expression> can not include the following variables.

- Host parameter
- SQL parameter
- Dynamic parameter
- Embedded variable
- SEQUENCE object

## Description

A view is the object which gave a name to the query, and it is used in the similar way of a table.

When executing a query including the view, that view is interpreted as the query included in the view definition. If the table referenced by the view is altered, as the following example, the asterisk (\*) included in the view definition is automatically interpreted based on the altered table information.

```
gSQL> CREATE VIEW v1 AS SELECT * FROM t1;
gSQL> COMMIT;
gSQL> SELECT * FROM v1;
ID NAME
-- -----
1 leekmo
2 mkkim
3 egonspace
3 rows selected.
gSQL> ALTER TABLE t1 ADD COLUMN (dept_id INTEGER, addr VARCHAR(1024));
gSQL> COMMIT;
gSQL> select * from v1;
ID NAME DEPT_ID ADDR
-- -----
1 leekmo null null
2 mkkim null null
3 egonspace null null
```

3 rows selected.

The view is affected if the view is created on the query including errors by using FORCE option, the tables referred by the view, or views are altered or deleted.

This information can be retrieved from INFORMATION\_SCHEMA.VIEWS information.

- IS\_COMPILED column
  - TRUE: The view is normally created.
  - FALSE: The view is created having an error by using FORCE option.
- IS\_AFFECTED column
  - TRUE : The referenced tables by a view or view is altered.
  - FALSE: After a view is created and compiled, the referenced tables or views are not altered.

The maximum number of creating views and the maximum number of columns to be created within a view is not limited. Therefore, they can be created as many as the storage space is available.

## Examples

The following is an example of creating a view.

```
gSQL> CREATE VIEW v1 AS SELECT * FROM t1 WHERE dept_id = 101;
View created.
```

The following is an example of defining the column names when defining a view.

```
gSQL> CREATE VIEW v1 (v_id, v_name)
 AS SELECT id, name FROM t1 WHERE dept_id = 101;
View created.
```

The following is an example of removing the existing view and creating a new view by using REPLACE option.

```
gSQL> CREATE OR REPLACE VIEW v1(id, name)
 AS SELECT id, name FROM t1;
View created.
```

The following is an example of forcing to create a view by using FORCE option even when the referenced object by the view does not exist.

```
gSQL> CREATE FORCE VIEW v1
 AS SELECT * FROM t1 WHERE dept_id = 101;
ERR-01000(16243): Warning: View created with compilation errors
ERR-42000(16040): table or view does not exist :
 AS SELECT * FROM t1 WHERE dept_id = 101
 *
ERROR at line 2:
View created.
```

## Compatibility

The SQL standard does not define the following clauses.

- [ OR REPLACE ] clause
- [ FORCE | NO FORCE ] clause

**Table 16-33** SQL standard compatibility

Feature ID	Description	Compatibility
T131	Recursive query	X
F751	View CHECK enhancements	X
S043	Enhanced reference types	X
T111	Updatable joins, unions, and columns	X
F852	Top-level <order by clause> in views	O
F864	Top-level <result offset clause> in views	O
F859	Top-level <fetch first clause> in views	O
S081	Subtables	X

## For More Information

Refer to the followings.

- DROP VIEW
- ALTER VIEW
- SELECT

## 16.93 DECLARE cursor\_name

### Function

It declares a cursor.

### Syntax

```

<declare cursor> ::=
 DECLARE cursor_name <cursor properties> { FOR | IS } <cursor specification>
 ;
<cursor properties> ::=
 [<cursor sensitivity>] [<cursor scrollability>] CURSOR [<cursor holdability>]
 | [<odbc cursor type>] CURSOR [<cursor holdability>]
<cursor sensitivity> ::=
 INSENSITIVE
 | SENSITIVE
 | ASENSITIVE
<cursor scrollability> ::=
 NO SCROLL
 | SCROLL
<cursor holdability> ::=
 WITH HOLD
 | WITHOUT HOLD
<odbc cursor type> ::=
 STATIC
 | KEYSET
<cursor specification> ::=
 statement_name
 | <cursor query> [<updatability clause>]
<cursor query> ::=
 <select statement>
 | <insert returning query statement>
 | <update returning query statement>
 | <delete returning query statement>
<updatability clause> ::=
 FOR READ ONLY

```

```

 | FOR UPDATE [OF <column name list>] [<lock wait mode>]
<lock wait mode> ::=
 | WAIT
 | WAIT second
 | NOWAIT

```

## Invocation and Access Rules

The dynamic cursor which uses `statement_name` can be used in an embedded SQL.

An appropriate access privilege is required depending on `<cursor query>` types.

For more information about the access privileges, refer to the followings.

- The access privilege of a **SELECT** statement
- The access privilege of a **SELECT .. FOR UPDATE** statement
- The access privilege of a **INSERT INTO name RETURNING** statement
- The access privilege of a **UPDATE name RETURNING** statement
- The access privilege of a **DELETE FROM name RETURNING** statement

## Syntax Rules and Parameters

### `cursor_name`

It is the cursor name to be declared.

It should be a unique name within the session.

The length of cursor name should be shorter than 128 bytes.

### `{ FOR | IS }`

Either FOR or IS is used as a syntax keyword in SQL standard.

### `<cursor properties>`

It defines the cursor properties.

- If `<cursor sensitivity>` is not specified, the default value is **INSENSITIVE**.
- If `<cursor scrollability>` is not specified, the default value is **NO SCROLL**.
- If `<cursor holdability>` is not specified, the default value is determined by `<cursor updatability>`.

## updatable query

To use a cursor property such as SENSITIVE or FOR UPDATE, a query of the cursor should identify changes in rows of the base table, or it should be the updatable query which can acquire a lock on the row.

The updatable query should satisfy all of the following conditions.

- DISTINCT should not exist at the top level query.
  - (X) SELECT DISTINCT \* FROM t1;
- GROUP BY, HAVING, aggregation function should not exist at the top level query.
  - (X) SELECT MAX(c1) FROM t1;
- A returning query should not exist.
  - (X) DELETE FROM t1 RETURNING c1;
- Set operator should not exist.
  - (X) SELECT \* FROM t1 UNION ALL SELECT \* FROM t2;
- At least one updatable column is required on the listed tables in FROM clause.
  - The columns of the tables, which are included in join operations and are not used in the cross join, are not the updatable columns.
    - FULL OUTER JOIN is not cross join.
    - NATURAL JOIN is not cross join.
    - If INNER JOIN uses USING phrase, it is not cross join.
  - The columns of the following tables are not the updatable columns.
    - Dictionary table, fixed table, performance view
  - The columns of the view are not updatable tables.

## ⟨cursor sensitivity⟩

It determines whether the following data changes that affect the query results can be queried when operating the cursor.

- INSENSITIVE
  - It can not detect the data updated during the cursor operation.
- SENSITIVE
  - ⟨cursor query⟩ should be an updatable query.
  - It detects the updated and deleted data in the transaction as same as that of the cursor.
  - It detects the data updated and deleted through COMMIT of other transactions.
- ASENSITIVE
  - INSENSITIVE or SENSITIVE is determined depending on the type of ⟨cursor query⟩.
    - For the updatable query, it is SENSITIVE.
    - For no updatable query, it is INSENSITIVE.
- If it is not specified, the default value is INSENSITIVE.

## ⟨cursor scrollability⟩

It specifies whether the result set of the cursor can be fetched sequentially or non-sequentially.

- NO SCROLL
  - Only sequential FETCH (FETCH NEXT) is possible.
- SCROLL
  - Non-sequential FETCH is possible.
- If not specified, the default value is NO SCROLL.

## ⟨cursor holdability⟩

It determines whether the cursor is maintained after the cursor is OPEN and the transaction is committed.

- WITH HOLD
  - The cursor is maintained after the transaction is committed.
  - It can not be used together with FOR UPDATE statement.
  - It can not be used together with **INSERT INTO name RETURNING** statement.
  - It can not be used together with **UPDATE name RETURNING** statement.
  - It can not be used together with **DELETE FROM name RETURNING** statement.
- WITHOUT HOLD
  - When the transaction is committed or rolled back, the cursor is closed.
- Rollback and cursor
  - It closes a cursor included in a transaction when rolling back the transaction.
  - It closes a cursor created since the savepoint when rolling back up to the savepoint.
- If not specified, the default value of ⟨cursor holdability⟩ is determined by ⟨cursor updatability⟩.
  - If it is FOR READ ONLY or ⟨cursor updatability⟩ is not specified, the default value is WITH HOLD.
  - If it is used together with FOR UPDATE statement, the default value is WITHOUT HOLD.

## ⟨odbc cursor type⟩

It is the cursor type in the ODBC standard, and it has the SCROLL property.

- STATIC CURSOR
  - It is as same as INSENSITIVE SCROLL in SQL standard.
  - Non-sequential FETCH is possible.
  - It is the static scroll cursor in the ODBC standard.
- KEYSET CURSOR
  - It is as same as ASENSITIVE SCROLL in SQL standard.
  - It is the keyset-driven scroll cursor in the ODBC standard.

- The property of sensitivity is determined according to the following characteristics.

**Table 16-34** Sensitivity according to FOR [UPDATE / READ ONLY] statement and the query type

Updatability	Query type	Sensitivity
FOR UPDATE	Updatable query	SENSITIVE
FOR UPDATE	Non-updatable query	Query error
FOR READ ONLY	Any query	INSENSITIVE
N/A	Updatable query	SENSITIVE
N/A	Non-updatable query	INSENSITIVE

## ⟨cursor specification⟩

It defines a query which is a target of the cursor.

If statement\_name is used, a dynamic cursor whose query has not been defined is declared.

If ⟨cursor query⟩ is used, a standing cursor whose query is defined is declared.

## statement\_name

It is a statement\_name to be referenced by the cursor, and it can be used in an embedded SQL.

statement\_name should exist before performing ⟨declare cursor⟩ statement, and the SQL statement referenced by statement\_name should be the query prepared by **PREPARE statement\_name** statement.

If it is not a query, an error occurs when executing **OPEN cursor\_name** statement.

## ⟨cursor query⟩

For more information about available query types in the cursor, refer to the followings.

- SELECT
- SELECT .. FOR UPDATE
- INSERT INTO name RETURNING
- UPDATE name RETURNING
- DELETE FROM name RETURNING

## ⟨updatability clause⟩

It specifies whether to change rows by using the cursor.

- FOR READ ONLY
  - It declares a read-only cursor.

- FOR UPDATE
  - It declares a writable cursor.
  - When opening the cursor, the x lock for the corresponding rows is acquired to prevent the change by other transactions until the transaction is completed.
  - It can not be used together with WITH HOLD statement.
  - <cursor query> should be an updatable query.
- If not specified, the default value is FOR READ ONLY.

## FOR UPDATE OF ...

It lists the columns associated with the lock obtaining when OPENing the cursor.

- If it is the columns listed in FOR UPDATE OF statement
  - It should be an updatable column of the table listed in FROM clause of <select statement>.
  - It acquires the lock for the table of listed columns.
- If only FOR UPDATE statement is used
  - It is the same meaning as listing all updatable columns of the table in FROM clause of <select statement>.
  - It acquires the lock for the table of all columns.

## <lock wait mode>

It is used together with FOR UPDATE clause, and it specifies the lock acquisition method.

- WAIT
  - It acquires the lock for all rows of the query result when OPENing the cursor.
  - It waits until acquiring the lock.
- WAIT second
  - It acquires the lock for all rows of the query result when OPENing the cursor.
  - An error occurs if the lock is not acquired within the specified time.
  - The wait time is in seconds, and it can use the value between 0 and 1000000000.
- NOWAIT
  - It acquires the lock for all rows of the query result when OPENing the cursor.
  - An error occurs if the lock is not immediately acquired.
- If not specified, the default value is WAIT.

## Description

When controlling the query property, using DECLARE CURSOR, OPEN, FETCH, CLOSE statements have the performance burden compared to using the cursor with the ODBC or JDBC statements. It is because using

ng DECLARE CURSOR, OPEN, FETCH, CLOSE statements control the cursor of the server.

Before executing the query, the cursor property can be controlled by ODBC statement and JDBC statement. The SQL cursor property control method by DECLARE CURSOR statement, and cursor property control method by the ODBC standard and the JDBC standard are as follows.

**Table 16-35** Controlling the cursor property of ODBC/ JDBC

Property	GOLDILOCKS cursor property	ODBC standard cursor property	JDBC standard cursor property
Sensitivity	INSENSITIVE	SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_SENSITIVITY, SQL_INSENSITIVE, len)	It can not be set.
	SENSITIVE	SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_SENSITIVITY, SQL_SENSITIVE, len)	It can not be set.
	ASENSITIVE	SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_SENSITIVITY, SQL_UNSPECIFIED, len)	It can not be set.
Scrollability	NO SCROLL	SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_SCROLLABLE, SQL_NONSCROLLABLE, len)	It can not be set.
	SCROLL	SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_SCROLLABLE, SQL_SCROLLABLE, len)	It can not be set.
Holdability	WITHOUT HOLD	It can not be set.	java.sql.Connection::prepareStatement( query, type, conc, ResultSet. CLOSE_CURSORS_AT_COMMIT )
	WITH HOLD	It can not be set.	java.sql.Connection::prepareStatement( query, type, conc, ResultSet. HOLD_CURSORS_OVER_COMMIT )

SQL cursor declaration corresponding to ODBC cursor type is as follows.

**Table 16-36** SQL cursor declaration corresponding to ODBC cursor type

ODBC cursor type	SQL cursor declaration
SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_TYPE, SQL_CURSOR_FORWARD_ONLY, len)	NO SCROLL CURSOR
SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_TYPE, SQL_CURSOR_STATIC, len)	STATIC CURSOR
SQLSetStmtAttr(stmt, SQL_ATTR_CURSOR_TYPE, SQL_CURSOR_KEYSET_DRIVEN, len)	KEYSET CURSOR

SQL cursor declaration corresponding to JDBC cursor type is as follows.

**Table 16-37** SQL cursor declaration corresponding to JDBC cursor type

JDBC cursor type	SQL cursor declaration
java.sql.Connection::prepareStatement( query, ResultSet.TYPE_FORWARD_ONLY, conc, hold )	INSENSITIVE NO SCROLL CURSOR
java.sql.Connection::prepareStatement( query, ResultSet.TYPE_SCROLL_INSENSITIVE, conc, hold )	INSENSITIVE SCROLL CURSOR
java.sql.Connection::prepareStatement( query, ResultSet.TYPE_SCROLL_SENSITIVE, conc, hold )	KEYSET CURSOR

## Examples

The following is an example of declaring the cursor by using interactive SQL (gsql), and using it.

```
gsQL> DECLARE cur1 CURSOR FOR SELECT id, data FROM t1;
Cursor declared.
gsQL> OPEN cur1;
Cursor is open.
gsQL> \var v_id INTEGER
gsQL> \var v_data VARCHAR(128)
gsQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gsQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA

 2 data_2
1 row fetched.
gsQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3
1 row fetched.
gsQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA

 4 data_4
1 row fetched.
```

```

gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA

5 data_5
1 row fetched.
gSQL> FETCH cur1 INTO :v_id, :v_data;
no rows fetched.
gSQL> CLOSE cur1;
Cursor closed.

```

The following is an example of declaring KEYSET cursor, sequentially searching, then completing the transaction of UPDATE, DELETE statements, and searching for it in the reverse direction.

```

gSQL> DECLARE cur_keyset KEYSET CURSOR FOR SELECT id, data FROM t1;
Cursor declared.
gSQL> OPEN cur_keyset;
Cursor is open.
gSQL> \var v_id INTEGER
gSQL> \var v_data VARCHAR(128)
gSQL> FETCH NEXT cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

1 data_1
1 row fetched.
gSQL> FETCH NEXT cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

2 data_2
1 row fetched.
gSQL> FETCH NEXT cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

3 data_3
1 row fetched.
gSQL> FETCH NEXT cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

4 data_4
1 row fetched.
gSQL> FETCH NEXT cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

```

```

 5 data_5
1 row fetched.
gSQL> FETCH NEXT cur_keyset INTO :v_id, :v_data;
no rows fetched.
gSQL> UPDATE t1 SET data = 'new data_2' WHERE id = 2;
1 row updated.
gSQL> COMMIT;
Commit complete.
gSQL> DELETE FROM t1 WHERE id = 4;
1 row deleted.
gSQL> COMMIT;
Commit complete.
gSQL> FETCH PRIOR cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

 5 data_5
1 row fetched.
gSQL> FETCH PRIOR cur_keyset INTO :v_id, :v_data;
no rows fetched.
gSQL> FETCH PRIOR cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3
1 row fetched.
gSQL> FETCH PRIOR cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

 2 new data_2
1 row fetched.
gSQL> FETCH PRIOR cur_keyset INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> CLOSE cur_keyset;
Cursor closed.

```

The following is an example of declaring SCROLL cursor, and using the cursor through the fetch orientation.

```
gSQL> DECLARE cur_scroll SCROLL CURSOR FOR SELECT id, data FROM t1;
```

Cursor declared.

```
gSQL> OPEN cur_scroll;
```

Cursor is open.

```
gSQL> \var v_id INTEGER
```

```
gSQL> \var v_data VARCHAR(128)
```

```
gSQL> FETCH LAST cur_scroll INTO :v_id, :v_data;
```

V\_ID V\_DATA

----

5 data\_5

1 row fetched.

```
gSQL> FETCH PRIOR cur_scroll INTO :v_id, :v_data;
```

V\_ID V\_DATA

----

4 data\_4

1 row fetched.

```
gSQL> FETCH FIRST cur_scroll INTO :v_id, :v_data;
```

V\_ID V\_DATA

----

1 data\_1

1 row fetched.

```
gSQL> FETCH ABSOLUTE 3 cur_scroll INTO :v_id, :v_data;
```

V\_ID V\_DATA

----

3 data\_3

1 row fetched.

```
gSQL> FETCH RELATIVE -1 cur_scroll INTO :v_id, :v_data;
```

V\_ID V\_DATA

----

2 data\_2

1 row fetched.

```
gSQL> FETCH ABSOLUTE 3 cur_scroll INTO :v_id, :v_data;
```

V\_ID V\_DATA

----

3 data\_3

1 row fetched.

```
gSQL> CLOSE cur_scroll;
```

Cursor closed.

## Compatibility

⟨declare cursor⟩ statement has the following differences compared to the SQL standard.

- In SQL standard, the default value of ⟨cursor sensitivity⟩ is ASENSITIVE, but in GOLDDILOCKS, the default value is INSENSITIVE.
- The SQL standard does not cover the following ⟨odbc cursor type⟩.
  - STATIC CURSOR
  - KEYSET CURSOR
- In SQL standard, the default value of ⟨cursor holdability⟩ is WITHOUT HOLD, but in GOLDDILOCKS, the default value depends on ⟨cursor updatability⟩.
- SQL standard can use only ⟨select statement⟩ as ⟨cursor query⟩, but GOLDDILOCKS can use the returning query as follows.
  - **INSERT INTO name RETURNING**
  - **UPDATE name RETURNING**
  - **DELETE FROM name RETURNING**
- In SQL standard, the default value of ⟨cursor updatability⟩ is determined by ⟨select statement⟩, but in GOLDDILOCKS the default value is FOR READ ONLY.
- In SQL standard, ⟨lock wait mode⟩ statement does not exist.

**Table 16-38** SQL standard compatibility

Feature ID	Description	Compatibility
F831	Full cursor update	O
T231	Sensitive cursors	O
F791	Insensitive cursors	O
F431	Read-only scrollable cursors	O
T471	Result sets return value	X
T551	Optional key words for default syntax	O
T111	Updatable joins, unions, and columns	X
B031	Basic dynamic SQL	O

## For More Information

Refer to the followings.

- **OPEN cursor\_name**
- **FETCH cursor\_name**
- **CLOSE cursor\_name**
- **PREPARE statement\_name**

- SELECT
- SELECT .. FOR UPDATE
- INSERT INTO name RETURNING
- UPDATE name RETURNING
- DELETE FROM name RETURNING

## 16.94 DELETE FROM

### Function

It deletes rows in a table.

### Syntax

```
<delete statement: searched> ::=
 DELETE [FROM] table_name [[AS] alias_name]
 [WHERE <search condition>]
 [<result offset clause>]
 [<fetch limit clause>]
 ;
<result offset clause> ::=
 OFFSET skip_count [ROW | ROWS]
<fetch limit clause> ::=
 <fetch first clause>
 | <limit clause>
<fetch first clause> ::=
 FETCH [FIRST | NEXT] [row_count] [ROW ONLY | ROWS ONLY]
<limit clause>
 LIMIT { fetch_row_count | offset_row_count, fetch_row_count | ALL }
```

### Invocation and Access Rules

One of the following privileges is required to perform <delete statement: searched>.

- (DELETE or CONTROL TABLE) ON TABLE for the table
- (DELETE TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- DELETE ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a target table whose rows are to be deleted.

It defines the schema to which the table belongs such as schema\_name.table\_name.

If schema\_name is omitted, the default schema name of the user performing the statement is used.

### [ AS alias\_name ]

It is the alias of table\_name.

### WHERE <search condition>

It deletes the rows which satisfy WHERE condition.

If WHERE condition is omitted, it deletes all rows.

For more information about WHERE condition, refer to **where clause** of SELECT statement.

### <result offset clause>

It specifies the number of rows to be skipped among the query result.

For more information, refer to **offset limit clause** of SELECT statement.

### <fetch limit clause>

The following two ways are used to specify the number of rows to be fetched.

- <fetch first clause>
  - It specifies the number of rows to be fetched.
  - For more information, refer to **<fetch first clause>** of SELECT statement.
- <limit clause>
  - It specifies the number of rows to be fetched, or it simultaneously specifies both the number of rows to be skipped and the number of rows to be fetched.
  - For more information, refer to **<limit clause>** of SELECT statement.

## Description

### Differences among DELETE-related Statements

- **DELETE FROM**
  - It deletes multiple rows which satisfy conditions.
  - e.g. DELETE FROM t1 WHERE c1 = 0;
- **DELETE FROM name WHERE CURRENT OF cursor\_name**
  - It deletes the row which the current cursor indicates.
  - e.g. DELETE FROM t1 WHERE CURRENT OF cursor;
- **DELETE FROM name RETURNING**
  - It deletes multiple rows which satisfy the conditions, and the deleted rows can be retrieved in the same way as **SELECT** statement (API such as SQLFetch ()).
  - e.g. DELETE FROM t1 WHERE c1 = 0 RETURNING c2;
- **DELETE FROM name RETURNING .. INTO**
  - It deletes row equal to or less than one, and if one row is deleted, the value is obtained into the host variable of RETURNING INTO clause.
  - e.g. DELETE FROM t1 WHERE c1 = 0 RETURNING c2 INTO :v1;

## Examples

The following is an example of DELETE statement.

```
gSQL> DELETE FROM t1 WHERE id > 3;
2 rows deleted.
```

The following is an example of skipping some rows (two rows) and deleting some rows (two rows) among the rows which satisfy the conditions by using <result offset clause> and <fetch first clause> clauses.

```
gSQL> DELETE FROM t1 OFFSET 2 FETCH 2;
2 rows deleted.
gSQL> SELECT * FROM t1 ORDER BY 1;
ID DATA
-- -----
1 data_1
2 data_2
5 data_5
3 rows selected.
```

## Compatibility

The SQL standard does not define the following clauses of DELETE statement.

- <result offset clause>
- <fetch limit clause>

**Table 16-39** SQL standard compatibility

Feature ID	Description	Compatibility
F781	Self-referencing operations	X
T111	Updatable joins, unions, and columns	X

## For More Information

Refer to the followings.

- DELETE FROM name WHERE CURRENT OF cursor\_name
- DELETE FROM name RETURNING
- DELETE FROM name RETURNING .. INTO
- SELECT

## 16.95 DELETE FROM name RETURNING

### Function

It deletes rows of the table, and retrieves the deleted rows.

### Syntax

```

<delete returning query statement> ::=
 DELETE [FROM] table_name [[AS] alias_name]
 [WHERE <search condition>]
 [<result offset clause>]
 [<fetch limit clause>]
 <returning clause>
 ;
<result offset clause> ::=
 OFFSET skip_count [ROW | ROWS]
<fetch limit clause> ::=
 <fetch first clause>
 | <limit clause>
<fetch first clause> ::=
 FETCH [FIRST | NEXT] [row_count] [ROW ONLY | ROWS ONLY]
<limit clause>
 LIMIT { fetch_row_count | offset_row_count, fetch_row_count | ALL }
<returning clause> ::=
 { RETURN | RETURNING } { * | { <value expression> [[AS] alias_name] } [, ...] }

```

### Invocation and Access Rules

The user should satisfy the following conditions to perform <delete returning query statement>.

- One of the following privileges is required to perform DELETE statement.
  - (DELETE or CONTROL TABLE) ON TABLE for the table
  - (DELETE TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - DELETE ANY TABLE ON DATABASE

- One of the following privileges is required for all the columns used in RETURNING clause.
  - SELECT(columns) ON TABLE for all columns used in RETURNING clause.
  - (SELECT or CONTROL TABLE) ON TABLE for the table
  - (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - SELECT ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a target table whose rows are to be deleted.

### [ AS alias\_name ]

It is the alias of table\_name.

### WHERE <search condition>

It deletes the rows which satisfy WHERE condition.

For more information, refer to **DELETE FROM** statement.

### <result offset clause>

It specifies the number of rows to be skipped among the query result.

For more information, refer to **DELETE FROM** statement.

### <fetch first clause>

It specifies the number of rows to be fetched.

For more information, refer to **DELETE FROM** statement.

### <limit clause>

It specifies the number of rows to be fetched, or it simultaneously specifies both the number of rows to be skipped and the number of rows to be fetched.

For more information, refer to **DELETE FROM** statement.

## ⟨returning clause⟩

It sets the deleted rows as a result set, and it specifies the columns to be searched from the set.

- RETURNING clause returns the rows deleted by DELETE statement as a result set.
- ⟨value expression⟩
  - It is as same as ⟨select list⟩ of SELECT statement, but it can not use aggregation.
- [[AS] alias\_name]
  - It can give the name to the value expression by using AS clause.

The keywords RETURNING and RETURN have the same meaning.

## Description

For more information, refer to **Differences among DELETE-related Statements**.

## Examples

The following is an example of deleting rows which satisfy the condition, and searching for the deleted rows.

```
gSQL> DELETE FROM t1 WHERE id > 3 RETURNING *;
ID DATA
-- -----
4 data_4
5 data_5
2 rows deleted.
```

The following is an example of querying information of the deleted rows by using operation in RETURNING clause.

```
gSQL> DELETE FROM t1
 WHERE id > 3
 RETURNING 'ID: ' || id || ', DATA: ' || data AS id_data;
ID_DATA

ID: 4, DATA: data_4
ID: 5, DATA: data_5
2 rows deleted.
```

## Compatibility

The SQL standard does not cover <delete returning query statement>.

## For More Information

Refer to the followings.

- DELETE FROM
- DELETE FROM name WHERE CURRENT OF cursor\_name
- DELETE FROM name RETURNING .. INTO
- SELECT

## 16.96 DELETE FROM name RETURNING .. INTO

### Function

It deletes a single row from the table, and the value of the deleted row is obtained into the host variable.

### Syntax

```

<delete returning query statement> ::=
 DELETE [FROM] table_name [[AS] alias_name]
 [WHERE <search condition>]
 [<result offset clause>]
 [<fetch limit clause>]
 <returning into clause>
 ;
<result offset clause> ::=
 OFFSET skip_count [ROW | ROWS]
<fetch limit clause> ::=
 <fetch first clause>
 | <limit clause>
<fetch first clause> ::=
 FETCH [FIRST | NEXT] [row_count] [ROW ONLY | ROWS ONLY]
<limit clause>
 LIMIT { fetch_row_count | offset_row_count, fetch_row_count | ALL }
<returning into clause> ::=
 { RETURN | RETURNING } { * | { <value expression> [[AS] alias_name] } [, ...] } INTO
 variable_name [, ...]

```

### Invocation and Access Rules

The user should satisfy the following conditions to perform <delete returning into statement>.

- One of the following privileges is required to perform DELETE statement.
  - (DELETE or CONTROL TABLE) ON TABLE for the table
  - (DELETE TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs

- DELETE ANY TABLE ON DATABASE
- One of the following privileges is required for all columns used in RETURNING clause.
  - SELECT(columns) ON TABLE for all columns used in RETURNING clause
  - (SELECT or CONTROL TABLE) ON TABLE for the table
  - (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - SELECT ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a target table whose rows are to be deleted.

### [ AS alias\_name ]

It is the alias of table\_name.

### WHERE <search condition>

It deletes the rows which satisfy WHERE condition.

For more information, refer to **DELETE FROM** statement.

### <result offset clause>

It specifies the number of rows to be skipped among the query result.

For more information, refer to **DELETE FROM** statement.

### <fetch first clause>

It specifies the number of rows to be fetched.

For more information, refer to **DELETE FROM** statement.

### <limit clause>

It specifies the number of rows to be fetched, or it simultaneously specifies both the number of rows to be skipped and the number of rows to be fetched.

For more information, refer to **DELETE FROM** statement.

## ⟨returning into clause⟩

- RETURNING .. AS ..
  - For more information, refer to ⟨returning clause⟩ of **16.95 DELETE FROM name RETURNING statement.**
- INTO variable\_name [, ...]
  - The number of variables specified in INTO clause should be equal to the number of the expressions specified in RETURNING clause.

## Description

The number of rows to be deleted should be equal to or less than one.  
If two or more rows are deleted, then an error occurs.

For more information, refer to **Differences among DELETE-related Statements.**

## Example

The following is an example of deleting rows and obtaining the value of deleted rows into the host variable in an interactive SQL (gsq).

```
gsq> \var v_id INTEGER
gsq> \var v_data VARCHAR(128)
gsq> DELETE FROM t1 WHERE id = 3 RETURNING id, data INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3
1 row deleted.
```

## Compatibility

The SQL standard does not cover ⟨delete returning into statement⟩.

## For More Information

Refer to the followings.

- `DELETE FROM`
- `DELETE FROM name WHERE CURRENT OF cursor_name`
- `DELETE FROM name RETURNING`
- `SELECT`

## 16.97 DELETE FROM name WHERE CURRENT OF cursor\_name

### Function

It deletes a single row which the cursor indicates.

### Syntax

```
<delete statement: positioned> ::=
 DELETE [FROM] table_name [[AS] alias_name]
 WHERE CURRENT OF cursor_name
 ;
```

### Invocation and Access Rules

The privilege to perform **DELETE FROM** statement is required to perform <delete statement: positioned>.

### Syntax Rules and Parameters

#### table\_name

It is the name of a target table whose rows are to be deleted.

#### [ AS alias\_name ]

It is the alias of table\_name.

#### cursor\_name

The cursor corresponding to cursor\_name should satisfy the following conditions.

- The cursor should be OPEN. (Refer to **OPEN cursor\_name**.)

- Fetched rows by using the cursor should exist. (Refer to **FETCH cursor\_name.**)
- The query used for the cursor should identify table\_name. (Refer to **DECLARE cursor\_name.**)
- The cursor should be updatable for table\_name. (Refer to **DECLARE cursor\_name.**)

## Description

For more information, refer to **Differences among DELETE-related Statements.**

## Example

The following is an example of declaring the FOR UPDATE cursor, and deleting rows by using the cursor in interactive SQL (gsql).

```
gSQL> DECLARE cur1 CURSOR FOR SELECT id, data FROM t1 FOR UPDATE;
Cursor declared.
gSQL> OPEN cur1;
Cursor is open.
gSQL> \var v_id INTEGER
gSQL> \var v_data VARCHAR(128)
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA
---- -
 1 data_1
1 row fetched.
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA
---- -
 2 data_2
1 row fetched.
gSQL> DELETE FROM t1 WHERE CURRENT OF cur1;
1 row deleted.
gSQL> FETCH cur1 INTO :v_id, :v_data;
V_ID V_DATA
---- -

1 row fetched.
gSQL> FETCH cur1 INTO :v_id, :v_data;
no rows fetched.
gSQL> CLOSE cur1;
Cursor closed.
gSQL> SELECT id, data FROM t1 ORDER BY 1;
ID DATA
-- -----
 1 data_1
 3 data_3
 5 data_5
3 rows selected.
```

## Compatibility

Table 16-40 SQL standard compatibility

Feature ID	Description	Compatibility
S111	ONLY in query expressions	X
B031	Basic dynamic SQL	O

## For More Information

Refer to the followings.

- DECLARE cursor\_name
- OPEN cursor\_name
- FETCH cursor\_name
- DELETE FROM
- DELETE FROM name RETURNING

DELETE FROM name WHERE CURRENT OF cursor\_name | 1,887

- DELETE FROM name RETURNING .. INTO

## 16.98 DROP AUDIT POLICY

### Function

It drops an audit policy.

### Syntax

```
<drop audit policy statement> ::=
 DROP AUDIT POLICY [IF EXISTS] policy_name
 ;
```

### Invocation and Access Rules

AUDIT SYSTEM ON DATABASE privilege is required to perform <drop audit policy statement>.

### Syntax Rules and Parameters

#### IF EXISTS

An error does not occur even when a policy\_name does not exist.

#### policy\_name

It is the name of an audit policy object to be dropped.

### Description

The audit policy object which is already activated can not be dropped. In this case, the audit policy should be deactivated by using NOAUDIT POLICY statement.

## Examples

The following is an example of dropping an audit policy.

```
DROP AUDIT POLICY policy_table;
```

## Compatibility

In the SQL standard, an audit policy does not exist.

## For More Information

Refer to the followings.

- Managing audit policy object
  - **CREATE AUDIT POLICY**
  - **DROP AUDIT POLICY**
  - **ALTER AUDIT POLICY**
- Activating/ deactivating audit policy
  - **AUDIT POLICY**
  - **NOAUDIT POLICY**
- Retrieving audit trail: **AUDIT\_TRAIL**
- Clearing audit trail: **ALTER DATABASE CLEAR AUDIT TRAIL**

## 16.99 DROP CLUSTER GROUP

### Function

It drops a cluster group from a cluster system.

### Syntax

```
<drop cluster group statement> ::=
 DROP CLUSTER GROUP [IF EXISTS] group_name
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <drop cluster group statement>.

### Syntax Rules and Parameters

#### [IF EXISTS]

An error does not occur even when a cluster group does not exist.

#### group\_name

It is the name of a cluster group.

A cluster group without any shard can be dropped.

### Description

A cluster group can be dropped only when dropping the cluster group does not cause the data loss.

## Examples

The following is an example of dropping a cluster group.

```
gSQL> DROP CLUSTER GROUP g3;
Cluster Group dropped.
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to [CREATE CLUSTER GROUP](#).

## 16.100 DROP CLUSTER LOCATION

### Function

It drops the access information of a cluster member.

### Syntax

```
<drop cluster location statement> ::=
 DROP CLUSTER LOCATION member_name
 ;
```

### Invocation and Access Rules

It can be performed in a cluster system.

ADMINISTRATION ON DATABASE privilege is required to perform <drop cluster location statement>.

### Syntax Rules and Parameters

#### member\_name

It is the name of a cluster member.

The same cluster member name should exist in a registered cluster location information.

The length of the name should be shorter than 128 bytes.

### Description

Generally, the information of the cluster location is automatically created by using the connection information provided when creating the cluster group or adding the cluster member. The created information is deleted together when deleting the cluster member and the cluster group.

If the access information of the cluster location is modified, then the connection information can be modi

fied by using **ALTER CLUSTER LOCATION** without deleting or recreating the cluster member.

## Example

```
gSQL>
DROP CLUSTER LOCATION g1n2
;
Created
```

## Compatibility

The SQL standard does not define the concepts of the cluster.

## For More Information

Refer to the followings.

- **CREATE CLUSTER LOCATION**
- **ALTER CLUSTER LOCATION**

## 16.101 DROP INDEX

### Function

It drops an index.

### Syntax

```
<drop index statement> ::=
 DROP INDEX [IF EXISTS] index_name
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <drop index statement>.

- The owner of that index
- The owner of the table to which the index belongs
- CONTROL TABLE ON TABLE for the table to which the index belongs
- (DROP INDEX or CONTROL SCHEMA) ON SCHEMA for the schema to which the index belongs
- DROP ANY INDEX ON DATABASE

### Syntax Rules and Parameters

#### IF EXISTS

Even when the index does not exist, an error does not occur.

#### index\_name

It is the index name to be dropped.

It can define schema to which the index belongs such as schema\_name.index\_name and if schema\_name is omitted, the default schema name of the user performing the statement is used.

The indexes created for UNIQUE constraint, PRIMARY KEY constraint can not be dropped.

To drop the indexes created for the constraints above, the constraints should be removed through **ALTER TABLE name DROP CONSTRAINT** statement.

## Description

Data Definition Language (DDL) statement such as DROP INDEX can be rolled back if it is before when the transaction is committed.

## Examples

The following is an example of dropping an index.

```
gSQL> DROP INDEX idx_t1_id;
Index dropped.
```

The following is an example of preventing an error even when the index does not exist by using IF EXISTS statement.

```
gSQL> DROP INDEX IF EXISTS not_exist_index;
Index dropped.
```

## Compatibility

The SQL standard does not cover the concepts of the index.

## For More Information

Refer to the followings.

- CREATE INDEX
- DROP TABLE
- ALTER TABLE name DROP CONSTRAINT

## 16.102 DROP PROFILE

### Function

It drops a profile.

### Syntax

```
<drop profile statement> ::=
 DROP PROFILE [IF EXISTS] profile_name [CASCADE] ;
```

### Invocation and Access Rules

DROP PROFILE ON DATABASE privilege is required to perform <drop profile statement>.

### Syntax Rules and Parameters

#### IF EXISTS

Even when the profile does not exist, an error does not occur.

#### profile\_name

It specifies the profile name to be dropped.

It can not drop the DEFAULT profile.

#### CASCADE

If the profile has already been assigned to users, CASCADE clause should be explicitly specified to drop the profile.

The profile which is assigned to users and to be dropped is changed to DEFAULT profile.

## Example

The following is an example of dropping a profile by using CASCADE statement.

```
gSQL> DROP PROFILE prof CASCADE;
Profile dropped.
gSQL> COMMIT;
Commit complete.
```

## Compatibility

The SQL standard does not cover the concepts of the profile.

## For More Information

Refer to the followings.

- CREATE PROFILE
- ALTER PROFILE

## 16.103 DROP SCHEMA

### Function

It drops a schema.

### Syntax

```
<drop schema statement> ::=
 DROP SCHEMA [IF EXISTS] schema_name
 [<drop behavior>]
 ;
<drop behavior> ::=
 RESTRICT
 | CASCADE
```

### Invocation and Access Rules

One of the following privileges is required to perform <drop schema statement>.

- The owner of that schema
- CONTROL SCHEMA ON SCHEMA for the schema
- DROP SCHEMA ON DATABASE

### Syntax Rules and Parameters

#### IF EXISTS

Even when the schema does not exist, an error does not occur.

## schema\_name

It is the schema name to be dropped.

However, it can not drop the built-in schema such as "DICTIONARY\_SCHEMA", "INFORMATION\_SCHEMA" and "PUBLIC" which are automatically created when creating the database.

## <drop behavior>

- When it is RESTRICT
  - Objects should not exist within the schema.
- When it is CASCADE
  - It drops all objects in the schema together.
- When it is omitted, the default value is RESTRICT.

## Description

Data Definition Language (DDL) statement such as DROP SCHEMA can be rolled back if it is before when the transaction is committed.

## Examples

The following is an example of dropping a schema and all objects which exist within the schema.

```
gSQL> DROP SCHEMA s1 CASCADE;
Schema dropped.
```

The following is an example of preventing an error even when the schema does not exist by using IF EXISTS statement.

```
gSQL> DROP SCHEMA IF EXISTS not_exist_schema;
Schema dropped.
```

## Compatibility

The SQL standard does not define IF EXISTS clause.

**Table 16-41** SQL standard compatibility

Feature ID	Description	Compatibility
F032	CASCADE drop behavior	O
F381	Extended schema manipulation	O

## For More Information

Refer to `CREATE SCHEMA`.

## 16.104 DROP SEQUENCE

### Function

It drops a sequence.

### Syntax

```
<drop sequence generator statement> ::=
 DROP SEQUENCE [IF EXISTS] [schema_name.] sequence_name
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <drop sequence generator statement>.

- The owner of that sequence
- (DROP SEQUENCE or CONTROL SCHEMA) ON SCHEMA for the schema to which the sequence belongs
- DROP ANY SEQUENCE ON DATABASE

### Syntax Rules and Parameters

#### IF EXISTS

Even when the sequence does not exist, an error does not occur.

#### sequence\_name

It is the sequence name to be dropped.

It can define schema to which the sequence belongs such as schema\_name.sequence\_name and if schema\_name is omitted, the default schema name of the user performing the statement is used.

## Description

Data Definition Language (DDL) statement such as DROP SEQUENCE can be rolled back if it is before when the transaction is committed.

## Examples

The following is an example of dropping a sequence.

```
gSQL> DROP SEQUENCE seq1;
Sequence dropped.
```

The following is an example of preventing an error even when the sequence does not exist by using IF EXISTS statement.

```
gSQL> DROP SEQUENCE invalid_sequence;
ERR-42000(16044): sequence does not exist :
DROP SEQUENCE invalid_sequence
 *
ERROR at line 1:
gSQL> DROP SEQUENCE IF EXISTS invalid_sequence;
Sequence dropped.
```

## Compatibility

The SQL standard does not define IF EXISTS clause.

**Table 16-42** SQL standard compatibility

Feature ID	Description	Compatibility
T176	Sequence generator support	O

## For More Information

Refer to the followings.

- CREATE SEQUENCE

- ALTER SEQUENCE

## 16.105 DROP SYNONYM

### Function

It drops a synonym.

### Syntax

```
<drop synonym statement> ::=
 DROP [PUBLIC] SYNONYM [IF EXISTS] [schema_name.]synonym_name
 ;
```

### Invocation and Access Rules

DROP PUBLIC SYNONYM ON DATABASE privilege is required to drop a public synonym by specifying PUBLIC.

One of the following privileges is required to drop a private synonym.

- The owner of that synonym
- (DROP SYNONYM or CONTROL SCHEMA) ON SCHEMA for the schema to which the synonym belongs
- DROP ANY SYNONYM ON DATABASE

### Syntax Rules and Parameters

#### [ PUBLIC ]

It is specified when dropping the public synonym.

If this clause is omitted, the private synonym is dropped.

## IF EXISTS

Even when the synonym does not exist, an error does not occur.

### synonym\_name

It is the synonym name to be dropped.

It can define schema to which the synonym belongs such as schema\_name.synonym\_name and if schema\_name is omitted, the default schema name of the user performing the statement is used.

If PUBLIC is explicitly specified, the schema name can not be specified.

## Description

Data Definition Language (DDL) statement such as DROP SYNONYM can be rolled back if it is before when the transaction is committed.

## Examples

The following is an example of dropping a private synonym.

```
gSQL> DROP SYNONYM MyEmp;
Synonym dropped.
```

The following is an example of dropping a public synonym.

```
gSQL> DROP PUBLIC SYNONYM MainEmp;
Synonym dropped.
```

## Compatibility

The SQL standard does not define DROP SYNONYM statement.

## For More Information

Refer to `CREATE SYNONYM`.

# 16.106 DROP TABLE

## Function

It drops a table.

## Syntax

```
<drop table statement> ::=
 DROP TABLE [IF EXISTS] table_name
 [<drop behavior>]
 ;
<drop behavior> ::=
 RESTRICT
 | CASCADE
 | CASCADE CONSTRAINTS
```

## Invocation and Access Rules

One of the following privileges is required to perform <drop table statement>.

- The owner of that table
- CONTROL TABLE ON TABLE for that table
- (DROP TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- DROP ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### IF EXISTS

Even when the table does not exist, an error does not occur.

## table\_name

It is the table name to be dropped.

It can define schema to which the table belongs such as schema\_name.table\_name and if schema\_name is omitted, the default schema name of the user performing the statement is used.

The following tables which are automatically created during creating the database, can not be dropped.

- The tables in "DEFINITION\_SCHEMA" schema
- The tables in "FIXED\_TABLE\_SCHEMA" schema

It also drops constraints and indexes created in the table.

## drop behavior

Currently, both RESTRICT and CASCADE are operated same.

When it is omitted, the default value is RESTRICT.

## Description

Data Definition Language (DDL) statement such as DROP TABLE can be rolled back if it is before when the transaction is committed.

## Examples

The following is an example of dropping an ordinary table.

```
gSQL> DROP TABLE region;
Table dropped.
```

The following is an example of preventing an error even when the table does not exist by using IF EXISTS statement.

```
gSQL> DROP TABLE IF EXISTS invalid_table;
Table dropped.
```

The following is an example of rolling back the dropped table.

```

gSQL> SELECT r_regionkey, r_name FROM region;
R_REGIONKEY R_NAME

0 AFRICA
1 AMERICA
2 ASIA
3 EUROPE
4 MIDDLE EAST
5 rows selected.
gSQL> DROP TABLE region;
Table dropped.
gSQL> SELECT r_regionkey, r_name FROM region;
ERR-42000(16040): table or view does not exist :
SELECT r_regionkey, r_name FROM region
 *

ERROR at line 1:
gSQL> ROLLBACK;
Rollback complete.
gSQL> SELECT r_regionkey, r_name FROM region;
R_REGIONKEY R_NAME

0 AFRICA
1 AMERICA
2 ASIA
3 EUROPE
4 MIDDLE EAST
5 rows selected.

```

## Compatibility

The SQL standard does not define the following clauses.

- IF EXISTS
- CASCADE CONSTRAINTS

**Table 16-43** SQL standard compatibility

Feature ID	Description	Compatibility
F032	CASCADE drop behavior	O

## For More Information

Refer to `CREATE TABLE`.

## 16.107 DROP TABLESPACE

### Function

It drops a tablespace.

### Syntax

```
<drop tablespace statement> ::=
 DROP TABLESPACE [IF EXISTS] tablespace_name
 [INCLUDING CONTENTS]
 [{ AND | KEEP } DATAFILES]
 [<drop behavior>]
 ;
<drop behavior> ::=
 RESTRICT
 | CASCADE
 | CASCADE CONSTRAINTS
```

### Invocation and Access Rules

DROP TABLESPACE ON DATABASE privilege is required to perform <drop tablespace definition>.

### Syntax Rules and Parameters

#### IF EXISTS

Even when the tablespace does not exist, an error does not occur.

#### tablespace\_name

It is the tablespace name to be dropped.

The following system tablespaces which are automatically created during creating the database, can not

be dropped.

- `DICTIONARY_TBS`: system tablespace for dictionary management
- `MEM_UNDO_TBS`: system tablespace for default undo tablespace
- `MEM_DATA_TBS`: system tablespace for default user data tablespace
- `MEM_TEMP_TBS`: system tablespace for default temporary tablespace

#### Note

If `tablespace_name` was used as a default tablespace of a user, the space for the objects can not be allocated after dropping the tablespace.

After dropping the tablespace, the default tablespace should be changed by using **16.69** `ALTER USER` statement.

## INCLUDING CONTENTS

It drops objects (table, index, key constraint) which belong to the tablespace. If the index or key constraint which refers to the table which belongs to the tablespace exists outside of the tablespace, then it is also dropped.

If `INCLUDING CONTENTS` clause is not used, then any object which belongs to the tablespace should not exist.

## [ { AND | KEEP } DATAFILES ]

It specifies whether to drop the datafiles which configure the tablespace together. The datafiles are not in the memory temporary tablespace, so the clause is ignored.

- `AND DATAFILES`
  - It drops the datafiles together.
- `KEEP DATAFILES`
  - It does not drop the datafiles, but keeps them.
- If it is not specified, the default value is `KEEP DATAFILES`.

## drop behavior

Currently, both RESTRICT and CASCADE are operated same.  
When it is omitted, the default value is RESTRICT.

## Description

Unlike other Data Definition Language (DDL), DROP TABLESPACE statement can not be rolled back and the executed transaction is automatically committed.

## Examples

The following is an example of dropping a tablespace together with all objects in the tablespace and data files which configure the tablespace.

```
gSQL> DROP TABLESPACE space1 INCLUDING CONTENTS AND DATAFILES CASCADE CONSTRAINTS;
Tablespace dropped.
```

The following is an example of preventing an error even when the tablespace does not exist by using IF EXISTS statement.

```
gSQL> DROP TABLESPACE IF EXISTS not_exist_tablespace;
Tablespace dropped.
```

## Compatibility

The SQL standard does not cover the concepts of the tablespace.

## For More Information

Refer to the followings.

- CREATE MEMORY DATA TABLESPACE
- CREATE MEMORY TEMPORARY TABLESPACE
- ALTER TABLESPACE

## 16.108 DROP USER

### Function

It drops a database user.

### Syntax

```
<drop user statement> ::=
 DROP USER [IF EXISTS] user_identifier [<drop behavior>]
 ;
<drop behavior> ::=
 RESTRICT
 | CASCADE
```

### Invocation and Access Rules

DROP USER ON DATABASE privilege is required to perform <drop user statement>.

#### Note

The schema owned by user\_identifier should not exist.

For more information about dropping the schema, refer to **DROP SCHEMA**.

### Syntax Rules and Parameters

#### IF EXISTS

Even when the user does not exist, an error does not occur.

## user\_identifier

It is the database username to be dropped.

However, the user which is automatically created during creating the database such as "SYS", can not be dropped.

It does not drop the object which is created by user\_identifier but is not an owner as follows.

- Role
- Tablespace

## <drop behavior>

- RESTRICT
  - There should not be the following user owned SQL schema objects.
    - Table, view
    - Index
    - Sequence
    - Table constraint
- CASCADE
  - It drops all the following user owned SQL schema objects.
    - Table, view
    - Index
    - Sequence
    - Table constraint
- When it is omitted, the default value is RESTRICT.

### Note

The relationship between user and schema in other DBMS

- Oracle
  - User : schema = 1 : 1.
  - When CASCADE, the schema is also dropped.
- DB2
  - It is as same as the OS user.

- The separate SQL statements which create or delete a user do not exist.
- Postgres
  - User : schema = 1 : N.
  - It does not support CASCADE option, and a user can be dropped after dropping all the objects owned by the user and all the privileges granted to other users.
- MySQL
  - Database : schema = 1 : 1.
  - User is a subordinate object of database (schema), and it does not support CASCADE option.

## Description

In GOLDBLOCKS, relationship between the user and the schema is 1 : N. A user does not own a schema, or the user can have multiple schemas.

To drop a user, all schema owned by the user should be dropped.

## Examples

The following is an example of dropping all schema owned by the user and then dropping the user.

```
gSQL> DROP SCHEMA u1 CASCADE;
Schema dropped.
gSQL> DROP USER u1 CASCADE;
User dropped.
```

The following is an example of preventing an error even when the user does not exist by using IF EXISTS statement.

```
gSQL> DROP USER IF EXISTS not_exist_user;
User dropped.
```

## Compatibility

SQL standard cover the concepts of the user, but they do not define the SQL statements related to creating or dropping a user.

## For More Information

Refer to the followings.

- [CREATE USER](#)
- [ALTER USER](#)
- [DROP SCHEMA](#)

## 16.109 DROP VIEW

### Function

It drops a view.

### Syntax

```
<drop view statement> ::=
 DROP VIEW [IF EXISTS] view_name
 ;
```

### Invocation and Access Rules

One of the following privileges is required to perform <drop view statement>.

- The owner of that view
- CONTROL TABLE ON TABLE for that view
- (DROP VIEW or CONTROL SCHEMA) ON SCHEMA for the schema to which the view belongs
- DROP ANY VIEW ON DATABASE

### Syntax Rules and Parameters

#### IF EXISTS

Even when the view does not exist, an error does not occur.

#### view\_name

It is the view name to be dropped.

The schema to which the table belongs, such as schema\_name.view\_name, can be defined. If schema\_name is omitted, the default schema name of the user performing the statement is used.

## Description

Data Definition Language (DDL) statement such as DROP VIEW can be rolled back if it is before when the transaction is committed.

## Examples

The following is an example of dropping a view.

```
gSQL> DROP VIEW v1;
View dropped.
```

The following is an example of preventing an error even when the view does not exist by using IF EXISTS statement.

```
gSQL> DROP VIEW IF EXISTS not_exist_view;
View dropped.
```

## Compatibility

The SQL standard does not define IF EXISTS clause.

**Table 16-44** SQL standard compatibility

Feature ID	Description	Compatibility
F032	CASCADE drop behavior	X

## For More Information

Refer to the followings.

- CREATE VIEW
- ALTER VIEW

## 16.110 EXECUTE statement\_name

### Function

It executes the prepared statement.

### Syntax

```
<execute statement> ::=
 EXECUTE statement_name [<parameter using clause>] [<result into clause>]
 ;
<parameter using clause> ::=
 <using parameter arguments>
<using parameter arguments> ::=
 USING variable_name [, ...]
<result into clause> ::=
 <into result arguments>
<into result arguments> ::=
 INTO variable_name [, ...]
```

### Invocation and Access Rules

It can be used in an embedded SQL.

An appropriate privilege according to the type of a dynamic SQL statement is required.

### Syntax Rules and Parameters

#### statement\_name

It is the name of a prepared statement.

Statement\_name should be prepared by using **PREPARE statement\_name**.

If the dynamic SQL statement referenced by statement\_name contains a dynamic parameter, <parameter using clause> should explicitly be specified.

```
{
 ...
 EXEC SQL PREPARE stmt1 FROM 'DELETE FROM t1 WHERE c1 > ?';
 EXEC SQL EXECUTE stmt1 USING :sValue;
 ...
}
```

```
{
 ...
 EXEC SQL PREPARE stmt1 FROM 'SELECT COUNT(*) INTO :v1 FROM t1';
 EXEC SQL EXECUTE stmt1 USING :sValue;
 ...
}
```

If the dynamic SQL statement referenced by statement\_name is a query or a stored function including the result, <result into clause> should explicitly be specified.

```
{
 ...
 EXEC SQL PREPARE stmt1 FROM 'SELECT COUNT(*) FROM t1';
 EXEC SQL EXECUTE stmt1 INTO :sValue;
 ...
}
```

If there are multiple queries they are normally executed, but only the first query can get the result. To get multiple results, the following statements related to the cursor should be used.

- **DECLARE cursor\_name**
- **OPEN cursor\_name**
- **FETCH cursor\_name**
- **CLOSE cursor\_name**

If there is not any query result, it is completed as NO DATA.

## [ <parameter using clause> ] [ <result into clause> ]

<parameter using clause> and <result into clause> can be specified in any order, but they should not be repeated.

## ⟨parameter using clause⟩

If any parameter exists in a dynamic SQL statement referenced by `statement_name`, the parameter information is specified with ⟨using parameter arguments⟩ clause.

## ⟨using parameter arguments⟩

If ⟨using parameter arguments⟩ statement is used, the number of `variable_name` should be equal to the number of the parameter included in the dynamic SQL statement referenced by `statement_name`.

The listed `variable_name` corresponds to the dynamic parameter in an order of its description.

```
{
 ...
 EXEC SQL PREPARE stmt1 FROM 'DELETE FROM t1 WHERE c1 IN (?, ?, ?)';
 EXEC SQL EXECUTE stmt1 USING :sValue1, :sValue2, :sValue3;
 ...
}
```

## ⟨result into clause⟩

If the dynamic SQL statement referenced by `statement_name` is a query, the information about the result columns is specified with ⟨into result arguments⟩ clause.

If the result is null and `INDICATOR` is not specified, [DATA EXCEPTION, NULL VALUE, NO INDICATOR PARAMETER] error occurs.

## ⟨into result arguments⟩

If ⟨into result arguments⟩ clause is used, the number of `variable_name` should be equal to the number of the result column in the dynamic SQL statement referenced by `statement_name`.

The listed `variable_name` corresponds to the dynamic parameter in an order of its description.

```
{
 ...
 EXEC SQL PREPARE stmt1 FROM 'SELECT MIN(salary), MAX(salary), AVG(salary) FROM employee';
 EXEC SQL EXECUTE stmt1 INTO :sMinValue, :sMaxValue, :sAvgValue;
 ...
}
```

## Description

Statement\_name is an identifier which informs the precompiler the statement in an embedded SQL source code.

A separate type or declaration is not required because statement\_name is not a host variable. EXECUTE statement\_name should be written after PREPARE statement\_name.

For more information, refer to **Embedded Dynamic SQL**.

## Example

The following is an example of using EXECUTE statement\_name in an embedded SQL source code.

```
{
 ...
 sprintf(sUpdateSql, "UPDATE EMP SET sal = sal * :v1 WHERE JOB = 'SALES'");
 EXEC SQL PREPARE UPDATE_STMT FROM :sUpdateSql;
 if(sqlca.sqlcode != 0)
 {
 goto fail_exit;
 }
 sRatio = 1.1;
 EXEC SQL EXECUTE UPDATE_STMT USING :sRatio;
 if(sqlca.sqlcode != 0)
 {
 goto fail_exit;
 }
 ...
}
```

The full source code in which EXECUTE statement\_name was used can be viewed in **Dynamic Embedded SQL Example Program**.

## Compatibility

**Table 16-45** SQL standard compatibility

Feature ID	Description	Compatibility
B031	Basic Dynamic SQL	O
B032	Extended dynamic SQL	X

## For More Information

Refer to the followings.

- `PREPARE statement_name`
- `DECLARE cursor_name`
- `OPEN cursor_name`
- `FETCH cursor_name`
- `CLOSE cursor_name`
- Embedded Dynamic SQL

## 16.111 EXECUTE IMMEDIATE 'sql\_string'

### Function

It executes a dynamic SQL statement which was not defined when writing a program.

### Syntax

```
<execute immediate statement> ::=
 EXECUTE IMMEDIATE <SQL statement variable>
 ;
<SQL statement variable> ::=
 variable_name
 | 'sql statement'
 | "sql statement"
 | sql statement
```

### Invocation and Access Rules

It can be used in an embedded SQL.

An appropriate privilege according to the type of a dynamic SQL statement is required.

### Syntax Rules and Parameters

#### <SQL statement variable>

The dynamic SQL statement referenced by <SQL statement variable> can not use a host variable (:var) or parameter marker (?).

The following four types of <SQL statement variable> can be used.

- `variable_name`: It is a variable in which an SQL statement is stored.
- `'sql statement'`: It is an SQL statement which is enclosed with a single quote (').
- `"sql statement"`: It is an SQL statement which is enclosed with double quotes (").

- `sql statement`: It is an SQL statement without quote.

The single quote (') is used twice as follows to represent string data within a single-quoted string.

```
{
 ...
 EXEC SQL EXECUTE IMMEDIATE 'INSERT INTO t1 VALUES (''literal data'')';
 ...
}
```

If the SQL statement is a query including a query result, it is successfully executed, but the result can not be obtained.

## variable\_name

The type corresponding to the `variable_name` should be a character string.

The dynamic SQL statement defined in the `variable_name` should be valid.

## sql statement

The dynamic SQL statement defined in the `sql statement` should be valid.

## Description

EXECUTE IMMEDIATE '`sql_string`' statement can be used as the non-query SQL without a host variable in dynamic embedded SQL application. It is appropriate to execute DDL, DML as one-off because it does not require separate preparation procedure.

For more information, refer to **Embedded Dynamic SQL**.

## Example

The following is an example of using EXECUTE IMMEDIATE '`sql_string`' in the embedded SQL source code.

```
{
 ...
 sprintf(sSqlStmt, "INSERT INTO EMP_RND\n"
```

```
 "SELECT *\n"
 "FROM EMP\n"
 "WHERE JOB = 'RND'\n");
EXEC SQL EXECUTE IMMEDIATE :sSqlStmt;
if(sqlca.sqlcode != 0)
{
 goto fail_exit;
}
...
}
```

The full source code in which EXECUTE IMMEDIATE 'sql\_string' was used can be viewed in [Dynamic Embedded SQL Example Program](#).

## Compatibility

Table 16-46 SQL standard compatibility

Feature ID	Description	Compatibility
B031	Basic Dynamic SQL	O

## For More Information

Refer to the followings.

- `PREPARE statement_name`
- `EXECUTE statement_name`
- Embedded Dynamic SQL

## 16.112 FETCH cursor\_name

### Function

It locates the cursor on a specific row of result set, and obtains the value of that row to a host variable.

### Syntax

```
<fetch statement> ::=
 FETCH [<fetch orientation>] [FROM] cursor_name
 <result into clause>
 ;
<fetch orientation> ::=
 NEXT
 | PRIOR
 | FIRST
 | LAST
 | CURRENT
 | ABSOLUTE position
 | RELATIVE position
<result into clause> ::=
 <into result arguments>
<into result arguments> ::=
 INTO variable_name [, ...]
```

### Syntax Rules and Parameters

#### [ FROM ] cursor\_name

It should be an open cursor in a session.

FROM can be omitted.

## <fetch orientation>

To use <fetch orientation> other than FETCH NEXT, a scrollable cursor should be used.  
If <fetch orientation> is omitted, the default value is NEXT.

The open cursor has the cursor position information for the result set as follows.

**Figure 1** The position of cursor

**Table 16-47** The position of cursor

Cursor position	Description
BEFORE THE FIRST ROW	The cursor is positioned before the first row of the result set. It is also the cursor position when opening it.
ON A CERTAIN ROW	The cursor is positioned on a certain row of the result set through FETCH.
AFTER THE LAST ROW	The cursor is positioned after the last row of the result set.

Each <fetch orientation> operates based on the cursor position as follows.

- NEXT: It searches for the row next to the current position.
- PRIOR: It searches for the row prior to the current position.
- FIRST: It searches for the first row of the result set.
- LAST: It searches for the last row of the result set.
- CURRENT: It searches for the row in the current position.
- ABSOLUTE position
  - It searches for the row corresponding to the position from the result set.
  - If the position value is negative, it searches for the row at previous position from AFTER THE LAST ROW.
- RELATIVE position

- It searches for the row apart as much as position from the current position.

## ⟨result into clause⟩

The variable information to obtain the result column is specified by using ⟨into result arguments⟩.

If the result is null and INDICATOR is not specified, [DATA EXCEPTION, NULL VALUE, NO INDICATOR PARAMETER] error occurs.

## ⟨into result arguments⟩

The number of variables in INTO clause should be as same as the number of columns in the result set of the cursor.

## Description

If the cursor is BEFORE THE FIRST ROW or AFTER THE LAST ROW after performing FETCH, it is positioned at the same position regardless of the entered position in ⟨fetch orientation⟩.

## Example

The following is an example of declaring SCROLL cursor by using the interactive SQL (gsql), then operating the various ⟨fetch orientation⟩.

```
gSQL> DECLARE cur_scroll SCROLL CURSOR FOR SELECT id, data FROM t1;
Cursor declared.
gSQL> OPEN cur_scroll;
Cursor is open.
gSQL> \var v_id INTEGER
gSQL> \var v_data VARCHAR(128)
gSQL> FETCH NEXT cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

1 data_1
1 row fetched.
gSQL> FETCH NEXT cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

```

```

 2 data_2
1 row fetched.
gSQL> FETCH PRIOR cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> FETCH PRIOR cur_scroll INTO :v_id, :v_data;
no rows fetched.
gSQL> FETCH FIRST cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> FETCH FIRST cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> FETCH LAST cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 5 data_5
1 row fetched.
gSQL> FETCH LAST cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 5 data_5
1 row fetched.
gSQL> FETCH FIRST cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> FETCH CURRENT cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> FETCH LAST cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

```

```

 5 data_5
1 row fetched.
gSQL> FETCH CURRENT cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 5 data_5
1 row fetched.
gSQL> FETCH ABSOLUTE 3 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3
1 row fetched.
gSQL> FETCH CURRENT cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3
1 row fetched.
gSQL> FETCH ABSOLUTE 1 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> FETCH ABSOLUTE -1 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 5 data_5
1 row fetched.
gSQL> FETCH ABSOLUTE 6 cur_scroll INTO :v_id, :v_data;
no rows fetched.
gSQL> FETCH ABSOLUTE -6 cur_scroll INTO :v_id, :v_data;
no rows fetched.
gSQL> FETCH ABSOLUTE 3 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3
1 row fetched.
gSQL> FETCH ABSOLUTE -3 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3

```

```

1 row fetched.
gSQL> FETCH RELATIVE 1 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 4 data_4
1 row fetched.
gSQL> FETCH RELATIVE -1 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 3 data_3
1 row fetched.
gSQL> FETCH RELATIVE 5 cur_scroll INTO :v_id, :v_data;
no rows fetched.
gSQL> FETCH RELATIVE -5 cur_scroll INTO :v_id, :v_data;
V_ID V_DATA

 1 data_1
1 row fetched.
gSQL> CLOSE cur_scroll;
Cursor closed.

```

## Compatibility

The SQL standard does not define CURRENT among <fetch orientation>.

**Table 16-48** SQL standard compatibility

Feature ID	Description	Compatibility
F431	Read-only scrollable cursors	O
B031	Basic dynamic SQL	O

## For More Information

Refer to the followings.

- DECLARE cursor\_name
- OPEN cursor\_name
- CLOSE cursor\_name

## 16.113 GRANT privileges TO

### Function

It grants privileges to a user.

### Syntax

```

<grant privilege statement> ::=
 GRANT <privilege> TO <grantee> [, ...]
 [WITH GRANT OPTION]
 ;

<grantee> ::=
 PUBLIC
 | user_identifier
 ;

<privilege> ::=
 <database privilege>
 | <tablespace privilege>
 | <schema privilege>
 | <table privilege>
 | <sequence privilege>
 | <procedure privilege>

<database privilege> ::=
 ALL [PRIVILEGES] [ON DATABASE]
 | <database action> [, ...] [ON DATABASE]

<database action> ::=
 ADMINISTRATION
 | ANALYZE ANY
 | ALTER DATABASE
 | ALTER SYSTEM
 | AUDIT SYSTEM
 | ACCESS CONTROL
 | CREATE SESSION
 | CREATE PROFILE
 | ALTER PROFILE

```

```

| DROP PROFILE
| CREATE USER
| ALTER USER
| DROP USER
| CREATE ROLE
| ALTER ROLE
| DROP ROLE
| CREATE TABLESPACE
| ALTER TABLESPACE
| DROP TABLESPACE
| USAGE TABLESPACE
| CREATE SCHEMA
| ALTER SCHEMA
| DROP SCHEMA
| CREATE PUBLIC SYNONYM
| DROP PUBLIC SYNONYM
| CREATE ANY TABLE
| ALTER ANY TABLE
| DROP ANY TABLE
| SELECT ANY TABLE
| INSERT ANY TABLE
| DELETE ANY TABLE
| UPDATE ANY TABLE
| LOCK ANY TABLE
| CREATE ANY VIEW
| DROP ANY VIEW
| CREATE ANY SEQUENCE
| ALTER ANY SEQUENCE
| DROP ANY SEQUENCE
| USAGE ANY SEQUENCE
| CREATE ANY INDEX
| ALTER ANY INDEX
| DROP ANY INDEX
| CREATE ANY SYNONYM
| DROP ANY SYNONYM
| CREATE ANY PROCEDURE
| ALTER ANY PROCEDURE
| DROP ANY PROCEDURE
| EXECUTE ANY PROCEDURE

```

<tablespace privilege> ::=

```
ALL [PRIVILEGES] ON TABLESPACE tablespace_name
```

```

 | <tablespace action> [, ...] ON TABLESPACE tablespace_name
<tablespace action> ::=
 CREATE OBJECT
<schema privilege> ::=
 ALL [PRIVILEGES] ON SCHEMA schema_name
 | <schema action> [, ...] [ON SCHEMA schema_name]
<schema action> ::=
 CONTROL SCHEMA
 | CREATE TABLE
 | ALTER TABLE
 | DROP TABLE
 | SELECT TABLE
 | INSERT TABLE
 | DELETE TABLE
 | UPDATE TABLE
 | LOCK TABLE
 | CREATE VIEW
 | DROP VIEW
 | CREATE SEQUENCE
 | ALTER SEQUENCE
 | DROP SEQUENCE
 | USAGE SEQUENCE
 | CREATE INDEX
 | ALTER INDEX
 | DROP INDEX
 | ADD CONSTRAINT
 | CREATE SYNONYM
 | DROP SYNONYM
 | CREATE PROCEDURE
 | ALTER PROCEDURE
 | DROP PROCEDURE
 | EXECUTE PROCEDURE
<table privilege> ::=
 ALL [PRIVILEGES] ON [TABLE] table_name
 | { <table action> | <column action> } [, ...] ON [TABLE] table_name
<table action> ::=
 CONTROL TABLE
 | SELECT
 | INSERT
 | UPDATE
 | DELETE

```

```

| REFERENCES
| LOCK
| INDEX
| ALTER
<column action> ::=
 SELECT (column_name [, ...])
| INSERT (column_name [, ...])
| UPDATE (column_name [, ...])
| REFERENCES (column_name [, ...])
<sequence privilege> ::=
 ALL [PRIVILEGES] ON SEQUENCE sequence_name
| <sequence action> ON SEQUENCE sequence_name
<sequence action> ::=
 USAGE
<procedure privilege> ::=
 ALL [PRIVILEGES] ON PROCEDURE procedure_name
| <procedure action> ON PROCEDURE procedure_name
<procedure action> ::=
 EXECUTE

```

## Syntax Rules and Parameters

### <grantee>

It is the user to be granted the privileges.

- user\_identifier
  - It grants the privilege to a user.
- PUBLIC
  - It is an authorization object which means all users.

## WITH GRANT OPTION

It allows the grantee to grant the privilege to other users.

When the same <privilege> is granted as follows, WITH GRANT OPTION is maintained.

- GRANT SELECT ON t1 TO u1 WITH GRANT OPTION;
- GRANT SELECT ON t1 TO u1;

## ⟨privilege⟩

It is a privilege which is to be granted to a grantee (the user to be granted the privilege).

The grantor (the user to perform the statement) should satisfy one of the following conditions.

- The grantor owns that ⟨privilege⟩ by using WITH GRANT OPTION.
  - The grantor is the user who performs the statement.
- The grantor owns the ACCESS CONTROL ON DATABASE privilege.
  - The grantor is the object owner.
    - ⟨database privilege⟩: \_SYSTEM account
    - ⟨tablespace privilege⟩: \_SYSTEM account
    - ⟨schema privilege⟩: \_SYSTEM account
    - ⟨table privilege⟩: The owner of the table
    - ⟨sequence privilege⟩: The owner of the sequence
    - ⟨procedure privilege⟩: The owner of the procedure/function

## ⟨database privilege⟩

It is the privilege for the database objects.

[ON DATABASE] statement can be omitted.

The database action which can be defined with the database privilege is as follows.

- ALL [ PRIVILEGES ] [ON DATABASE]
  - All privileges for the database which the grantor (the user who performs the statement) owns by using WITH GRANT OPTION.

**Table 16-49** Database privilege

⟨database action⟩	Description
ADMINISTRATION	Privilege for starting or terminating the server
ALTER DATABASE	Privilege for executing ALTER DATABASE
ALTER SYSTEM	Privilege for executing ALTER SYSTEM
AUDIT SYSTEM	Privilege for controlling the audit policy
ACCESS CONTROL	Privilege for controlling all the privileges
CREATE SESSION	Privilege for connecting to the database
CREATE PROFILE	Privilege for creating profiles in the database
ALTER PROFILE	Privilege for altering any profile in the database
DROP PROFILE	Privilege for dropping any profile in the database
CREATE USER	Privilege for creating users in the database
ALTER USER	Privilege for altering any user in the database
DROP USER	Privilege for dropping any user in the database

⟨database action⟩	Description
CREATE ROLE	Privilege for creating roles in the database
ALTER ROLE	Privilege for altering any role in the database
DROP ROLE	Privilege for dropping any role in the database
CREATE TABLESPACE	Privilege for creating tablespaces in the database
ALTER TABLESPACE	Privilege for altering any tablespace in the database
DROP TABLESPACE	Privilege for dropping any tablespace in the database
USAGE TABLESPACE	Privilege for using any tablespace in the database
CREATE SCHEMA	Privilege for creating schemas in the database
ALTER SCHEMA	Privilege for altering any schema in the database
DROP SCHEMA	Privilege for dropping any schema in the database
CREATE PUBLIC SYNONYM	Privilege for creating public synonyms in the database
DROP PUBLIC SYNONYM	Privilege for dropping any public synonym in the database
CREATE ANY TABLE	Privilege for creating tables in any schema of the database
ALTER ANY TABLE	Privilege for altering any table in the database
DROP ANY TABLE	Privilege for dropping any table in the database
SELECT ANY TABLE	Privilege for querying rows of any table in the database
INSERT ANY TABLE	Privilege for creating rows of any table in the database
DELETE ANY TABLE	Privilege for deleting rows of any table in the database
UPDATE ANY TABLE	Privilege for updating rows of any table in the database
LOCK ANY TABLE	Privilege for locking any table in the database
CREATE ANY VIEW	Privilege for creating views in any schema of the database
DROP ANY VIEW	Privilege for dropping any view in the database
CREATE ANY SEQUENCE	Privilege for creating sequences in any schema of the database
ALTER ANY SEQUENCE	Privilege for altering any sequence of the database
DROP ANY SEQUENCE	Privilege for dropping any sequence of the database
USAGE ANY SEQUENCE	Privilege for using any sequence of the database
CREATE ANY INDEX	Privilege for creating indexes in any schema of the database
ALTER ANY INDEX	Privilege for altering any index in the database
DROP ANY INDEX	Privilege for dropping any index in the database
CREATE ANY SYNONYM	Privilege for creating synonyms in the database
DROP ANY SYNONYM	Privilege for dropping any synonym in the database
CREATE ANY PROCEDURE	Privilege for creating any procedure/function in any schema of the database
ALTER ANY PROCEDURE	Privilege for altering any procedure/function in the database
DROP ANY PROCEDURE	Privilege for dropping any procedure/function in the database
EXECUTE ANY PROCEDURE	Privilege for executing any procedure/function in the database

## ⟨tablespace privilege⟩

It is the privilege for the tablespace objects.

The tablespace action which can be defined with the tablespace privilege is as follows.

- ALL [ PRIVILEGES ] ON TABLESPACE tablespace\_name
  - All privileges for the tablespace which the grantor (the user who performs the statement) owns by using WITH GRANT OPTION.

**Table 16-50** Tablespace privilege

⟨tablespace action⟩	Description
CREATE OBJECT	Privilege for creating objects in the tablespace

## ⟨schema privilege⟩

It is the privilege for the schema objects.

- Whether to omit [ON SCHEMA schema\_name]
  - If multiple ⟨grantee⟩ exist, [ON SCHEMA schema\_name] statement can not be omitted.
  - If ALL [PRIVILEGES] is used, [ON SCHEMA schema\_name] statement can not be omitted.
  - If [ON SCHEMA schema\_name] statement is omitted, ⟨grantee⟩ can use only one user\_identifier, and the privilege on the first schema in the schema search path of ⟨grantee⟩ is granted.

The schema action which can be defined with the schema privilege is as follows.

- ALL [ PRIVILEGES ] ON SCHEMA schema\_name
  - All privileges for the schema which the grantor (the user who performs the statement) owns by using WITH GRANT OPTION

**Table 16-51** Schema privilege

⟨schema action⟩	Description
CONTROL SCHEMA	All privileges for that schema
CREATE TABLE	Privilege for creating tables in the schema
ALTER TABLE	Privilege for altering any table in the schema
DROP TABLE	Privilege for dropping any table in the schema
SELECT TABLE	Privilege for querying rows of any table in the schema
INSERT TABLE	Privilege for creating rows of any table in the schema
DELETE TABLE	Privilege for deleting rows of any table in the schema
UPDATE TABLE	Privilege for updating rows of any table in the schema
LOCK TABLE	Privilege for locking any table of the schema
CREATE VIEW	Privilege for creating views in the schema

⟨schema action⟩	Description
DROP VIEW	Privilege for dropping any view of the schema
CREATE SEQUENCE	Privilege for creating sequences in the schema
ALTER SEQUENCE	Privilege for altering any sequence of the schema
DROP SEQUENCE	Privilege for dropping any sequence of the schema
USAGE SEQUENCE	Privilege for using any sequence of the schema
CREATE INDEX	Privilege for creating indexes in the schema
ALTER INDEX	Privilege for altering any index in the schema
DROP INDEX	Privilege for dropping any index in the schema
ADD CONSTRAINT	Privilege for creating constraints in the schema
CREATE SYNONYM	Privilege for creating synonyms in the schema
DROP SYNONYM	Privilege for dropping any synonym of the schema
CREATE PROCEDURE	Privilege for creating any procedure/function in the schema
ALTER PROCEDURE	Privilege for altering any procedure/function in the schema
DROP PROCEDURE	Privilege for dropping any procedure/function in the schema
EXECUTE PROCEDURE	Privilege for executing any procedure/function in the schema

## ⟨table privilege⟩

It is the privilege for the table object or the view object.

[TABLE] statement can be omitted.

The table action which can be defined with the table privilege is as follows.

- ALL [ PRIVILEGES ] ON [TABLE] table\_name
  - All privileges for the table which the grantor (the user who performs the statement) owns by using WITH GRANT OPTION

**Table 16-52** Table privilege

⟨table action⟩	Description
CONTROL TABLE	All privileges for that table
SELECT	Privilege for querying rows of the table
INSERT	Privilege for creating rows into the table
UPDATE	Privilege for updating rows in the table
DELETE	Privilege for deleting rows from the table
REFERENCES	Privilege for creating referential constraints which refers to the table
LOCK	Privilege for locking the table
INDEX	Privilege for creating indexes in the table
ALTER	Privilege for altering the table

For SELECT, INSERT, UPDATE, REFERENCES, additional privileges are granted to all columns of the table.

The column action which can be defined with the table privilege is as follows. However, the column action is applicable only to the base table.

**Table 16-53** Column privilege

⟨column action⟩	Description
SELECT (columns)	Privilege for querying that columns
INSERT (columns)	Privilege for creating rows including that columns
UPDATE (columns)	Privilege for updating that columns
REFERENCES (columns)	Privilege for creating referential constraints which refers to that columns

## ⟨sequence privilege⟩

It is the privilege for the sequence object.

The sequence action which can be defined with the sequence privilege is as follows.

- ALL [ PRIVILEGES ] ON SEQUENCE sequence\_name
  - All privileges for the sequence which the grantor (the user who performs the statement) owns by using WITH GRANT OPTION.

**Table 16-54** Sequence privilege

⟨sequence action⟩	Description
USAGE	Privilege for using the sequence

## ⟨procedure privilege⟩

It is the privilege for the procedure/ function object.

The action which can be defined with the procedure privilege is as follows.

- ALL [ PRIVILEGES ] ON PROCEDURE procedure\_name
  - All privileges for the procedure/ function which the grantor (the user who performs the statement) owns by using WITH GRANT OPTION

**Table 16-55** Procedure privilege

⟨procedure action⟩	Description
EXECUTE	Privilege for executing the procedure/function

## Description

Data Definition Language (DDL) such as GRANT privilege can be rolled back if it is before when the transaction is committed.

The owner who created SQL schema object, such as table, sequence, has certain privileges without being granted any separate privilege for the object.

For more information, refer to the following CREATE statements.

- CREATE TABLE
- CREATE VIEW
- CREATE SEQUENCE
- ALTER TABLE name ADD COLUMN
- CREATE FUNCTION
- CREATE PROCEDURE

The owner who created non-schema object such as schema, tablespace, does not automatically have any privilege for the object. Therefore, the privilege should be separately granted.

For more information, refer to the following CREATE statements.

- CREATE SCHEMA
- CREATE TABLESPACE
- CREATE USER

## Examples

The following is an example of granting SELECT ON TABLE t1 privilege to the user u1.

```
gSQL> GRANT SELECT ON t1 TO u1;
Grant succeeded.
```

The following is an example of granting SELECT ON TABLE t1 privilege to the PUBLIC account (all users).

```
gSQL> GRANT SELECT ON t1 TO PUBLIC;
Grant succeeded.
```

The following is an example that the user u1 grants the privilege to the other user by using WITH GRANT OPTION.

```
gSQL> GRANT SELECT ON t1 TO u1 WITH GRANT OPTION;
Grant succeeded.
```

The following is the example that the user executing the statement grants all privileges on the TABLE t1 to user u1 by using WITH GRANT OPTION.

```
gSQL> GRANT ALL PRIVILEGES ON TABLE t1 TO u1;
Grant succeeded.
```

The following is an example of granting CREATE SESSION ON DATABASE privilege which is a privilege for connecting to the database.

```
gSQL> GRANT CREATE SESSION ON DATABASE TO u1;
Grant succeeded.
```

The following is an example of granting multiple privileges for creating objects such as the table, view, index, sequence, constraint in the SCHEMA s1 to the user u1.

```
gSQL> GRANT CREATE TABLE, CREATE VIEW, CREATE INDEX, CREATE SEQUENCE, ADD CONSTRAINT ON SCHEMA
s1 TO u1;
Grant succeeded.
```

The following is an example of granting the privileges for creating objects in TABLESPACE mem\_data\_tbs to the user u1.

```
gSQL> GRANT CREATE OBJECT ON TABLESPACE mem_data_tbs TO u1;
Grant succeeded.
```

The following is an example of granting the privilege for querying some columns in the TABLE t1 to the user u1.

```
gSQL> GRANT SELECT(id, name) ON TABLE t1 TO u1;
Grant succeeded.
```

The following is an example of granting the privilege to the user u1 for using NEXTVAL(), CURRVAL() functions in the SEQUENCE seq1.

```
gSQL> GRANT USAGE ON SEQUENCE seq1 TO u1;
Grant succeeded.
```

## Compatibility

The SQL standard does not define the following privileges.

- <database privilege>
- <tablespace privilege>
- <schema privilege>

**Table 16-56** SQL standard compatibility

Feature ID	Description	Compatibility
S023	Basic structured types	X
S024	Enhanced structured types	X
S081	Subtables	X
T211	Basic trigger capability	X
T281	SELECT privilege with column granularity	O
T332	Extended Roles	X
F731	INSERT column privileges	O

## For More Information

Refer to the followings.

- REVOKE privileges FROM
- CREATE USER
- DROP USER
- ALTER USER

## 16.114 INSERT INTO

### Function

It creates new rows in a table.

### Syntax

```

<insert statement> ::=
 INSERT INTO table_name [(column_name [, ...])]
 <insert source>
 ;
<insert source> ::=
 <values clause>
 | <from subquery>
 | <from default>
<values clause> ::=
 VALUES { ({ <value expression> | DEFAULT } [, ...]) } [, ...]
<from subquery> ::=
 <query expression>
<from default> ::=
 DEFAULT VALUES

```

### Invocation and Access Rules

A user should satisfy the following conditions to perform <Insert statement>.

- One of the following privileges is required to perform the INSERT statement.
  - INSERT(columns) ON TABLE for all columns which are targets of insert
  - (INSERT or CONTROL TABLE) ON TABLE for the table
  - (INSERT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - INSERT ANY TABLE ON DATABASE
- One of the following privileges is required for all tables used in <from subquery>.
  - SELECT(columns) ON TABLE for all columns of tables which were used in the statement
  - (SELECT or CONTROL TABLE) ON TABLE for the table

- (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- SELECT ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a target table in which the row is to be created.

It can define schema to which the table belongs such as schema\_name.table\_name and if schema\_name is omitted, the default schema name of the user performing the statement is used.

### [ ( column\_name [, ...] ) ]

It is the column name of a table.

The column list can be omitted.

The number of columns and the number of <insert source> values should be same, and DEFAULT value is assigned to the omitted column.

### <values clause>

It is the list of values to be assigned to the corresponding columns.

- <value expression>
  - It is the value or expression to be assigned to the corresponding column.
- DEFAULT
  - The value of corresponding column will use the default value which were defined through **CREATE TABLE**.
  - If it is not defined, NULL will be assigned.

Multiple rows can be created as follows.

```
INSERT INTO table_name VALUES (1, 'A'), (2, 'B'), (3, 'C')
```

### <from subquery>

It is the query to create rows.

For more information, refer to **query expression** clause of **SELECT** statement.

## DEFAULT VALUES

It fills every column with default value.

DEFAULT VALUES clause means as same as the following.

```
VALUES (DEFAULT, DEFAULT, ..., DEFAULT)
```

## Description

### Differences among INSERT-related Statements

- **INSERT INTO**
  - It creates one or multiple rows into the table.
  - e.g. INSERT INTO t1 SELECT \* FROM t1;
- **INSERT INTO name RETURNING**
  - It creates one or multiple rows into the table, then the created rows can be retrieved in the same way as SELECT statement(API such as SQLFetch()).
  - e.g. INSERT INTO t1 SELECT \* FROM t1 RETURNING c1;
- **INSERT INTO name RETURNING .. INTO**
  - It creates one or less row, and if a single row is created, it obtains the value to the host variable of RETURNING INTO clause.
  - e.g. INSERT INTO t1 DEFAULT VALUES RETURNING c1 INTO :v1;

## Examples

The following is an example of creating a single row by using INSERT statement.

```
gSQL> INSERT INTO region VALUES (0, 'AFRICA');
1 row created.
```

The following is an example of using the DEFAULT value or identity value of the column in INSERT statement.

```
gSQL> CREATE TABLE region
(
 r_regionkey BIGINT GENERATED BY DEFAULT AS IDENTITY
, r_name CHAR(25) DEFAULT 'N/A'
);
```

```
Table created.
gSQL> COMMIT;
Commit complete.
```

- DEFAULT is inserted into all columns.

```
gSQL> INSERT INTO region DEFAULT VALUES;
1 row created.
```

- DEFAULT is inserted into all columns.

```
gSQL> INSERT INTO region VALUES (DEFAULT, DEFAULT);
1 row created.
```

- If a column is omitted, the DEFAULT value of r\_name column is used.

```
gSQL> INSERT INTO region(r_regionkey) VALUES (-100);
1 row created.
```

- If a column is omitted, the identity value of r\_regionkey column is used.

```
gSQL> INSERT INTO region(r_name) VALUES ('ASIA');
1 row created.
```

```
gSQL> SELECT * FROM region;
```

```
R_REGIONKEY R_NAME

 1 N/A
 2 N/A
 -100 N/A
 3 ASIA
4 rows selected.
```

The following is an example of creating multiple rows by describing them in VALUES clause.

```
gSQL> INSERT INTO region
 VALUES (1, 'AFRICA'),
 (2, 'ASIA'),
 (3, 'EUROPE');
3 rows created.
```

The following is an example of creating multiple rows by using a subquery.

```
gSQL> INSERT INTO region SELECT r_regionkey, r_name FROM tmp_region WHERE r_regionkey < 3;
3 rows created.
```

# Compatibility

Table 16-57 SQL standard compatibility

Feature ID	Description	Compatibility
F781	Self-referencing operations	X
F222	INSERT statement: DEFAULT VALUES clause	O
S204	Enhanced structured types	X
S043	Enhanced reference types	X
T111	Updatable joins, unions, and columns	X

# For More Information

Refer to the followings.

- [SELECT](#)
- [INSERT INTO name RETURNING](#)
- [INSERT INTO name RETURNING .. INTO](#)

## 16.115 INSERT INTO name RETURNING

### Function

It creates new rows in the table, and retrieves them.

### Syntax

```

<insert statement> ::=
 INSERT INTO table_name [(column_name [, ...])]
 <insert source>
 <returning clause>
 ;
<insert source> ::=
 <values clause>
 | <from subquery>
 | <from default>
<values clause> ::=
 VALUES { ({ <value expression> | DEFAULT } [, ...]) } [, ...]
<from subquery> ::=
 <query expression>
<from default> ::=
 DEFAULT VALUES
<returning clause> ::=
 [RETURN | RETURNING] { * | { <value expression> [[AS] alias_name] } [, ...]

```

### Invocation and Access Rules

A user should satisfy the following conditions to perform <insert returning query statement>.

- One of the following privileges is required to perform INSERT statement.
  - INSERT(columns) ON TABLE for all columns which are targets of insert
  - (INSERT or CONTROL TABLE) ON TABLE for the table
  - (INSERT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - INSERT ANY TABLE ON DATABASE

- One of the following privileges is required for all tables used in <from subquery>.
  - SELECT(columns) ON TABLE for all columns of tables which were used in the statement
  - (SELECT or CONTROL TABLE) ON TABLE for the table
  - (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - SELECT ANY TABLE ON DATABASE
- One of the following privileges is required for all columns used in RETURNING clause.
  - SELECT(columns) ON TABLE for all columns which were used in RETURNING clause.
  - (SELECT or CONTROL TABLE) ON TABLE for the table
  - (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - SELECT ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a target table in which the row is to be created.

### [ ( column\_name [, ...] ) ]

It is the column name of a table.

For more information, refer to **INSERT INTO**.

### <values clause>

It is the list of values to be assigned to the corresponding columns.

For more information, refer to **INSERT INTO**.

### <from subquery>

It is the query to create rows.

For more information, refer to **INSERT INTO**.

## DEFAULT VALUES

It fills every column with default value.

For more information, refer to **INSERT INTO**.

## ⟨returning clause⟩

It returns the inserted rows.

- It sets the inserted rows as a result set, and specifies the rows to be retrieved.
  - RETURNING clause returns the rows which were inserted by INSERT statement, and which is a result set.
  - ⟨value expression⟩
    - It is as same as ⟨select list⟩ in SELECT statement, but it can not use the aggregation.
  - [[AS] alias\_name]
    - It can name a value expression by using AS clause.

The keywords RETURNING and RETURN have the same meaning.

## Description

For more information, refer to [Differences among INSERT-related Statements](#).

## Examples

The following is an example of retrieving the column values created by using INSERT statement.

```
gSQL> CREATE TABLE region
(
 r_regionkey BIGINT GENERATED BY DEFAULT AS IDENTITY
 , r_name CHAR(25) DEFAULT 'N/A'
);
Table created.
gSQL> COMMIT;
Commit complete.
```

- The following is an example of returning the created DEFAULT value (RETURNING).

```
gSQL> INSERT INTO region VALUES (DEFAULT, DEFAULT) RETURNING r_regionkey, r_name;
R_REGIONKEY R_NAME

1 N/A
1 row created.
```

- The following is an example of returning the omitted column value (RETURNING).

```
gSQL> INSERT INTO region(r_name) VALUES ('ASIA') RETURNING r_regionkey;
R_REGIONKEY

 2
1 row created.
```

The following is an example of retrieving the rows created by using the subquery.

```
gSQL> INSERT INTO region
 SELECT r_regionkey, r_name FROM tmp_region WHERE r_regionkey < 3
 RETURNING r_regionkey, r_name;
R_REGIONKEY R_NAME

 0 AFRICA
 1 AMERICA
 2 ASIA
3 rows created.
```

## Compatibility

The SQL standard does not define <insert returning query statement>.

## For More Information

Refer to the followings.

- **INSERT INTO**
- **INSERT INTO name RETURNING .. INTO**

## 16.116 INSERT INTO name RETURNING .. INTO

### Function

It creates a single row in a table, and obtains the value of the created row as a host variable.

### Syntax

```

<insert statement> ::=
 INSERT INTO table_name [(column_name [, ...])]
 <insert source>
 <returning into clause>
 ;
<insert source> ::=
 <values clause>
 | <from subquery>
 | <from default>
<values clause> ::=
 VALUES { ({ <value expression> | DEFAULT } [, ...]) } [, ...]
<from subquery> ::=
 <query expression>
<from default> ::=
 DEFAULT VALUES
<returning into clause> ::=
 [RETURN | RETURNING] { * | { <value expression> [[AS] alias_name] } [, ...] INTO
 variable_name [, ...]

```

### Invocation and Access Rules

A user should satisfy the following conditions to perform <insert returning into statement>.

- One of the following privileges is required to perform INSERT statement.
  - INSERT(columns) ON TABLE for all columns which are targets of insert.
  - (INSERT or CONTROL TABLE) ON TABLE for the table
  - (INSERT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs

- INSERT ANY TABLE ON DATABASE
- One of the following privileges is required for all tables used in <from subquery>.
  - SELECT(columns) ON TABLE for all columns of tables which were used in the statement
  - (SELECT or CONTROL TABLE) ON TABLE for the table
  - (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - SELECT ANY TABLE ON DATABASE
- One of the following privileges is required for all columns used in RETURNING clause.
  - SELECT(columns) ON TABLE for all columns which were used in RETURNING clause
  - (SELECT or CONTROL TABLE) ON TABLE for the table
  - (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
  - SELECT ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### table\_name

It is the name of a target table in which the row is to be created.

### [ ( column\_name [, ...] ) ]

It is the column name of a table.

For more information, refer to **INSERT INTO**.

### <values clause>

It is the list of values to be assigned to the corresponding columns.

For more information, refer to **INSERT INTO**.

### <from subquery>

It is the query to create rows.

For more information, refer to **INSERT INTO**.

## DEFAULT VALUES

It fills every column with default value.

For more information, refer to **INSERT INTO**.

## ⟨returning clause⟩

It returns the inserted rows.

For more information, refer to ⟨returning clause⟩ in **INSERT INTO name RETURNING** statement.

## INTO variable\_name [, ...]

The number of variables in INTO clause should be equal to the number of the expressions in RETURNING clause.

The row to be created should be one or less. If two or more rows are created, an error occurs.

## Description

For more information, refer to **Differences among INSERT-related Statements**.

## Example

The following is an example of obtaining the value of the created row as a host variable.

```
gSQL> CREATE TABLE region
(
 r_regionkey BIGINT GENERATED BY DEFAULT AS IDENTITY
 , r_name CHAR(25) DEFAULT 'N/A'
);
Table created.
gSQL> COMMIT;
Commit complete.
```

- The host variables are declared.

```
\VAR v_key BIGINT
\VAR v_name VARCHAR(128)
```

- The created DEFAULT values are obtained as the host variables.

```
gSQL> INSERT INTO region
 VALUES (DEFAULT, DEFAULT)
 RETURNING r_regionkey, r_name
 INTO :v_key, :v_name;
V_KEY V_NAME

 1 N/A
1 row created.
```

- The omitted column value is obtained as the host variable.

```
gSQL> INSERT INTO region(r_name)
 VALUES ('ASIA')
 RETURNING r_regionkey
 INTO :v_key;
V_KEY

 2
1 row created.
```

## Compatibility

The SQL standard does not define <insert returning into statement>.

## For More Information

Refer to the followings.

- **INSERT INTO**
- **INSERT INTO name RETURNING**

## 16.117 LOCK TABLE

### Function

It locks one or more tables.

### Syntax

```
<lock table statement> ::=
 LOCK TABLE lock target [, ...]
 IN <lock mode> MODE [<wait clause>]
 ;
<lock mode> ::=
 SHARE
 | EXCLUSIVE
 | ROW SHARE
 | ROW EXCLUSIVE
 | SHARE ROW EXCLUSIVE
<wait clause> ::=
 NOWAIT
 | WAIT time
```

### Invocation and Access Rules

One of the following privileges is required to perform <lock table statement>.

- (LOCK or CONTROL TABLE) ON TABLE for the table
- (LOCK TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- LOCK ANY TABLE ON DATABASE

## Syntax Rules and Parameters

### ⟨lock target⟩

It specifies the target table to be locked.

### ⟨lock mode⟩

It specifies the LOCK mode.

- SHARE
  - It allows concurrent queries for the locked table, but prohibits updating the table.
- EXCLUSIVE
  - It allows exclusive queries for the locked table.
- ROW SHARE
  - It allows concurrent access to the locked table, but prohibits locking the entire table for exclusive access.
- ROW EXCLUSIVE
  - It allows concurrent access to the locked table, but prohibits locking the entire table for exclusive access.
  - If ROW EXCLUSIVE mode is set, it prohibits locking in SHARE mode.
  - ROW EXCLUSIVE mode is automatically obtained when updating, inserting, deleting.
- SHARE ROW EXCLUSIVE
  - It is used to search for the entire table or to make other users search for the rows in the table.
  - It prohibits other users from accessing the locked tables in SHARE mode or accessing the rows being updated.

### ⟨wait clause⟩

It specifies the waiting time to acquire the lock.

- NOWAIT
  - It immediately acquires the lock control for the object.
  - If the lock is already set by another user, the control is immediately handed over.
    - In this case, the database generates a message.
- WAIT time
  - It sets the waiting time for acquiring the lock.
  - It is specified in seconds, and its value is from 0 to 1,000,000,000.
- If it is not specified, it waits indefinitely until acquiring the lock.

## Description

If the transaction is committed or rolled back all acquired locks are automatically released. When using ROLLBACK TO SAVEPOINT statement, all locks acquired since that savepoint are released.

## Examples

The following is an example of locking the TABLE t1 to prevent any updating operation by another transaction.

```
gSQL> LOCK TABLE t1 IN EXCLUSIVE MODE;
Table locked.
```

The following is an example of performing LOCK statement for multiple tables.

```
gSQL> LOCK TABLE t1, t2 IN EXCLUSIVE MODE;
Table locked.
```

The following is an example of acquiring SHARE ROW EXCLUSIVE lock for the TABLE t1.

```
gSQL> LOCK TABLE t1 IN SHARE ROW EXCLUSIVE MODE;
Table locked.
```

The following statement is performed only when the lock can be immediately acquired for the table. If the lock can not be acquired, an error occurs.

```
gSQL> LOCK TABLE t1 IN EXCLUSIVE MODE NOWAIT;
Table locked.
```

The following is an example of waiting 10 seconds to acquire the lock.

```
gSQL> LOCK TABLE t1 IN EXCLUSIVE MODE WAIT 10;
Table locked.
```

## Compatibility

The SQL standard does not cover the concepts of the lock table.

## For More Information

Refer to the followings.

- COMMIT
- ROLLBACK

## 16.118 NOAUDIT POLICY

### Function

It deactivates the audit policy.

### Syntax

```
<noaudit policy statement> ::=
 NOAUDIT POLICY policy_name
 [<specified_user_option>]
 ;
<specified_user_option> ::=
 BY user_name [, ...]
```

### Invocation and Access Rules

AUDIT SYSTEM ON DATABASE privilege is required to perform <noaudit policy statement>.

### Syntax Rules and Parameters

#### policy\_name

It is the name of the audit policy object to be deactivated.

The deactivated audit policy does not effect on the existing session, and it effects only on the newly created session.

#### <specified\_user\_option>

It specifies the user to be excluded from the auditing target.

Unlike AUDIT POLICY statement, NOAUDIT POLICY does not have EXCEPT option.

If AUDIT POLICY name BY clause is used, NOAUDIT POLICY name BY statement should be used to deactivate it.

If AUDIT POLICY name EXCEPT clause is used, NOAUDIT POLICY name statement without BY clause should be used to deactivate it.

NOAUDIT POLICY statement should be used as follows according to the usage of AUDIT POLICY statement to deactivate it.

**Table 16-58** Activating/ deactivating audit policy

Type	AUDIT POLICY statement	NOAUDIT POLICY statement
All users	AUDIT POLICY p1	NOAUDIT POLICY p1
Using BY	AUDIT POLICY p1 BY u1	NOAUDIT POLICY p1 BY u1
Using EXCEPT	AUDIT POLICY p1 EXCEPT u1	NOAUDIT POLICY p1

When deactivating all activated users, the audit policy object is completely deactivated.

## Description

The activation information of an audit policy object can be queried as follows.

```
SELECT policy_name
 , enabled_opt
 , user_name
FROM audit_policy_enabled
WHERE policy_name = 'P1';
```

NOAUDIT POLICY statement deletes each created information about activation according to the AUDIT POLICY specifying method.

If the information activated through the query above does not exist, then the audit policy is completely deactivated.

If all users are activated as follows, NOAUDIT POLICY BY clause does not affect it.

```
AUDIT POLICY p1;
```

- It does not have any effect.

```
NOAUDIT POLICY p1 BY u1;
```

- It should be deactivated as follows.

```
NOAUDIT POLICY p1;
```

If one or more users are separately activated, use NOAUDIT POLICY statement according to the AUDIT POLICY specifying method.

## When Activated by Using BY

If the audit policy is activated as follows,

```
AUDIT POLICY p1 WHENEVER NOT SUCCESSFUL;
AUDIT POLICY p1 BY u1;
AUDIT POLICY p1 BY u2;
```

the information about activation is as follows.

```
SELECT policy_name
 , enabled_opt
 , user_name
 , when_success
 , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'P1';
```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
P1	BY	ALL USERS	NO	YES
P1	BY	U1	YES	YES
P1	BY	U2	YES	YES

The following is an example of performing NOAUDIT statement and the information about activation.

```
NOAUDIT POLICY p1;
SELECT policy_name
 , enabled_opt
 , user_name
 , when_success
 , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'P1';
```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
P1	BY	U1	YES	YES
P1	BY	U2	YES	YES

The auditing for a failure for ALL USERS is deactivated, but the auditing for user u1, u2 is still activated.

If NOAUDIT POLICY statement is additionally used through BY option as follows, then audit policy p1 is completely deactivated.

```
NOAUDIT POLICY p1 BY u1, u2;
SELECT policy_name
 , enabled_opt
 , user_name
 , when_success
 , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'P1';
no rows selected.
```

## When Activated by Using EXCEPT

If the audit policy is activated as follows,

```
AUDIT POLICY p1 EXCEPT u1, sys;
```

the information about activation is as follows.

```
SELECT policy_name
 , enabled_opt
 , user_name
 , when_success
 , when_failure
FROM audit_policy_enabled
WHERE policy_name = 'P1';
```

POLICY_NAME	ENABLED_OPT	USER_NAME	WHEN_SUCCESS	WHEN_FAILURE
P1	EXCEPT	U1	YES	YES
P1	EXCEPT	SYS	YES	YES

Unlike AUDIT POLICY statement, NOAUDIT POLICY does not have EXCEPT option, so execute the statement without an option as follows.

```
NOAUDIT POLICY p1;
SELECT policy_name
 , enabled_opt
 , user_name
```

```
, when_success
, when_failure
FROM audit_policy_enabled
WHERE policy_name = 'P1';
no rows selected.
```

In other words, if the audit policy is activated by using EXCEPT option, each user can not be deactivated again by using NOAUDIT POLICY statement.

## Examples

The following is an example of deactivating all users.

```
NOAUDIT POLICY table_pol;
```

The following is an example of deactivating a specific activated user by using BY.

```
NOAUDIT POLICY table_pol BY u1;
```

## Compatibility

The SQL standard does not have the audit policy.

## For More Information

Refer to the followings.

- Managing audit policy object
  - **CREATE AUDIT POLICY**
  - **DROP AUDIT POLICY**
  - **ALTER AUDIT POLICY**
- Activating/ deactivating audit policy
  - **AUDIT POLICY**
  - **NOAUDIT POLICY**
- Viewing audit trail: **AUDIT\_TRAIL**

- Clearing audit trail: **ALTER DATABASE CLEAR AUDIT TRAIL**

## 16.119 OPEN cursor\_name

### Function

It opens a cursor.

### Syntax

```
<open statement> ::=
 OPEN cursor_name [<parameter using clause>]
 ;
<parameter using clause> ::=
 <using parameter arguments>
<using parameter arguments> ::=
 USING variable_name [, ...]
```

### Invocation and Access Rules

If cursor\_name is a dynamic cursor which is declared by using **PREPARE statement\_name** and **DECLARE cursor\_name**, it can be used in an embedded SQL.

It is same with the privilege of **<cursor query>** included in **DECLARE cursor\_name** which declared cursor\_name.

### Syntax Rules and Parameters

#### cursor\_name

It should be a cursor declared with **DECLARE cursor\_name** within the session.

## ⟨parameter using clause⟩

It can be used in an embedded SQL.

When ⟨parameter using clause⟩ is used, `cursor_name` should be a dynamic cursor declared by using **PREPARE statement\_name** and **DECLARE cursor\_name**.

## ⟨using parameter arguments⟩

When ⟨using parameter arguments⟩ is used, the number of `variable_name` should be equal to the number of the parameter included in a query which is referenced by **PREPARE statement\_name**.

The listed `variable_name` corresponds to the dynamic parameter in an order of its description.

```
{
 ...
 EXEC SQL PREPARE stmt1 FROM 'SELECT c1, c2 FROM t1 WHERE c1 IN (?, ?, ?)';
 EXEC SQL DECLARE cur1 CURSOR FOR stmt1;
 EXEC SQL OPEN cur1 USING :sValue1, :sValue2, :sValue3;
 ...
 EXEC SQL WHENEVER NOT FOUND DO break;
 for(;;)
 {
 EXEC SQL FETCH cur1 INTO :sC1, :sC2;
 }
 EXEC SQL WHENEVER NOT FOUND CONTINUE;
 ...
 EXEC SQL CLOSE cur1;
 ...
}
```

## Description

The cursor is a distinguishable object in a session. The cursor being used in the current session has nothing to do with the cursor being used in another session.

To use `OPEN cursor_name` statement, it should be a cursor declared with **DECLARE cursor\_name**, and it should be a closed cursor.

## Examples

The following is an example of declaring a cursor and using OPEN cursor statement in an interactive SQL (gsql).

```
gsQL> DECLARE cur1 CURSOR FOR SELECT id, data FROM t1;
```

```
Cursor declared.
```

```
gsQL> OPEN cur1;
```

```
Cursor is open.
```

```
gsQL> \var v_id INTEGER
```

```
gsQL> \var v_data VARCHAR(128)
```

```
gsQL> FETCH cur1 INTO :v_id, :v_data;
```

```
V_ID V_DATA
```

```

```

```
1 data_1
```

```
1 row fetched.
```

```
gsQL> FETCH cur1 INTO :v_id, :v_data;
```

```
V_ID V_DATA
```

```

```

```
2 data_2
```

```
1 row fetched.
```

```
gsQL> FETCH cur1 INTO :v_id, :v_data;
```

```
V_ID V_DATA
```

```

```

```
3 data_3
```

```
1 row fetched.
```

```
gsQL> FETCH cur1 INTO :v_id, :v_data;
```

```
V_ID V_DATA
```

```

```

```
4 data_4
```

```
1 row fetched.
```

```
gsQL> FETCH cur1 INTO :v_id, :v_data;
```

```
V_ID V_DATA
```

```

```

```
5 data_5
```

```
1 row fetched.
```

```
gsQL> FETCH cur1 INTO :v_id, :v_data;
```

```
no rows fetched.
```

```
gsQL> CLOSE cur1;
```

```
Cursor closed.
```

# Compatibility

Table 16-59 SQL standard compatibility

Feature ID	Description	Compatibility
B031	Basic Dynamic SQL	O

## For More Information

Refer to the followings.

- DECLARE cursor\_name
- FETCH cursor\_name
- CLOSE cursor\_name
- PREPARE statement\_name

## 16.120 PREPARE statement\_name

### Function

It prepares a dynamic SQL statement for a repeated execution.

### Syntax

```

<prepare statement> ::=
 PREPARE statement_name FROM <SQL statement variable>
 ;
<SQL statement variable> ::=
 variable_name
 | 'sql statement'
 | "sql statement"
 | sql statement

```

### Invocation and Access Rules

It can be used in an embedded SQL.

An appropriate privilege according to the type of a dynamic SQL statement is required.

### Syntax Rules and Parameters

#### statement\_name

It is the name of the statement to be prepared.

The length of the statement name should be shorter than 128 bytes.

**EXECUTE statement\_name** and **DECLARE cursor\_name**, which are to be performed later, refers to the statement\_name.

If the same statement\_name exists, the previously prepared dynamic SQL is dropped.

```
{
 ...
 EXEC SQL PREPARE stmt1 FROM 'DELETE FROM t1';
 ...
 EXEC SQL PREPARE stmt1 FROM 'UPDATE t1 SET c1 = c1 + 10';
 ...
}
```

## ⟨SQL statement variable⟩

⟨SQL statement variable⟩ can be used as following four types.

- `variable_name`: It is a variable in which an SQL statement is stored.
- `'sql statement'`: It is an SQL statement which is enclosed with single quote (').
- `"sql statement"`: It is an SQL statement which is enclosed with double quotes (").
- `sql statement`: It is an SQL statement without quote.

The single quote (') is used twice as follows to represent string data within single-quoted string.

```
{
 ...
 PREPARE stmt_name FROM 'INSERT INTO t1 VALUES (''literal data'')';
 ...
}
```

The dynamic SQL statement referenced by ⟨SQL statement variable⟩ can use a host variable (:var) or parameter marker (?).

However, if the unquoted SQL statement is used, the parameter marker (?) can not be used.

Depending on the characteristics of the referenced dynamic SQL statements, the variable can be either input or output dynamic parameter.

The dynamic parameter described in the dynamic SQL statement does not have a meaning for the variable name, and it is identified by the specified order regardless of its type.

- Example 1

```
{
 ...
 int sValue1;
 int sValue2;
 ...
 EXEC SQL PREPARE stmt1 FROM 'DELETE FROM t1 WHERE c1 BETWEEN ? AND ?';
```

```

EXEC SQL EXECUTE stmt1 USING :sValue1, :sValue2;
...
}

```

- All parameter markers are the input dynamic parameters.
- The order to identify
  - No. 1 - BETWEEN ?
    - Input dynamic parameter
    - It uses the value of :sValue1.
  - No. 2 - AND ?
    - Input dynamic parameter
    - It uses the value of :sValue2.
- Example 2

```

{
...
int sValue1;
int sValue2;
...
EXEC SQL PREPARE stmt1 FROM 'SELECT SUM(c2) INTO :v1 FROM t1 WHERE c1 > :v2';
EXEC SQL EXECUTE stmt1 USING :sValue1, :sValue2;
...
}

```

- The input dynamic parameter and the output dynamic parameter exist.
- The order to identify
  - No. 1 - :v1
    - Output dynamic parameter
    - It stores the value in :sValue1.
  - No. 2 - :v2
    - Input dynamic parameter
    - It uses the value of :sValue2.

## variable\_name

The type corresponding to variable\_name should be a character string.  
 The dynamic SQL statement defined in variable\_name should be valid.

## sql statement

The dynamic SQL statement defined in the sql statement should be valid.

## Description

PREPARE statement\_name FROM sql\_string statement analyzes SQL statement to use EXECUTE or cursor statement. Statement\_name is an identifier which informs the precompiler the statement in an embedded SQL source code. A separate type or declaration is not required because statement\_name is not a host variable.

For more information, refer to **Embedded Dynamic SQL**.

## Example

The following is an example of using PREPARE statement\_name in an embedded SQL source code.

```
{
 ...
 sprintf(sUpdateSql, "UPDATE EMP SET sal = sal * :v1 WHERE JOB = 'SALES'");
 EXEC SQL PREPARE UPDATE_STMT FROM :sUpdateSql;
 if(sqlca.sqlcode != 0)
 {
 goto fail_exit;
 }
 sRatio = 1.1;
 EXEC SQL EXECUTE UPDATE_STMT USING :sRatio;
 if(sqlca.sqlcode != 0)
 {
 goto fail_exit;
 }
 ...
}
```

The full source code in which PREPARE statement\_name was used can be viewed in **Dynamic Embedded SQL Example Program**.

## Compatibility

Table 16-60 SQL standard compatibility

Feature ID	Description	Compatibility
B031	Basic Dynamic SQL	O
B034	Dynamic specification of cursor attributes	X

## For More Information

Refer to the followings.

- EXECUTE statement\_name
- DECLARE cursor\_name
- EXECUTE IMMEDIATE 'sql\_string'
- Embedded Dynamic SQL

## 16.121 RELEASE SAVEPOINT savepoint\_specifier

### Function

It releases a savepoint.

### Syntax

```
<release savepoint statement> ::=
 RELEASE SAVEPOINT savepoint_name
 ;
```

### Syntax Rules and Parameters

#### savepoint\_name

It is a name of the savepoint, and it should exist.

The length of the savepoint name should be shorter than 128 bytes.

### Description

If multiple savepoints are defined and RELEASE SAVEPOINT savepoint\_name statement is performed, all savepoints defined since the savepoint\_name are also released.

### Example

The following is an example of releasing a savepoint.

```
gSQL> RELEASE SAVEPOINT sp2;
Savepoint dropped.
```

## Compatibility

**Table 16-61** SQL standard compatibility

Feature ID	Description	Compatibility
T271	Savepoints	O

## For More Information

Refer to the followings.

- COMMIT
- ROLLBACK
- SAVEPOINT savepoint\_specifier

## 16.122 REVOKE privileges FROM

### Function

It revokes the granted privilege from a user.

### Syntax

```
<revoke privilege statement> ::=
 REVOKE [<revoke option extention>] <privilege>
 FROM <grantee> [, ...]
 [<revoke behavior>]
 ;
<revoke option extention> ::=
 GRANT OPTION FOR
<revoke behavior> ::=
 RESTRICT
 | CASCADE
 | CASCADE CONSTRAINTS
```

### Syntax Rules and Parameters

#### <privilege>

It is a privilege which is to be revoked from the revokee (the user whose privilege is to be revoked).

The revoker (the user who performs the statement) should satisfy one of the following conditions.

- If it is <privilege> which the revoker grants to the revokee.
  - Only the <privilege> which the revoker grants to the revokee is revoked.
- If the revoker owns ACCESS CONTROL ON DATABASE privilege.
  - The <privilege> which other grantors grant to the revokee is revoked.

When using ALL [PRIVILEGES], it succeeds even when the satisfying <privilege> does not exist.

For more information about the types of `<privilege>`, refer to `<privilege>` clause of **GRANT privileges TO** statement.

## `<grantee>`

It is a user whose privilege is to be revoked.

- `user_identifier`
  - It revokes the privilege of that user.
- `PUBLIC`
  - They are authorization objects which mean all users.

## GRANT OPTION FOR

It revokes `WITH GRANT OPTION` included in the privilege.

It also revokes `WITH GRANT OPTION` of the dependent privilege.

The privilege is maintained.

## `<revoke behavior>`

- **Dependent privilege:** It is as same as the `<privilege>` which was granted to the revokee by using `WITH GRANT OPTION` and granted to another user by the revokee.
- `RESTRICT`
  - If the dependent privilege exists, it can not be revoked.
- `CASCADE`
  - The dependent privilege should also be revoked.
- `CASCADE CONSTRAINTS`
  - The dependent privilege should also be revoked.
- If it is omitted, the default value is `CASCADE`.

## Description

Data Definition Language (DDL) such as `REVOKE` privilege can be rolled back if it is before when the transaction is committed.

When performing the following `DROP` statement, all privilege information related to the object is revoked even without performing any separate `REVOKE` statement.

- `DROP` statement related to SQL schema object

- DROP TABLE
  - DROP VIEW
  - DROP SEQUENCE
  - ALTER TABLE name SET UNUSED COLUMN
  - DROP FUNCTION
  - DROP PROCEDURE
- DROP statement related to non-schema object
    - DROP SCHEMA
    - DROP TABLESPACE
    - DROP USER

## Examples

The following is an example of revoking multiple privileges for the table t1.

```
gSQL> REVOKE INSERT, UPDATE, DELETE, LOCK, ALTER, INDEX ON t1 FROM u1;
Revoke succeeded.
```

The following is an example of revoking SELECT ON TABLE t1 privilege granted to the PUBLIC account, which means all users. However, only the privilege for PUBLIC account is revoked, and SELECT ON TABLE t1 privilege which was explicitly granted to a specific user is not revoked.

```
gSQL> REVOKE SELECT ON t1 FROM PUBLIC;
Revoke succeeded.
```

The following is an example that SELECT ON TABLE t1 privilege granted to user u1 is remained, and only REVOKE GRANT OPTION which can grant the privilege to another user is revoked.

```
gSQL> REVOKE GRANT OPTION FOR SELECT ON t1 FROM u1;
Revoke succeeded.
```

The following is an example that an error occurs when the privilege granted to the user u1 is revoked by using RESTRICT option and the user u1 grants it to another user. CASCADE option is used to revoke these dependent privileges as well.

```
gSQL> REVOKE SELECT ON t1 FROM u1 RESTRICT;
ERR-2B000(16235): dependent privilege descriptors still exist
gSQL> REVOKE SELECT ON t1 FROM u1 CASCADE;
Revoke succeeded.
```

# Compatibility

The SQL standard does not define the following privileges.

- <database privilege>
- <tablespace privilege>
- <schema privilege>

<revoke behavior> of the SQL standard has the following differences.

- The default value of the SQL standard is RESTRICT.
- The SQL standard does not cover CASCADE CONSTRAINTS.

**Table 16-62** SQL standard compatibility

Feature ID	Description	Compatibility
T311	Basic roles	X
F034	Extended REVOKE statement	X
S081	Subtables	X

# For More Information

Refer to the followings.

- GRANT privileges TO
- <database privilege>
- <tablespace privilege>
- <schema privilege>
- <table privilege>
- Column privilege
- <sequence privilege>

## 16.123 ROLLBACK

### Function

It rolls back a transaction, or the operation after the savepoint.

### Syntax

```
<rollback statement> ::=
 ROLLBACK [WORK] [<rollback force clause> | <savepoint clause>]
 ;
<rollback force clause> ::=
 FORCE 'xid_string' [COMMENT 'comment_string']
<savepoint clause> ::=
 TO SAVEPOINT savepoint_name
```

### Syntax Rules and Parameters

#### WORK

It is a reserved word which does not affect the operation.

#### <rollback force clause>

It is used to manually rollback the distributed transaction.

- FORCE 'xid\_string'
  - It rolls back the distributed transaction corresponding to 'xid\_string'.
  - 'xid\_string' consists of 'format\_id.transaction\_id.branch\_id'.
- COMMENT 'comment\_string'
  - It specifies the comment on a transaction when rolling back the distributed transaction.

## ⟨savepoint clause⟩

It specifies the rollback scope of the current transaction.

- If it is omitted
  - It undoes all operations of the current transaction.
  - It ends the transaction.
  - It deletes all savepoints.
  - It releases all transaction locks.
- TO SAVEPOINT savepoint\_name
  - It undoes the operations of the current transaction since savepoint\_name.
  - It does not end the transaction.
  - It deletes all savepoints since savepoint\_name.
  - It releases all transaction locks acquired since savepoint\_name.

## Description

ROLLBACK statement undoes the following statements performed in the transaction.

- Data Manipulation Language (DML) statement
  - The statements to update data, such as INSERT, UPDATE and DELETE
- Data Definition Language (DDL) statement
  - The statements to alter the structure and definition of the object such as CREATE, DROP, ALTER, TRUNCATE, GRANT and REVOKE

Exceptionally, the following statements of DDL which deals with OS resources or alters the DATA TYPE can not be rolled back, but are automatically committed when executing the statement.

- CREATE TABLESPACE
- DROP TABLESPACE
- ALTER TABLESPACE
- ALTER TABLE .. ALTER COLUMN .. SET DATA TYPE: ⟨alter column data type clause⟩

## Examples

The following is an example of rolling back the INSERT statement.

```
gSQL> INSERT INTO t1 VALUES (1, 'anonymous');
1 row created.
gSQL> SELECT * FROM t1;
ID DATA
-- -----
1 anonymous
1 row selected.
gSQL> ROLLBACK;
Rollback complete.
gSQL> SELECT * FROM t1;
no rows selected.
```

The following is an example of ROLLBACK after performing the DROP TABLE statement.

```
gSQL> DROP TABLE t1;
Table dropped.
gSQL> SELECT * FROM t1;
ERR-42000(16040): table or view does not exist :
SELECT * FROM t1
 *
ERROR at line 1:
gSQL> ROLLBACK;
Rollback complete.
gSQL> SELECT * FROM t1;
ID DATA
-- -----
1 anonymous
1 row selected.
```

# Compatibility

Table 16-63 SQL standard compatibility

Feature ID	Description	Compatibility

T261	Chained transactions	X

## For More Information

Refer to the followings.

- COMMIT
- SAVEPOINT `savepoint_specifier`

## 16.124 SAVEPOINT savepoint\_specifier

### Function

It defines a savepoint.

### Syntax

```
<savepoint statement> ::=
 SAVEPOINT savepoint_name
 ;
```

### Syntax Rules and Parameters

#### savepoint\_name

It is a name of the savepoint.

If the savepoint name is as same as the existing savepoint name, then the existing savepoint is deleted.

The length of the savepoint name should be shorter than 128 bytes.

### Description

The defined savepoint is used by ROLLBACK TO SAVEPOINT statement (refer to **ROLLBACK.**), and DML or DDL statement which has been performed up to the savepoint is rolled back. Then the locks acquired by using that statement are released, too.

The defined savepoint is automatically deleted when the transaction is committed or rolled back, or it can be explicitly deleted by using **RELEASE SAVEPOINT savepoint\_specifier**.

## Example

The following is an example of defining the savepoint and using ROLLBACK TO SAVEPOINT statement.

```
gSQL> SAVEPOINT sp1;
Savepoint created.
gSQL> INSERT INTO t1 VALUES (1, 'anonymous');
1 row created.
gSQL> SAVEPOINT sp2;
Savepoint created.
gSQL> INSERT INTO t1 VALUES (2, 'someone');
1 row created.
gSQL> SAVEPOINT sp3;
Savepoint created.
gSQL> INSERT INTO t1 VALUES (3, 'anyone');
1 row created.
gSQL> SELECT * FROM t1;
ID DATA
-- -----
1 anonymous
2 someone
3 anyone
3 rows selected.
gSQL> ROLLBACK TO SAVEPOINT sp3;
Rollback complete.
gSQL> SELECT * FROM t1;
ID DATA
-- -----
1 anonymous
2 someone
2 rows selected.
gSQL> ROLLBACK TO SAVEPOINT sp2;
Rollback complete.
gSQL> SELECT * FROM t1;
ID DATA
-- -----
1 anonymous
1 row selected.
gSQL> ROLLBACK TO SAVEPOINT sp1;
Rollback complete.
```

```
gSQL> SELECT * FROM t1;
no rows selected.
```

- ROLLBACK
- RELEASE SAVEPOINT savepoint\_specifier

# 16.125 SELECT

## query expression

### Function

It retrieves desired rows from one or more tables or views.

### Syntax

```

<query expression> ::=
 <query expression body> [<order by clause>] [<offset limit clause>]
<query expression body> ::=
 <query term>
 | <set operator>
<query term> ::=
 <query specification>
 | <left paren> <query expression body> [<order by clause>] [<offset limit clause>]
 <right paren>

```

### Invocation and Access Rules

One of the following privileges for all tables used in the statement is required for a user to perform <query expression>.

- SELECT(columns) ON TABLE for all used columns of table in the statement
- (SELECT or CONTROL TABLE) ON TABLE for the table
- (SELECT TABLE or CONTROL SCHEMA) ON SCHEMA for the schema to which the table belongs
- SELECT ANY TABLE ON DATABASE

### Syntax Rules and Parameters

#### <set operator>

It performs a set operation among the subqueries.

For more information, refer to **set operator**.

## ⟨query specification⟩

It specifies a single subquery.

For more information, refer to **⟨query specification⟩**.

## ⟨order by clause⟩

It specifies sorting information of a query result.

For more information, refer to **order by clause**.

## ⟨offset limit clause⟩

It specifies the number of rows to skip and the number of rows to fetch from the query result set.

For more information, refer to **offset limit clause**.

## Description

It is specifying SELECT statement, and ⟨order by clause⟩, ⟨offset limit clause⟩ can be omitted and two or more subqueries can be specified through ⟨set operator⟩.

## Examples

The following is an example of SELECT statement.

```
gSQL> SELECT s_name, s_nation FROM supplier;
```

S_NAME	S_NATION
Supplier#1	FRANCE
Supplier#2	KOREA
Supplier#3	GERMANY
Supplier#4	UNITED STATES
Supplier#5	CANADA

5 rows selected.

The following is an example of the SELECT statement which uses ⟨order by clause⟩.

```
gSQL> SELECT s_name, s_nation FROM supplier ORDER BY s_name DESC;
```

S_NAME	S_NATION
Supplier#5	CANADA
Supplier#4	UNITED STATES
Supplier#3	GERMANY

```

Supplier#2 KOREA
Supplier#1 FRANCE
5 rows selected.

```

The following is an example of the SELECT statement which uses <offset limit clause>.

```

gSQL> SELECT s_name, s_nation FROM supplier OFFSET 1;
S_NAME S_NATION

Supplier#2 KOREA
Supplier#3 GERMANY
Supplier#4 UNITED STATES
Supplier#5 CANADA
4 rows selected.
gSQL> SELECT s_name, s_nation FROM supplier LIMIT 1;
S_NAME S_NATION

Supplier#1 FRANCE
1 row selected.

```

The following is an example of the SELECT statement which uses <order by clause> and <offset limit clause>.

```

gSQL> SELECT s_name, s_nation FROM supplier ORDER BY s_name DESC OFFSET 3 LIMIT 1;
S_NAME S_NATION

Supplier#2 KOREA
1 row selected.

```

## Compatibility

# query specification

## Function

It specifies the table which is derived from the result of <table expression>.

## Syntax

```
<query specification> ::=
 SELECT [<hint clause>] [<set quantifier>] <select list> <table expression>
<set quantifier> ::=
 ALL
 | DISTINCT
<table expression> ::=
 <from clause> [<where clause>] [<group by clause>] [<having clause>]
```

## Invocation and Access Rules

The use should satisfy one of the following conditions to perform <query specification>.

- The owner of that table
- SELECT privilege for the table
- The user owns one of SELECT TABLE, CONTROL TABLE, CONTROL privileges for the schema to which the table belongs
- The user owns the SELECT TABLE privilege for the database

## Syntax Rules and Parameters

### <hint clause>

It specifies the hint for query execution.  
For more information, refer to **hint clause**.

### <set quantifier>

It specifies whether to remove a duplicate of the query result.  
If it is omitted, it operates in the same way as ALL.

## ⟨select list⟩

It specifies the expression to be output among query results.  
For more information, refer to **select list**.

## ⟨from clause⟩

It specifies the tables to be retrieved.  
For more information, refer to **from clause**.

## ⟨where clause⟩

It specifies conditions for retrieving.  
For more information, refer to **where clause**.

## ⟨group by clause⟩

It specifies grouping of the query result.  
For more information, refer to **group by clause**.

## ⟨having clause⟩

It specifies conditions for the grouping result.  
For more information, refer to **having clause**.

## Description

### ⟨hint clause⟩

⟨hint clause⟩ is a statement that the user commands an optimizer to perform the better execution plan than the plan selected by an optimizer, if exist.

The optimizer of GOLDILOCKS preferentially applies ⟨hint clause⟩ specified by a user. If it is not applicable, the optimizer selects the best execution plan through the cost calculation.

Even when a syntactic error occurs in ⟨hint clause⟩, GOLDILOCKS is set to ignore and perform it by default. Set "HINT\_ERROR" property to *on*, then execute the query to check if a syntactic error exist in ⟨hint clause⟩.

### ⟨set quantifier⟩

⟨set quantifier⟩ sets whether to remove duplicates for each row consisting of the expressions specified in ⟨select list⟩. The meaning of each set quantifier is as follows.

- ALL: It does not remove the duplicates from the result set.
- DISTINCT: It removes the duplicates from the result set.

⟨set quantifier⟩ can be omitted. If it is omitted, it is operated by default which is as same as ALL.

## ⟨select list⟩

⟨select list⟩ specifies the expression list to be returned from each row of the result set.

They are listed by separating by a comma (,).

An asterisk (\*) is used to specify all columns in ⟨from clause⟩.

## ⟨from clause⟩

⟨from clause⟩ specifies the tables or views to be retrieved.

## ⟨where clause⟩

⟨where clause⟩ specifies the conditions to get only the desired results from the result obtained from ⟨table expression⟩.

## ⟨group by clause⟩

⟨group by clause⟩ specifies the grouping method for the result set acquired from ⟨table expression⟩.

When ⟨group by clause⟩ is specified, only the group key determining the group, or aggregation function for the data belonging to the group can be used in ⟨select list⟩.

## ⟨having clause⟩

⟨having clause⟩ specifies the retrieving condition for the group to get only the desired results from the grouped result set.

It is generally used together with ⟨group by clause⟩. When it is used without ⟨group by clause⟩, the result set returned from ⟨table expression⟩ operates as same as when ⟨group by clause⟩, a single group, is specified.

## Examples

The following is an example of SELECT statement which uses ⟨hint clause⟩.

```
gSQL> SELECT /*+ INDEX_DESC(supplier, supplier_pk_index) */ s_name, s_nation FROM supplier;
S_NAME S_NATION

Supplier#5 CANADA
Supplier#4 UNITED STATES
```

```

Supplier#3 GERMANY
Supplier#2 KOREA
Supplier#1 FRANCE
5 rows selected.

```

The following is an example of SELECT statement which uses <set quantifier>.

```

gSQL> SELECT ALL p_type FROM part;
P_TYPE

COPPER
NICKEL
STEEL
NICKEL
STEEL
5 rows selected.
gSQL> SELECT DISTINCT p_type FROM part;
P_TYPE

COPPER
STEEL
NICKEL
3 rows selected.

```

The following is an example of SELECT statement which uses <where clause>.

```

gSQL> SELECT p_name, p_brand, p_type, p_size FROM part where p_size < 10;
P_NAME P_BRAND P_TYPE P_SIZE

Part#1 Brand#1 COPPER 7
Part#2 Brand#1 NICKEL 1
2 rows selected.

```

The following is an example of SELECT statement which uses <group by clause>.

```

gSQL> SELECT ps_partkey, SUM(ps_availqty) FROM partsupp GROUP BY ps_partkey;
PS_PARTKEY SUM(PS_AVAILQTY)

1 11401
2 8025
3 13864
4 11564

```

```

 5 8744
5 rows selected.

```

The following is an example of SELECT statement which uses <having clause>.

```

gSQL> SELECT ps_partkey, SUM(ps_availqty) FROM partsupp GROUP BY ps_partkey having
SUM(ps_availqty) > 10000;
PS_PARTKEY SUM(PS_AVAILQTY)

 1 11401
 3 13864
 4 11564
3 rows selected.

```

## Compatibility

**Table 16-66** SQL standard compatibility

Feature ID	Description	Compatibility
F801	Full set function	X
T051	Row types	X
T301	Functional dependencies	X
T325	Qualified SQL parameter references	X
T053	Explicit aliases for all-fields reference	O
T285	Enhanced derived column names	O

## For More Information

Refer to **query expression**.

## select list

### Function

It specifies the columns to be retrieved from the query result.

### Syntax

```

<select list> ::=
 <asterisk>
 | <select sublist> [{ <comma> <select sublist> } ...]
<select sublist> ::=
 <derived column>
 | <qualified asterisk>
<qualified asterisk> ::=
 <asterisked identifier chain> <period> <asterisk>
<asterisked identifier chain> ::=
 <asterisked identifier> [{ <period> <asterisked identifier> } ...]
<derived column> ::=
 <value expression> [<as clause>]
<as clause> ::=
 [AS] <column name>

```

### Invocation and Access Rules

If columns or subqueries exist in <select list> statement, to perform <select list>, a user should have the access privileges for the columns and the access privileges for the table and columns of the subqueries.

### Syntax Rules and Parameters

#### <select list>

It has <asterisk> or <select sublist>.

<asterisk> can be used in <select list> only when it is alone. In other words, it can not specify <select sublist>.

If two or more <select sublist> are specified, each <select sublist> should be separated by a comma(,).

## ⟨select sublist⟩

It has ⟨derived column⟩ or ⟨qualified asterisk⟩.

A single table can have only one ⟨quantified asterisk⟩.

⟨derived column⟩ can change the output name by using *AS*, and *AS* can be omitted.

## Description

### ⟨select list⟩

⟨select list⟩ specifies the columns to be included in the result set. If ⟨asterisk⟩ is specified in ⟨select list⟩, all columns in ⟨from clause⟩ are specified as a select list, and ⟨select sublist⟩ can not be additionally specified.

### ⟨select sublist⟩

⟨select sublist⟩ has ⟨derived column⟩ or ⟨qualified asterisk⟩. If two or more ⟨select sublist⟩ are specified, they should be separated by a comma (',').

For ⟨qualified asterisk⟩, all columns belonging to a particular table or view are set as a select list. For ⟨derived column⟩, the column can be directly specified, or ⟨value expression⟩ can be specified.

⟨derived column⟩ can change the column name by using ⟨as clause⟩, and *AS* can be omitted.

## Names to Be Set in select list

- When ⟨column name⟩ is specified in ⟨derived column⟩, the name is set as a select list name.
- When ⟨column name⟩ is not specified in ⟨derived column⟩, the select list name is specified as follows.
  - If ⟨derived column⟩ is a single column reference, the column name of a single column is set to a select list name.
  - If ⟨derived column⟩ is SQL parameter reference, ⟨SQL parameter name⟩ of SQL parameter is set as a select list name.
  - Otherwise, the column name of ⟨derived column⟩ is not set.
- When two or more tables exist in ⟨from clause⟩ and the columns with the same name are included in these tables, the table name or table alias should be specified to refer to these columns.

## Examples

The following is an example of SELECT statement which uses ⟨asterisk⟩.

```
gSQL> SELECT * FROM supplier;
```

S_SUPPKEY	S_NAME	S_NATION	S_PHONE
-----	-----	-----	-----

1 Supplier#1	FRANCE	27-918-335-1736
2 Supplier#2	KOREA	15-679-861-2259
3 Supplier#3	GERMANY	11-383-516-1199
4 Supplier#4	UNITED STATES	25-843-787-7479
5 Supplier#5	CANADA	21-151-690-3663

5 rows selected.

The following is an example of SELECT statement which uses <select sublist>.

```
gSQL> SELECT revenue.* FROM revenue;
```

```
SUPPLIER_NO TOTAL_REVENUE
```

```

1 11978.64
2 20321.5
3 41844.68
```

3 rows selected.

```
gSQL> SELECT supplier_no suppno, total_revenue AS TOTAL FROM revenue;
```

```
SUPPNO TOTAL
```

```

1 11978.64
2 20321.5
3 41844.68
```

3 rows selected.

```
gSQL> SELECT 1, revenue.*, CAST(total_revenue AS NATIVE_INTEGER) TOTAL FROM revenue;
```

```
1 SUPPLIER_NO TOTAL_REVENUE TOTAL
```

```
- - - - -
1 1 11978.64 11979
1 2 20321.5 20322
1 3 41844.68 41845
```

3 rows selected.

## Compatibility

Unlike <select list>, the SQL standard supports <all fields reference>.

## For More Information

Refer to [query specification](#).

# from clause

## Function

It specifies the table which is derived from one or more tables.

## Syntax

```

<from clause> ::=
 FROM <table reference list>
<table reference list> ::=
 <table reference> [{ , <table reference> } ...]
<table reference> ::=
 <table factor>
 | <joined table>
<table factor> ::=
 <table primary>
<table primary> ::=
 <table name> [<cluster domain>] [[AS] <correlation name>]
 | <derived table> [<cluster domain>] [[AS] <correlation name> [<left paren> <derived
column list> <right paren>]]
 | <parenthesized joined table>
<derived table> ::=
 <table subquery>
<parenthesized joined table> ::=
 <left paren> <parenthesized joined table> <right paren>
 | <left paren> <joined table> <right paren>
<derived column list> ::=
 <column name list>
<cluster domain> ::=
 @ <cluster domain name>
<cluster domain name> ::=
 GLOBAL
 | LOCAL
 | LOCAL_OFFLINE
 | <identifier>

```

## Invocation and Access Rules

The access privilege for the table or view specified in `<table reference list>` is required.

## Syntax Rules and Parameters

### `<table reference list>`

- One or more tables can be specified in `<table reference list>` by using a comma (,).
- When two or more tables are specified
  - The evaluation order for the tables is from left to right.
  - When `*` is specified in `<select list>`, the columns are sequentially mapped in `<select list>` from the left table to the right table.

### `<table primary>`

An alias name can be specified by using `<correlation name>`.

`<table subquery>` is in `<derived table>`, and an alias name can be specified by using `<correlation name>`. `<derived column list>` can be specified in `<derived table>`, and the number of `<column name>` in `<derived column list>` should be same as the number of the target of `<select list>` specified in `<table subquery>`.

If `<derived column list>` is specified in `<derived table>`, then it is sequentially mapped one to one with targets of `<select list>` specified in `<table subquery>`.

If `<derived column list>` is specified in `<derived table>`, `<column name>` in `<derived column list>` should be used to refer to `<select list>` of `<table subquery>` in `<derived table>`.

### `<correlation name>`

The same `<correlation name>` should not exist two or more in `<table reference list>`.

When `<correlation name>` is specified in `<table name>` or `<derived table>`, `<correlation name>` should be used to refer to `<table name>` or `<derived table>`.

`AS` which is specified in front of `<correlation name>` can be omitted.

### `<derived column list>`

The same `<column name>` should not exist two or more in `<derived column list>`.

## ⟨cluster domain⟩

- ⟨cluster domain⟩ may be a table, a view, or a table subquery, but a joined table in parentheses can not be ⟨cluster domain⟩.
- ⟨cluster domain⟩ can not be specified in a table or a view whose structure or data is to be altered.
  - However, "@LOCAL" is specified in a target table for a data altering query created by **Processing SELECT in Cluster**.

## ⟨cluster domain name⟩

Only a cluster group name or a cluster member name can be ⟨identifier⟩ of ⟨cluster domain name⟩.

## Description

### ⟨table reference list⟩

Two or more tables can be specified in ⟨table reference list⟩ by using a comma (,). When specifying two or more tables, it operates in the same way as cross join each table from left to right. If the conditions to join two tables exist in ⟨where clause⟩, the two tables operate in the same way as inner join which has ⟨where clause⟩ as a join condition.

If outer join operator (+) is used in ⟨where clause⟩, it operates in the same way as outer join.

For more information about outer join operator (+), refer to outer join operator specification of **joined table**.

### ⟨table reference⟩

A single table, or view, table subquery, joined table can be ⟨table reference⟩. They can have a correlation name except for the joined table.

For more information about joined table, refer to **joined table**.

### ⟨table primary⟩

The tables, views, table subqueries and joined tables in parentheses can be ⟨table primary⟩. The table, view, table subquery can have a correlation name, and 'AS' can be omitted. If the correlation name is specified, it should be used in everywhere referring to the table, view, table subquery such as ⟨select list⟩, ⟨where clause⟩.

The table subquery can specify ⟨derived column list⟩ by using parentheses. The name specified in ⟨derived column list⟩ should be used in everywhere referring to table subquery column like as correlation name. To use ⟨derived column list⟩ in the table subquery, the correlation name should be specified.

The joined table enclosed with parentheses specifies the logical join order for the table participating in the

e join operation. At this time, if all join operations for the tables enclosed with parentheses are cross join, inner join, the join order can be changed by an optimizer.

## ⟨cluster domain⟩

When ⟨cluster domain⟩ is omitted, it means the same as using GLOBAL as ⟨cluster domain name⟩.

## ⟨cluster domain name⟩

The reserved words defined in ⟨cluster domain name⟩ mean as follows.

- GLOBAL
  - It selects all cluster groups as a cluster domain.
- LOCAL
  - It selects only the server performing the user query as a cluster domain.
- LOCAL\_OFFLINE
  - If the table to which the domain is to be applied is offline, it selects only the server performing the user query as a cluster domain.
  - If LOCAL\_OFFLINE domain is specified in an online table, then an error occurs.

If ⟨identifier⟩ is specified in ⟨cluster domain name⟩, a cluster group or a cluster member with the corresponding name is selected as **Cluster Domain**.

## Examples

The following is an example of SELECT statement to query a single table by using ⟨table name⟩.

```
gSQL> SELECT c_name, c_nation FROM customer;
C_NAME C_NATION

Customer#1 KOREA
Customer#2 CANADA
Customer#3 KOREA
Customer#4 GERMANY
Customer#5 UNITED STATES
5 rows selected.
```

The following is an example of SELECT statement which uses ⟨derived table⟩.

```
gSQL> SELECT * FROM (SELECT c_name, c_nation FROM customer);
C_NAME C_NATION

Customer#1 KOREA
```

```

Customer#2 CANADA
Customer#3 KOREA
Customer#4 GERMANY
Customer#5 UNITED STATES
5 rows selected.
gSQL> SELECT * FROM (SELECT c_name, c_nation FROM customer) AS CUST ("CUSTOMER_NAME",
"CUSTOMER_NATION");
CUSTOMER_NAME CUSTOMER_NATION

Customer#1 KOREA
Customer#2 CANADA
Customer#3 KOREA
Customer#4 GERMANY
Customer#5 UNITED STATES
5 rows selected.

```

The following is an example of SELECT statement for a joined table which uses parentheses.

```

gSQL> SELECT customer.c_name, o_totalprice FROM (customer INNER JOIN orders ON
customer.c_custkey = orders.o_custkey);
C_NAME O_TOTALPRICE

Customer#1 173665.47
Customer#2 46929.18
Customer#4 193846.25
Customer#3 32151.78
Customer#5 144659.2
5 rows selected.

```

The following is an example of SELECT statement which uses two table separated by a comma (,).

```

gSQL> SELECT c_name, o_totalprice FROM customer, orders;
C_NAME O_TOTALPRICE

Customer#1 173665.47
Customer#1 46929.18
Customer#1 193846.25
Customer#1 32151.78
Customer#1 144659.2
Customer#2 173665.47
Customer#2 46929.18
Customer#2 193846.25

```

```

Customer#2 32151.78
Customer#2 144659.2
Customer#3 173665.47
Customer#3 46929.18
Customer#3 193846.25
Customer#3 32151.78
Customer#3 144659.2
Customer#4 173665.47
Customer#4 46929.18
Customer#4 193846.25
Customer#4 32151.78
Customer#4 144659.2
C_NAME O_TOTALPRICE

Customer#5 173665.47
Customer#5 46929.18
Customer#5 193846.25
Customer#5 32151.78
Customer#5 144659.2
25 rows selected.

```

The following is an example of SELECT statement which uses <cluster domain>.

- Using the reserved word GLOBAL

```

gSQL> SELECT * FROM (SELECT c_name, c_nation FROM customer@GLOBAL);
C_NAME C_NATION

Customer#1 KOREA
Customer#2 CANADA
Customer#3 KOREA
Customer#4 GERMANY
Customer#5 UNITED STATES
5 rows selected.

```

- Using the reserved word LOCAL

```

gSQL> SELECT * FROM (SELECT c_name, c_nation FROM customer)@LOCAL;
C_NAME C_NATION

Customer#1 KOREA
Customer#2 CANADA

```

2 rows selected.

- Using the cluster group name G1

```
gSQL> SELECT * FROM (SELECT c_name, c_nation FROM customer@G1);
C_NAME C_NATION

Customer#1 KOREA
Customer#2 CANADA
2 rows selected.
```

- Using the cluster member name G2N1

```
gSQL> SELECT * FROM (SELECT c_name, c_nation FROM customer@G2N1);
C_NAME C_NATION

Customer#3 KOREA
Customer#4 GERMANY
2 rows selected.
```

## Compatibility

The SQL standard has the following differences compared to GOLDILOCKS.

- It supports <sample clause> in <table factor>.
- It supports <lateral derived table>, <collection derived table>, <table function derived table>, <only spec>, <data change delta table> in <table primary>.
  - <lateral derived table> allows <from clause> to refer to the left tables of the corresponding statement within subquery of <lateral derived table>. (e.g. select \* from dual a,(select \* from dual b where a.dummy = b.dummy);)
  - <only spec> does not allow the results of the subview to be included if the view of <from clause> is a hierarchical view.
- It supports system-versioned table in <table primary>.
- It supports <derived column list> in <table primary>.
- It supports <transition table name> and <query name> in <table primary>.
- <correlation name> should exist for <derived table>.

## For More Information

Refer to [subquery](#).

## joined table

### Function

It specifies the table derived from a cartesian product, inner join, outer join.

### Syntax

```

<joined table> ::=
 <cross join>
 | <qualified join>
 | <natural join>
<cross join> ::=
 <table reference> CROSS JOIN <table factor>
<qualified join> ::=
 <table reference> [<join type>] JOIN <table reference> <join specification>
<natural join> ::=
 <table reference> NATURAL [<join type>] JOIN <table factor>
<join specification> ::=
 <join condition>
 | <named columns join>
<join condition> ::=
 ON <search condition>
<named columns join> ::=
 USING (<join column list>)
<join type> ::=
 INNER
 | { LEFT | RIGHT | FULL } [OUTER]
<join column list> ::=
 <column name list>

```

### Invocation and Access Rules

The access privilege for all tables and views specified in a joined table is required.

### Syntax Rules and Parameters

## ⟨cross join⟩

⟨join specification⟩ does not appear, and a single table, ⟨table subquery⟩ or ⟨joined table⟩ in parentheses can appear on the right.

## ⟨qualified join⟩

- ⟨join specification⟩ should be specified.
- ⟨join type⟩ can be omitted. When it is omitted, it performs INNER.
- OUTER can be omitted in ⟨join type⟩.
- If ⟨join type⟩ is OUTER JOIN, only ⟨join condition⟩ can appear in ⟨join specification⟩. (If ⟨named columns join⟩ appears, an error occurs.)

## ⟨natural join⟩

- ⟨join specification⟩ does not appear and a single table, ⟨table subquery⟩ or ⟨joined table⟩ in parentheses can appear on the right.
- ⟨join type⟩ can be omitted. When it is omitted, it performs INNER.
- It does not support OUTER in ⟨join type⟩.
- If the same ⟨column name⟩ does not exist between the left row and right row of NATURAL JOIN, it performs ⟨cross join⟩.
- If the same ⟨column name⟩ exists between the left row and right row of NATURAL JOIN, it is treated in the same way specified with USING clause.
- If comparison operation does not exist for the two corresponding columns, an error occurs.

## ⟨join specification⟩

- Only one of ⟨join condition⟩ or ⟨named columns join⟩ can be specified.
- When ⟨named columns join⟩ is specified
  - One or more column name should be specified in ⟨join column list⟩.
  - The column name can not be specified such as ⟨table name⟩.⟨column name⟩.
  - The listed columns in ⟨join column list⟩ should be on the left row and right row of JOIN, and they should be able to be compared.
